Capital markets and structured investments

Issuing and investing in debt securities

*Are there any restrictions on issuing debt securities?*

No.

Last modified 23 Jul 2020

*What are common issuing methods and types of debt securities?*

The most common type of debt securities in Angola is the issuance of commercial paper. Commercial paper is debt securities with a maturity of one year or less. Commercial companies, public companies, civil companies in commercial form and other legal persons governed by public or private law may issue commercial paper.

Among other requirements, the issue of commercial paper requires prior legal certification of accounts or auditing by an auditor registered with the Capital Market Commission (CMC).

Last modified 23 Jul 2020

*What are the differences between offering debt securities to institutional / professional or other investors?*

- Agreements for investment services concluded with non-institutional investors shall be in writing and only such investors may invoke invalidity resulting from failure to comply with the form.
- In intermediation agreements signed with non-institutional investors for the execution of operations in Angola, the possible application of foreign law may not have the consequence of depriving the investor of the protection ensured by the Angolan Securities Code provisions on information, conflict of interest and asset segregation.
- Brokers must establish, in writing, an internal policy that allows them, always, to know the nature of each client, as a non-institutional or institutional investor, and to adopt the necessary procedures for its implementation.
- The Broker’s information duties to non-institutional investors are far more extensive than to institutional investors.

Assessment of the Adequate Character of the Operation:

In the case of non-institutional investors, the broker must ask the client for information regarding their knowledge and investment experience with regard to the type of security and derivative instrument or the service considered, to enable them to assess whether the client understands the risks involved.
If the broker considers that the transaction under consideration is not suitable for that client, they should advise the client in writing.

In the case of institutional investors, the broker may assume that, in respect of securities and derivatives, operations and investment services, the client has the necessary level of experience and knowledge to assess the appropriateness of the operation.

- Public Offers:

An offer addressed to at least 150 people who are non-institutional investors resident or established in Angola is qualified as public.

**When is it necessary to prepare a prospectus?**

The general rule is that any public offer of securities must be preceded by the disclosure of a prospectus.

The exceptions to this rule are:

- public offers of securities to be awarded, on the occasion of a merger, to at least 150 shareholders other than institutional investors, provided that a document containing information considered by the CMC to be equivalent to that of a prospectus is available at least 15 days before the date of the General Meeting;

- the payment of dividends in the form of shares of the same class as the shares in respect of which the dividends are paid, provided that a document is available containing information on the number and nature of the shares and the reasons for and details of the offer;

- public offers for distribution of securities to existing or former directors or employees by their employer where the employer has securities admitted to trading on a regulated market or by a company controlled by it, provided that a document is available containing information on the number and nature of the securities and the reasons for and details of the offer; and

- public offers for sale of securities admitted to trading on a regulated market, provided that the admission prospectus is up to date.

**What are the main exchanges available?**

BODIVA – Angolan Debt and Stock Exchange

**Is there a private placement market?**

No.

**Are there any other notable risks or issues around issuing or investing in debt securities?**

No.

**Establishing and investing in debt / hedge funds**

**Are there any restrictions on establishing a fund?**
What are common fund structures?

Securities investment funds
Real Estate investment funds
Venture Capital investment funds

What are the differences between offering fund securities to professional / institutional or other investors?

Investment funds may be set up exclusively for institutional investors. In that case the Fund rules shall be explicit about the exclusive participation of institutional investors. A Fund intended exclusively for institutional investors may establish different rules compared to other funds, in particular establishing different time limits for ascertaining the value of the unit and payment of redemption, charge a management fee on the basis of the results of the Fund or dispense with the preparation of a half-yearly report.

Are there any other notable risks or issues around establishing and investing in funds?

No.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

The establishment of an investment fund is subject to prior authorization by the CMC.

Authorization requires approval by the CMC of the incorporation documents, the choice of depositary and the management entity's request to manage the Fund.

Are there any restrictions on managing a fund?

The management of Investment Funds may only be exercised by fund management entities empowered by law and registered with the CMC.

Fund management entities must maintain their business organization equipped with the human, material and technical resources necessary to provide their services under appropriate conditions of quality, professionalism and efficiency, in order to avoid wrong procedures.

Real Estate Fund Management entities must also maintain a technical department qualified to provide real estate project analysis and monitoring services or to contract such services externally.
Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

No.

What are common types of derivatives?

- Swaps
- Options
- Futures

Are there any other notable risks or issues around entering into derivatives contracts?

No.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

The development of professional lending activity may only be carried out by financial institutions authorized by the BNA.

Foreign investors who develop their projects by using benefits under the Private Investment Law may have recourse to credit in Angolan banks (under the Angolan applicable legislation).

What are common lending structures?

The common lending structures are Financial Banking institutions.

What are the differences between lending to institutional / professional or other borrowers?

The law does not mention special differences between lending to institutional and non-institutional debtors.

The only legal regime that is exclusive to individuals is the consumer credit regime.

Do the laws recognize the principles of agency and trusts?
Are there any other notable risks or issues around lending?
No.

Are there any other notable risks or issues around borrowing?
No.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?
A company can grant a security interest aiming to secure its obligations as a borrower on a credit facility and as a guarantor of the obligations of other borrowers and guarantors' obligations under a credit facility.

For that reason, the general rule set forth under Angolan legal framework is that a company's corporate power is restricted to rights and duties considered adequate in order to proceed with the exercise of the company's corporate object.

Hence, it is assumed that the granting of guarantees regarding other entities' duties is opposed to the purpose of companies, except in situations where the companies' own interest is legitimate in providing the guarantee or the company being considered is in a group or control relationship with other companies (Article 6(3) Angolan Companies Law).

The company's own legitimate interest is visible when providing the downstream guarantees. However, it is less visible when providing upstream and cross-stream guarantees, being advisable for the necessary resolutions to be given with the intention to justify the own interest of the company, which in certain circumstances might be an indirect one, when providing the guarantee.

In regard to governmental or other consents or filings (or other formalities) required when granting/taking a guarantee, with exception of when there are state-owned and other public sector companies, the general rule is that no governmental consent or filings is required under the law, in order for a guarantee being provided by an Angolan company to be enforceable.

Notwithstanding, a guarantee provided by an Angolan company becomes enforceable when either a shareholder or border consent is given in accordance with the Angolan Companies Law. Commonly, such consent will detail expressly the benefit expected to be acquired from the provision of the guarantee.

Moreover, a security can be taken over inventory when executing a written agreement. Whenever there is a situation of non-payment or the occurrence of other circumstances presumed to be described in the pledge agreement, the pledger or security agent can provide an enforcement notice to the pledgor. As an alternative, parties may prefer the provision of ordinary notices containing details of the stock.

Additionally, a company cannot guarantee and/or give a security to support borrowing arising from the financing of direct or indirect acquisition of shares of the company, being expressly forbidden (Article 344 of the Angolan Companies Law). Exceptions are available. Criminal liability of the directors/managers of such company may be considered when violating this prohibition, as well as the declaration of voidance and nullity of the agreement, guarantee or security interest.

Contrary to that, no express prohibition exists when the subject is the direct or indirect financing of shares of any company which directly or indirectly owns shares in the company or shares in a sister subsidiary, even though it is generally understood as applicable. Again, as previously mentioned, the corporate powers of the company may be restricted in respect of granting of guarantees or security.
What are common types of guarantees and security?

The Angolan Civil Code in Book II, Chapter VI, establishes the following types of secure lending obligations:

I. Provision of Bonds;

II. Bail;

III. Consignation of income;

IV. Pledge;

V. Mortgage, and

VI. Right of Retention.

Angolan law establishes that the possibility to provide general security over the assets of a given entity through a general security agreement is treated as null and void since there is a lack of determination of the specific assets subject to the security.

Thus, a security agreement must identify the assets that are subject to the security created by the agreement. It must have a certain criterion that as a result gives the possibility to identify the secured assets at a given time.

As mortgages and consignation of income must be granted by public deed, whereas pledged may be granted by the celebration of private agreements, the adoption of one single agreement or separate agreements varies in accordance with the type of security being granted.

Moreover, in companies incorporated in Angola, security can be taken over shares by pledges of shares (quotas or shares).

The shares on a Joint Stock limited liability companies (Sociedades Anónimas) are carried out through means of registration in the securities holder’s account, with an indication of the number of shares pledged, the guaranteed obligation and identification of the beneficiary. If the voting right is granted to the pledge creditor, the pledge may be constituted by registration in their account. In the other hand, on Private limited liability companies (Sociedades por Quotas), the pledge must be done through means of a public deed.

The said pledges of shares may be either in book-entry form or in a certified form. The procedure to be followed varies according to the type of company in question, since such security can be granted by a document governed by the laws of other jurisdiction (e.g. English law) upon the compliance of the formalities set out by Angolan Law.

Are there any other notable risks or issues around giving and taking guarantees and security?

In circumstances where only a small benefit to the guaranteeing/securing company can be shown, it is likely that there is no legitimate interest to the company in providing the guarantee/security.

Consequently, unless the company is part of a group or it is in a control relationship with the entity whose obligations it guarantees/secures, the granting of the guarantee/security may be declared null and void.

The Civil Procedure Code, article 1175, determines that the declaration of bankruptcy may be filed within two years of the occurrence of the facts established by law, even if the trader has ceased trading or died.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in
**finance and investments generally?**

**Banking**

Law of the National Bank (Law nº 16/10, from July 15)
Financial Institutions Law (Law nº 12/15, from June 17)
Law to Prevent and Combat Money Laundering and the Financing of Terrorism and the proliferation of weapons of mass destruction (Law nº 5/20, from January 27)
Foreign Exchange Regime Law (Law nº 5/97, from June 27)

**Securities**

Securities Code (Law nº 22/15, from August 31)
Legal Framework of Investment Funds (Presidential Legislative Decree No. 7/13, from October 11)
Legal Framework for Venture Capital Collective Investment Schemes (Presidential Legislative Decree 4/15, from September 16)

**Regulatory authorization**

**Who are the regulators?**

- Central Bank (*Banco Nacional de Angola* (BNA));
- Capital Market Commission (*Comissão de Mercado de Capitais* (CMC)).

**What are the authorization requirements and process?**

The incorporation of financial banking institutions is subject to authorization by the Central Bank (BNA).

In general, in order to obtain authorization from the regulator, financial banking institutions based in Angola must:

- have as their exclusive object the exercise of the activity legally permitted, under the terms of Article 6 of this Basic Law of Financial Institutions;
- adopt the form of a public limited company;
- have share capital not less than the legal minimum;
- have share capital represented by registered shares;
- have sound corporate governance arrangements, including a clear organizational structure with well-defined, transparent and consistent lines of responsibility;
- have effective processes to identify, manage, control and communicate the risks to which is or might be exposed;
- have appropriate internal control mechanisms, including robust administrative and accounting procedures; and
- have remuneration policies and practices that promote and are consistent with sound and prudent risk management.

**What are the main ongoing compliance requirements?**

Financial institutions must comply with the requirements set out in Law 5/20, of January 27 – Law to Prevent and Combat Money Laundering, Financing Terrorism and Proliferation of Weapons of Mass Destruction.
Qualified holdings: the banking financial institution over which a natural or legal person, directly or indirectly, intends to hold a qualified holding must first formulate an authorization request to the Central Bank (BNA). A holding in a company, directly or indirectly, of not less than 10% of the capital or voting rights of the company in which a participation is held or which, for any reason, makes it possible to exercise a significant influence over the management of the institution in which the participation is held, shall be deemed to be qualified.

What are the penalties for failure to be authorized?

The unauthorized practice of transactions reserved for financial institutions, as well as the exercise by a financial institution of activity not included in its legal object, and the carrying out of unauthorized operations or operations which are specially prohibited to them, is punishable by a fine of AOA300,000 to AOA150 million and from AOA500,000 to AOA500 million, depending on whether an individual or legal person is involved.

In addition to fines, ancillary sanctions, such as seizure and confiscation of the object of the offence, including the economic proceeds thereof, may be imposed on the offender.

Regulated activities

What finance and investment activities require authorization?

The financial activities carried out by the following entities require the authorization of the Capital Market Commission (CMC):

- securities brokerage firms;
- securities distribution companies;
- investment companies;
- asset management companies;
- securities and real estate investment fund management companies;
- venture capital companies;
- venture capital fund management companies;
- brokers, investment advisors and independent financial analysts.

In particular, the following investment services and activities in securities and derivatives require authorization:

- the reception and transmission of orders on behalf of others;
- the execution of orders on behalf of others;
- portfolio management for third parties;
- investment advice, including the preparation of studies, financial analysis and other general recommendations;
- underwriting and placement with or without a guarantee in a public offer for distribution;
- assistance in connection with public offerings of securities;
- registration and deposit of securities and derivative securities and services related to their safekeeping, such as cash or guarantee management;
- the granting of credit, including the lending of securities, intended exclusively for the purpose of carrying out transactions in securities and derivative instruments involving the grantor of credit; and
Are there any possible exemptions?

As a rule, only brokers may engage in securities and derivatives investment services and activities in a professional capacity. However, the following are excluded from this rule:

- the Central Bank (BNA), the State and other public entities within the scope of the management of public debt and State reserves;
- people who provide investment services exclusively to its dominant company, its subsidiary, or to its own subsidiary;
- people who provide investment advice as a normal, non-specifically remunerated supplement to the provision of investment services;
- people whose only investment activity is dealing on own account, provided they are not market makers or entities dealing on own account outside a regulated market in an organized, frequent and systematic manner, providing a system accessible to third parties for the purpose of dealing with them.

Do any exchange controls or other restrictions on payments apply?

The Foreign Exchange Law regulates the acts and commercial and financial transactions which have or may have an actual or potential impact on its balance of payments. The implementation of the provisions of this law and of the respective complementary or regulatory diplomas shall be subject to the provisions of this law:

- exchange transactions;
- exchange trading.

According to this legislation, certain foreign exchange transactions are subject to restrictions, such as the need to obtain authorization from the Central Bank (BNA), the limit on the transfer of values. Given the size of foreign exchange transactions, the restrictions must be analyzed on a case-by-case basis. Nevertheless, the most recent legislation has been drafted with a view to making these same operations simpler and more expeditious.

Foreign exchange transactions may only be carried out through a financial institution authorized to engage in foreign exchange trading. Foreign exchange operations are considered, according to the law:

- the acquisition or disposal of gold in cash, in bar or in any unworked form;
- the acquisition or disposal of foreign currency;
- the opening and movement in the country by residents or non-residents of foreign currency accounts;
- the opening and operation in the country, by non-residents, of accounts in national currency; and
- the settlement of any transactions of goods, current invisibles or capital.

What are the rules around financial promotions?

Information disclosed in Angola which may influence investors' decisions, namely when it relates to public offers, regulated markets, services and activities of investment in securities and derivatives and issuers, must be written in Portuguese or accompanied by a legalized translation into Portuguese.

Information concerning securities and derivatives, issuers, public offers, regulated markets and their infrastructures, investment services
and activities in securities and derivatives must be complete, true, timely, clear, objective and lawful.

Contracts for investment services concluded with non-institutional investors shall be in writing and only such investors may invoke invalidity resulting from failure to comply with the form.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

The legal entities generally used to undertake financial or investment activity are investment funds.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes, it is possible to conduct lending or investment business through a branch of a financial institution.

Foreign-based financial institutions wishing to carry out activities in Angola through the establishment of branches are subject to the authorization of the President of the Republic, subject to the prior opinion of the BNA.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

- Fintech for payments services
- Fintech for banking services

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

There are no specific laws applicable to fintech products. General legislation, such as the consumer protection act or the personal data protection law, among others, are applicable to said products.

What type of funding arrangements and incentives are available to FinTech businesses?

The BNA has a program called LISPA, which is an innovation laboratory for the payment system.

The goal is to accelerate the development of fintechs and innovative projects that promote access to financial services. LISPA is the only program that we consider an incentive to fintech businesses.
Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

The most common way to buy and sell loans is through the assignment of credit and the assumption of debt. These operations are regulated and provided for in the Angolan civil code.

What are the main considerations when transferring a loan and related security?

- Make sure that the initial agreement does not prohibit any form of transmission.
- The effectiveness of the assignment is dependent on notification to the debtor.
- Obey the legal form of the business that serves as the basis.
- The assignment of mortgage credits when not made in a will and the mortgage falls on real estate to be made by public deed.

The credit that is the subject of assignment must comply with the following requirements:

- it must have a pecuniary nature;
- it must be unconditional;
- it cannot be litigious; and
- it cannot have been given as a guarantee or collateral.

The assignment of credits, since it is subject to the general regime of legal business, may be the object of the means of preserving the equity guarantee provided for in arts. 605 and following of the Civil Code. Consequently, it can be contested by the creditor of the assignor, in the exercise of their right of action.

In addition, the requirements and effects of the assignment between the parties are defined according to the type of business on which it is based.

The assignment may not occur when it is prohibited by law or agreement of the parties and the claim is, by the very nature of the benefit, linked to the person of the creditor.

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

The main assets of the sector in terms of production, transport and distribution have been acquired through public investment. Although public investment has advantages in terms of less complexity associated with works contracts and lower financial costs associated with concessional loans, in many cases, the participation of the private sector allows greater efficiency in investment decisions, risk mitigation and operation, which also constitutes an additional source of financing for the sector.
For the future, public investment should be reduced and reserved for activities and infrastructures that are in charge of the public sector or that benefit rural electrification, namely:

- large dams that due to their size cannot be made via private financing;
- Very High Voltage Transport – an activity that guarantees national energy security;
- investments in the distribution of areas that are the responsibility of the public utility company for the distribution of electricity; and
- investments in rural electrification, including transport and distribution infrastructures for isolated systems, which will later be managed by the private sector responsible for construction.

The participation of the private sector should cover an investment of USD8.9 billion, essentially at the level of Urban Production and Distribution.

Are there special rules for investing in energy and infrastructure?

There are general rules provided for in the Private Investment Law, approved by Law 10/18 of June 26, which are applicable to investment in the energy and infrastructure sector. Rules such as access to tax, exchange, customs and other benefits. Or also the forms of investment.

In addition to these rules, there are special rules for these sectors, of which we highlight the following:

The electricity sector has its main legislative and regulatory source in the Law no. 14-A / 96, of May 31 (General Electricity Law), which establishes the general guidelines the legal regime for the exercise of production, transportation, distribution and use of electrical energy, and has many other relevant diplomas, aimed to regulate its supply; distribution; production and transport chain, as also its commercial relations, including the quality of services, tariff regulation and access to networks and interconnections.

The exercise of electricity production, distribution and transport activities requires authorization from the state or a public legal person, by means of a concession or license.

The construction and operation of the electrical installations associated with the activities of production, distribution and transport of electricity also requires licensing, under the terms of the Installation Licensing Regulation. The competence for licensing these facilities is, as a general rule, the Ministry that supervises energy (Ministry of Energy and Water).

The regulation of the Angolan electrical system determines that the commercialization of electrical energy can be made within the scope of the Public Electrical System (SEP) (e.g. linked) or outside it (i.e. not linked).

What is the applicable procurement process?

According to the law, the approval of concessions as well as their attribution are the responsibility of the President of the Republic. The award of concessions is preceded by a public tender or restricted tender by prior qualification, carried out in accordance with the Public Procurement Law.

In the case of award to a public company or to a company under the effective control of the state, the above tender process is dispensed.

The attribution of licenses is the responsibility of the government, and this responsibility may be delegated to the local administration bodies of the state in its area of jurisdiction, the object of the licenses is concerned with the distribution and sale of electricity under a public service regime.

What are the most common forms of funding / investing in energy and infrastructure?

Public companies or companies with public domain of the state, if the investor is a public entity.
Or, for a private investor, the most common types of business structures considered by foreign companies to operate in Angola are:

- branches, which, although allowing the undertaking of commercial activities in Angola, are not independent legal entities, and thus the foreign parent entity undertakes unlimited liability for the obligations of the branch, and arising out from the performance of its activity in Angola; or
- representative offices, which are merely aimed at developing and following the business of the foreign entity in Angola but are expressly forbidden to conduct any commercial activity in the country; or
- companies (subsidiaries), which in Angola include (i) Private limited liability companies (Sociedades por Quotas), and (ii) Joint Stock limited liability companies (Sociedades Anónimas).

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

Regulatory investigations can occur in the following situations:

By the BNA:

- In carrying out its supervisory functions, it is the responsibility of the supervisory body to monitor the activity of financial institutions under its responsibility supervision and promote risk assessment and control, as well as the sufficiency of own funds to support these risks.
- When customers submit complaints based on non-compliance with rules governing the activity.
- In case of suspicion of the laws mentioned in topic I.
- In case of violation of the laws mentioned in topic I.

Additionally, the CMC continuously monitors the entities subject to its supervision. The CMC can carry out regulatory investigations:

- when investor protection is at stake;
- to prevent systemic risk; and
- to prevent and reprimand of actions contrary to the law or regulation.

What regulatory penalties may apply?

For committing infringements/infractions, the regulatory penalties to be applied consist of warnings, fines and fines for particularly serious infringements. For example:

- AOA50 million and AOA150,000 to AOA150 million, depending on whether it is applied to a natural or legal person.
- AOA300,000 to AOA150 million and AOA500,000 to AOA500 million, depending on whether the natural or legal person is applied.

Some examples of infractions are: the exercise of the activity in disregard of the rules on registration with the supervisory body; the violation of the rules on subscription or payment of the capital stock, as to the term, amount and form of representation; the omission of information and communications due to the respective supervisory body, within the time limits established and the provision of information incomplete.

In addition to the above-mentioned fines, ancillary sanctions may be imposed on the offender, such as: seizure and confiscation of the object of the offence, including its economic product; disqualification from exercising corporate positions and management functions in
financial institutions, for a period of six months to three years, in certain cases provided for by law or three months to one year, in others, also provided for by law.

Last modified 23 Jul 2020

**What criminal penalties may apply?**

The court is not bound by the assessment of the fact as a misdemeanor and may, *ex officio* or at the request of the Public Prosecutor’s Office, convert the case into a criminal case.

If such a situation occurs, the court should apply the regime established in the Criminal Code and complementary legislation to the crime in question. This may vary from case to case and punishments may include prison sentences and criminal fines.

However, there are certain criminal offences for which the law already provides for the criminal institute to apply, such as the illegal activity of receiving deposits and other repayable funds, for which the law provides that those who carry out activities consisting of receiving deposits or other repayable funds from the public, on their own account or on behalf of others, without the necessary authorization, shall be punished by imprisonment of up to five years.

Notwithstanding this provision, the regime established in the Criminal Code and complementary legislation shall always apply.

Last modified 23 Jul 2020

**Tax**

**Tax issues**

*Are stamp, registration, transfer or other similar taxes applicable?*

Yes. Stamp and registration taxes are applicable. Regarding the transfer taxes, they are also applicable, and the value added tax (VAT) on transfers of goods and services carried out in the national territory for consideration and imports of goods which the investor will carry out shall also apply.

Last modified 23 Jul 2020

*Do tax authorities take priority on enforcement?*

According to the tax enforcements code of Angola, the complaint of the acts of the tax enforcement process on the grounds of suspension foreseen in the tax enforcement code are considered urgent processes and, as such, they always run continuously, having priority before the other acts of the Court.

Last modified 23 Jul 2020

*Is withholding tax on interest payments applicable?*

Yes, it is applicable, according to article 29 of the Capital Tax Code, the paying entity retains the rate of 10% of income and delivery to the state.

Last modified 23 Jul 2020

*Are foreign lenders and debt security holders subject to tax on interest payments?*

Yes. Under the capital investment tax. Foreign lenders at a rate of 15%, and debt security holders at a rate of 10%.

In the first case: The tax is assessed by the holder of the income, except when they do not have a residence, registered office, effective management or fixed establishment in Angola, in which case it should be assessed by the debtor of the income.
Regarding the debt security holder, the liquidation is made by the entities that are responsible for the payment of the income, which are responsible for the totality of the tax and legal additions, in case of non-payment.

If such entities do not have a residence, head office, place of effective management or permanent establishment in Angola to which the payments are attributable, the beneficiary of the income shall be liable to pay the tax.

Issuing and investing in debt securities

*Are there any restrictions on issuing debt securities?*

The general position under the *Corporations Act 2001* (Cth) is that debt securities may only be offered and sold in Australia if they are accompanied by a disclosure document prepared in accordance with the *Corporations Act 2001* (Cth). Disclosure documents must be lodged with ASIC.

There are exceptions to the requirement to prepare a disclosure document which are outlined below.

The *Corporations Act 2001* (Cth) also imposes a general prohibition on the advertising or publicity of offers of securities that require a disclosure document. There are further prohibitions on 'hawking' (i.e. unsolicited meetings or telephone calls).

If debt securities are listed on the Australian Securities Exchange, there are additional disclosure requirements and continuing obligations that will apply – these are contained in the Listing Rules of the Australian Securities Exchange.

*What are common issuing methods and types of debt securities?*

The debt securities market in Australia includes stand-alone bonds and bond programs (e.g. Medium-Term Note programs) issued by large corporations and financial institutions.

Bonds may be issued in wholesale and retail formats. Wholesale issues do not require a prospectus or other disclosure document, and are rarely listed.

Many different types of debt securities are offered in the Australia, including guaranteed and asset-backed securities, high yield bonds, covered bonds, hybrid securities (including convertible notes and preference shares), derivative securities and green bonds.

Parties that are not resident in Australia may issue 'Kangaroo Bonds' (i.e. bonds issued in Australian dollars). In many cases, these issues are driven by favorable Australian dollar terms in the cross-currency swap markets.

Wholesale debt securities can be cleared through Austraclear, the Australian domestic clearing system. In order to be eligible, the securities must be issued in Australian dollars.

*What are the differences between offering debt securities to institutional / professional or other investors?*
Offers of debt securities can generally be made to institutional/professional investors without a disclosure document. Offers of debt securities to retail investors require a disclosure document prepared in accordance with the Corporations Act 2001 (Cth).

When is it necessary to prepare a prospectus?

The general position under the Corporations Act 2001 (Cth) is that debt securities may only be offered and sold in Australia if they are accompanied by a disclosure document prepared in accordance with the Corporations Act 2001 (Cth).

Offers of debt securities can generally be made to institutional/professional investors without a disclosure document.

Offers of debt securities to retail investors will require a disclosure requirement, most commonly in the form of a prospectus.

Even where a prospectus is not required by law, an information memorandum is commonly used for marketing purposes.

What are the main exchanges available?

The Australian Securities Exchange is the main exchange in Australia.

Is there a private placement market?

It is certainly possible to issue bonds through private placement in Australia, although domestic demand for such bonds is generally lower than in the US and Europe, due in part to a relative lack of liquidity. Many corporate issuers prefer to issue bonds in overseas jurisdictions.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers are required to take responsibility for disclosure documents for debt securities. Liability may arise for breach of statute for statements that are misleading or deceptive, or omit any required information. In addition to the issuer, directors, underwriters, and other parties making statements in a defective disclosure document may also be liable for the damage arising from such defective disclosure.

Investing in debt securities

Debt security terms and conditions typically contain provisions which may permit their modification without the consent of all investors and confer significant discretions on the trustee, which depending on the terms of issue may be exercised with or without the consent of investors and without regard to the individual interests of particular investors. The conditions also provide for meetings of investors to consider matters affecting the investors interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?
Generally

The Australian funds management industry is mature and heavily regulated. An Australian hedge or debt fund is usually structured as a unit trust and would ordinarily fall within the definition of a ‘managed investment scheme’ in the Corporations Act 2001 (Cth). That Act imposes a wide range of obligations and requirements on the operators of managed investment schemes. Managed investment schemes are regulated by ASIC.

Managed investment schemes

The following key restrictions apply when establishing a managed investment scheme:

- managed investment schemes, particularly those offered to ‘retail clients’ (as that term is defined in the Corporations Act 2001 (Cth)), are subject to relatively heavy regulatory requirements which may impose a significant compliance burden on the operators of such schemes;
- the operator of the managed investment scheme (which is called the ‘Responsible Entity’) must hold an Australian Financial Services License (AFSL) issued by ASIC (or be an authorized representative of another entity's AFSL) which authorizes it to act as the Responsible Entity of managed investment schemes;
- a managed investment scheme which is offered to retail clients must be registered with ASIC;
- if a managed investment scheme is structured as a unit trust (as is usually the case), general trust law will apply to the operation of the trust; and
- the offer of interests in a managed investment scheme to retail clients will require the preparation of a detailed disclosure document, the contents of which is heavily regulated.

Managed investment schemes may also be listed on the Australian Securities Exchange, provided that a range of regulatory requirements are met.

Last modified 3 Dec 2019

What are common fund structures?

Unit trust

As noted above, the most common fund structure in Australia is a unit trust, where each investor holds units representing a beneficial interest in the assets of the fund.

Unit trusts are usually managed so they can be treated as ‘flow through’ vehicles for tax purposes (similar to a partnership) so that the fund itself is not subject to taxation. Investors are taxed on their share of the net income and capital gains earned by the fund.

Certain unit trusts that are managed investment schemes for Corporations Act 2001 (Cth) purposes may also qualify for tax concessions as a managed investment trust.

Collective investment vehicles

The Australian Government has been working on the introduction of an Australian collective investment vehicle (CIV) regime, which will introduce two alternatives to the current Australian unit trust structure. The new vehicles will be a corporate CIV and a limited partnership CIV, which will be similar to the equivalent structures which are commonly used in foreign jurisdictions.

The Australian Government is still conducting a consultation process (which began in 2017) with the most recent pieces of draft legislation outlining the proposed regime released in January 2019.

Asia Region Funds Passport

The Asia Region Funds Passport was implemented in Australia in 2018 with the Corporations Amendment (Asia Region Funds Passport) Act 2018 (Cth). It allows Australian fund managers to offer interests in qualifying funds to investors across multiple participating economies in the Asian region with limited additional regulatory requirements. Similarly, fund managers in other participating economies
will be able to market their qualifying funds to Australian investors using the more streamlined regulatory process.

However, the uptake of the Asia Region Funds Passport will largely depend on how the corresponding tax reforms and the CIV regime will look once enacted by Parliament.

**What are the differences between offering fund securities to professional / institutional or other investors?**

**Distinction between retail and wholesale investors**

An investor is deemed to be a 'wholesale' investor for Australian law purposes where it has invested AUD500,000 or more in a particular fund. There are numerous other criteria for an investor to qualify as a 'wholesale' investor for Australian law purposes. For example, where an investor can produce a copy of a certificate given within the preceding two years by a qualified accountant that confirms that it has net assets of at least AUD2.5 million or has a gross income for each of the last two financial years of at least AUD250,000. Further, a person who has or controls gross assets of AUD10 million (including any assets held by an associate or under a trust that that person manages) is deemed to be a wholesale investor no matter what the size of its investment.

All investors that are not wholesale investors are considered to be retail investors.

**Retail funds**

Funds offered to retail investors must be registered with ASIC. The offer of interests in retail funds must be accompanied by a PDS, which must contain specific information as prescribed by the Corporations Act 2001 (Cth) (for example, information about the Responsible Entity, the fees and costs payable, the risks and benefits and significant characteristics of the fund). A PDS must also contain all other information that might reasonably be expected to influence the decision of a retail investor considering whether to invest in the fund.

**Institutional/professional funds**

Funds which are offered exclusively to wholesale investors do not need to be offered using a PDS. However, it is usual to provide another disclosure document, such as a private placement memorandum or information memorandum, when offering interests in such funds. Any such disclosure document must not be misleading or deceptive.

Last modified 3 Dec 2019

**Are there any other notable risks or issues around establishing and investing in funds?**

**Establishing funds**

As noted above, in order to establish a fund in Australia, the operator of the fund must usually hold an AFSL (or be an authorized representative of an AFSL holder) with appropriate license authorizations.

In addition, where the fund is a managed investment scheme (which is usually the case for retail funds), a Responsible Entity must be appointed. In order for an entity to act as a Responsible Entity, it must:

- be an Australian public company;
- hold an AFSL (or be an authorized representative of another AFSL holder) authorizing it to provide the various financial services relevant to the operation of the fund; and
- either have a majority of directors who are external directors or have a compliance committee (to oversee the retail fund's compliance requirements) with a majority of ‘external members’.

It is common for investment managers who do not satisfy the requirements for being a Responsible Entity to enter into an arrangement with an external or ‘professional’ Responsible Entity, which will operate the fund according to the investment strategy which the investment manager may set.
As mentioned, managed investment schemes may also qualify for tax concessions if they qualify as a "managed investment trust" under Australian tax laws. For a wholesale unit trust fund to qualify as a "managed investment trust", the trust must be operated or managed by an AFSL licensee or by an authorised representative of such licensee.

Investing in funds

As noted above, most investment funds in Australia are structured as unit trusts. These funds are subject to the general law of trust. In addition, usually:

- The investors in a fund have no power to influence the fund's investment strategy, or any of the decisions or operations of the fund, solely by virtue of being a unit holder.
- The investors in the fund do not have a specific right to any particular assets of the trust.
- The investors in the fund will rank behind the fund's creditors in the event of insolvency.
- The fund operator will usually be entitled to an indemnity from the assets of the fund for any liabilities it may incur in performing its duties, and will usually limit its liability to the amount by which it is actually indemnified.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

The marketing of a fund in Australia will normally constitute providing 'financial product advice' and so will be a 'financial service' for the purposes of the Corporations Act 2001 (Cth). That Act provides that, generally, all providers of financial services must hold an AFSL (or be appointed as an authorized representative of another AFSL holder) with an authorization to provide the relevant financial service.

When offering interests in retail funds it is also generally necessary to prepare a PDS.

Exemptions

There are a number of very limited exemptions from the need to obtain an AFSL or to act under an authorization from another AFSL in order to market a fund in Australia. These exemptions generally only apply when the fund is marketed solely to wholesale investors. For example:

- Certain foreign financial services providers who are regulated in jurisdictions that ASIC considers to have a regulatory framework sufficiently similar to the Australian regime (such as the UK, US, Singapore, Hong Kong and Germany) may be eligible to apply for relief from licensing to enable them to market funds to Australian 'wholesale' investors.

- An exemption applies where the marketing is done in Australia to a prospective investor which itself holds an AFSL and is not acting as a trustee or on behalf of another person (as Australian superannuation funds and Australian fund managers offer their products to their Australian investors through trusts, this limits the exemption to true proprietary investors which commonly do not have an AFSL as they are not usually required to hold one).

- An exemption applies where a prospective Australian investor makes enquiries of a foreign fund manager without any prior solicitation by the foreign fund manager, and the foreign fund manager does not during this time actively solicit persons in Australia in respect of the relevant fund (other than in response to the enquiry initiated by the Australian investor or by the Australian investor's agent).

Are there any restrictions on managing a fund?

2 ASIC is currently conducting a consultation process to formalise this exemption into a foreign financial services licence for foreign financial services providers. ASIC has proposed a prospective commencement date of 1 April 2020, however this is subject to the finalisation of the draft instruments proposed by ASIC.

Last modified 3 Dec 2019
Australian domiciled funds will usually fall within the definition of 'managed investment scheme' in the Corporations Act 2001 (Cth). The Responsible Entity of a managed investment scheme (which is the operator of the fund) is typically required to hold an AFSL (or be an authorized representative of an AFSL holder) which authorizes it to provide the various financial services necessary to operate the fund, including a specific authorization to act as the Responsible Entity of a managed investment scheme.

As noted above an entity wishing to act as the Responsible Entity of a managed investment scheme must also:

- be an Australian public company; and
- either have a majority of directors who are external directors or have a compliance committee (to oversee the retail fund's compliance requirements) with a majority of ‘external members’.

An investment manager which is not able to act as a Responsible Entity may enter into an arrangement with an external or ‘professional’ Responsible Entity, which will operate the fund according to the investment strategy which the investment manager may set. In those situations, from a strictly legal perspective, it is the Responsible Entity of a retail fund that engages the investment manager and is responsible for the acts of the investment manager, and the Responsible Entity will bear any liability for the mismanagement of the fund. Such external Responsible Entities will therefore typically charge a significant fee for their service.

If a managed investment scheme is to be offered to retail investors, it must be registered with ASIC and will be subject to a further layer of regulatory requirements. For example, a registered managed investment scheme must have a ‘constitution’ which is compliant with the Corporations Act 2001 (Cth) and must also maintain a ‘compliance plan’ which sets out the measures which the Responsible Entity must take to ensure compliance with the constitution and the Corporations Act 2001 (Cth).

The offer of interests in a managed investment scheme to retail investors will also generally require certain disclosure documents, including a PDS, to be prepared in accordance with the content requirements mandated by the Corporations Act 2001 (Cth) and by ASIC.

As mentioned, managed investment schemes may also qualify for tax concessions if they qualify as a “managed investment trust” under Australian tax laws. For a wholesale unit trust fund to qualify as a “managed investment trust”, the trust must be operated or managed by an AFSL licensee or by an authorised representative of such licensee. For a managed investment trust that seeks the 15% concessionally withholding tax rate for its fund payments, a substantial proportion of its investment activities must also be carried out in Australia.

Entering into derivatives contracts

*Are there any restrictions on entering into derivatives contracts?*

Unless an exemption or exclusion applies, a person issuing derivatives as part of its financial services business is deemed to be dealing in financial products, which requires an AFSL under the Corporations Act 2001 (Cth) and the Corporation Regulations 2001 (Cth). If a person issues derivatives without an AFSL, the counterparty would be entitled to rescind any agreements in relation to that product and the relevant agreements will be unenforceable. There are specific financial requirements for a person authorized to issue derivatives, which differ from requirements in relation to other financial products, which recognize the exposure of the licensee to counterparties arising from entering into derivatives.

For these purposes, a ‘derivative’ is broadly defined as an arrangement that has a future liability element and a derived value element, and is sufficiently wide to cover all commonly-regarded types of derivative contracts, including futures agreements and forwards, options, swaps and contracts for difference. Under the relevant legislation, certain arrangements are specifically excluded as derivatives including:

- arrangements for mandatory physical delivery of tangible property;
- a contract for the future provision of services; and
- anything that falls within one of the other categories of financial product (such as a security).

AFSL licensees have ongoing obligations under the Corporations Act 2001 (Cth) in terms of their conduct, including to:

- notify the ASIC of breaches or likely breaches of certain significant licensee obligations;
- quote their AFSL number in documents;
What are common types of derivatives?

Derivative contracts are entered into in Australia for a range of reasons including hedging, trading and speculation.

Derivatives may be traded over-the-counter or on an organized exchange.

All of the main types of derivative contract are widely used in Australia, including futures agreements and forwards, options, swaps (including credit default swaps) and contracts for difference. Underlying assets commonly include equities, fixed income instruments, commodities, foreign currencies and credit events.

The gross notional outstanding for interest rate derivatives in Australia is worth in excess of AUD10 trillion, the majority of which are denominated in AUD. There is also a sizeable FX swap market, with average daily turnover in excess of AUD100 billion.

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007-to-2008, and the G20 summit in 2009 the derivatives market has been subject to a significant amount of new regulation, and this has led to substantial compliance costs for market participants.

In January 2013, ASIC introduced the ASIC Derivative Transaction Rules (Reporting) 2013, together with the ASIC Derivative Trade Repository Rules 2013. Among other things, these Rules introduced mandatory reporting requirements for derivative transactions for the majority of derivatives users. These rules were subsequently softened by the ASIC Derivative Transactions Rules (Reporting) Amendment 2015 (no 1).

Other recent regulatory changes of note include the requirement for certain standardized over-the-counter derivative trades to be subject to clearing with a prescribed Central Clearing Counterparty, as implemented through the Corporations (Derivatives) Amendment Determination 2015 (No 1), and the requirement for reporting of certain trades to a licensed Trade Repository, as implemented through the Derivative Transaction Rules (Reporting) 2013 (both regulations have been subject to subsequent amendment).

The Prudential Standard CPS 226 (Margining and risk mitigation for non-centrally cleared derivatives), as published by the APRA in 2016, establishes the requirement for the posting and collection of variation and initial margin in transactions which include a covered entity (for example, deposit-taking institutions that are authorized under the Banking Act 1959 (Cth)).

In addition, it is important to note that the approach to market misconduct is generally the same for securities and for derivatives (including market manipulation and insider trading) although compensation orders for damages do not apply to derivatives.

Finally, the ATO has recently issued guidelines setting out risk factors applicable to cross-border related party derivatives.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

While there are no general restrictions on lending, a lender may need to comply with various codes or regulations if engaging in certain lending practice, particularly if lending to individuals or consumers. The most important to note are as follows:
• The National Credit Code applies to credit contracts entered into by natural persons or strata corporations, for personal domestic or household purposes or the purposes of residential improvement. The National Credit Code imposes a range of regulatory requirements on the lender that do not apply to loans that fall outside its scope. Those outside its scope generally include loans to companies and loans predominately for business or investment purposes.

• The Banking Code of Practice (BCOP) of the Australian Banking Association (ABA) came into effect on 1 July 2019. It is effectively a complete rewrite of the previous 2013 Code of Banking Practice. Although the BCOP is voluntary, each ABA member bank with a retail presence in Australia is required to subscribe to the BCOP as a condition of its ABA membership. The BCOP is binding and the BCOP rules form part of the contractual relationship between the bank and its customer. The BCOP applies to specified banking services provided to individual customers, small businesses, and guarantors and prospective guarantors in respect of a loan to an individual or small business. Affected “banking services” include bank accounts, term deposits, credit and debit cards, home and personal loans, overdrafts, bill facilities, consumer credit insurance and payment and forex services. However, “banking services” expressly excludes shares, bonds and securities, as well as financial products and services provided to wholesale customers.

• An Australian credit license must be held by any person engaging in the provision of consumer ‘credit activities’ (including supplying goods on credit). Licensees must comply with a number of general conduct obligations and responsible lending guidelines.

• The Banking Act 1959 (Cth) and various legislative and prudential requirements must be adhered to for a lender to be a ‘bank’ or to operate as a deposit taking institution. A person must not hold itself out to be a ‘bank’ unless authorized to do so.

1A business is a “small business” if at the time it obtains the banking service all of the following apply:

   a) it had an annual turnover of less than AUD10 million in the previous financial year; and
   b) it has fewer than 100 full-time equivalent employees; and
   c) it has less than AUD3 million total debt to all credit providers including:
      i. any undrawn amounts under existing loans;
      ii. any loan being applied for; and
      iii. the debt of all its related entities that are businesses.

Borrowing

While borrowers are generally not regulated, it is advisable for a borrower to consider whether the National Credit Code or the BCOP apply to his, her or its activities, in which case various protections may be available.

Last modified 3 Dec 2019

What are common lending structures?

Lending in Australia may be structured in a number of different ways to include a variety of features, depending on the commercial aims of the parties.

A loan may be provided on a bilateral basis (a single lender providing the entire facility), a syndicated basis (multiple lenders each providing a portion of the overall facility) or a club basis (multiple lenders lending bilaterally in parallel).

Syndicated facilities by their nature involve more parties (such as an arranger, an agent and a security trustee which each carry out a specific role for the syndicate banks), are more highly structured and involve more complex documentation. Large financings will typically be done on a syndicated basis, with one of the syndicate taking the lead in coordinating and arranging the financing.

Club facilities involve multiple lenders lending bilaterally to the borrower in parallel to each other on materially similar terms. Club facilities usually do not involve a facility agent (at least for payment purposes) and they lack syndication terms which dictate funding mechanics, payment distribution, sharing provisions and lender voting regimes. A club facility may be documented in a variety of ways, including by:

• a deed of common provisions which are adopted wholly or in part by each lender under its facility agreement;
• individual, but largely identical, bilateral loan agreements; and
• a single document similar to syndicated loan agreement, but without a payment agent or syndication terms.

Loans will be structured to achieve the borrower's specific funding objectives. For example, they may be term loans, revolving credit facilities, working capital loans, equity bridge facilities, project facilities and letter of credit facilities, to name a few.

### Loan durations

Typically, the Australian banking market accommodates commercial loan tenors of three to five years. Longer-term debt may be available in limited circumstances.

The duration of a loan may also be determined by its type. For example, typically:

• a term loan is provided for an agreed period of time but with a short availability period;
• a revolving credit facility is provided for an agreed period of time with an availability period that extends nearer to the date of its maturity. It may be redrawn if repaid;
• an overdraft is provided on a short-term basis to solve short-term cash flow issues;
• a standby or a bridging loan is intended to be used in exceptional circumstances when other forms of finance are unavailable. It often attracts a higher margin; or
• a cash advance, provided on a short-term basis to cover short-term cash flow issues and often attracting a higher margin.

In Australia, bill facilities are also used sometimes and they operate with bills maturing and ‘rolling over’ at set intervals (usually 30, 60, 90 or 180 days). Historically, loan note facilities have also been made available for stamp duty or income withholding tax purposes.

### Loan security

A loan may be either secured, unsecured (including on a ‘negative pledge’ basis) or guaranteed.

### Loan commitment

A loan may be:

• committed, meaning that the lender is obliged to provide the loan if certain limited conditions are fulfilled. Conditions precedent will be set out in the loan agreement; or
• uncommitted, meaning that the lender has discretion whether or not to provide the loan.

No conditions precedent will be set out in the loan agreement.

### Loan repayment

A loan may be repayable:

• on demand,
• on an amortizing basis (that is, in instalments over the life of the loan or as may be scheduled); or
• upon maturity (commonly referred to as a ‘bullet loan’).

### What are the differences between lending to institutional / professional or other borrowers?

Consumer and small business lending is generally heavily regulated, requiring necessary licenses and compliance obligations.

By contrast, lending to institutional or professional borrowers is subject to less regulatory oversight and is less burdensome from a compliance perspective.
Do the laws recognize the principles of agency and trusts?

Yes, both principles are recognized under Australian law. Relationships based on the principles of agency and trust are commonly found in Australian financing transactions.

For example, in a syndicated financing, the syndicate will appoint an agent (usually the arranging bank) to act on behalf of the syndicate banks.

The agent will coordinate activities relating to the loan repayments, correspondence between the borrower and the syndicate banks and other matters. The syndicated loan documentation will typically contain provisions defining the nature of the agent's appointment and the scope of its authority and liabilities.

In a secured syndicated financing, the security will be granted in favor of a security trustee which will hold the security on trust for the benefit of the banks.

Borrowers are also commonly trustees, particularly in the real estate investment sector.

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general statutory, contractual and common law principles.

Australian courts will not enforce a penalty in a loan agreement. Lenders must therefore be careful when determining the rate of default interest and the amount of any cancellation, prepayment or similar fees.

A lender should be aware that, even if it is rightfully exercising its rights under the loan agreement, the Australian Securities and Investments Commission Act 2001 (Cth) (ASIC Act) prohibits persons from engaging in unconscionable conduct or morally wrong behavior. In determining what constitutes unconscionable conduct, the court will consider the bargaining power of the parties, the parties' respective abilities to understand the documents and the lender's disclosure of certain risks.

Unfair contract legislation

The Australian Consumer Law and the ASIC Act regulate unfair contract terms found in standard form contracts entered into or renewed after 12 November 2016 where:

- it is for the supply of goods or services or the sale or grant of an interest in land;
- at least one of the parties is a small business (employs less than 20 people, including casual employees employed on a regular and systematic basis); and
- the upfront price payable under the contract is no more than AUD300,000 or AUD1 million if the contract is for more than 12 months.

A standard form contract is a contract that is prepared by one party where the other party has little or no scope to negotiate the terms of the contract. If a court declares a term of a standard form contract to be unfair, the term will be void and the contract will continue to operate unless it is inoperable without the void term. Consumers and Australian Consumer Law regulators are able to claim for damage incurred as a consequence of the unfair contract term.

In the context of financing transactions, the unfair contract legislation will be primarily relevant to home loans and small to medium sized commercial loans documented on the lender’s standard form documentation.

Specific types of lending

ACQUISITION FINANCE
An Australian company may not provide financial assistance to a person to purchase shares in the company itself or its holding company (even if that holding company is incorporated outside of Australia) unless the financial assistance:

- does not materially prejudice the company, its shareholders or its ability to pay its creditors (the ‘no material prejudice’ exception);
- has been approved by the company's shareholders in accordance with the 'whitewash' procedure prescribed by the Corporations Act 2001 (Cth); or
- falls within a specified exemption. A common example of prohibited financial assistance is the granting of a guarantee or security by a company whose shares are being purchased in support of a loan advanced by a financier to the purchaser to fund the share acquisition.

Companies and their financiers do not generally rely on the 'no material prejudice' exception and the specified exemptions are only sometimes relevant. Instead, the common practice in Australia (and the prudent approach) is for the company to obtain shareholder approval of the financial assistance by way of the whitewash procedure. The whitewash procedure in Australia can be more time consuming and complex to implement than equivalent procedures in other jurisdictions.

A breach of the financial assistance prohibition will not affect the validity of the transaction, but may result in civil and criminal sanctions.

THE PERSONAL PROPERTY SECURITIES ACT 2009 (CTH) (PPSA)

The PPSA came into effect on 2012 and it comprehensively overhauled the laws then in force for taking security over personal property in Australia. The PPSA has been modelled on the equivalent Canadian and New Zealand statutes and it bears much resemblance to Article 9 of the US Uniform Commercial Code.

The PPSA adopts a substance-over-form definition of ‘security interest’, which captures not only traditional forms of security, such as charges and mortgages, but also quasi-security arrangements, such as turnover trusts and retention of title. The PPSA also deems certain other arrangements to be security interests, such as leasing or bailment interests and the interests in assigned receivables. Each of these types of ‘security interests’ should be perfected, most commonly by registration on the Personal Property Securities Register, to ensure that it operates effectively upon the grantor's insolvency or liquidation. It is important to give careful consideration to whether a registrable form of ‘security interest’ under the PPSA arises in the relevant transaction.

Standard form documentation

Most syndicated finance transactions in Australia are documented on the basis of recommended form Australian law documentation published by the Asia Pacific Loan Market Association (APLMA). This documentation has been modelled on the recommended forms produced by the Loan Market Association in London.

Less complex and usually bilateral transactions are generally documented on bank standard form documentation prepared in-house or on bespoke facility documentation prepared by the advising solicitors.

The Banking & Financial Services Law Association (BFSLA) has produced standard templates for legal opinions in financing transactions and these are generally followed in the Australian market.

Are there any other notable risks or issues around borrowing?

There are limited restrictions on borrowing in Australia. However, depending on the nature of the transaction, the following issues may need to be considered:

- foreign investment approval;
- superannuation funds general prohibition from borrowing money;
- financial assistance;
- loans to directors;
- corporate benefit rules; and
Giving and taking guarantees and security

**Are there any restrictions on giving and taking guarantees and security?**

Some of the key areas affecting the giving and taking of guarantees and security are as follows.

**Corporate benefit**

A transaction may be voidable if there is no corporate benefit to the entity. The presence of corporate benefit is a factual matter.

Corporate benefit is a particular issue for guarantees. Each director owes a duty to the company to act for the benefit of the company in its best interests, with due care and diligence, in good faith and for a proper purpose. Each director must also avoid any conflict between his or her personal interests and those of the company. These duties must be observed when it is proposed that a company grants a guarantee of the obligations of another.

In deciding whether to grant a guarantee (or provide third party security), the directors may consider both direct and indirect benefits flowing to the company. For example, in the context of a corporate group, the granting of a guarantee might indirectly benefit the guarantor if it is a requirement for the support of a related company and benefits flow back to the guarantor. Note that corporate benefit must be assessed at the level of the individual company – i.e. it is not sufficient that the guarantee benefits the group as a whole.

A director of a wholly-owned subsidiary may take into account the best interests of its holding company so long as the company's constitution permits him or her to act in the best interests of the holding company and the subsidiary is solvent.

It may be possible to address concerns regarding the presence of corporate benefit by obtaining shareholder approval for the transaction.

A guarantee that does not benefit the company commercially may be voidable. Further, the guarantee could be held to be an unfair preference or uncommercial transaction. The directors could be subject to civil and criminal penalties and personal liability.

**Insolvency and voidable transactions**

If a lender enters into a secured transaction shortly before the company becomes insolvent, unsecured creditors may be able to challenge the security on the basis that the grant of security constituted an unfair preference or an uncommercial transaction. Unfair preferences and uncommercial transactions are both voidable. If the unsecured creditors are successful, the lender will not be able to have recourse to the purportedly secured assets and they will be distributed amongst all creditors, including the unsecured creditors. The rules are technical and the following is a simplified outline.

Unfair preferences arise where one creditor is unfairly preferred over others.

Uncommercial transactions do not involve creditors as such, but aim to recover any disposals of assets at an undervalue.

The transaction must have been entered into while the company is insolvent, or the company must have become insolvent as a consequence of the transaction. It must also have been entered into during the period ending on the ‘relation-back day’, but on or before the winding up process began. For unfair preferences, the period is six months, and for uncommercial transactions, it is two years. In each case, the period is four years in the case of related parties and 10 years if the transaction was entered into to avoid the rights of creditors. The relevant period is known as the ‘hardening period’.
After the end of the hardening period, the transaction is no longer vulnerable to being voided.

Financial assistance

An Australian company may not provide financial assistance to a person to purchase shares in the company itself or its holding company (even if that holding company is incorporated outside of Australia) unless the financial assistance:

- does not materially prejudice the company, its shareholders or its ability to pay its creditors (‘no material prejudice’ exception);
- has been approved by the company’s shareholders in accordance with the ‘whitewash’ procedure prescribed by the Corporations Act 2001 (Cth); or
- falls within a specified exemption.

A common example of prohibited financial assistance is the granting of a guarantee or security by a company whose shares are being purchased in support of a loan advanced by a person financier to the purchaser to fund the share acquisition.

Companies and their financiers do not generally rely on the ‘no material prejudice’ exception and the specified exemptions are only sometimes relevant. Instead, the common practice in Australia (and the prudent approach) is for the company to obtain shareholder approval of the financial assistance by way of the whitewash procedure. The whitewash procedure in Australia can be more time consuming and complex to implement than equivalent procedures in other jurisdictions.

A breach of the financial assistance prohibition will not affect the validity of the transaction, but may result in civil and criminal sanctions.

Related party transactions

Chapter 2E of the Corporations Act 2001 (Cth) is intended to preserve and maintain the assets or resources of public companies by requiring that, in simple terms, financial benefits passed to related parties that might diminish or adversely affect those assets or resources are disclosed and approved by a general meeting of the public company beforehand.

The provisions are detailed, but essentially a public company (or an entity controlled by a the public company) may only give a financial benefit to a related party of the public company if:

- the benefit falls within one of the seven categories of exempted financial benefit (e.g. arm’s-length terms, pursuant to a court order); or
- if the benefit is of any other kind, the public company has obtained the approval of its members to give the benefit or to enter into a contract to give the benefit.

Failure to comply with the related party transactions laws will not affect the validity of the transaction, but it may render any person involved liable for a civil or criminal penalty.

National Credit Code

The National Credit Code applies to credit contracts entered into on or after 1 July 2010 where:

- the lender is in the business of providing credit;
- a charge is made for providing credit;
- the debtor is a natural person or strata corporation; and
- the credit is provided for personal or domestic use or to purchase, renovate or improve residential property for investment purposes or refinance credit previously provided for this purpose.

There are certain confined exemptions (e.g. for low cost short term credit). The Code does not apply to business loans.

Where the National Credit Code applies there are restrictions on the guarantees that a lender may obtain from a customer. For example, a guarantee from an individual must be limited (in terms of the amount the lender can recover) to the amount of the relevant loan plus interest, charges, costs and expenses. There also are various disclosure and other obligations that the lender must comply with. Failure to
comply may render the guarantee or security unenforceable.

**Banking Code of Practice**

The restrictions noted above apply in a similar manner under the 2019 BCOP, the ABA's voluntary code of practice which is mandatory for retail banks to adopt as a condition of their membership of the ABA and which is enforceable by law. Similar to the National Credit Code, a bank that is a signatory to the BCOP may only accept a guarantee which is limited to (a) a specific amount or category of amounts (such as all amounts owing under a specific loan) plus other amounts (such as interest and recovery costs) or (b) the value of a specified property or other asset under a specified security at the time of recovery.

**Foreign lenders**

There are technical restrictions on the foreign ownership of Australian assets and companies set out in Australia's foreign investment legislation, namely the Foreign Acquisitions and Takeovers Act 1975 (Cth). Foreign lenders and foreign entities taking the benefit of security over Australian assets should consider the possible application of this legislation, which is administered by FIRB. Notification to FIRB and FIRB approval may be required in some cases before a foreign entity takes or enforces security. Particular issues arise for foreign government investors upon enforcement.

There is a fairly broad ‘moneylender’ exemption for lenders. In simplified terms, if security over Australian assets is held in the ordinary course of carrying on a business of lending money and solely by way of security for the purposes of a ‘moneylending agreement’, the moneylender exemption will generally apply. This exemption also applies to the acquisition of an interest in an Australian asset arising by way of enforcement of a security interest held solely for the purposes of a moneylending agreement.

A moneylending agreement is defined as:

- an agreement entered into in good faith, on ordinary commercial terms and in the ordinary course of carrying on a business (a moneylending business) of lending money or otherwise providing financial accommodation, except an agreement dealing with any matter unrelated to the carrying on of that business; and

- for a person carrying on a moneylending business, or its subsidiary or holding entity, an agreement to acquire an interest arising from a moneylending agreement as described above.

Where the exemption applies, notification and FIRB approval are not required when taking or enforcing the security.

There are limits on how long the foreign government investors may hold onto an interest upon enforcement. For these investors, the moneylender exemption requires in effect that, if its interest is acquired by way of enforcement of a security, that interest must disposed of, or a genuine sale process commenced, within six months of the acquisition (or 12 months in the case of an authorised deposit-taking institution). If this does not occur, separate FIRB approval is required. The concept of ‘foreign government investor’ is broadly defined and potentially easily triggered. For example, it could include a trustee of a trust in which a foreign government holds a substantial interest and general partner of a limited partnership in which a foreign government holds (alone or with associates) at least a 20% interest (or 40% or more where there is more than one foreign government).

Failure to obtain FIRB approval, if required, could give rise to penalties, an unwinding of the transaction or an order for the disposal of assets.

**Critical infrastructure**

If the security is taken over a ‘critical infrastructure asset’, which includes approximately 200 electricity, gas, water and port assets, then a secured creditor may have reporting obligations under the Security of Critical Infrastructure Act 2018 (Cth) if it is in a position to directly or indirectly influence or control the asset.

*Last modified 3 Dec 2019*

**What are common types of guarantees and security?**

**Common types of guarantees**

Guarantees may take a number of forms, including the following.
GUARANTEES AND INDEMNITIES

Guarantees taken in support of loan facilities typically include both guarantee and indemnity provisions (albeit the document may be described simply as a ‘guarantee’). A guarantee is a promise by the guarantor to ensure that the borrower fulfils its obligations under the facility agreement (primarily to repay the loan) and a promise by the guarantor to fulfil those obligations if the borrower fails to do so. The borrower’s obligations are primary and the guarantor’s obligations are secondary. A guarantee is contingent on the borrower’s primary obligation remaining valid, so that if for any reason the borrower’s obligations are set aside, the guarantee will also fall away. An indemnity is also a promise to be responsible for another’s loss. However, unlike a guarantee, it is a primary obligation given by the indemnifier in favour of the beneficiary. It is not contingent on the borrower’s obligations remaining on foot. Therefore if the borrower’s obligations are set aside for any reason, the indemnifier will remain liable under the indemnity.

This category may include a parent guarantee and indemnity, whereby a parent company or sponsor promises to be accountable for its subsidiary’s obligations. A parent guarantee and indemnity is sometimes limited by its terms or operation.

PERFORMANCE GUARANTEES

A guarantor’s promise to be accountable for the performance of an act or contractual obligation of another individual. For example, a completion guarantee ensuring that completion of the project occurs on a specified date. This is distinct from a traditional guarantee only in so far as the guarantee usually is limited to performance obligations (rather than payment obligations) and, with the exception of damages, the guaranteed beneficiary’s recourse is limited to demanding performance (rather than payment).

BANK GUARANTEES

An unconditional and irrevocable undertaking by a bank in favour of a named beneficiary to make a payment upon receipt of a complying demand from the beneficiary. The bank will then seek reimbursement from its customer under the terms of the indemnity contained in the facility agreement between the bank and the customer.

PERFORMANCE BONDS

An irrevocable undertaking by a financial institution to pay an amount on demand or, in some cases, on the condition that the performance obligations of its customer are not met.

Common types of security

Security may be granted over almost all types of assets in Australia, subject to any contractual or statutory restrictions. The most commons forms of security are as follows.

MORTGAGES OVER LAND

State and Territory real property legislation applies. Mortgages of real property must be registered with the land titles office of the State or Territory in which the land is situated. Mortgages of leasehold interest in land must also (in most cases) be registered with the relevant land title office.

Mandatory electronic lodgement of land dealings, including mortgages, is currently being rolled out across Australia.

SECURITY OVER PERSONAL PROPERTY

The following forms of security over personal property are governed by the Personal Property Securities Act 2009 (Cth) (PPSA):

- a general security agreement, where the collateral is all of a grantor’s personal property; and
- a specific security agreement, where the collateral is specific personal property of a grantor, such shares, book debts, plant or motor vehicles.

The PPSA adopts a substance-over-form definition of ‘security interest’, which captures not only traditional forms of security, such as charges and mortgages, but also quasi-security arrangements, such as turnover trusts and retention of title. The PPSA also deems certain other arrangements to be security interests, such as leasing or bailment interests and the interests in assigned receivables. Each of these
types of ‘security interests’ should be perfected, (most commonly by registration) on the Personal Property Securities Register, to ensure that it operates effectively upon the grantor’s insolvency or liquidation. It is important to give careful consideration to whether a registrable form of 'security interest' under the PPSA arises in the relevant transaction.

Are there any other notable risks or issues around giving and taking guarantees and security?

Guarantees

In most Australian States and Territories, a guarantee must be in writing and be signed by the guarantor.

Parties should be careful not to inadvertently discharge the guarantor from its liabilities under the guarantee when making variations to the underlying loan facility agreement. A guarantor may be released from its guarantee if the underlying facility agreement is varied, save if the variation is immaterial or incapable of prejudicing the guarantor. This is the case even if the guarantor (a) agrees in the guarantee to variations being made to the underlying facility agreement without its consent and (b) is aware of the variations being made. The guarantor should acknowledge the variations to the loan agreement at the time they are made and affirm that its liabilities under the guarantee remain in full force.

Security

MORTGAGES OF REAL PROPERTY

Mortgages of real property must be registered with the land titles office of the State or Territory in which the land is situated. Failure to register may result in the mortgagee losing priority to prior registered interests. Priority between registered interests is generally determined in order of registration. Accordingly, mortgagees should not delay in registering.

SECURITY OVER PERSONAL PROPERTY

Where the PPSA applies, security interests in personal property should be ‘perfected’. Security interests may be perfected by registration or, in some circumstances, by control (e.g. for certain financial assets) or possession (e.g. for goods and some intangible rights) of the collateral. Registration on the Personal Property Securities Register is the most common method of perfection.

It is not mandatory to perfect a security interest under the PPSA. However, if a security interest is not registered or not registered within an applicable timeframe (and not otherwise perfected), then (a) it may vest in the grantor immediately upon the grantor being wound up or entering into voluntary administration, a deed of company arrangement or bankruptcy or (b) a third party may acquire an interest in the collateral free from the security interest.

Registration is also relevant to the priority of security interests. A security interest that is not registered (or otherwise perfected) will lose priority to a security interest that is perfected. Generally, priority between security interests perfected by registration (that are otherwise equal in priority) is determined by the order of registration. Therefore it is important for secured parties to register as soon as, if not before, the security agreement is executed. Certain types of security interests are given 'super priority'. An example is a supplier’s security interest in goods that it has delivered to a customer (the grantor) on a retention of title basis. This is called a ‘purchase money security interest’ (PMSI) and, if perfected, has priority over non-PMSIs. This applies also to the interests of lessors or bailors. A PMSI must be specifically registered as a PMSI to be effective in this manner.

The registration requirements under the PPSA are very prescriptive. Failure to register correctly or and errors in a registration, (for example, in a grantor's details,) can render a registration ineffective.

The broad definition of ‘security interest’ under the PPSA means that the rules regarding registration and perfection apply to many arrangements that, prior to the PPSA, were not considered security interests. Failure to recognize the existence of, and in-turn to perfect, security interests can have significant consequences for the transacting parties.
A secured creditor has better rights on enforcement if it has a charge over the whole or substantially the whole of the grantor's property. During an administration period, subject to certain exceptions, the Corporations Act 2001 (Cth) imposes a statutory moratorium that prevents security from being enforced against the company's assets, save with the administrator's written consent or with the court's leave. The main exception to the moratorium is that a secured creditor with a charge over the whole, or substantially the whole, of the company's property may enforce it during the 'decision period' (being 13 business days from the time notice of the administrator's appointment is given to the charge, or from the time the administration starts). It is therefore common practice for a lender to obtain security over all or substantially all of the company's assets so as to avoid the risk of moratorium on enforcement of security during an administration. A featherweight charge also addresses administration risk.

‘Ipso facto’ stays

The recent ‘ipso facto’ reforms in Australia may impact on the ability of a lender to enforce upon certain insolvency events occurring in respect of the borrower. From 1 July 2018, new provisions in the Corporations Act 2001 (Cth) have imposed a stay on the enforcement of ‘ipso facto’ clauses against a company if it becomes subject to certain insolvency procedures, namely a substantial receivership or controllership, a voluntary administration or a scheme of arrangement.

An ‘ipso facto’ clause enables a party to terminate a contract or exercise other rights by virtue of the fact the other party becomes insolvent or subject to an insolvency process. An example in a typical facility agreement would be an event of default triggered by the appointment of a receiver to all of the borrower's assets. The new stay on the enforcement of ipso facto clauses is intended to give companies the space to recover from insolvency without the threat of major contracts being terminated. A party will not be able to enforce an ipso facto clause if the reason for doing so is because (a) the company has entered into the relevant insolvency procedure (b) the company's financial procedure during the procedure (c) a reason prescribed by regulations or (d) a reason that, in substance, is contrary to the stay (this being an anti-avoidance measure). The stay also extends to rights that arise automatically without a party taking action (known as 'self-executing' rights).

There are a number of exceptions and carve-outs. Most relevantly, it does not apply to (a) syndicated loans or bonds, (b) variations to contracts made prior to 1 July 2018, (c) enforcement by a secured creditor holding security over the whole or substantially the whole of the company's assets (d) enforcement against guarantors and third party security providers (e) drawstops under a facility agreement, meaning that the lender is not obliged to advance new monies (f) arrangements entered into during the relevant procedure and (g) a right exercised with the consent of the court or the administrator, scheme administrator, liquidator or other relevant officer.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Australian Securities and Investments Commission Act 2001 (Cth)
Australian Securities Exchange Listing Rules
Australian Prudential Regulation Authority Act 1998 (Cth)
Banking Act 1959 (Cth)
Banking Code of Practice
Competition and Consumer Act 2010 (Cth)
Corporations Act 2001 (Cth)
Customer Owned Banking Code of Practice
ePayments Code
Financial Sector (Collection of Data) Act 2001 (Cth)
Financial Sector (Shareholdings) Act 1998 (Cth)
Financial Sector (Transfer and Restructure) Act 1999 9 (Cth)
Financial Services Reform Act 2001 (Cth)
Foreign Acquisitions and Takeovers Act 1975 (Cth)
Payment Systems (Regulation) Act 1998 (Cth)
Payment Systems and Netting Act 1998 (Cth)
Reserve Bank Act 1959 (Cth)

Consumer credit

Banking Code of Practice
Competition and Consumer Act 2010 (Cth)
National Consumer Credit Protection Act 2010 (Cth)

Mortgages and other security interests

Banking Code of Practice
National Consumer Credit Protection Act 2009 (Cth)
Personal Property Securities Act 009 (Cth)

Corporations

Corporations Act 2001 (Cth)
Superannuation Act 1976 (Cth)
Superannuation Industry (Supervision) Act 1993 (Cth)

Taxation

Income Tax Assessment Act 1997 (Cth)
Income Tax Assessment Act 1936 (Cth)
Income Tax Assessment Act 1953 (Cth)

Funds and platforms

Corporations Act 2001 (Cth)

Other key market legislation

Anti-Money Laundering and Counter-Terrorism Financing Act 2006 (Cth)
Privacy Act 1988 (Cth)

NB Reference to an Act refers to all regulations under that Act.

Last modified 26 Feb 2020

Regulatory authorization

Who are the regulators?

Regulation of the financial services sector is split between the Reserve Bank of Australia (RBA), the Australian Prudential and Regulation Authority (APRA) and the Australian Securities and Investments Commission (ASIC).

The RBA is Australia's central bank and responsible for the overall stability of financial markets and monetary policy.

APRA has the responsibility of supervising Australia's Authorized Deposit Taking Institutions (ADIs), with the primary task to ensure that organizations in the banking and financial services sector manage their risk appropriately.
ASIC has responsibility for the supervision of operators of financial markets, clearing and settlement facilities, and market participants. It advises the Australian government on licensee operating rules as well as on new market and clearing and settlement facility operators. ASIC's other main role is to regulate consumer protection in the financial sector.

Other regulators to note are:

- the Australian Transaction Reports and Analysis Centre (Austrac); and
- the Australian Competition and Consumer Commission (ACCC).

Austrac is the regulator and specialist financial intelligence unit responsible for regulation of anti-money laundering and counter-terrorism financing.

The ACCC is the national agency responsible for enforcing the Competition and Consumer Act 2010 (Cth)(CCA), Australia's key legislation in respect of trade practices. The ACCC regulates anti-competitive and unfair market practices, mergers or acquisitions of companies, consumer protection (including product safety) and third-party access to facilities of national significance.

**What are the authorization requirements and process?**

**Australian Financial Services (AFS)**

If an entity wishes to carry on a financial services business, it will have to apply to the ASIC for an AFS license or have the benefit of an exemption. Financial services include advice and dealing in respect of financial products such as investment products, non-cash payment facilities and arrangements for the management of financial risk.

To apply for a license, the entity is required to lodge an application form and a suite of proof documents (i.e. business descriptions, organizational structures, people proofs and financial statements). In some cases, ASIC may require additional information, and request the entity lodge further proof documents or answer specific questions in relation to the documents submitted with ASIC.

When evaluating an application for an AFS License, ASIC will assess if the entity:

- is competent to carry on the type of financial services indicated in the application;
- has sufficient resources to carry on the business; and
- can meet the obligations of an AFS licensee (i.e. training, compliance, insurance and dispute resolution).

The application fee depends on the type of application and, as at December 2019, ranges from AUD899 (i.e. paper lodgement for a request to cancel a body corporate AFS license), AUD3,721 (i.e. online application for a body corporate AFS license for retail clients and low complexity products) to AUD11,305 (i.e. paper lodgement for a body corporate AFS license for retail clients and high complexity products).

The application process takes around five to eight months in total, depending on the type of application lodged.

Firms which hold AFS Licenses are listed on the ASIC register.

**Australian Prudential and Regulation Authority**

If an entity wishes to carry on a banking business in Australia it is required to be authorized by APRA as an 'authorized deposit-taking institution' (ADI) or have the benefit of an exemption.

To apply for authorization, the applicant must:

- engage in a preliminary consultation with APRA to discuss the applicant's intention to engage in banking business in Australia;
- lodge an application and required documentation with APRA; and
- arrange meeting(s) with APRA to complete an onsite review.

The application fee depends on the type of application and ranges from AUD30,000 to AUD80,000.
The time required to process an application is dependent on the nature of the application and the supporting documents required to be provided to APRA. APRA states that generally the overall licensing process could take from three to twelve months.

Institutions classified as ADIs are listed on the APRA website.

Engagement with APRA prior to an application being made is recommended.

**Credit**

Credit providers and intermediaries require an Australian Credit License to provide credit or financial broking services (unless they are exempt). The credit licensing system is based on the AFS licensing concepts and requirements as ASIC is now the national regulator for consumer credit and finance broking.

To apply for a license, the entity will be required to lodge an application, answer questions in relation to proposed credit activities, provide supporting documents regarding employees and operations and provide a declaration the entity will comply with set obligations if granted a credit license.

To be granted a credit license, you will need to be able to comply with the general conduct obligations under the National Consumer Credit Protection Act 2009 (Cth), and be a 'fit and proper' person to engage in credit activities.

The application fee is determined by reference to a calculation method prescribed in the relevant regulatory guide and information sheets published by ASIC, and the relevant tiered scale. Depending on the calculation and scale, the application fee can range AUD450 to AUD26,250.

ASIC aims to decide whether to grant a credit licence within 60 days. However, the time required to process an application is dependent on the nature of the application, and the supporting documents required to be provided to ASIC.

**Australian Transaction Reports and Analysis Centre**

The Anti-Money Laundering and Counter-Terrorism Financing Act 2006 (Cth) imposes legal obligations on certain financial services providers, including the obligation to register with the Austrac if providing designated services, such as deposit-taking, currency exchange, loan, life insurance, securities and derivatives market services.

To register an entity with Austrac, the entity must complete and lodge an Austrac business profile form.

*Last modified 3 Dec 2019*

**What are the main ongoing compliance requirements?**

**Australian Financial Services (AFS)**

AFS Licenses carry a range of financial solvency and risk management requirements. Current general obligations include, but are not limited to:

- ensuring the financial services covered by the license are provided honestly and fairly;
- ensuring adequate arrangements are in place for managing conflicts of interests;
- complying with financial services laws and conditions of the license;
- employing adequate resources (e.g. financial, technological and human resources) to carry out the services covered by the license;
- maintaining the skills and competence to provide the financial services covered by the license;
- employing a dispute resolution and risk management system; and
- ensuring employees are adequately trained and competent to provide the financial services.

The time and resources required for a new license and to maintain ongoing compliance with an AFS License can be significant depending on the required AFS License authorizations. Some of the more time-consuming requirements concern the preparation of licensing proofs on topics such as risk management, compliance, information technology processes and capabilities.
AFS licensees are required to notify ASIC of any 'significant' breach (or likely breach) of their obligations or financial services laws as soon as practically possible, and in any event within ten business days of becoming aware of the significant breach (or likely breach). Failure to report a significant breach is an offence and may result in penalties.

**Australian Prudential and Regulation Authority**

APRA requires all ADIs to comply with its prudential requirements relating to governance, audit, risk management and capital adequacy from the commencement of their banking operations.

APRA's current prudential requirements include but are not limited to:

- maintaining sufficient capital adequacy (namely the prudential capital ratio (PCR));
- ensuring substantial shareholders are 'fit and proper' in the sense that they are financially sound;
- ensuring persons who hold key positions within the ADI are 'fit and proper';
- providing evidence of adequate risk management and internal control systems, business continuity management and information security standards;
- providing evidence of adequate compliance systems and processes;
- employing accounting systems that maintain secure, up-to-date records of all transactions and commitments undertaken by the ADI; and
- engaging in adequate internal and external audit procedures and arrangements.

If APRA authorizes an entity to be deemed an 'authorized deposit-taking institution' this does not automatically allow the ADI to refer to itself as a 'bank' unless special provision has been made. APRA will generally permit an ADI to refer to itself as a ‘bank’ in its trading name and advertising if the ADI holds at least AUD50 million in Tier 1 capital.

Depending on the nature of the breach, if an APRA-regulated institution becomes aware that it has breached (or will breach) a prudential requirement and that breach is 'significant', a breach of a prudential requirement must be reported immediately, or within 10 business days after the institution becomes aware a breach has occurred. Failure to report such a breach is an offence and may result in penalties.

A corporation may also be required to register with APRA as a registered financial corporation under the Financial Sector (Collection of Data) Act 2001 (Cth). In general, this Act applies to any corporation which engages in the provision of finance in the course of carrying on business in Australia. Provision of finance includes but is not limited to:

- the lending of money, with or without security;
- carrying out of activities, whether directly or indirectly, that result in the funding of originating loans or other financing;
- the supplying of goods by way of hire-purchase;
- purchase of debentures or other securities (other than shares) issued by a corporation; and
- acquisition of debts due to another person.

Intra-group financing activity between corporations that are related to one another does not constitute provision of finance.

There are some exemptions, including that this Act does not apply to corporations whose:

- sum of assets in Australia, consisting of debts due to the corporation resulting from transactions entered into in the course of the provision of finance by the corporation, does not exceed AUD50 million in aggregate value; and
- sum of the values of the principal amounts outstanding on loans or other financing, as entered into in a financial year, does not exceed AUD50 million in aggregate value.

Under this Act, APRA collects data from registered financial corporations. Corporations may be required to submit the appropriate forms on a monthly or quarterly basis, as confirmed by APRA upon registration.

_Last modified 3 Dec 2019_
What are the penalties for failure to be authorized?

A person undertaking a regulated activity without being authorized, licensed or exempt, commits a criminal offence and may be liable to imprisonment.

For example, engaging in financial services without an Australian Financial Services license, attracts a criminal penalty under the Corporations Act 2001 (Cth) of five years’ imprisonment, and, in the case of a body corporate, a maximum 6,000 penalty units (having a monetary value of AUD1.26 million). The court may also declare a maximum pecuniary civil penalty.

A person who engages in consumer credit activity without an Australian Credit License is, in the case of a body corporate, subject to a civil penalty of up to 5,000 penalty units (having a monetary value of AUD1.05 million) and a criminal penalty fine of up to AUD504,000, or in the case of an individual, two years’ imprisonment.

If a corporation should be registered with APRA as a registrable financial corporation, and fails to provide APRA with the relevant documents within 60 days of becoming a corporation that should be registered with APRA, the corporation is subject to a fine of 50 penalty units (having a monetary value of AUD10,500) for every day that it does not comply with the reporting requirements.

Regulated activities

What finance and investment activities require authorization?

Generally

To carry on banking business an entity must be authorized by APRA to be an ADI.

All financial activity requires regulatory authorization by ASIC when it is carried on by way of financial services or consumer credit business in Australia.

The following activities are likely to require authorization, if they have sufficient connection with Australia:

- providing financial services, such as advice and dealing in respect of financial products, investment products, non-cash payment facilities, arrangements for the management of financial risk, derivatives, shares and managed investment schemes;
- engaging in Australian financial securities activities, such as arranging and underwriting services in ‘financial products’ in the wholesale markets;
- providing deposit-taking services, such as accepting deposits; and
- engaging in consumer credit activities, relating to consumer leases, consumer credit contracts, credit assistance and securing payment obligations.

Financial Sector (Shareholdings) Act 1998

Acquisitions of shareholdings are covered by the Financial Sector (Shareholdings) Act 1998 (Cth) (FSSA). The FSSA restricts individual shareholdings in financial sector companies to a 20% stake. A financial sector companies is:

- an authorised deposit-taking institution; or
- an authorised insurance company; or
- a holding company of an authorised deposit-taking institution or an authorised insurance company.

The Treasurer may approve a higher percentage stake limit if it is in the national interest to do so or the person is a fit and proper person and the company is new or recently establish, with assets below a certain threshold amount.

If a person obtains practical control of the Australian company, as declared by the Treasurer, then steps will need to be taken to end the practical control.
Foreign Investment Policy

The Australian government's regulation of foreign investment has two main aspects. The first is the Foreign Acquisitions and Takeovers Act 1975 (Cth) (FATA) and the regulations made under FATA. The second consists of various ministerial statements and policy guidelines issued from time to time.

The Treasurer, assisted by the Foreign Investment Review Board (FIRB), administers this regulation. The Australian government has the power to block notifiable proposals determined to be contrary to the national interest or may impose conditions on an approval.

FIRB is a non-statutory body to advise the Treasurer and the Australian government on Australia's foreign investment policy and its administration. FIRB examines foreign investment proposals and advises the Treasurer whether or not they comply with the policy. It also generally advises the Australian government on foreign investment matters and can assist foreign investors to ensure their proposals (and their associates) conform with government policy.

For business acquisitions, foreign persons should obtain approval for the acquisition of:

- a substantial interest in an Australian corporation or in an offshore company having Australian assets; or
- control of an Australian business, the value of which exceeds the prescribed limits.

A substantial interest exists if the foreign person (and any associates) has 20% or more or several foreign persons (and any associates) have 40% or more of the share capital or voting power in the corporation. Different thresholds apply for designated sectors such as agribusiness.

Foreign persons will require approval for the acquisition of interests in certain types of Australia real estate, depending on its value.

All foreign government investors must obtain approval before making a direct investment in Australia, starting a new business or acquiring interests in land regardless of the value of those acquisitions. Foreign government investors includes bodies politic, entities in which foreign governments or their agencies and related entities have an interest of 20% or more (or such entities from more than one foreign country having an aggregate interest of 40% or more) and entities that are controlled by foreign governments or their agencies or related entities.

Notification and approval of foreign investment will differ depending on the type of transaction and the type of investor (ie. private sector or foreign government investor). Applications are typically considered within 30 days and a further 10 days to notify the applicant, however this period may be extended, and in the case of the Treasurer making an interim order, by up to a further 90 days.

Are there any possible exemptions?

ASIC, APRA and the ACCC have the power to grant a large variety of exemptions in relation to authorisation and licensing requirements.

ASIC may exempt an individual or entity from the requirement to hold an Australian Financial Services license under the Corporations Act 2001 (Cth). For example, product providers are not required to hold an Australian Financial Services (AFS) license when providing general financial product advice on their own products. It must be noted that when an individual or entity relies on this exemption they must disclose to the recipient that the provider does not hold an AFS license. There are a wide variety of other exemptions that may apply.

APRA has the power to grant exemptions to certain institutions (such as charitable, religious and other registered entities) to engage in “banking business” without violating the Banking Act 1959 (Cth).

The ACCC may exempt an individual or entity from the requirement to hold a Credit License under the National Consumer Credit Protection Act 2009 (Cth). For example, a public body or authority constituted under legislation, is not required to hold a credit license for any credit activities they engage in.

Do any exchange controls or other restrictions on payments apply?

Generally, banks are authorized to deal in foreign exchange and can operate foreign currency accounts. The RBA maintains general
oversight of dealers in the foreign exchange market and sets conditions and prudential standards, but does not impose general restrictions on the import and export of funds in and out of Australia.

The flow of currency into and out of Australia is monitored through a reporting system. Under this system, designated cash dealers and individuals are required to report significant transactions – those involving AUD10,000 (other than the foreign currency equivalent) or more – to Austrac. This report is due within 10 business days after the date of the transaction.

The RBA’s express approval may be required to complete some foreign exchange transactions that are real-time gross settlement (RTGS) systems (being RITS, Austraclear and CHESS) and multilateral netting arrangements. For example, the RBA has restricted foreign exchange transactions with governments and nationals of countries subject to United Nations sanctions.

There may also be anti-money laundering and tax considerations to take into account.

What are the rules around financial promotions?

Chapter 7 of the Corporations Act 2001 (Cth) outlines various criteria which must be met when issuing promotional material relating to financial products and financial services. The Australian Securities and Investments Commission Act 2001 (Cth) also prescribes other requirements such as consumer protection provisions.

Any promotional material relating to financial products must not include the use of restricted titles, words or expressions unless strict criteria are met, or the scope of an Australian financial services license permits the provider to do so. For retail clients, advertising materials for financial products are often required to specify the issuer and seller of the product, and inform the client to consider the Product Disclosure Statement (PDS) when making a decision about the financial product.

In addition, tax promoter penalty laws prohibit the promotion of tax avoidance schemes and schemes implemented directly to the way it has been described in a tax product ruling approved by the ATO.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The type of legal entity used to undertake financial or investment activity in Australia will to a degree depend on the nature of that investment or activity.

COMPANIES

A company is a separate legal entity capable of holding assets and being sued in its own name. The most common types of companies are proprietary companies limited by shares (denoted by ‘Proprietary Limited’ or ‘Pty Ltd’ appearing at the end of the company’s name) and public companies limited by shares (denoted by ‘Limited’ or ‘Ltd’).

A key advantage of undertaking financial or investment activity through a company limited by shares is that the liability of the shareholders for the company’s liabilities is limited to the company’s assets and unpaid share capital.

A public company may also be listed on the Australian Securities Exchange, subject to compliance with additional regulatory requirements that apply to listed entities.

PARTNERSHIPS

Partnerships involve two or more individuals or companies carrying on a business, generally pursuant to a partnership agreement. Most partnerships are limited to no more than 20 partners, unless the partnership applies to a particular profession (e.g. an accountancy
practice). A partnership is not a separate legal entity. Its partners are jointly and severally liable for the partnership's liabilities. In certain states limited liability partnerships can be registered with State regulatory authorities. An incorporated limited partnership is a special kind of limited partnership. Limited partnerships are far less common than ordinary partnerships.

JOINT VENTURES

A joint venture is usually a contractual arrangement entered into by two or more parties to carry out a specific commercial endeavour. A joint venture may be incorporated or unincorporated. An incorporated joint venture operates through a company, which is a separate legal entity. An unincorporated joint venture is a purely contractual arrangement between the joint venturers, and they will directly engage in the activities of the joint venture.

TRUSTS

A trust is an arrangement where one person, the trustee, holds property for the benefit of another person, the beneficiary. The trustee holds legal title to the property and must deal with the property for the benefit of the beneficiary. The trustee may be an individual or a company. The trustee is liable for any obligations it incurs as trustee, but it generally has a right to be indemnified out of the trust property.

Common types of trusts are discretionary trusts, unit trusts and bare trusts. The trustee of a discretionary trust may determine which of the beneficiaries are to receive distributions from the trust. The beneficiaries of a unit trust hold units in the trust and their respective entitlements to distributions from the trust is are determined by the number and class of units held. The trustee of a bare trust simply holds the property without having any active duties in relation to it, except to convey the property on demand to the beneficiaries or to deal with the property as they direct.

Funds

An Australian hedge or debt fund is usually structured as a unit trust and would ordinarily fall within the definition of a 'managed investment scheme' in the Corporations Act 2001 (Cth). That Act imposes a wide range of obligations and requirements on the operators of managed investment schemes. Managed investment schemes are regulated by the ASIC. Managed investment schemes may also qualify for tax concessions if they qualify as a "managed investment trust" under Australian tax laws.

Last modified 3 Dec 2019

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

Foreign companies wishing to carry on business in Australia through a branch need to register as a foreign company with ASIC. To apply, a company must lodge an application form with ASIC, along with certified copies of the company's certificate of registration and constituent documents.

To be registered, the foreign company must have a registered office in Australia and a local agent to act on its behalf.

Registered foreign companies are required to lodge annual financial statements with ASIC and comply with certain notice obligations. The local agent will be responsible for acts, matters and things that the company is required to do under the Corporations Act 2001 (Cth) and may be held personally liable for any penalties imposed should a company contravene the Corporations Act 2001 (Cth).

Australia is in the process of transitioning to a new licensing framework for foreign financial service providers with Australian wholesale clients. ASIC has issued Consultation Paper 301: Foreign financial service providers (June 2018) and Consultation Paper 315: Foreign financial service providers: Further consultation (July 2019). The new regime is expected to commence on 1 April 2020, alongside transitional arrangements.

FinTech
FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

Australia has seen substantial growth in active FinTech businesses in sectors such as lending (including peer-to-peer (P2P) and marketplace lending), personal and business finance and payment management. There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
- consumer loans;
- student lending products;
- small and medium-sized enterprises (SME) lending; and
- residential property and commercial property mortgage lending.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes P2P-type structures often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or increasingly rather than, individual investors on a traditional P2P basis.

ISSUES FOR START-UP MARKETPLACE LENDERS

Following the initial incorporation and start-up funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform. As the start-up lender will not have an established track record, deposit base or asset pools, the funding structure will often follow the format of a warehouse securitization structure. Origination of new assets will be funded through drawings on a note issuance facility backed by security over the new assets. Each of the new assets will be subject to eligibility criteria determined by reference to the nature of the underlying asset. In order to provide an efficient financing structure, the assets will typically be held through an SPV with origination and servicing provided by the marketplace lender. In order to cover expected losses on the asset pool, the senior facility will be subject to the lending platform maintaining sufficient subordinated capital in the form of equity, or a combination of equity and subordinated debt.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable
WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

The ATO has published guidance setting out its views that trading cryptocurrencies are generally subject to Australia’s capital gains tax and the use of cryptocurrencies in businesses may give rise to Australian goods and services tax implications.
Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Last modified 3 Dec 2019
Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

ASIC is the financial services regulator in Australia.

GENERAL

To conduct a financial services business in Australia, businesses must hold an AFSL issued by the ASIC. Most FinTech services are captured in the definition of financial services and financial products in the Corporations Act 2001 (Cth) and unless an exemption applies, FinTech companies will require an AFSL. There are limited statutory exemptions available to foreign entities who conduct financial services in Australia.

Additionally, an Australian credit license (ACL) issued by ASIC is required for a business engaging in consumer credit activities in Australia which are captured in the National Consumer Credit Protection Act 2009 (Cth), unless an ASIC exemption applies.

NATIONAL INNOVATION AND SCIENCE AGENDA

In December 2015, the Australian Government introduced the National Innovation and Science Agenda (NISA) to facilitate the development of FinTech. NISA, among other things:

- encourages investment in FinTech companies through tax incentives for early-stage investment;
- enables crowdsourced equity funding of public companies (described further below); and
- establishes the FinTech Advisory Group to advise the Treasurer and the ASIC Innovation Hub.

The ASIC Innovation Hub assists FinTech startup companies to navigate the Australian financial regulatory system by engaging with FinTech businesses and providing information to streamline the licensing process.

Electronic payments platforms and regulation of peer-to-peer lenders

ELECTRONIC PAYMENT PLATFORMS

The New Payments Platform (NPP) is an industry initiative to develop a new national infrastructure for fast, versatile, data-rich payments in Australia between financial institutions and their customers. The NPP will connect to all financial institutions and, as a result, to businesses and consumers, allowing funds to be accessible almost immediately upon receipt of a payment.

PEER-TO-PER LENDERS

Peer-to-peer lending involves a financial service provider (the lending platform) acting as the intermediary between investors and borrowers. Lending platforms are generally set up as managed investment schemes, meaning the platform operator must have an AFSL that allows them to run the scheme. Accordingly, these transactions will be caught by the Corporations Act 2001 (Cth) and must comply with the regulatory regime.

Where the borrower is an individual and not a business, the loan will be a consumer credit contract and the platform operator will be required to comply with the National Consumer Credit Protection Act 2009 (Cth), in addition to holding an AFSL.

Regulation of payment services

THE RESERVE BANK OF AUSTRALIA

RBA is responsible for the designation and regulation of systems facilitating the transfer of funds in Australia under the Payment Systems (Regulation) Act 1998 (Cth) and the Payment Systems and Netting Act 1998 (Cth). The RBA has established the Payment Systems Board to take responsibility for the payments system policy. The powers of the RBA include designating a payment system as being subject to regulation, imposing an access regime to establish rules of participation in a payment system and setting standards for payment systems to promote safety and efficiency.
To this end, the RBA has established a number of standards for compliance and access regimes applicable to participants in payment systems.

**EPAYMENTS CODE**

Consumer electronic payment transactions in Australia are regulated by the ePayments Code, administered by ASIC. The ePayments Code applies to voluntary subscribers, including banks, credit unions and building societies.

The Code, among other things:

- requires subscribers to give consumers clear and unambiguous terms and conditions;
- stipulates how terms and conditions changes (such as fee increases), receipts and statements need to be made;
- sets out the rules for determining who pays for unauthorized transactions; and
- establishes a regime for recovering mistaken internet payments.

**Application of data protection and consumer laws**

The Privacy Act 1988 (Cth) regulates the use of personal data within Australia. Where a FinTech business provides credit or handles information relevant to credit, the Privacy Act will apply. The Australian Privacy Principles that are set out in the Privacy Act outline the obligations on the collection, use, disclosure and management of personal information. Where a business undertakes an act outside Australia and there is some link to an Australian citizen or organization, or where it carries out business in Australia, the Privacy Act will apply.

The Office of the Australian Information Commissioner (OAIC) is the body responsible for administering the Privacy Act and has the power to investigate non-compliance.

**Money laundering regulations**

The Anti-money Laundering and Counter-terrorism Financing Act 2006 (Cth) establishes a regime to target and deter money laundering and terrorism financing in designated services. Where a FinTech company provides a designated financial service, such as lending or issuing or selling interests in managed investment schemes, they will become a reporting entity and have obligations under the Anti-money Laundering and Counter-terrorism Financing Act 2006 (Cth). These obligations include compliance reporting and conducting due diligence on customers prior to engaging in any financial services.

**Licensing exemption for FinTech testing**

ASIC has implemented a FinTech licensing exemption, to facilitate the testing of new FinTech services before requiring a business or start-up to obtain an AFSL or ACL. Based on the regulatory guide published by ASIC, allowing FinTech businesses to test their new products and services before they obtain a license can help alleviate the barriers to innovation (including access to capital and speed to market) by:

- allowing concepts to be validated and refined before businesses spend the time and money associated with obtaining a license; and
- providing increased opportunities for businesses to obtain investment that may assist with meeting the costs of complying with the law.

Three components are necessary in this regard:

- existing flexibility in the regulatory framework or exemptions provided by the law which means that a license is not required;
- tailored, individual licensing exemptions granted by the ASIC to a particular business to facilitate product or service testing (individual exemptions of this nature are similar to the regulatory sandbox frameworks established by financial services regulators in other jurisdictions); and
- ASIC’s ‘FinTech licensing exemption’ – provided under ASIC Corporations (Concept Validation Licensing Exemption) Instrument 2016/1175 and ASIC Credit (Concept Validation Licensing Exemption) Instrument 2016/1176, which apply to certain products or
services (FinTech Exemption).

Under the FinTech exemption, a business may, without needing to hold an AFSL, give financial product advice in relation to (or deal in) the following products:

- listed or quoted Australian securities;
- debentures, stocks or bonds issued or proposed to be issued by the Australian Government;
- simple managed investment schemes;
- deposit products;
- some kinds of general insurance products; and
- payment products issued by Australian banks.

Initial Coin Offerings

The ASIC is due to release guidelines in relation to Initial Coin Offerings (ICOs) (which have not been released to date). It is expected that the ASIC will follow the lead of the US, Canada and Hong Kong regulators by including the fundraising method within the regulatory framework governing Initial Public Offerings. The ASIC is reportedly working with advocates in the startup community (including FinTech Australia), to develop guidelines although it is expected that the ASIC may take the view that many of the 'tokens' currently being issued through ICOs would fall within ASIC definitions of 'securities'.

Crowdfunding in Australia

Australia's previous regulatory requirements generally created a barrier to widespread use of crowdsourced equity funding. However changes are underway to make it easier and less expensive for businesses, including start-ups, to raise equity from the general public up to A$5 million in any 12-month period, while ensuring adequate investor protection. However, the Australian Parliament has enacted the Corporations Amendment (Crowd-sourced Funding) Act 2017 (Cth), which will allow eligible Australian businesses (including start-ups) to access crowdsourced equity investments through a licensed online portal.

For companies to access the benefits of the new crowdsourced funding regime, providers of crowdsourced funding services must hold an AFSL issued by ASIC. ASIC accepts applications from potential crowdsourced funding intermediaries for AFSL authorizations to provide crowdfunding services.

The following general restrictions apply:

- Individuals seeking to invest using a crowdsourced funding platform can contribute up to AUD10,000 per year, per company.
- Crowdsourced funding will also be available to Australian public companies with turnover/gross assets less than AUD25 million.
- Proprietary companies will be subject to additional governance and reporting requirements (including the provision of annual financial reports to shareholders).

Last modified 3 Dec 2019

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.
The crowdfunding sector is well established, and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform, such as Equitise and Pozible. Significant changes have recently been made in the Australian regulatory landscape to make crowdfunding more accessible. (For further information, please see FinTech products and uses – particular rules.)

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

ACCELERATORS

There are various incubators or accelerators in the Australia market which offer support, facilities and funding for startups, often in return for an equity stake.

Venture capital and debt

Venture capital (VC) funding is a type of equity investment usually targeted at early-stage FinTech companies with an established business and some trading history. VC provides a viable alternative to traditional lending, given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions. Australian VC funds include Blackbird Ventures, Carthona Capital, Our Innovation Fund and Squarepeg Capital.

Corporate venture capital (CVC) is a type of VC and involves an equity investment by a corporate fund, examples of which includes Reinventure, NAB Ventures and Telstra Ventures. The benefit of having a CVC as an investor for a FinTech start-up is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), which is secured against a company's assets and includes an equity element (i.e. a warrant) allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through VC. At the time of writing, venture debt is increasingly a source of funding in the Australian market with about 5 regular providers of venture debt locally. However, the venture debt industry is still nascent as compared to the United States.

Warehouse and platform funding

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to an SPV. The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

One recent example of warehouse financing involves Zip Money Limited, a listed Australian non-bank consumer financier, which involved a two-year asset-backed securitization warehouse in relation to its consumer receivables loan book.

Senior bank debt and capital markets funding

SENIOR BANK DEBT

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

CAPITAL MARKETS FUNDING

Australia has both debt and equity capital markets which are accessible to businesses (usually of a certain size).
Raising finance by way of an Initial Public Offering (IPO) is a popular funding arrangement for FinTech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange, such as the Australian Securities Exchange.

**CONVERTIBLE BONDS/LOAN NOTES**

A popular funding tool for fast-growing FinTech businesses is to issue convertible bonds or loan notes which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

**Initial Coin Offerings**

An Initial Coin Offering (ICO) is an alternative to a share market IPO, crowdfunding or venture capital funding round for a startup with a blockchain-based platform or project. A startup looking to undertake an ICO will first produce a 'white paper' and then market itself to potential investors, much in the same way as a company undertaking an IPO.

ICOs are not common in Australia however there is a growing demand for this method of fundraising in Australia, particularly for startups with blockchain-based platforms that are looking to raise money fast.

In late 2017, Perth-based blockchain energy start-up Power Ledger become the first Australian company to undertake an ICO – raising AUD17 million in three days.

It is likely that, in most circumstances, Australian ICOs will involve the issue of securities and therefore fall under existing regulations for the offer of securities. This means ICOs will be subject to the same reporting obligations and regulations as an IPO.

**Incentives and reliefs**

**INCENTIVES FOR EARLY STAGE INNOVATION START UPS**

Incentives are available for startups (known as 'Early Stage Innovation Companies') which:

- are less than three years' old;
- have income less than AUD200,000 and expenses less than AUD1 million; and
- have businesses that are eligible (meaning that they have scalability, potential for growth and are undertaking research and development (R&D)).

Investments (less than 30% of the equity in an Early Stage Innovation Company) would generally qualify for a 20% non-refundable tax offset (capped at AUD200,000 per investor) and a ten-year exemption to capital gains tax.

**ELIGIBLE VENTURE CAPITAL LIMITED PARTNERSHIPS**

Investment funds investing into FinTech growth companies may be structured as venture capital limited partnerships (VCLPs) or early stage venture capital limited partnerships (ESVCLPs) to receive favorable tax treatment for the funds limited partners and with regard to carried interest payable to the funds general partner. For VCLPs, benefits include tax exemptions for foreign investors (eligible foreign limited partners) from capital gains tax on their share of any profits made by the partnership. For ESVCLPs, an income tax exemption applies to both resident and non-resident investors, plus a 10% non-refundable tax offset is available for new capital invested.

**FINTECH INCENTIVES**

The R&D Tax Incentive program is available for entities incurring eligible expenditure on R&D activities, including certain software R&D activities commonly conducted by FinTech/tech-growth companies. Claimants under the R&D Tax Incentive may be eligible for:

- **small businesses (< AUD20 million aggregated turnover)** – 43.5% refundable tax offset of the first AUD100 million of eligible R&D expenditure, and
- **other businesses** – a 38.5% non-refundable tax offset.

Generally, eligible R&D activities include experimental activities whose outcome cannot be known in advance and are undertaken for the purposes of acquiring new knowledge (known as 'core R&D activities'), and supporting activities directly related to core R&D activities (known as 'supporting R&D activities').
Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Buying and selling loans is very common in Australia.

A loan may be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are novation, assignment and sub-participation, as described below.

NOVATION

A novation is a full legal transfer of the party's rights and obligations. It is a tripartite arrangement between the existing parties and the transferee. It results in a fresh contract being formed between the continuing party and the transferee, with the transferor being released from its obligations.

Assignment

An assignment is a transfer of rights only, not obligations. Subject to any contractual restrictions, an assignment may occur without the debtor's consent. An assignment may be effected as either an equitable assignment or legal assignment, depending on whether certain statutory requirements have been satisfied.

Sub-participation

A sub-participation is a transfer of the economic interest in a loan without the legal relationship between the existing parties changing. Sub-participations involve the buyer taking on double credit risk, on both the borrower and the seller.

TRANSFER MECHANICS

The facility agreement and the security trust deed will usually include transfer mechanics. These will specify the way in which the rights and obligations of an existing lender are novated or assigned to a transferee lender and any conditions that may apply, such as consents or restrictions on the nature of the transferee. The loan transfer itself is commonly based on the Loan Market Association recommended form documents made available by the Asia Pacific Loan Market Association. For more complex transactions, a more bespoke form of sale and purchase agreement will usually be used. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

Where security interests are transferred, registration may be required either on the Personal Property Securities Register or elsewhere (depending on the nature of the asset).

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often considered in the due diligence undertaken by the seller's legal advisors. Some of the key issues are:

- **Confidentiality**: whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **Data protection**: whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser (in particular, the Privacy Act 1988 (Cth) and the National Credit Code should be considered);
Lender eligibility - whether there are any restrictions considering the type of entity to which the loan may be transferred;

Undrawn commitments: whether there are any continuing obligations for further funding or other material obligations of the lender that may bind the transferee or reduce claims made by the transferee;

Transfer mechanics: whether there are any steps that need to be taken to transfer the loan in accordance with its terms;

Consent: whether a transfer requires the consent of, or notification to, any other parties; and

Voidable transactions: if the seller is insolvent, whether certain transactions may be declared voidable under the Corporations Act 2001 (Cth).

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

The ownership of energy and infrastructure assets in Australia varies according to the asset class. The main asset classes are usually considered to be:

- social infrastructure assets including:
  - health (hospitals and medical centers);
  - education (schools, childcare and universities);
  - social accommodation (social housing and retirement villages); and
  - community (court houses, fire stations and prisons); and
- economic infrastructure assets, including:
  - regulated utilities such as water companies;
  - transport assets such as roads and airports; and
  - telecommunication assets such as mobile phone towers.

Key sectors are considered below.

Energy

The gas and electricity industries in Australia are regulated by the states and territories.

ELECTRICITY

There is a mix of both government-owned and privately owned electricity distribution and retail businesses in Australia, with a trend towards privately owned utilities in all states and territories.

The majority of states and territories have combined to form an interconnected National Electricity Market (NEM), being Queensland (QLD), New South Wales (NSW), the Australian Capital Territory (ACT), Victoria (VIC), South Australia (SA) and Tasmania (TAS). The NEM is a wholesale electricity market for the supply and purchase of electricity across those interconnected states and territories and it is currently under construction with anticipated completion in 2021. Western Australia (WA) and the Northern Territory (NT) do not participate in the NEM and have their own major networks. The Australian Energy Market Operator (AEMO), an independent corporate body established by the Australian government, administers and operates the NEM.
There is only one major electricity transmission and distribution network in each of the ACT, SA and TAS. While there are multiple networks in QLD, NSW and VIC, each is a monopoly provider in a particular area. For example, Ausgrid, Endeavour Energy and Essential Energy operate monopolies in NSW. The distribution and transmission sectors are not generally integrated, although there is some common ownership in the distribution and retailing sectors in TAS and the ACT.

**GAS**

AEMO operates the wholesale and retail gas markets of eastern and southern Australia and oversees the gas transmission network in VIC.

In addition, AEMO is responsible for national transmission planning and the operation of the Short-Term Trading Market (STTM) for gas. The STTM is a market-based wholesale gas balancing mechanism that has been established at defined gas hubs in NSW, QLD and SA. The STTM facilitates the short-term trading of gas between pipeline owners/operators, shippers and gas producers. VIC does not participate in the STTM, and has established its own wholesale gas market which producers, transporters, retailers and end users all engage in.

**Telecoms infrastructure**

The telecommunications networks (fixed and mobile) in Australia are predominantly privately owned by a number of service providers.

Telstra, a wholly privatized company offering a full range of telecom services, is Australia’s largest telecommunications provider and dominates ownership of the fixed-line network. Control of the wireless telecommunications sector is predominantly shared between three privately owned service providers, Telstra, Optus and Vodafone.

The Commonwealth Government is currently investing in fiber-optic, fixed wireless and satellite infrastructure to develop, construct and deliver Australia’s first national wholesale only, open access broadband network (the National Broadband Network, or NBN) through a government-owned entity which is classed as a government business enterprise, NBN Co Limited. The new infrastructure will replace the existing broadband infrastructure, aiming to create quicker and more consistent broadband service and provide opportunities for development of improved asset management systems. The regulatory framework for the NBN provides that the Australian Government will retain full ownership of NBN Co until the national broadband network rollout is complete, which is anticipated to be in 2021.

**Transport infrastructure**

Public transport networks in Australia are predominantly government-owned and operated, across the three levels of government – federal, state and local, with certain exceptions where networks have been franchised, privatized or governments have entered into public-private partnerships.

**RAIL**

Typically, the infrastructure and assets for rail networks in Australia are owned by state governments or the federal government. The operation of trains in Australia is commonly franchised by the government and outsourced to the private sector. The passenger networks in each state and territory are typically owned by government entities. The railway infrastructure in QLD, TAS, VIC (for non-interstate lines), SA (for non-interstate lines) and the NT are integrated. The mainland interstate track is, for all states and territories except the NT and TAS, owned, leased, maintained and controlled by a federal government owned corporation (the Australian Rail Track Corporation), however, the interstate freight operations in Australia are wholly commercial, being privately owned and operated.

**ROADS, BRIDGES AND TUNNELS**

The operation, maintenance and improvement of roads in Australia is largely the responsibility of local governments, with the exception of the arterial road network and most local roads in unincorporated areas which are the responsibility of the state and territory governments. The federal government also shares responsibility with the states and territories for a defined national network of road transport corridors and rail-road inter-modal connections. The delivery, operation and maintenance of such infrastructure is often outsourced to the private sector. For example, management of toll-roads (including the design, build, financing, operation, maintenance and collection of tolls) is typically outsourced to the private sector on a full concession basis, with the states and territories holding the perpetual lease over toll road land.

**AVIATION**

Aviation infrastructure in Australia is typically government-owned. All federal airports are located on government-owned land and are under long-term leases to private entities. There are significant restrictions on ownership of airport-operating companies under the
Airports Act 1996 (Cth), including a 49% limit on foreign ownership, a 5% limit on airline ownership and a 15% limit on cross-ownership between paired airport operator companies. The majority of all other Australian airports are owned and operated by local government authorities, with a small number operated by the private sector on the government's behalf, or both owned and operated by the private sector for public use. The aviation regulator in Australia is the Civil Aviation Safety Authority (CASA). The government has influenced market structures to combat competition issues, for instance prohibiting the cross-ownership of airports.

**MARITIME AND PORTS**

The ports in Australia are typically owned by the state and territory governments, however, the operation of, and investment in ports is largely privatized, with port assets typically privatized on a long-term lease basis.

Infrastructure Australia, a government body, oversees rail, road, airports and other infrastructure at a national level.

**Other infrastructure**

**WATER**

State and local governments are typically responsible for the ownership of infrastructure and delivery of water services in Australia, generally through government-owned companies. The operation and management of water in SA has been privatized, and local utilities in VIC have been largely privatized. Water utilities are regulated across the states and territories by the relevant State authorities.

**DEFENSE**

Typically, defense assets are owned by the public sector.

**EDUCATION**

The education sector in Australia consists of both public and private institutions. Governance and management of education is split between the three levels of government. For instance, the majority of universities operate under State and territory laws and regulations, while early child education facilities operate under the guise of local governments. The Australian Government's Department of Education has the primary responsibility of distributing funding and developing policy in regards to childhood education, higher education, vocational education and training, international education and research.

**WASTE**

The waste management systems in Australia are the responsibility of state, territory and local governments. The sector is a mix of both public and private operations. The Australian Government is responsible for waste management policy. The private and public sector are involved in all forms of the waste management process.

**Are there special rules for investing in energy and infrastructure?**

**Generally**

Energy and infrastructure markets in Australia, similar to other developed nations, operate in a heavily regulated environment. There is no specific regime governing or restricting investment in energy or infrastructure in Australia over and above existing regulation for investors and funders more generally. When making an investment, the legal and regulatory position relevant to the underlying project must be considered. For example, a project relating to a hospital will require various environmental and planning approvals, consents, building and operating permits, and work-health and safety accreditations.

**AUSTRALIAN COMPETITION AND CONSUMER COMMISSION**

The ACCC regulates a range of infrastructure services, such as energy, communications, water and smaller markets with limited competition. While the ACCC acts as an overarching regulator, investors, owners and operators must also comply with both State and industry-specific regulation. The ACCC facilitates the National Access Regime, which encourages third party access to nationally significant infrastructure services. The ACCC assesses access undertakings lodged by the owners or providers of infrastructure services.
FOREIGN INVESTMENT REVIEW BOARD

All foreign investment proposals in Australia above certain thresholds, determined on a case-by-case basis, are reviewed by the FIRB to ensure such investments are not contrary to the national interest. Notification and approval of foreign investment will differ depending on the type of transaction (i.e. telecommunications or energy transaction), or the type of investor (i.e. private sector or foreign government investor).

FIRB aims to provide a decision within 30 days of being notified. Once formally notified, the Treasurer has 30 days to make a decision and a further 10 days to notify the parties concerned of the outcome. If these timeframes are not met, the Australian Government loses the ability to block the proposal or impose conditions on it. The government may, however, extend the process by up to 90 days by issuing an interim order.

Key sector-specific issues are flagged in the sections below.

Energy

The energy markets in Australia have a complex system of arrangements between suppliers, generators, transmission and distribution which are moderately regulated. Regulation and market oversight of the energy sector is split between the Australian Energy Regulator (AER) (for all states other than WA) and the Australian Energy Market Commission (AEMC).

The National Energy Retail Laws and National Energy Retail Rules, establish a national energy customer framework for the regulation of the retail supply of energy (electricity and gas) to customers where the NEM applies. The laws aim to promote retail competition and empower customers to negotiate energy contracts. The NEM operates on a relatively competitive basis, with generation, transmission and retailing assets split in each state and territory. The market operates with streamlined regulations, limited barriers to access, and minimal direct government intervention. In WA and the NT, where the NEM does not apply, energy is regulated by the Economic Regulation Authority (ERA) and the Utilities Commission, respectively.

Under the NEM, an authorization issued by the AER is required prior to engaging in the retail sale of energy, unless an exemption applies. Under state-based authorities, transmission and distribution businesses are required to be issued with a license before providing transmission and distribution services. Applications must be lodged with the state based regulator and an associated fee will apply.

It is important to note certain infrastructure assets are subject to more stringent safeguards on pricing and staffing, in an effort to preserve community expectations. For example, in the recent sale of Ausgrid (in October 2016), the NSW government implemented legislation prescribing the minimum number of employees the buyer would have to maintain until 2020, and the categorization of employee.

Recently, increasing demand for ‘clean’ energy, alongside firm environmental regulation, has presented concern for external investors wishing to invest in Australia’s energy sector. In 2015, the federal government increased Australia’s Renewable Emission Target to 23.5% of Australia’s electricity generation being sourced from renewable sources by 2020. Investors need to understand how environmental and technology changes may impact on the overarching regulatory framework and should consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with license conditions or the granting of specific subsidies.

Telecoms infrastructure

The telecommunications sector in Australia operates in a competitive market, where the regulatory barriers to entry are limited. The telecommunications sector has two main regulators:

- The ACCC which operates under the Competition and Consumer Act 2010 (Cth) prohibits and prevents carriers engaging in anti-competitive conduct, breaching record-keeping rules or breaching access rules.

- The Australian Communication and Media Authority (ACMA) which operates under the Telecommunications Act 1997 (Cth) and has responsibility over technical matters (i.e. carrier licensing, service provider licensing and number portability). The cabling industry is regulated by the Telecommunications Cabling Provider Rules 2014 (Cth) (CPRs).

The ACCC’s access regulation plays a key role in the increase of infrastructure and retail competition in the telecommunications sector. For example, the ACCC assisted opening access to Telstra’s line services, increasing competition in retail and broadband networks. ACCC regulation is commonly higher in areas of insufficient competition, namely transmission routes in regional and outer metropolitan areas.

There are two different types of individuals or entities that may provide telecommunication services to the public – being carriers and carriage service providers (CSPs). Carriers are owners of telecommunications networks unit that supply carriage services to the public. The
ACMA requires carriers to obtain a carrier license and to comply with certain obligations under the license, unless an exemption applies or the authority allows for nominated authority declarations, whereby another party to takes on the responsibilities of a carrier for a network unit. The Minister for Communication also has the authority to impose license condition declarations, whereby further license conditions are imposed on certain classes of carriers. In contrast, a CSP, a person or entity that supplies a carriage service to the public using a network unit (i.e. internet service providers) is not required to hold a carrier license.

Under the CPRs, all cabling work is required to be performed by a registered cabler or under the express direction of a registered cabler. Cablers are required to register with an ACMA-accredited registrar.

**Transport infrastructure**

The National Transport Commission operates under the National Transport Commission Act 2003 (Cth) as an independent advisory body with the aim of enhancing safety, productivity and environmental performance of Australia's transport systems. The body provides impartial advice and reform proposals through the Transport and Infrastructure Council.

**RAIL**

The Office of the National Rail Safety Regulator (ONRSR) is responsible for the implementation of safe rail operations and controls a singular set of rail safety laws in Australia, with each state and territory (except QLD) passing enabling legislation to give effect to the Rail Safety National Law. Rail Transport Operators must obtain a license that certifies the competence and capacity of the operator to manage the risks associated with railway operations. The accreditation is required prior to commencing any railway operations.

**ROADS**

The state and territory governments each have government departments which administer the National Prequalification System for Civil (Road and Bridge) Construction Contracts (NPS). The NPS separately takes into consideration the financial and technical capacity of contractors and identifies prequalification categories for road construction, bridge construction and financial levels (referring to financial stability, solvency and capacity to manage cash flow), against which the NPS assesses the capacity of a contractor to undertake contracts of varying risk and complexity. Austroads is the key organization responsible conducting strategic research on transport developments, provides guidance on the design, construction, management and infrastructure of road networks.

**Other infrastructure**

For most infrastructure assets in the private sector, it is likely that there will be a ‘change of control’ provision requiring the regulator or controlling government to approve the new owner. On publicly-procurred infrastructure, it is quite common for long-term projects to have a ‘change in control’ clause which restricts change in ownership structures of the private sector. For example, in most sectors there is a restriction on change in control during the construction period but this is often relaxed post construction provided any change in control is not to an ‘Unsuitable Third Party’.

*Last modified 3 Dec 2019*

**What is the applicable procurement process?**

In Australia, procurement of infrastructure projects is almost invariably carried out on a contestable tender basis. A contestable tender basis is deemed to be a fair, transparent and competitive way to obtain value for money. Such contestability may be publicly advertised or sought from a formal pre-qualified list of bidders or informally sought from a private list of contractors. Some states do, however, have unsolicited proposal regimes whereby the private sector may directly approach Government with a proposal for infrastructure development and then be awarded the rights on an uncontested basis, but there are strict criteria that apply.

**Investing in energy and infrastructure**

There is no body of public procurement law. Procurement by the state and federal governments is governed by a mixture of policies such as guidelines and codes of practice, statute, regulations and common law.

While private sector procurers of construction services are generally free to set their own ‘rules’ of procurement, they can still be exposed under statute (for example under the Australian Consumer Law) or at common law. Procurers will find themselves exposed to these laws if they either do not follow the process which has been specified in the tender documentation or if they make inaccurate representations.
about the way in which the tender process will be managed or contracts awarded. Conversely, bidders may be exposed to common law process contract challenges if they withdraw during evaluation.

In addition to the infrastructure research and advisory bodies established by some states and the federal government, each government agency has at least one designated department or body which develops and implements policy applicable to procurement of infrastructure projects. In some cases specialized policies will apply to particular types of procurement such as defense, health infrastructure and the delivery of Public-Private Partnerships (PPP) and unsolicited proposals. In addition, government agencies which procure a large amount of infrastructure (for example statutory road management agencies) often have their own internal policies and procedures applicable to the procurement of that work.

For projects with a value in excess of AUD10 million, many government agencies have implemented a system of audits, checks and balances to seek to ensure that the tender and procurement processes are competitive, transparent and compliant with the relevant rules and policies. This means that many government agencies are required (or choose to):

- appoint a probity (fairness and honesty) auditor to audit the tender process for the project;
- engage a probity advisor to provide ongoing advice to the agency in relation to management of the tender and tender queries; and
- participate in periodical reviews (sometimes known as ‘Gateway’ reviews) in order to benchmark, test and check the business case for the project.

**STATUTORY REGULATION OF GOVERNMENT TENDERS**

The Australian Consumer Law (and state based Fair Trading legislation) will prohibit certain kinds of behavior and conduct during the course of a procurement, for example, misleading and deceptive conduct. Bid rigging, cover pricing and certain other collusion between tenderers is prohibited under the Competition and Consumer Act 2010 (Cth).

To avoid the possibility of collusion or corruption, tenderers may be asked to provide a statutory declaration that there has been no collusion in the tender process with other tenderers.

To emphasize the transparent nature of government tendering, many government agencies are often now required by statute or policy to publish detailed information:

- identifying the successful tenderer;
- specifying the tender prices submitted by all tenderers; and
- detailing the nature and form of contract executed in respect of the works;

Additionally, government agencies may be required to disclose information under Freedom of Information legislation or through pre-trial discovery processes.

**POLICIES, GUIDELINES AND CODES OF PRACTICE**

There are numerous policies, guidelines and codes of practice which govern procurement of infrastructure by government agencies at all levels of government. Many government agencies also have specific policies directed at the delivery of projects by different forms of procurement such as a PPP or alliance contracting. In some cases, such as the Commonwealth Procurement Rules issued by the federal government, there are rules dealing specifically with when competition in a tender process may be limited, and additional requirements for procurements at or above a certain threshold.

The core objective of the Commonwealth Procurement Rules is to ensure that value for money is obtained in federal government procurement. The value for money principle requires consideration of all relevant financial and non-financial costs and benefits of each proposal including whole of life costs (such as any maintenance costs or costs in connection with a dispute). The Commonwealth Procurement Rules state that value for money is enhanced in government procurement by:

- encouraging competition and being non-discriminatory;
- promoting the use of resources;
- making decisions in an accountable and transparent manner;
- encouraging appropriate engagement with risk; and
Financing energy and infrastructure

There are three general ways that can be implemented to allow the private sector to assist deliver infrastructure:

- traditional procurement using government financing;
- corporate financing using private financing; and
- project financing using private financing.

PPPs are often perceived as a way to improve or create public infrastructure without hindering on government funds and budget constraints.

What are the most common forms of funding / investing in energy and infrastructure?

The principal forms of private sector funding/investment in energy and infrastructure in Australia (including in relation to PPPs) are as follows.

Funding

Common forms of funding in energy and infrastructure include:

- debt finance, including:
  - loans made on a project finance basis;
  - loans made on a corporate finance basis (balance sheet debt); and
  - mezzanine debt;
- asset sales;
- federal grants;
- value capture;
- concessional loans;
- asset finance or hire-purchase arrangements; and
- subordinated shareholder loans.

PROJECT FINANCE

Generally, project sponsors prefer debt to be secured on a limited-recourse basis. Limited-recourse means that financiers only take security over the assets of the project itself and its outputs (including revenue) rather than any wider assets of the sponsor and its corporate group. This preference is largely driven by the fact that it is only the project’s assets and revenues which are ‘at risk’ of enforcement. This approach enables project sponsors to retain flexibility with respect to their other ventures.

A common structure for project finance involves incorporating a special purpose vehicle for the project (Project Co). The Project Co then enters into a range of documents for the delivery of the project including the project documents (relating to construction and operation of the project) and the finance documents (relating to the financing of the project).

In order to secure this funding, the project needs to stack up from a ‘bankability’ perspective. In essence, bankability is a term used to describe:

- the willingness of financiers to fund the project based on security of cash flows (in and out) of the project; and
- the minimization of any residual risk held by the Project Co receiving the funding.
CORPORATE FINANCE

Debt based on corporate finance facilities may be utilized where a project is not sufficiently bankable to receive limited recourse finance. Such facilities may be made on an aggregated basis so that a variety of smaller projects create a portfolio of assets. Recourse for the financier to security is limited to the security based on that portfolio of assets with all assets being cross-collateralised. Alternatively, such facilities can be full recourse, meaning financiers may have recourse against all assets of the relevant companies within the corporate group of the Project Co.

BONDS

While debt-based bond funding is available for project finance, the Australian bond market:

- currently lacks longer tenor instruments to provide the long-term certainty that is often desired in the infrastructure project finance market; and
- is often considered too small to support the funding needs of Australia’s mega projects.

It is now becoming increasingly common for those seeking bond debt to access the US and Asian bond markets instead.

Investing

Australia’s superannuation funds have been predominate investors and experts in Australia’s infrastructure sector over the past two decades. It is common to see large fund managers or infrastructure investment teams partner with Australian superannuation funds to participate in the infrastructure market. These specialists often compete with overseas investors and entities such as Chinese state owned enterprises.

Common forms of investing in energy and infrastructure include:

- equity investment in special purpose vehicles or entities that may have a portfolio of interests (i.e. share capital); and
- secondary market investment in operational projects.

Standard form documentation may be used when entering into an energy or infrastructure transaction in Australia. Standard forms include:

- Australian Standards (Standards Australia);
- PC-1 1998 (Property Council of Australia);
- Australia Building Industry Contract (Master Builders’ Association and Royal Australian Institute of Architects);
- FIDIC (International Federation of Consulting Engineers); and
- NEC3 (Institution of Civil Engineers)

It is important to note that these contracts are heavily amended and bespoke contracts are often used for alliances, PPPs or hybrid models.

Restructuring

Enforcement and sanctions

*When can there be regulatory investigations?*

ASIC is a key regulator of the financial services industry in Australia. ASIC has the power to conduct a formal investigation when it suspects that a breach of law is being committed or is likely to be committed by:
In conducting such an investigation, ASIC has various compulsory powers including powers to require the production of documents and information, and for individuals to be formally questioned by ASIC.

ASIC also has the power to institute proceedings or seek other remedies for breaches.

Other regulators relevant to financial services businesses include APRA, ATO and ACCC, while Austrac operates as an intelligence gathering agency. Each of these bodies (except Austrac) has similar investigative powers to ASIC; Austrac has slightly more limited powers. All of them can also institute proceedings for contraventions of relevant legislation.

**What regulatory penalties may apply?**

Where a breach of law has occurred, ASIC may take various steps, including obtaining an enforceable undertaking from, or issuing an infringement notice on, the offending party.

An enforceable undertaking may include providing compensation, or outlining a process for independent monitoring of an organization's continuing compliance with the law, while an infringement notice will impose financial penalties on an offending party.

If an infringement notice is not complied with or an enforceable undertaking is breached, ASIC can bring a civil penalty action against the recipient seeking payment of the fine and/or compliance with the terms of the enforceable undertaking. ASIC can also pursue civil penalties and other remedies (e.g. banning individuals from operating in the industry or serving as directors) even without first seeking enforceable undertakings or issuing infringement notices. For serious breaches which involve criminal conduct, it can (working with the Commonwealth Director of Public Prosecutions (CDPP)) pursue criminal charges.

ASIC will always assert the right to make an enforcement outcome public, unless the law requires otherwise.

The other regulators listed above (APRA, ATO, ACCC and Austrac) also have the ability to pursue various types of penalties for breaches of the legislation and rules that they respectively regulate.

**What criminal penalties may apply?**

ASIC can and does pursue criminal charges (working with the CDPP) when it considers the conduct involved warrants it. ASIC will generally only consider criminal action for offences involving serious conduct that is dishonest, intentional or highly reckless, even if a civil remedy is available for the same breach. Such offences include:

- insider trading;
- a breach of statutory duty by a director; and
- market manipulation.

The same is also true for some of the other regulators listed, for example for cartel conduct (the ACCC), or failure to withhold withholding tax or committing a tax fraud or evasion (the ATO), or breaches of reporting requirements under Australia's AML/CTAF legislation (Austrac).

**Current regulatory enforcement outlook**

A major judicial inquiry into the Australian financial services sector held in 2018/2019 has resulted in Australian regulators switching to a 'why not litigate?' stance. This has resulted in regulators proceeding with court proceedings in circumstances where, in the past, they may have sought to reach a negotiated outcome on penalties to be imposed for breaches of non-criminal contraventions of legislation.
Tax

Tax issues

*Are stamp, registration, transfer or other similar taxes applicable?*

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

There is no stamp duty, registration, transfer or similar tax payable on the advance of a loan in Australia.

Only one Australian state, Queensland, levies stamp duty (of up to 5.75%) on transfers or assignments of loans. In Queensland, the transfer or assignment may be dutiable where the borrower is located in Queensland or if the loan is secured by a mortgage or charge over property in Queensland.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

There is no stamp duty, registration, transfer or similar tax payable on the taking, or issue, of a mortgage, debenture or other security in Australia.

In certain Australian states and territories, the transfer or assignment of a mortgage can potentially trigger stamp duty. Certain exemptions or concessions are available, depending on the relevant jurisdiction. Also, there are potential structuring options (e.g. appointing a security trustee to hold mortgages and other securities) to minimize exposure to stamp duty in respect of an assignment of such securities.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?

There is no stamp duty, registration, transfer or similar tax payable on the issue of a debt security in Australia.

As noted above, Queensland is the only Australian state that levies stamp duty on transfers or assignments of loans and other debt instruments. However, the transfer or assignment of corporate bonds are generally exempt from stamp duty in Queensland. There are also exemptions in Queensland in respect of certain securitisation arrangements or debt factoring arrangements.

*Do tax authorities take priority on enforcement?*

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?

For federal taxes (e.g. income tax, Goods and Services Tax and Fringe Benefits Tax), the Australian Taxation Office (ATO) generally does not take priority over any secured lenders or debt security holders. However, in certain limited circumstances, the ATO may take priority over secured lenders, for example when:

- a garnishee notice is issued to allow the ATO to recoup from third parties amounts they owe, or may owe, a tax-owing taxpayer; or
- trustees (including administrators, receivers and liquidators) are obliged to retain sufficient monies from the trust fund to pay tax if the relevant assessment has been issued.

However, for certain state taxes (e.g. stamp duties and land tax), the relevant state revenue authority can take priority over secured lenders or debt security holders.

*Last modified 3 Dec 2019*
Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Unless an exemption applies under domestic law or an applicable double tax treaty, where a payment of interest (as broadly defined) is paid (or is deemed to be paid) from Australia to offshore under a loan which is treated as debt for Australian tax purposes, the borrower is required to withhold and pay an amount equal to the applicable withholding tax rate to the ATO.

If so:
What is the rate of withholding?

The current rate of Australian interest withholding tax is 10%.

What are the key exemptions?

The more commonly relied on exemptions include:

- exemptions for a publicly offered syndicated loan facility or a publicly offered debenture issued by an Australian resident company or Australian unit trusts and by a company or unit trusts not resident in Australia but carrying on business at or through permanent establishments in Australia;

- exemptions for certain foreign tax exempt superannuation funds and foreign sovereign entities which do not have control or influence in certain Australian borrowers; and

- reliance on a double tax treaty (for example, an exemption is available for interest paid to government entities or independent financial institutions).

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes, the analysis described above is generally applicable to both interest payments under a loan or other form of debt security.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

Generally no.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both Austrian and EU law.

The admission criteria to be listed on the Official Market and the Second Regulated Market are set out in the Stock Exchange Act 2018 (SEA).

The admission must be:

- submitted in writing by the issuer;
- co-signed by an exchange member; and
- accompanied by:
  - a current excerpt from the companies register;
  - the current company by-laws;
  - the company's compliance guidelines; and
  - an approved prospectus in two counterparts in accordance with SEA, unless an exemption from these rules applies.

For the entire duration of the listing, the issuer's securities must be included in the continuous trading procedure according to the Trading Rules for the Automated Trading System XETRA (Exchange Electronic Trading). The applicable admission criteria and ongoing obligations of the issuer are set out in the prime market and mid-market rules which can be downloaded from the Vienna Stock Exchange website.

Last modified 6 Dec 2019

What are common issuing methods and types of debt securities?

The most common types of debt securities issued are bonds such as corporate bonds, government bonds (e.g., notes or treasury bills) and banking bonds (e.g., debt securities, mortgage bonds or medium-term notes). Bonds issued by the public sector, but also increasingly corporate bonds, are the most common forms.

The admission criteria to be listed on the Official Market and the Second Regulated Market are set out in the Stock Exchange Act 1989 (SEA). Bonds that are admitted to listing on the Official Market or Second Regulated Market or admitted to trading in the Third Market include government bonds, federal treasury certificates, treasury notes, interest rate and government strips, corporate bonds, banking
bonds and convertible bonds. The trading platform used is Xetra® with the trading procedure 'Auction Trading' (intra-day auction).

The public sector segment contains all debt securities issued by government bodies or that have a guarantee from the public sector: Austrian federal government bonds, Austrian Treasury bills (ATBs), bonds issued by provincial governments, bonds issued by other states etc.

The segment corporate sector contains bonds, that are issued by companies for the purpose of financing corporate activities (bonds issued by banks are, by definition, not classified as corporate bonds.).

The corporate sector is divided into the corporates prime segment and the corporates standard segment.

The financial sector segment contains debt securities issued by banks and insurance companies. This is the largest segment as measured by the number of issues. Investors have a wide choice of products regarding the security of their investment (asset-backed bank bonds, mortgage-backed bonds and mortgage-backed bonds issued by public bodies, unsecured bonds, junior bonds and unsecured supplementary capital bank bonds) as well as the type of interest (fixed-interest bonds, floating-rate bonds, zero-coupon bonds).

The performance-linked bond segment contains structured bonds whose interest and repayment depend on an underlying instrument. Underlyings may be stock indices, commodities or hedge funds etc. The issuers are usually banks or special purpose vehicles (SPVs). The range of products includes securities with a capital guarantee as well as without a capital guarantee, and reverse convertible notes (cash or share bonds).

What are the differences between offering debt securities to institutional / professional or other investors?

If debt securities are only being issued to professional investors and not to the public, a prospectus is not required.

In some cases, bonds may be issued in the form of registered bonds (Namensschuldverschreibungen) where the bonds are subscribed by insurance companies that allocate the bonds to their reserve fund (Deckungsstock), since a more favorable risk weighing applies to registered bonds under the current regulatory framework (as compared to bearer bonds).

When is it necessary to prepare a prospectus?

In order to list on a regulated market, the preparation of a prospectus will normally be required. However, the Austrian Stock Exchange Act and the Capital Market Act grant the following exemptions from the obligation to publish a prospectus:

- bonds issued by credit institutions from Austria or from European Economic Area (EEA) member states regularly or as tap issues provided the following requirements are met:
  - issuing volume of the bond < EUR75 million;
  - bonds are not subordinated bonds or convertible bonds; and
  - the interest payments and principal payments are not permitted to be contingent on a derivative;
- bonds issued by the Republic of Austria, the Austrian federal states or EEA member states provided the following requirements are met:
  - Official Market – ‘automatic’ admission by law to the Official Market, after submission of the terms and conditions of the bond and of request for admission to listing, the bond may start trading two days later; and
  - Second Regulated Market – admission to listing is possible without a prospectus;
- bonds issued by a public body of an EEA member state:
  - admission for listing to the Official Market and to the Second Regulated Market without a prospectus; and
- bonds guaranteed by the Republic of Austria, by an Austrian federal state, by an EEA member state or by a public body of an EEA.
member state:

- admission for listing to the Official Market and to the Second Regulated Market without a prospectus.

Admission to the Official Market or the Second Regulated Market may be granted without requiring a listing prospectus in the above mentioned cases.

To supplement the existing supervisory rules such as the Capital Market Act (\textit{Kapitalmarktgesetz}), a specific legal framework has been put in place for the purposes of providing small and medium-sized Enterprises with finance via particular financing models. The Alternative Financing Act (\textit{Alternativfinanzierungsgesetz}) will make it easier for such companies to access the capital market. The Act also stipulates minimum standards for the operators of crowdfunding platforms. Neither a prospectus obligation nor an information obligation applies to a public offering of alternative financial instruments with a total value of up to EUR100,000 (or up to EUR750,000 in the case of shares in a cooperative). If the alternative financial instruments take the form of equities or bonds, a prospectus as defined by law must be published for any public offering in excess of EUR250,000. Public offerings of other alternative financial instruments up to a total amount of EUR1.5 million are only subject to certain information obligations. These include the obligation to publish the latest financial statements without delay and to provide an annual information update. For public offerings with a total value of EUR1.5 million upwards (or EUR250,000 upwards in the case of equities and bonds), a prospectus as defined by law must be published. Up to a limit of EUR5 million, the obligation to publish a prospectus may be met by preparing a simplified prospectus as defined in Annex F of the Capital Market Act. The provisions of the Alternative Financing Act apply to the calculation of this limit. If the total value exceeds EUR5 million or if the limit defined in the Alternative Financing Act is exceeded, the general obligation to publish a prospectus applies accordingly.

\textit{Last modified 6 Dec 2019}

\textbf{What are the main exchanges available?}

The main market for debt securities is the Vienna Stock Exchange (VSE).

Debt securities can be admitted to trading on one of the two regulated markets (that is, the Official Market and the Second Regulated Market) and the Third Market, which is operated as a multilateral trading facility (MTF).

The bond market is divided into the following segments:

- \textbf{Public sector} – This contains all debt securities issued by the federal government, entities under public law and supranational institutions.

- \textbf{Corporate sector} – This contains bonds issued by companies for the purpose of financing corporate activities.

- \textbf{Financial sector} – This contains bonds issued by banks, frequently used to refinance loans.

- \textbf{Performance-linked bonds} – This contains debt securities whose redemption price has not yet been fixed at the date of issue, as it is based on performance.

The admission criteria to be listed on the Official Market and the Second Regulated Market are set out in the Stock Exchange Act 1989 (SEA). Bonds that are admitted to listing on the Official Market or Second Regulated Market or admitted to trading in the Third Market include government bonds, federal treasury certificates, treasury notes, interest rate and government strips, corporate bonds, banking bonds and convertible bonds. The trading platform used is Xetra® with the trading procedure 'Auction Trading' (intra-day auction).

The public sector segment contains all debt securities issued by government bodies or that have a guarantee from the public sector: Austrian federal government bonds, Austrian Treasury bills (ATBs), bonds issued by provincial governments, bonds issued by other states etc.

\textit{Last modified 6 Dec 2019}

\textbf{Is there a private placement market?}

Austria has a private placement market. There is no dominant standard for documentation.

\textit{Last modified 6 Dec 2019}
Are there any other notable risks or issues around issuing or investing in debt securities?

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil and criminal liability under Austrian law. There are various statutory provisions aimed at investor protection relating to prospectus liability and liability for unsuitable advice on investments. There are also general fraud statutes and liability may also arise under common law through a civil action for deceit, negligent misstatement or misrepresentation.

Debt security terms and conditions typically contain provisions which may permit their modification without the consent of all investors and confer significant discretions on the trustee, which may be exercised without the consent of investors and without regard to the individual interests of particular investors. However, where the interests of bondholders may be prejudiced the Austrian Custodian Act (Kuratorengesetz – KurG) provides that the competent Austrian court shall appoint a custodian in favor of the non-represented bondholders. This may, in particular, be the case where insolvency proceedings are opened with respect to the issuer or other circumstances generally affecting bondholders' rights occur. If a custodian is appointed, it will exercise the collective rights and represent the interests of the bondholders and will be entitled to make statements on their behalf that are binding on all bondholders.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

The Austrian Financial Market Authority (FMA) supervises various types of Austrian investment funds and their managers. Austrian investment funds supervised by the FMA are:

- alternative investment funds (AIFs) pursuant to the Alternative Investment Fund Managers Act 2013 (Alternative Investmentsfonds Manager-Gesetz 2013 – AIFMG 2013);
- investment funds pursuant to the Investment Fund Act 2011 (Investmentfondsgesetz 2011 – InvFG 2011); and

These funds are managed by investment fund management companies, real estate investment fund management companies and alternative investment fund managers (AIFMs).

As banks, investment fund management companies and real estate investment fund management companies are subject to supervision by the FMA. The FMA has also supervised AIFMs since 2014.

The FMA is required to perform the official tasks and use the powers as laid down in the abovementioned legislation (BWG, InvFG 2011, ImmoInvFG, AIFMG and, where applicable, the Securities Supervision Act 2018). Furthermore, the FMA is required to enforce numerous regulations.

What are common fund structures?

Common forms of funds include:

- open-ended and closed-ended funds;
- retail and non-retail funds;
- Undertakings for Collective Investments in Transferrable Securities (UCITS) and non-UCITS funds; and
- qualified investor structures that invest in, for example, corporate shares or bonds, real property, commodities and derivatives.

An investment fund is managed by an investment fund management company with the assets being held at a separate custodian bank. A capital investment fund established in accordance with the Investment Funds Act 2011 (InvFG 2011) is jointly owned by all unit holders.
Such funds include undertakings for collective investment in transferable securities (UCITS). The special assets must be held separately from the assets of the management company and no liability is assumed for the company's liabilities.

Umbrella constructions are also possible, in which a fund may consist of several sub funds, which might have different technical characteristics.

Alternative Investment Funds (AIFs) encompass every collective investment undertaking including its subfunds, that collect capital from a number of investors, in order to invest it in accordance with a determined investment strategy for the benefit of the investors. The collected capital may not directly be used for an operational activity and the fund is not subject to the UCITS Directive.

The types of AIFs addressed in the Investment Funds Act of 2011 (InvFG 2011 – Investmentfondsgesetz 2011) include special funds, other special funds and pension investment funds.

Real estate investment funds and real estate special investment funds pursuant to the Real Estate Investment Fund Act (ImmoInvFG – Immobilien-Investmentfondsgesetz) are also classified as AIFs.

As the scope of the Austrian Alternative Investment Fund Managers Act 2013 (AIFMG) is very wide it covers a wide range of funds, and hence, regulates the distribution of all kinds of AIFs. Only such investment undertakings which do not qualify as AIFs are not subject to those rules, such as operational companies or certain trust structures.

Last modified 6 Dec 2019

**What are the differences between offering fund securities to professional / institutional or other investors?**

The Austrian Alternative Investment Fund Managers Act (AIFMG) only allows Alternative Investment Funds (AIFs) and non-EU AIFs to be placed in accordance with a dedicated set of rules, which do not provide for a private placement exemption.

The AIFMG does not impose an obligation to draw up a prospectus, however, it requires the submission of comprehensive information to the investors and the supervisory authorities. In addition, the Austrian Capital Markets Act provides the requirements for public offerings which also apply to AIF.

A substantial part of the AIFMG provides regulation for the marketing of AIFs. The provisions set out complex rules and distinguish between:

- whether the AIFM is licensed in Austria or in another EU Member State or it is a non-EU AIFM; and
- whether the AIF is an EU AIF or a non-EU AIF.

In general, an AIFM which is licensed in Austria is entitled to market EU AIFs to professional investors in Austria and in other EU member states. However, the marketing of AIFs to Private Investors and Qualified Private Investors is possible only under certain conditions. A ‘Qualified Private Investor’ is a person who owns free deposits and securities of more than EUR500,000, commits to invest at least EUR100,000 and does not invest more than 20% of its assets into an AIF.

The following AIFs are eligible for marketing to Private Investors and Qualified Private Investors:

- Real Estate Funds according to the Real Estate Fund Act (ImmoInvFG) provided that the AIFM holds a license pursuant to Sec 1 para 1 cf 13a Austrian Banking Act (BWG);
- Special Funds, Other Funds and Pension Investment Funds according to the Investment Fund Act (InvFG), provided that the AIFM holds a license pursuant to Sec 1 para 1 cf 13 BWG;
- AIFs in Real Estate provided that the AIFM holds a license according to the AIFMG;
-Managed Futures Funds subject to the conditions of sec 48 para 7 and 8 AIFMG provided that the AIFM holds a license according to the AIFMG;

- Private Equity Umbrella Funds according to the new sec 48 para 8a and 8b AIFMG;
- funds investing in interests of companies according to sec 48 para 8c and 8d AIFMG; and
• exclusively to Qualified Private Investors, AIFs which are authorized to be marketed to professional investors and provided that they do not employ leverage exceeding 30%.

Pursuant to sec 48 para 1a AIFMG the Private Investor and the Qualified Private Investor have to confirm in writing sufficient knowledge about the investment and the risks contained therein. The AIFM needs to be sufficiently convinced that the Private Investor and the Qualified Private Investor is able to assess the risk and the adequacy of the obligation related to the investment.

Last modified 6 Dec 2019

Are there any other notable risks or issues around establishing and investing in funds?

The management of investment funds as specified in the InvFG 2011 is defined as a banking transaction pursuant to the Austrian Banking Act (BWG – Bankwesengesetz). This is why the BWG provisions also apply to investment fund management companies, unless they are explicitly exempted. Investment fund management companies are therefore considered special-purpose credit institutions.

With an appropriate license, they may also provide the investment services specified in the Securities Supervision Act 2018 (Wertpapieraufsichtsgesetz). In this case, the WAG 2018 provisions listed in Article 10 para. 5 of the InvFG 2011 must also be applied to them.

It should be noted that the InvFG 2011 not only includes regulations concerning Austrian undertakings for collective investment in transferable securities (UCITS), but also provisions on alternative investment funds (AIFs). Such AIFs could be other special assets, pension investment funds and special funds.

Most Austrian investment fund management companies not only manage UCITS, but also AIFs. Consequently, these companies are also alternative investment fund managers (AIFMs), that hold a license pursuant to the InvFG and a license pursuant to the Alternative Investment Fund Managers Act (AIFMG, Alternatives Investmentfonds Manager-Gesetz).

The activities of alternative investment fund managers (AIFMs) are specified in the Alternative Investment Fund Managers Act (AIFMG; Alternatives Investmentfonds Manager-Gesetz), which is based on Directive 2011/61/EU on Alternative Investment Fund Managers (AIFMD). This Directive divides investment funds within the EU into two categories:

• undertakings for collective investment in transferable securities (UCITS); and
• alternative investment funds (AIFs).

In order to be allowed to manage AIFs, the alternative investment fund manager must be licensed as an AIFM. If the AIFM does not exceed certain threshold values with regard to the assets they manage, they may simply register their services instead of obtaining a license. In this context it should be noted that registered AIFMs are not permitted to market any AIFs to retail investors or qualified retail customers, or to engage in cross-border marketing or cross-border management.

The Real Estate Investment Fund Act (ImmoInvFG, Immobilien-Investmentfondsgesetz) regulates the management of real estate funds by investment fund management companies. Investment fund management companies for real estate are the only companies authorized to issue and manage this type of fund. These special-purpose credit institutions possess a restricted banking license pursuant to Article 1 para. 1 no. 13a Banking Act (BWG) and are subject to supervision by the FMA. Real estate investment fund management companies also hold a license pursuant to the AIFMG, as real estate funds and special real estate funds are classed as AIFs. The AIFMG provisions must therefore also be applied to real estate investment fund management companies.

Last modified 6 Dec 2019

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Prior to the implementation of the Alternative Investment Fund Managers Directive (AIFMD), foreign investment funds were distributed in Austria either by way of a ‘public offer’ or a ‘private placement’. With the implementation of the AIFMD, this regime has been abolished.
Now all AIFs being ‘marketed’ to investors in Austria have to be notified with the Financial Market Authority and have to comply with certain regulatory obligations. However, depending on the specific circumstances and a case by case analysis ‘reverse solicitation’ seems possible.

Austria has also ‘opted in’ for the option provided for in Article 43 of the AIFMD and allows for marketing to retail investors. However, this possibility is limited to certain fund structures and subject to additional notification requirements.

An extension of the passporting regime to non-EU Alternative Investment Fund Managers (AIFMs) and non-EU Alternative Investment Funds (AIFs) is contemplated by the AIFMD. However, respective EU legislation will have to be passed prior to implementation. Austria has exercised the option provided for in Article 42 of the AIFMD and allows the marketing of AIFs managed and marketed by non-EU AIFMs to professional investors, subject to certain additional Austria specific conditions and notification requirements as provided for in the Alternative Investment Fund Managers Act (AIFMG). This is an opportunity for non-EU AIFMs to continue or start marketing of their AIFs in Austria.

Last modified 6 Dec 2019

Are there any restrictions on managing a fund?

The Alternative Investment Fund Managers Act (AIFMG) in line with the Alternative Investment Managers Directive (AIFMD) is fund manager focused and introduces a new licensing requirement for such managers as well as a number of organizational and structural requirements to be met. An advantage of this licensing requirement is that once a fund manager situated in the EU is authorized by its home member state it will be able to passport its manager license to all other member states and market the Alternative Investment Funds (AIFs) it manages to professional investors in any other member state without an additional licensing requirement.

Last modified 6 Dec 2019

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

As a general rule, a person entering into a derivatives contract by way of business in Austria (for example a dealer) will ordinarily need to be authorized under the Austrian Banking Act (Bankwesengesetz, BWG) or the Austrian Securities Supervision Act (Wertpapieraufsichtsgesetz, WAG) if the transaction is one of the specified activities. These activities include trading in:

- options;
- futures;
- contracts for difference; or
- rights to or interests in investments.

One of the key exceptions to the requirements above applies to persons who deal in derivatives for risk management purposes (for their own account).

The European Market Infrastructure Regulation applies to all derivative transactions and requires transactions to be reported to regulators, for transactions between dealers to be cleared or subject to other risk mitigation techniques such as initial margin and variation margin requirements.

Certain governmental entities as well as insurance and investment funds are subject to specific statutory rules limiting their ability to enter into derivatives contracts.

The clearing and settlement of Austrian securities had previously been dealt with by Oesterreichische Kontrollbank (OeKB). As of January 2005, CCP Austria, a company owned jointly by Wiener Börse AG and OeKB, began operations for the clearing and settlement of all cash market and derivatives trades.

Last modified 6 Dec 2019
What are common types of derivatives?

Derivative contracts are entered into in Austria for a range of reasons including hedging, trading and speculation. Derivatives may be traded over-the-counter or on an organized exchange.

All of the main types of derivative contract are widely used in Austria:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of a derivative contract is based on the value of the underlying assets. The main classes of underlying asset in Austria are:

- equity;
- fixed income instruments;
- commodities;
- foreign currency; and
- credit events.

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007-to-2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. The European Commission has sought in particular, to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative position;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen, and continues to see, the introduction of a significant amount of new regulation which has led to substantial compliance costs for market participants.

Austria has recently seen a number of municipalities invoking different forms of an ultra vires defense against the enforcement of derivatives contracts. Following similar case law in Germany, there have also been cases where banks have been prevented from enforcing derivatives contracts against customers based on the argument that they withheld information according to which the derivative contract in question had a negative value at the time of conclusion of the contract. Finally, there have been occasional attempts, especially by smaller investors to invoke the gambling defense against the enforcement of derivatives contracts.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending is restricted under civil law by the general principle of good morals (gute Sitten) and by the limits of laesio enormis (that is, where parties to a contract are entitled to rescind certain unfair contracts) from exploiting the carelessness, plight or inexperience of the
contracting partner and charge monetary advantages that are clearly inappropriate. Extortionate loans are void and may also result in criminal liability.

Stock companies and limited liability companies are prohibited by law from granting financial assistance either in the form of a loan or credit support by providing a guarantee or other security for the purpose of purchasing its own shares. This also applies to limited liability companies in compliance with the capital maintenance rules.

Loans to managing directors may be subject to particular approval requirements.

Finally, a debt may be deemed to be of equity in nature and repayment may be forbidden if the loan was granted in the period prior to a borrower's insolvency and when borrower is insolvent and the lender either holds more than 25% of the borrower's shares or otherwise exerts control over the borrower.

There are no restrictions on granting security to a foreign lender or on a foreign lender making loans; however, engaging in banking or financial services may require a banking license. There is also a duty to notify to the Austrian Central Bank of certain cross-border business for statistical purposes.

Last modified 6 Dec 2019

What are common lending structures?

Lending in Austria can be structured in a number of different ways in order to include a variety of features depending on the commercial needs of the parties. A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Credit agreements have represented and still represent the most important instrument in terms of debt financing. However, more and more financing products have been developed and used in Austrian financing transactions, such as mezzanine debt financing, equity kickers and hybrid instruments.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities.

Loan durations

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Loan security

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

Loan repayment

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

Last modified 6 Dec 2019

What are the differences between lending to institutional / professional or other borrowers?
Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

By contrast, mortgages and consumer lending is governed by the Mortgage and Real Estate Credit Agreements and Other Credit Agreements in favor of Consumers (Hypothekar- und Immobilienkreditgesetzes – HIKrG) and the Consumer Credit Act (Verbraucher kreditgesetz – VerbrKrG).

Do the laws recognize the principles of agency and trusts?

The concept of facility agents, who act in the name and on behalf of the lenders in a syndicate, is recognized under Austrian law. However, under Austrian law security can only be given directly to the creditor as a secured party.

Pursuant to mandatory provisions of Austrian law a security agent (holding accessory security) must be a joint and several creditor (Gesamtgläubiger) under the loan agreement. A common alternative is to use an agreement stating that the security agent would be granted a claim vis-à-vis the borrower, which corresponds exactly to the outstanding claims under the loan agreement (a so-called parallel debt structure).

A valid and enforceable security interest can only be created in favor of the creditor of the obligation to be secured. A trust created under the common law of another country is not recognized in Austria and, therefore, a security trustee cannot enforce its rights in the Austrian courts.

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual principles. An irrevocable expression of intent (Willenserklärung) may nonetheless be terminated if there is a fundamental change in the circumstances that existed when the expression of intent was made (Wegfall der Geschäftsgrundlage) or for good cause (wichtiger Grund). Irrespective of the provisions of the documents, stipulations that purport to exclude a person’s right to terminate an agreement for good cause (aus wichtigem Grund) or to request early repayment/redemption following the occurrence of such good cause (wichtiger Grund) would not be enforceable.

Specific types of lending

Mortgages and consumer loans are highly regulated activities. A number of requirements are imposed on a lender including:

- the lender shall provide the borrower at any time with prescribed minimum information regarding the content of the contract (eg credit purpose, possible duration, types of offered interest rates or a representative example), either in written or electronic form;
- the lender shall deliver the European Standardized Information Sheet (ESIS) to the borrower containing tailored information purposes;
- the borrower shall be given a right to withdraw from the contract; and
- specific disclosure requirements with regard to amortization, change of interest rates, early prepayment etc.

Standard form documentation

Most syndicated finance transactions are governed by documentation based on recommended forms published by the Loan Market Association and adapted to Austrian law. Bilateral finance transactions are more likely to be documented on bank standard form documentation prepared in-house.

Are there any other notable risks or issues around borrowing?
Borrowers should be aware of the potential implications of the EU's Bank Recovery and Resolution Directive (BRRD) as well as the Austrian Recovery and Resolution of Credit Institutions Act (Bundesgesetz über die Sanierung und Abwicklung von Banken – BaSAG), which outline certain measures for dealing with failing financial institutions.

The provisions apply to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

The provisions give authorities the power to 'bail in' obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. 'Bail in' describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of Austrian or other EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

Last modified 6 Dec 2019

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the giving of guarantees and security are as follows.

Capacity

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors' powers that would prevent this.

Financial assistance

A parent company may guarantee the obligations of its subsidiary under a third party loan without violating any corporate benefit rules; however, for a company benefitting from limited liability and limited partnerships (with limited liability companies as partners) it is not allowed to grant security for the obligation of an indirect parent or sister company unless the transactions were at arm's length or justified by a corporate benefit. Under Austrian law transactions violating capital maintenance rules are null and void (and even security granted to third parties may not be enforceable).

Insolvency

Guarantees and security may be at risk of being set aside under Austrian insolvency laws if the guarantee or security was granted by a company within a certain period of time prior to the onset of insolvency. Guarantees and security may also be challenged on other grounds relating to insolvency.

Last modified 6 Dec 2019

What are common types of guarantees and security?

Guarantees are commonly used in Austria and are created by way of an agreement between the guarantor and the beneficiary or by unilateral declaration of the guarantor. They may be provided as either of the following.

Suretyship (Bürgschaft)

This is where the guarantor undertakes to settle certain obligations of a debtor in the event of default. It is an accessory security and therefore conditional on the debtor's default; and a valid and existing underlying obligation of the debtor.

Guarantee

This is where the guarantor promises to pay a certain amount of money on the formal request of the beneficiary under the guarantee. The guarantor's obligation is abstract and therefore (unlike a personal guarantee) independent from any underlying legal relationship.
between the beneficiary as creditor and his debtor.

**Common forms of security**

The most common forms of security over immovable property are as follows.

**MORTGAGE (HYPOTHEK)**

This is the transfer of an interest in property to a creditor as security for a debt. The debtor has a right of redemption if the terms of the mortgage are satisfied or performed.

**TRANSFER OF TITLE IN PROPERTY (SICHERUNGSÜBEREIGNUNG)**

This is where ownership is transferred from the transferor (debtor) to the transferee (creditor). However, the transferee holds the property as trustee for the transferor. Full ownership reverts to the transferor when it fulfils its obligations.

Both types of security can be enforced by either of the following means:

- auctioning the property; and
- putting the property under forced administration.

If the creditor wants to recover its claims in the form of income from rental or lease fees, it must choose forced administration.

The most common forms of security over movable property are as follows.

**PLEDGE (PFAND)**

A way of creating security by delivering an asset to a creditor to hold until an obligation is performed. The creditor takes possession of the asset while the debtor retains ownership. The creditor can sell the pledged asset if the obligation is not performed. Claims can also be pledged. Since no physical possession of a claim is possible, they are pledged by notifying the third party debtor.

**SECURITY TRANSFER (SICHERUNGSÜBEREIGNUNG)**

This is where in a security transfer, ownership is transferred from the debtor as transferor to the creditor as transferee, while the object remains in the transferor’s possession. The advantage over the pledge is that the object remains usable by the debtor.

**ASSIGNMENT (SICHERUNGSABTRETUNG)**

This is where a debtor can assign claims it has against a third party. The assignment is usually not disclosed to the third party. If the debtor defaults, the creditor can disclose the assignment and seek payment directly from the third party.

Are there any other notable risks or issues around giving and taking guarantees and security?

**Giving or taking guarantees**

No further specific issues – however, suretyships may trigger stamp duty under the Austrian Stamp Duty Act (GebG).

**Giving or taking security**

The relevant formalities for security are:

- **Mortgages and transfers of title in property** – These must be notarised and registered with the Land Registry (Grundbuch). Failure to comply with these formalities renders the security invalid.

- **Pledges** – A claim can only be pledged if the third party debtor is sufficiently notified of the pledge. If a physical asset is being pledged
it either must be transferred to the pledgee or held by a person on the pledgee’s behalf. Failure to comply with these formalities renders the security invalid.

- **Security transfers and assignments** – There are no specific formalities for assignments and security transfers.

**Financial regulation**

**Law and regulation**

*What are the main laws and regulations that apply to entities that are involved in finance and investments generally?*

**Generally**

Financial Market Authority Act 2011 (*Finanzmarktaufsichtsbehördenbesetz 2011*) (organization of the Financial Market Authority)
Insurance Supervision Act 2016 (*Versicherungsaufsichtsgesetz 2016*) (insurance companies)
Securities Supervision Act 2007 (*Wertpapieraufsichtsgesetz 2007*) (dealing with securities)
Capital Market Act 2011 (*Kapitalmarktggesetz 2011*) (public offering of securities and other financial instruments)
Banking Act 1993 (*Bankwesengesetz 1993*)
Securities Depository Act 1969 (*Depotgesetz 1969*) (purchase and disposition of securities)
E-Money Act 2010 (*E-Geldgesetz 2010*) (electronic money and regulating the conduct of institutions emitting electronic money)
Payment Services Act 2009 (*Zahlungsdienstegesetz 2009*) (offering of payment services)
Recovery and Resolution of Credit Institutions Act 2014 (*Bundesgesetz über die Sanierung und Abwicklung von Banken 2014*) (financial recovery and liquidation of credit institutions)
Austrian Custodian Act 1874 (*Kuratorengesetz 1874*) (joint representation of bearers of bearer bonds)
Austrian Stamp Duty Act 1957 (*Gebührenbesetz 1957*) (stamp duty)

**Consumer credit**

Consumer Protection Act 1979 (*Konsumentenschutzgesetz 1979*) (protection of consumer rights)
Consumer Credit Act 2010 (*Verbraucherkreditgesetz 2010*) (loans and other forms of credit to consumers)

**Mortgages**

Austrian Civil Code (*Allgemeines Bürgerliches Gesetzbuch*)
Mortgage Credit Directive (2014/17/EU Richtlinie über Wohnimmobilienkreditverträge)
Act on Mortgage and Real Estate Credit Agreements and Other Credit Agreements in favor of Consumers 2016 (*Hypothekar- und Immobilienkreditgesetz 2016*)

**Corporations**

Stock Corporation Act (*Aktiengesetz – AktG*)
Limited Liability Companies Act (Gesetz betreffend die Gesellschaften mit beschränkter Haftung – GmbH)
Austrian business enterprise code (*Unternehmensgesetzbuch – UGB*)

**Funds and platforms**

Investment Fund Act 2011 (*Investmentfondsgesetz 2011*)
Alternative Investment Fund Managers Act 2013 (*Alternative Investmentsfonds Manager-Gesetz 2013*)
Real Estate Investment Funds Act 2003 (*Immobilien-Investmentfondsgesetz 2003*)
Other key market legislation

UCITS Directive (1985/61/EWG, OGAW Richtlinie)
EU Prospectus Regulation (2017/1129/EU, Prospekterordnung)
Capital Requirements Regulation (2013/33/EU, Kapitaladäquanzverordnung) (capital requirements)
European Market Infrastructure Regulation (2012/64/EU – EMIR) (derivatives)
Market Abuse Regulation (2014/596/EU, Marktmissbrauchsverordnung) (market abuse)
Markets in Financial Instruments Directive II (2014/65/EU – MiFID II) (financial instruments)
Clearstream’s Central Securities Depositories (2014/909/EU – CSDR, Zentralverwahrerverordnung)
Financial Account Tax Compliance Act 2010 (FATCA)
Basel IV: International framework for liquidity risk measurement, standards and monitoring
Bank Recovery and Resolution Directive (BRRD)

Last modified 6 Dec 2019

Regulatory authorization

Who are the regulators?

The Financial Market Authority supervises various institutions including less significant banks, insurance undertakings, pension companies, corporate provision funds, investment firms and service providers, investment funds, financial conglomerates and stock exchanges. It also monitors compliance with legal requirements, and ensures fairness and transparency in relation to the trading of listed securities, capital market prospectuses, compliance and rules of conduct, any unauthorized offering and provision of financial services, and the observance of anti-money laundering and terrorist financing rules.

The Ministry of Finance supervises the Financial Market Authority.

The Österreichische Nationalbank (OeNB) is the central bank and is in charge of monetary policy, financial stability, supplying Austria with cash, providing financial statistics and facilitating cashless payments.

What are the authorization requirements and process?

The vast majority of authorizations are obtained from the Financial Market Authority.

The Financial Market Authority assesses whether or not the legal requirements are fulfilled and also the eligibility of certain key individuals. It bases its decision on documents to be provided by the applicant, including the business plan, the initial capital and the identity of the key individuals. Before issuing its decision, the Financial Market Authority must consult the Ministry of Finance and the Österreichische Nationalbank.

Authorized firms are listed in a database maintained by the Financial Market Authority.

Other authorities are responsible for authorizations of stock brokers, currency exchanges, Central Counterparties according to European Market Infrastructure Regulation, central securities depositories according to CSDR (Clearstream's Central Securities Depositories – Zentralverwahrerverordnung), financial advisors (Vermögensberater) and certain special institutions such as the post office, Österreichische National Bank, Austrian Control Bank (Österreichische Kontrollbank – OeKB) and certain local authorities.

The fee depends on the scope of the authorization and amounts to at least EUR10,200.
What are the main ongoing compliance requirements?

The main ongoing compliance requirements are maintenance of capital and liquidity requirements and observance of large exposure limitations. Failure to comply with these can result in loss of authorization.

Other key compliance requirements include preserving banking secrecy, combatting money laundering and terrorist financing and ensuring internal auditing. Furthermore the Financial Market Authority enjoys the power to issue decrees to further specify rules and (to a limited extent) impose rules. Failure to comply, generally can result in fines. Competitors may also be able to sue the non-compliant company on the basis that they have been engaging in unfair competition. Breach of banking secrecy can be a criminal offence and result in imprisonment.

What are the penalties for failure to be authorized?

The penalty for undertaking a regulated activity without authorization is a fine, which can be up to EUR5 million or twice the amount of the profit received from undertaking the activity. There is a possibility that such activity could also be classified as a criminal offence (deception).

Regulated activities

What finance and investment activities require authorization?

Generally

The finance and investment activities requiring authorization are explicitly stipulated in the Banking Act 1993. In order to conduct one of these activities in Austria on a commercial basis (which broadly corresponds to having an 'intent to realize a profit') requires authorization.

The activities include:

- deposit business;
- clearing;
- credit business;
- bill-broking;
- security deposit business;
- issuance and administration of instruments of payment;
- trading in foreign exchange instruments, money market instruments, derivatives and securities;
- guarantee business;
- securities issuance business;
- investment fund business including real estate investment fund business; and
- factoring.

Consumer credit

From a regulatory perspective, consumer credit activities are not treated any differently to other credit business, ie they require prior
authorization if conducted in Austria and on a commercial basis. However, additional rules apply including additional civil law rules. Examples for such additional civil law rules include the limitation to use certain clauses in general terms and conditions for consumers, additional requirements before taking security from consumers and additional information requirements before entering into a distance contracts.

_Last modified 6 Dec 2019_

**Are there any possible exemptions?**

Credit institutions and financial institutions which passported their respective authorizations to Austria are only subject to a limited set of Austrian rules and otherwise only to the rules of their home member states.

_Last modified 6 Dec 2019_

**Do any exchange controls or other restrictions on payments apply?**

There are no foreign currency controls other than sanctions imposed by the EU or international law if transferring money to and from non-EU member states. Declaration requirements may apply.

The EU rules on payments (EU Payments Regulation and the Transfer of Funds Regulations) must be complied with.

Anti-money laundering and tax considerations may also need to be taken into account.

_Last modified 6 Dec 2019_

**What are the rules around financial promotions?**

**Rules**

The promotion of finance and investment activities can qualify as 'acting on a commercial basis' and therefore require an authorization.

There are no restrictions on promotion for authorized entities. However, there are detailed information obligations upon such entities, especially in relation to consumers.

**Exemptions**

There are no general exemptions.

_Last modified 6 Dec 2019_

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

**Generally**

The Banking Act 1993 provides that in order for an entity to apply for authorization, it must be a capital company (*Kapitalgesellschaft*), cooperative (*Genossenschaft*) or savings bank (*Sparkasse*). Any other legal entities are not eligible for authorization. All of these are body corporates with separate legal personality (for purposes of both civil and tax law) and limit the liability of their shareholders or members respectively. The liability of a company's shareholders is limited by shares, meaning that the shareholders are liable to pay for their shares but not the company's debts.

**Funds**
Management companies of investment funds (Verwaltungsgesellschaften) require a banking license and are therefore subject to the same rules and requirements as described above.

The investment fund itself however, does not have its own legal personality. It is a separate estate (Sondervermögen) to which special rules apply, eg it consists of share certificates which must be of equal value and which represent:

- co-ownership in the investment fund; and
- certain rights and obligations vis-à-vis the management company as well as the depositary bank.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

A company can conduct lending or investment business through a branch which does however, not create a separate legal entity. Credit institutions and financial institutions from other EU member states may passport their respective authorizations to Austria via their home state authorities. All other entities must apply for an Austrian authorization.

Foreign entities which have a branch in Austria must comply with different rules including registration (companies register act and business enterprise code), accounting (business enterprise code) and disclosure (business enterprise code and banking act). Credit institutions and financial institutions which passported their respective authorizations to Austria must observe a catalogue of Austrian rules including rules on consumer protection and protection of young people, banking secrecy and anti-money laundering and terrorism financing. Otherwise they are supervised by their respective home state authority. All other foreign entities must observe all Austrian rules and regulations including supervision by the Austrian authorities.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending includes peer-to-peer (P2P) type structures often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.
ISSUES FOR STARTUP MARKETPLACE LENDERS

Following the initial incorporation and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform. As the startup lender will not have an established track record, deposit base or asset pools, the funding structure will often follow the format of a warehouse securitization structure.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the block using sophisticated algorithms and add the verified block to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a 'proof of work' process.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third-party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.
WHAT IS A CRYPTOCURRENCY?

Cryptocurrency or virtual currency is legally defined for the first time in the Anti Money Laundering Directive (RL (EU) 2018/843) (Article 3 (18): virtual currencies” means a digital representation of value that is not issued or guaranteed by a central bank or a public authority, is not necessarily attached to a legally established currency and does not possess a legal status of currency or money, but is accepted by natural or legal persons as a means of exchange and which can be transferred, stored and traded electronically.

The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchaser.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.
Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

Many alternative investments are now offered via platforms on the internet (sometimes also referred to as ‘crowdfunding platforms’). Whether such platforms are subject to supervision depends on both their activities and the instruments which are offered on them. Some platforms are subject to securities supervision law (usually as they involve the brokerage of shares or bonds), while others do not require a license and are not supervised. Credit brokerage platforms can rarely be operated without a licensed partner due to the fact that such lending business constitutes a banking transaction. Furthermore such platforms are not usually permitted to transfer payments between users unless they are authorized to do so.

There are specific obligations under Austrian law, in particular, with respect to investor information regarding platforms that broker alternative financial instruments in accordance with the Alternative Financing Act (Alternativfinanzierungsgesetz or AltFG), the law applicable to most alternative financial instruments.

FinTech models may be offered by financial market participants under the supervision of the Austrian Financial Markets Authority (FMA) such as banks and insurance companies. FinTechs that are not supervised by the FMA may only provide their services either outside the scope of transactions that require a license, or in cooperation with market participants that hold the requisite license. It is often difficult to determine which approach applies, so the FMA provides support to FinTechs in clarifying what is possible. If, however, any suspicion arises that transactions are being conducted without the requisite license being held, then the FMA is required to investigate – see Article 22b of the Financial Market Authority Act (Finanzmarktaufsichtsgesetz or FMABG) on unauthorized business operations – and, where applicable, to prohibit the activity from being conducted as well as to initiate administrative penal proceedings. The FMA therefore has multiple functions in this field: on the one hand it supervises FinTechs holding the requisite licenses as well as licensed entities with FinTech divisions, while also providing clarification about whether a license is required and whether authorized business operations are potentially being conducted.

RELEVANT REGULATORY PROVISIONS AND BUSINESS OPERATIONS

The FMA initiates investigations if it suspects that unauthorized business operations are being conducted. The FMA receives information and tip-offs from market participants and other authorities as well as from its own market monitoring. Unauthorized business operations are deemed to exist if they are conducted without the appropriate license.

The following transactions, conducted in Austria on a commercial basis, require a license from the FMA:

- conducting banking transactions (Article 1 paragraph 1 of the Austrian Banking Act (Bankwesengesetz or BWG));
- providing payment services (Article 1 paragraph 2 of the Payment Services Act (Zahlungsdienstegesetz or ZaDiG));
- providing investment services (Article 3 paragraph 2 of the Securities Supervision Act 2018 (Wertpapieraufsichtsgesetz or WAG));
- operating a securities exchange (Article 3 paragraph 2 of the Stock Exchange Act (Börsegesetz or BörseG));
- managing an alternative investment fund in accordance with the Alternative Investment Funds Manager Act (Alternative Investmentfonds Manager-Gesetz or AIFMG));
- issuing electronic money in accordance with the Electronic Money Act (E-Geldgesetz or E-GeldG);
- establishing and operating a Pensionskasse (pension company) in accordance with the Pension Funds Act (Pensionskassengesetz or
PKG; and

- operating contractual insurance in accordance with the Insurance Supervision Act 2016 (Versicherungsaufsichtsgesetz 2016 or VAG 2016).

**Regulation of peer-to-peer lenders**

Until 2015, no legal framework consisting of special law provisions existed regulating the activity of peer-to-peer (P2P) platforms. The AltFG, which has been in force since 2015, governs the activity of platforms but only to the extent that projects are mediated via the platforms that are qualified as 'crowdinvesting'. It has to be taken into consideration that the Austrian market (compared to some other European jurisdictions) has been limited so far and will remain limited.

The legally permitted field of application of crowdfunding platforms in Austria is restricted as far as commercial lending by private parties is concerned. Commercial lending is only permitted with a banking license pursuant to section 1 paragraph 1 clause (e) of BWG. The amount of the loan granted does not play a role (eg multiple awards of EUR25 loans triggers the license obligation).

The FMA takes a hard line in preventing the unauthorized operation of banking business. For example, in 2009 the FMA prohibited an Austrian P2P platform named 'bankless life' from receiving deposits on the grounds that the club operating the platform was accepting illicit deposits since it did not possess a banking license.

P2P platforms on which private or mortgage loans are procured require either a license under BWG or they have to register at the competent trade authority for the brokerage of private or mortgage loans.

A simple registration under industrial trade law at the locally competent regional administrative authority is only sufficient if the platform works together with a licensed credit institution that possesses a license for deposit business, since in that case, loan funds of the investors are 'collected' on the accounts of the credit institution.

The fact that the brokerage of private or mortgage loans is also regulated by the Austrian Industrial Code (Gewerbeordnung or GewO), is however not an obstacle to the activity of P2P platforms in Austria. Notably, some German platforms have offered their services in Austria.

It has to be pointed out again that 'crowdlending' (ie in particular lending among private persons without intervention of a credit institution) is excluded from the scope of AltFG's application. The latter only covers so-called 'crowdinvesting' (ie the granting of financial capital in exchange for financial instruments and investments etc).

P2P lending does not currently present a real or potential threat to the traditional banking sector in Austria. That said, banks (naturally protective of their market share) have been seen to cooperate with P2P lending platforms.

**Regulation of payment services**

**The Payment Services Act**

ZaDiG came into force on 1 November 2009. ZaDiG heralded two significant innovations: the detailed legal framework for the provision of payment services as well as the introduction of the aforementioned payment services (businesses/license categories).

Before then, the provision of payment services, in particular transfers, credit card payment and payment using mobile phones was not fully regulated. Following ZaDiG, precise legal provisions now exist, primarily to protect consumers.

The tasks performed by payment institutions address a broad range of aspects concerning payment services. Each type of activity requires a separate license, which is granted by the respective supervisory authority. Payment services requiring a license are set out ZaDiG, and under Austrian law may be any of the following:

- deposit and withdrawal transactions;
- payment transactions (eg direct debit, payment card and credit transfer transactions);
- payment transactions involving the granting of credit;
- payment instrument transactions;
- money remittance transactions; and
- digitalized payment transactions.
In addition to payment institutions, the following are also permitted to provide payment services within their administrative jurisdiction:

- credit institutions;
- electronic money institutions;
- the Oesterreichische Nationalbank; and
- the Government of the Republic of Austria and the provinces.

In the case of credit institutions, the services they are allowed to provide depends on which banking transactions they are authorized to conduct. Unlike credit institutions, payment institutions are not permitted to conduct other services over and above those listed above. Other business, which requires a banking license, in particular the deposit-taking business, is not permitted to be conducted by payment institutions.

**Application of data protection and consumer laws**

Recent fraud-related scandals involving P2P and crowdfunding platforms have served as stark reminders of the risks of using FinTech when appropriate regulation and compliance processes are not in place. FinTech users are concerned about fraud, so for the FinTech sector to survive, it must be protected against fraudulent activity.

**CONSUMER PROTECTION OVERVIEW**

Consumers (in particular borrowers) are well protected in Austria by rules which are directly and indirectly enforced by the FMA. The FMA's consumer protection activities in 2016 generally focused on companies' compliance with their information and notification duties (both to the FMA and consumers) as well as complaint handling procedures. In 2016 virtual currencies and the reduction of foreign currency loans in the consumer sector were a special focus of the FMA.

Banks that infringe the administrative provisions of consumer protection laws face administrative fines imposed by the FMA and could be sued by consumers who incur damage as a result of such breaches.

Additionally consumers may also contact the ombudsman of the Joint Alternative Dispute Resolution Institution of the Austrian Credit Institution Sector, or (but only with respect to foreign currency loans) the Alternative Dispute Resolution Institution for Consumer Deals. Both bodies are responsible for out-of-court settlement of consumer disputes and competent bodies under Article 3 of the Alternative Dispute Resolution Act (which implements Directive 2013/11/EU of the European Parliament and of the Council of 21 May 2013 on alternative dispute resolution for consumer disputes and amending Regulation (EC) No. 2006/2004 and Directive 2009/22/EC). Generally alternative dispute resolution procedures require the consent of the defendant; they are not mandatory, meaning a bank may refuse to participate, which leaves the consumer with the option to file a claim.

Furthermore, consumers may approach the Consumer Association for Consumer Information (VKI), the most well-known, organized and powerful consumer association in Austria. The VKI is very active with respect to the supervision of general terms and conditions of banks and investment funds; it has fought and won many actions for consumers leading to a detailed and consumer-friendly Austrian Supreme Court practice in recent years.

Austria has implemented Directive 2014/49/EU of the European Parliament and of the Council of 16 April 2014 on deposit guarantee schemes through the Deposit Guarantee and Investor Protection Act (ESEAG), which has led to a reorganization of Austrian deposit guarantee schemes to comply with European law standards. Following a transposition period until the end of 2018 (until which time the system of deposit guarantee schemes will be regulated on the level of financial market sectors and on an institutional level), as of 1 January 2019, a single deposit guarantee and investor protection scheme shall be applicable for all depositors with credit institutions in Austria.

**DATA PROTECTION OVERVIEW**

The General Data Protection Regulation (GDPR) entered into force on 25 May 2018. All data processing must comply with this legal situation. While the GDPR is directly applicable in every EU Member State as an EU Regulation, it does contain numerous so-called ‘opening clauses’ allowing national leeway. In order to implement these opening clauses and margins, two amendments to the Data Protection Act (the “Data Protection Adaptation Act 2018” and the “Data Protection Deregulation Act 2018”) were passed in Austria (in addition to amendments to numerous material laws).

The possible sanctions under the GDPR can be up to EUR20 million or 4 % of annual turnover. According to the concept of the Austrian
administrative penal provisions (Verwaltungsstrafrecht), such sanctions would be imposed on the management of a company unless a responsible representative (Verantwortlichen Beauftragten) is appointed.

The concept of an association’s direct responsibility is rather uncommon under Austrian administrative law (implemented eg in paragraph 99d of the Banking Act). The Data Protection Act provides that GDPR fines can be imposed on legal entities if the underlying offence was caused by its management or responsible representative.

**Money laundering regulations**

Provisions relating to the prevention of money laundering and terrorist financing are set out in various legal acts in Austria. For financial market participants, the provisions contained in the following laws and regulations apply:

- the BWG;
- the VAG 2016;
- the ZaDiG;
- the WAG;
- the E-GeldG;
- the AIFMG; and
- the Regulation on Money Laundering and Terrorist Financing Risk 2016 (Geldwäscherei- und Terrorismusfinanzierungsrisiko-Verordnung 2016 or GTV 2016).

On 26 June 2015 the Fourth Directive on Money Laundering (Directive 2015/849) as well as the new Regulation (EU) 2015/847 on information accompanying transfers of funds (Regulation on the Transfer of Funds) entered into effect. This new anti-money laundering package by the European Union includes the adoption and implementation of the 40 recommendations amended in 2012 by the Financial Action Task Force (FATF). The aim of the Fourth Money Laundering Directive is to prevent the misuse of the European Union's financial system for the purposes of money laundering and terrorist financing, and thereby to protect the integrity and stability of the financial system.

The so-called “fifth money laundering directive” Directive (EU) 2018/843 has been in force since 30.5.2018. The changes to this policy should be read in conjunction with the Fourth Money Laundering Directive. It also provides for the first time a definition of the “virtual currency”.

In this context, the FMA monitors supervised entities’ compliance with the legal and due diligence obligations in relation to combatting money laundering and terrorist financing. In the event that these obligations are breached, the FMA takes the necessary steps, such as onsite inspections and supervisory inspection procedures.

*Last modified 6 Dec 2019*

**What type of funding arrangements and incentives are available to FinTech businesses?**

**General**

Austria has been recognized as one of the most interesting international startup hotspots. The startup community, and particularly the FinTech startup community, is growing day-by-day and a lively ecosystem has developed as a result.

One of the reasons for such development is that Austria's environment perfectly fits startups' needs. New services are available online, providing any kind of information that could be useful for startups.

**THE STARTUP PROGRAM BY THE AUSTRIAN FEDERAL GOVERNMENT**

The Austrian Federal Government launched a comprehensive startup program in 2016, covering a period of three years and entailing a
volume of about EUR185 million. It consists of a number of initiatives, including:

- the creation of a new legal entity, the medium-sized financing company (Mittelstandsfinanzierungsgesellschaft or MiFiG), aiming to stimulate investors into providing risk capital for small and medium-sized companies; and
- tax exemption for applying up to EUR15,000 in dividends for investors in a MiFiG.

MiFiGs were introduced on 1 January 2008. The following conditions must be met to qualify as an MiFiG:

- The MiFiG must be established in the form of a limited liability company (Gesellschaft mit beschränkter Haftung or GmbH) or a stock corporation (Aktiengesellschaft or AG) with a minimum share capital of EUR7.3 million.
- The purpose of the MiFiG is limited to investing money and it cannot carry out its own business.
- Only 50% of the MiFiG’s shares can be held by public bodies and organisations.
- The MiFiG must invest at least 70% of the funds in companies. The remaining 30% of the funds can be held as cash, bank deposits or in the form of bonds.

A MiFiG’s earnings derived from investments in companies (Finanzierungsbereich) are tax exempt, but its earnings derived from bank deposits and bonds (Veranlagungsbereich) are not. A MiFiG must comply with section 6b of the Corporate Income Tax Law (Körperschaftsteuergesetz or KStG) for at least seven years, or the tax exemptions are retroactively revoked. MiFiGs are also tax exempt from capital duty and stamp duties occurring in connection with establishment. However, the tax exemptions under the MiFiG regime only apply to investments made before 31 December 2012 and there are currently no tax exemptions or benefits comparable to the MiFiG regime. Investments made before 31 December 2012 continue to benefit from the exemption of corporate income tax, under certain circumstances, until the beginning of the first business year after 31 December 2018.

At the beginning of 2019 plans were made regarding a new startup package, but not yet implemented.

RESEARCH FUNDING IN AUSTRIA

Research funding in Austria is based on a diversified range of funding instruments, encompassing a research premium, tax advantages and direct funding granted by three institutions:

- Whoever carries out research in Austria pays lower taxes – this applies to all companies in Austria. Companies are entitled to claim a 12% research premium (from 2018 on even 14%) paid in cash on in-house research expenditures as well as contract research.
- The Austrian Research Promotion Agency (FFG) promotes research and development by companies along the entire innovation chain via research grants. Funding volume in 2018 was EUR685 million (including EUR123 million broadband infrastructure).
- The Austrian Science Fund (FWF) is the country's central body for the promotion of basic research. Approved funding volume in 2018 was EUR230,8 million.
- Austria Wirtschaftsservice GmbH (AWS) is the funding bank for corporate business development. Total funding in 2017 was EUR1,145.4 billion.
- The funding initiative COMET (Competence Centers for Excellent Technologies) promotes the cooperation between companies and scientific facilities within the context of a jointly defined but high-level research program. Up until now 49 competence centers on three different levels have been established. A total of EUR2,24 billion will be invested in the period 2006 to 2019.

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING
The crowdfunding sector is well established, and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

Some of the large banks in Austria have their own reward-based or donation-based crowdfunding platforms. Overall, the banking sector is becoming more and more interested in crowdfunding, as it can be seen as a valuable tool for risk minimization. In economically difficult times when banks may not be lending freely, equity-based crowdfunding may also be a viable alternative to raising capital for startups and small businesses, and especially if combining these investments with traditional financing instruments.

**Accelerators**

**AUSTRIANSTARTUPS**

AustrianStartups is a non-profit platform of, by and for the Austrian startup community to increase its visibility and strengthen the entrepreneurial ecosystem. It has created an event calendar for startups where it is possible to find most of the relevant upcoming startup events in Vienna and Austria. These events are the best places to implement networking strategies to find potential partners and talent for working with and creating value.

**SPEEDINVEST**

The most recognized Venture Capital fund in Austria is SpeedInvest; it specializes in FinTech, technology, media-centric and e-commerce segments from CEE countries. It works hands-on with founders and partners. Startups which have their product and team ready can receive up to EUR500,000 in seed-round funding.

**ELEVATOR LAB**

Elevator Lab is a leading FinTech accelerator built by Raiffeisen Bank International AG (RBI) to jointly develop scalable business cases. It offers access to 14 Central and Eastern Europe markets and a global network of clients, business partners, and investors.

**Venture capital and debt**

Venture capital (VC) funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. VC provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

In light of the changes to the tax exemptions granted to MiFiGs, limited partnerships (Kommanditgesellschaft) are likely to become increasingly popular for VC funds. These are normally structured as a limited partnership with a GmbH as its general partner and the investors as limited partner. The general partner is excluded from management, which is provided by a separate management company with limited partner status. The respective management company is likely to be another GmbH (or legal person) as a matter of law, because the Alternative Investment Funds Manager Act (Alternative Investmentfonds Manager-Gesetz or AIFMG) requires the alternative investment funds manager to be a legal person.

**Senior bank debt and capital markets funding**

**SENIOR BANK DEBT**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.
CAPITAL MARKETS FUNDING

FinTech companies in Austria may issue bonds or securities either under the Alternative Financing Act (Alternativfinanzierungsgesetz or AltFG) or the Capital Market Act (Kapitalmarktgesetz or KMG) regime to obtain funding.

Last modified 6 Dec 2019

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are as follows.

Transfer by way of assumption/acquisition of contract (Vertragsübernahme)

A loan transfer by way of assumption/acquisition of contract is a full legal transfer of the party's rights and obligations (subject to contractual restrictions such as required prior consent). It is a tripartite arrangement between the existing parties and the transferee and results in a fresh contract being formed between the continuing party and the transferee and the transferor being released from its obligations.

Assignment

An assignment is a transfer of rights only, not obligations. Subject to any contractual restrictions, assignment could be done without the consent of the debtor (however, it is advised to inform the debtor for purposes of effective payment).

Sub-participation

A sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the buyer taking on double credit risk, both on the seller as well as the borrower.

Loan transfers are commonly documented by using standard form contracts related to documents by the Loan Market Association (LMA) although Austrian templates deviate to some extent from the LMA standard documentation. For more complex transactions, a more bespoke form of sale and purchase agreement would tend to be used. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller's legal advisors. Some of the key considerations include:

- **license requirement** – under Austrian law a banking license pursuant to the Banking Act is required in order to purchase loan debt from another party;

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser, which is very limited and administered very strictly by the Austrian regulator (FMA) pursuant to Austrian Banking Secrecy Act (the purchaser would need to maintain the banking secrecy and basically requires the purchaser to be a credit institution or to obtain prior explicit consent from the debtor to waive the banking secrecy obligations);

- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

The ownership of energy and infrastructure assets in Austria can be divided into:

- economic infrastructure (energy, aviation, rail, telecommunications, water, roads and waste); and
- social infrastructure (education, health and justice/prisons).

Energy

Austria is one of the foremost producers of hydroelectric power in Europe. The most important power facilities are publicly owned; 50% of the shares of the large private producers are owned by provincial governments.

The Austrian upstream sector is dominated by two companies, OMV, a partly federal-state-owned company, responsible for approximately 15% of crude oil and natural gas liquids produced, and Rohöl Aufsuchungs AG (RAG), a privately owned company responsible for about 15% of crude oil and natural gas liquids production. OMV is the operator of Austria's only refinery in Schwechat. RAG focuses on drilling technology and large-scale gas storage, boasting 70% of the Austrian annual gas demand.

Currently, the Austrian Federal State, namely the Austrian Industry Holding AG has a stake of 31.5% in OMV.

The existing Austrian transit pipelines are (at least partly) owned and operated by GCA, a subsidiary of OMV (51%) and a consortium consisting of Allianz and Snam S.p.A. (49%).

Telecoms infrastructure

The Austrian mobile phone market is characterized by a high share of mobile broadband, paired with an average take-up of fixed broadband. The telecommunications networks (fixed and mobile) are privately owned by a number of service providers. Austria has a highly developed and efficient telephone network and a number of radio and television broadcast stations. There are three nationwide GSM networks which also support additional brands and mobile virtual network operators (MVNOs).

Transport infrastructure

LIGHT RAIL

Typically, light rail assets (such as trams, buses and metros) are owned by local public sector promoting bodies.

Wiener Linien runs the largest part of the public transit network in the city of Vienna.

HEAVY RAIL

The rail market in Austria is privatized, however, shares are held by both public and private entities.
Österreichische Bundesbahnen (ÖBB) is the national railway system of Austria and the administrator of Liechtenstein's railways. The ÖBB group is owned entirely by the Republic of Austria and is divided into several separate businesses that manage the infrastructure and operate passenger and freight services.

ROADS, BRIDGES AND TUNNELS

The Autobahnen- und Schnellstraßen-Finanzierungs-Aktiengesellschaft (ASFiNAG) is an Austrian publicly owned corporation which plans, finances, builds, maintains and collects tolls for Austrian roads, bridges and tunnels. The ASFiNAG and is fully owned by the Austrian Republic.

AVIATION

Aviation is for the most part privatized. The Vienna International is the country's biggest airport and serves as the hub for Austrian Airlines and a base for Eurowings and Niki. Austrian Airlines is the largest subsidiary of German Lufthansa. It is one of the few publicly traded airport operators in Europe and was privatized in 1992.

Other infrastructure

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS/PRISONS)

Typically, these are owned by the public sector with the private's sector's responsibility being for any or all of the design, build, financing, operation and maintenance of the infrastructure.

EDUCATION

The Republic of Austria has a free and public school system and nine years of education are mandatory. The federal Ministry of Education is responsible for funding and supervising primary and secondary education, and since 2000, tertiary education enjoys partial autonomy.

HEALTHCARE

Austria has a healthcare system in which virtually all individuals receive publicly funded care, but they also have the option to purchase supplementary private health insurance. Some individuals choose to pay for all of their care privately.

DEFENSE

The Austrian Armed Forces (German: Österreichisches Bundesheer) is the military of the Republic of Austria and is divided into Joint Forces which consist of Land Forces, Air Forces, International Missions and Special Forces.

WASTE

Vienna's municipal waste management system is the largest waste disposal company of Austria. The Federal Waste Management Act provides the legal framework for waste management and regulates all matters pertaining to waste as well as all issues requiring uniform federal provisions.

WATER

The largest operator of the entire water supply is the Municipal Department 31 of the municipality of Vienna, which is responsible for operation and maintenance.

Are there special rules for investing in energy and infrastructure?

Generally

Austria's energy policy rests on three pillars – security of supply, energy efficiency and renewable energy sources. In this regard it is important to mention the Außenwirtschaftsgesetz (Foreign Trade Act) which implements the requirements of EU law and creates a balance between sufficient control standards and a high degree of user friendliness. Its main regulatory areas consist of export control, control of
transport of defense equipment within the EU and control of the takeover of Austrian companies by persons or companies from third countries (outside EU, EEA, Switzerland).

Energy

Austria's energy legislation is fairly comprehensive, with one central act (Mineral Resource Act 1999) regulating oil and gas exploration and production as well as general mining activities at the federal state level. The administrative role is centralized, with the Ministry (for Sustainability and tourism) being responsible for the performance of a great deal of administrative duties in the upstream sector.

The Mineral Resource Act 1999 is applicable to the entire federal state. Austria has had to implement a number of directives that apply to the upstream energy sector. The Oil and Gas Directive, which aims to ensure non-discriminatory access to oil and gas exploration and production. Austria is also a part of the internal market for gas, having implemented the European Third Energy Package, which aims to liberalize the European natural gas market. In addition to the European Directives, the reporting provisions of the Regulation on Wholesale Energy Market Integrity and Transparency (REMIT) have a direct effect on Austrian gas market participants. Furthermore, Austria is a signatory to the Energy Charter Treaty, which aims to facilitate trade between the signatory states.

Austria has entered into several bilateral agreements on energy matters, the most notable being with the Russian Federation regarding the cooperation in the construction of the South Stream gas pipeline connection. In addition, Austria has entered into bilateral agreements with Czech Republic and Slovakia, regarding cooperation in oil and gas exploration.

Furthermore, the Austrian national regulatory authority, E-Control, was created in 2001 when the market was liberalized. In line with a key objective of the Third Package, E-Control's powers have been augmented with the 2010 E-Control Act, which consolidates all regulatory power under one entity.

Telecoms infrastructure

Austria has invested heavily in expanding its telecommunications infrastructure (Telekommunikationsgesetz 2003) compared to other EU member states. Companies in Austria can take advantage of state-of-the-art, high-capacity networks and systems. Rules for investing are stated in paragraph 25a of the Foreign Trade Act 2013. As far as EU or international law provisions do not preclude a licensing requirement, any process regarding telecommunications requires the authorization from the Federal Minister for Economic Affairs, Family and Youth.

Transport infrastructure

RAIL

Rail transport in Austria is mainly owned by the national rail company Österreichische Bundesbahnen (ÖBB).

ROADS

National highways in Austria are maintained by the Federal Agency of the Transport Ministry. In order for a private sector partner to carry out its duties on certain types of roads projects, the procuring public sector authority may delegate certain of its statutory duties to a private sector partner. Another possibility is to arrange public-private partnerships which are typically cooperative arrangements between one or more public and private sectors, typically of a long-term nature.

Other infrastructure

Demand is also rising in Austria for electric-powered vehicles, electric vehicle charging stations and charging points. The number of e-vehicles is expected to increase in the coming years. As of March 2017, there are Austrian premiums granted for the purchase of electric vehicles.

Last modified 6 Dec 2019

What is the applicable procurement process?

Austria's public procurement system is quite streamlined and efficient as a result of a simple and stable regulatory framework. Although public procurement is carried out at all different levels of government, an important share of purchases is centralized by the Federal Procurement Agency (BBG), which plays a central role in the efficiency and harmonization of public procurement procedures as well as in
Investing in energy and infrastructure

For the state (Bund) and public bodies on the central government level, the Federal Public Procurement Law 2018 (Bundesvergabegesetz 2018 – BVergG 2018) implements Directives 2004/17/EC and 2004/18/EC (aspects on content) as well as Directives 89/665/EEC and 92/13/EEC (review proceedings).

First, the BVergG 2018 provides for the legal framework for the award of public works, supply and service contracts as well as works and service concessions and contests (the 'classic regime'). Second, it contains regulations coordinating the public procurement procedures of entities operating in the water, energy, transport and postal services sector (the 'sector regime'). Under both regimes, it covers public tenders above and below the thresholds of Regulation (EC) 2083/2005. Third, the BVergG 2018 comprises procedural provisions relating to the review of the award of public contracts.

- **'Open procedures’** are those procedures in which any economic operator may submit a tender.

- **'Restricted procedures with publication of a contract notice (classic regime)/with calling for a competition (sector regime)'** are those procedures in which any economic operator may request to participate and whereby only those economic operators invited by the contracting authority may submit a tender.

- **'Negotiated procedures with publication of a contract notice/with calling for a competition’** are those procedures in which any economic operator may request to participate and whereby only those economic operators invited by the contracting authority may submit a tender and whereby the contracting authority negotiates the terms of contract with those tenderers.

- **'Negotiated procedures without publication of a contract notice/without calling for a competition’** are those procedures whereby the contracting authority invites certain candidates to submit an offer and then negotiates the terms of contract with the selected tenderers.

- **'Dynamic purchasing systems’** are completely electronic processes for making commonly used purchases, the characteristics of which, as generally available to the market, meet the requirements of the contracting authority.

- A **'competitive dialogue’** is a procedure in which any economic operator may request to participate and whereby the contracting authority conducts a dialogue with the candidates admitted to that procedure, with the aim of developing one or more suitable alternatives capable of meeting its requirements and on the basis of which the candidates chosen are invited to submit a bid.

- **'Design contests’** are those procedures which enable contracting authorities to acquire, mainly in the fields of town and country planning, architecture and engineering, advertisement or date processing, a plan or design selected by a jury after being put out to competition with or without the award of prizes. Such contests can be either open, restricted or invited contests.

- **'Realization contests’** are contests which lead to a negotiated procedure to award a public service contract after carrying out a design contest.

- Innovation Partnership can be chosen if there is a need for an innovative product, construction or service. This procedure is only applicable, if the demand cannot be met by acquiring goods or services already available on the market.

Financing energy and infrastructure

Fundamentally, the BVergG 2018 covers all types of contracts whether their estimated value is above or below the EU thresholds. Thresholds are set for different tender procedures, with more formalized and transparent procedures applying where the estimated value of the public contract exceeds a threshold of currently EUR100,000 excluding VAT.

Last modified 6 Dec 2019

**What are the most common forms of funding / investing in energy and infrastructure?**

**Funding**

Common forms of funding in energy and infrastructure include:

- loans made on a corporate finance basis;
loans made on a project-finance basis on medium- to long-term bases;

- bond finance;
- mezzanine debt (in some sectors);
- refinancing of the debt in operational projects; and
- asset financing.

The Green Electricity Act 2012 expanded the number of facilities producing green electricity. As a result, funding volume doubled to about EUR50 million, granted by the Austrian government and approved by the European Commission. This offensive is designed to boost the share of electricity consumption generated by renewables to 85% by the year 2020.

Investing

Common forms of investing in energy and infrastructure include:

- 'equity' investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans; and
- secondary market investment in operational projects.

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

If the Financial Market Authority considers that an authorized firm or regulated individual may have breached its ongoing compliance requirements under applicable regulations, it will launch a formal investigation. This may result in regulatory sanctions.

What regulatory penalties may apply?

Consequences of conducting regulated activities (eg a banking business) when not authorized include:

- Financial Market Authority may impose a financial penalty; and
- loss of business-related remunerations, commissions earned and interest.

What criminal penalties may apply?

Following a formal investigation, the regulators and Austrian courts have powers to impose criminal penalties in certain cases, including:

- insider dealing and misleading statements and practices;
- disclosure of facts covered by a bank's duty of confidentiality in order to receive a financial benefit;
- breaches of the Money Laundering Regulations; and
- conducting regulated activities when not authorized.
Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

ADVANCE OF A LOAN

The advance of a loan is not subject to stamp, registration, transfer or other similar taxes.

TRANSFER OR ASSIGNMENT OF A DEBT UNDER A LOAN

A written agreement for the assignment of a debt is subject to stamp duty in the amount of 0.8% of the consideration for the assignment. However, exemptions may apply.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

A written mortgage agreement is subject to stamp duty in the amount of 1% of the debt for which the mortgage is granted. In addition, accessory guarantees are subject to stamp duty in the amount of 1% of the debt for which the guarantee is granted. However, if the mortgage or accessory guarantee is granted in respect of a loan, these securities are exempt from stamp duty.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

ISSUE OF A DEBT SECURITY

The issue of a debt security is not subject to stamp, registration, transfer or other similar taxes.

TRANSFER OR ASSIGNMENT OF A DEBT SECURITY

The transfer or assignment of a debt security may be subject to stamp duty in the amount of 0.8% of the consideration for the assignment.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

No.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

In general, interest payments under a loan are subject to withholding tax. However, if the loan is a between two individuals, the interest payments are not subject to withholding tax.
If so:
What is the rate of withholding?

The withholding tax rate is 27.5%.

What are the key exemptions?

If the loan is between two individuals, the interest payments are not subject to withholding tax.

An exemption is available under the EU Interest and Royalties Directive as implemented in Austria.

An exemption may also be available (in whole or in part) under an Austrian double tax treaty where applicable.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes, interest payments on debt securities are also subject to withholding tax as described above.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding tax (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

Both Belgian and EU law contain restrictions on offering and selling debt securities.

Unless certain exclusions or exemptions apply, the public offer of debt securities in Belgium and the admission of such securities to trading on a Belgian regulated market requires the publication of a prospectus in compliance with the Prospectus Regulation/Prospectus Law.

A prospectus shall, in particular, not be required for public offers of securities or other investment instruments that are either:

- For a total consideration of less than, or equal to, EUR5,000,000.

- For a total consideration of more than EUR5,000,000 and less than, or equal to, EUR8,000,000,000 which will be admitted to trading on Euronext Growth Brussels or Euronext Access Brussels.

However, any prospectus drawn up in respect of investment instruments (other than securities) will not benefit from the EEA passporting regime.

The Prospectus Law also requires issuers to prepare an "information note" in the following circumstances (in each case, subject to certain exemptions):

- An offer to the public of securities or other investment instruments for a total consideration of less than EUR5,000,000.

- An offer to the public of securities or other investment instruments for a total consideration of less than EUR8,000,000,000 to the extent these instruments will be listed on Euronext Growth Brussels or Euronext Access Brussels.

- An admission to trading of securities or other investment instruments on Euronext Growth Brussels or Euronext Access Brussels.

This obligation does not apply to the following offers (the so called ‘safe harbor provisions’):

- an offer for a total consideration of less than, or equal to, € 5,000,000;

- an offer for a total consideration of more than € 5,000,000 and less than, or equal to, € 8,000,000,000 which will be admitted to trading on Euronext Growth Brussels or Euronext Access Brussels.

What are common issuing methods and types of debt securities?
The most common types of debt securities issued in Belgium are bonds or notes issued on a standalone basis or under a program. Many different types of debt securities are offered in Belgium. Some common forms include:

- Debt securities characterized by the type of interest or payment such as fixed rate securities, floating rate securities, variable rate securities, and high yield bonds;
- Guaranteed securities, subordinated securities, perpetual debt securities (i.e., debt securities that have no specified redemption date);
- Asset backed securities;
- Derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rate, currency rate or index, and credit linked notes;
- Equity linked securities such as convertible bonds (debt securities convertible into the equity of the issuer);
- Depositary receipts (a security issued by a depositary conferring on the holders beneficial ownership of certain underlying assets held by the depositary for the holders); and
- Warrants (securities giving the holders the option to purchase the equity of the issuer or a related company).

What are the differences between offering debt securities to institutional / professional or other investors?

If the debt securities are offered solely to professional investors and no admission to trading on a regulated market of the debt securities is sought, no prospectus would be required, in line with the Prospectus Regulation/Law.

The issuer prepares an offering circular with certain information on the issuer and the securities offered, without FSMA approval.

The Belgian Prospectus Law however requires issuers in certain circumstances to prepare and publish a short-form information note which complies with the minimum information requirement set out in the Prospectus Law.

An offer to the public (retail issue) of debt securities is made under a placement agreement entered into before the offering period starts. In principle, a prospectus must be prepared, and it must be approved by the FSMA.

When is it necessary to prepare a prospectus?

Offers to professional investors require issuers in certain circumstances to prepare and publish a short-form information note which complies with the minimum information requirement set out in the Prospectus Law. A prospectus must be prepared in case of admission to trading on a regulated market.

An offer to the public of debt securities requires in principle a prospectus.

What are the main exchanges available?

Euronext Brussels is a regulated market for the purposes of the Markets in Financial Instruments Directive, so issuers are subject to the requirements of a number of EU Directives, including the Market Abuse Directive and the Transparency Directive.

Euronext Growth is the main multilateral trading facility (MTF) in Belgium.

Is there a private placement market?
Belgium has a private placement market.

There is no dominant standard for documentation but the standard private placement documentation developed by the Loan Market Association and International Capital Markets Association are often used.

Last modified 18 Dec 2019

**Are there any notable risks or issues around issuing or investing in debt securities?**

**Issuing debt securities**

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil and criminal liability under Belgian law. Belgium provides investor protection through legal and regulatory provisions relevant to liability for an inaccurate offering memorandum.

There are also general fraud laws and regulations and liability may also arise through a civil action for deceit, negligent misstatement or misrepresentation.

**Investing in debt securities**

Debt security terms and conditions typically provide for meetings of investors to consider matters affecting the investors interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

Last modified 18 Dec 2019

**Establishing and investing in debt / hedge funds**

**Are there any restrictions on establishing a fund?**

The AIFM Law provides a regulatory framework for alternative investment fund managers (AIFM) governed by either Belgian law or the laws of an EEA or non-EEA member state that are managing alternative investment funds (AIF) governed by Belgian law or marketing EEA or non-EEA AIFs in Belgium.

The Alternative Investment Fund Managers Directive (AIFMD) only applies to the (external or internal) AIFMs but it provides each member state with the option to also regulate on a national level the AIFs established in such member state. The Belgian legislator opted to keep the existing legislation with respect to public and specific non-public AIFs (including their managers) and to restate this legislation (with certain modifications) into the AIFM Law. The AIFM Law's scope is therefore broader than the AIFMD.

In line with the AIFMD, certain types of funds are excluded from the AIFM Law's scope of application. These include Undertakings for Collective Investment in Transferable Securities (UCITS), holding companies, institutions for occupational retirement provision and securitization special purpose entities.

The AIFM Law lays down a broad set of rules regarding, among other things, authorization, operating conditions (for example, rules on remuneration, conflicts of interest, risk management, liquidity management, valuation, delegation and acting as a depositary), transparency requirements for AIFMs (annual report, disclosure to investors, and reporting obligation to competent authorities) and special obligations for AIFMs managing specific types of AIFs, such as leveraged AIFs or AIFs which acquire control of non-listed companies and issuers (notification, disclosure, annual report, asset stripping). Furthermore, the AIFM Law contains a passport mechanism for management and/or marketing for EEA AIFMs managing or marketing EEA AIFs. The AIFM Law provides for a 'light regime' whereby certain smaller AIFMs (e.g., Belgian private equity fund managers) will not have to comply with the requirements under the AIFM Law unless they choose to opt in.

The UCITS Law provides a regulatory framework and introduces a simplified notification procedure for UCITS that wish to market their units in member states other than those in which they are established.
The UCITS Law provides certain obligations that must be taken into account, such as the publication of a prospectus and the prior approval of advertising materials and a key investor information document by the Financial Services and Markets Authority (Autorité des services et marchés financier/Autoriteit voor Financiële Diensten en Markten) (FSMA). The public offering of a UCITS also triggers an obligation to register the UCITS with the FSMA.

Last modified 18 Dec 2019

**What are common fund structures?**

They can (irrespective of legal form) take a closed ended or open ended form, so there may be four basic forms (either UCITS or AIFs):

- contractual funds with variable capital;
- contractual funds with fixed capital;
- companies with variable capital (SICAVs); and
- companies with fixed capital (SICAFs).

Last modified 18 Dec 2019

**What are the differences between offering fund securities to professional / institutional or other investors?**

EU based alternative investment fund managers (AIFMs) authorized under the AIFM Law will be granted a passport to either manage alternative investment funds (AIFs) in other EU member states or to market the units or shares of AIFs in other EU member states to professional investors. In order to exercise such activities in other EU member states, the EU based AIFM is required to notify the supervisory authority of the relevant member state.

The passport regime will not apply to the marketing of AIF units or shares to retail investors, as the Alternative Investment Fund Managers Directive (AIFMD) permits the member states to impose stricter requirements for marketing to such investors. As is the case in most EU member states, Belgium has elected to make use of this option, and the AIFM Law imposes more stringent conditions for AIFMs marketing units or shares in AIFs to retail investors.

For the purposes of the AIFMD, the term 'professional investors' is defined as any investor that is considered as, or may be treated as, a professional client under the Markets in Financial Instruments Directive (MiFiD). Professional clients include, among other things, credit institutions, investment firms and collective investment schemes, as well as 'opted up' retail clients.

The UCITS Law contains rules applicable to Belgian Undertakings for Collective Investment in Transferable Securities (UCITS) and foreign UCITS complying with the conditions of the Undertakings for Collective Investment in Transferable Securities Directive, whose shares are offered to the public in Belgium.

The UCITS Law is not applicable to foreign UCITS whose shares are offered within the context of a private placement. In derogation from the UCITS Directive, the UCITS Law further distinguishes between Belgian UCITS whose shares are offered within the framework of a public offering and Belgian UCITS whose shares are offered within the framework of a private placement. There is no public offer if the shares are exclusively offered to professional investors.

Publicly offered UCITS are subject to a list of additional requirements, such as a registration with the FSMA. Moreover, all communications, advertisements and other documents that are related to a public offering of the shares in a UCITS must be pre-approved by the FSMA and must be complete, accurate and consistent with the prospectus.

Last modified 18 Dec 2019

**Are there any other notable risks or issues around establishing and investing in funds?**

N/A

Last modified 18 Dec 2019
Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

The marketing of funds is generally covered under the Undertakings for Collective Investment in Transferable Securities (UCITS) or under the Alternative Investment Funds Managers Directive (AIFMD) regime.

UCITS, including those established in Belgium, have an EU passport which enables fund promoters to create a single product for marketing in all EU member states and on the completion of the appropriate notification procedure, a UCITS established in one member state can be sold in any other.

A UCITS intending to market in another member state must complete and submit to its home regulator a notification including certain specified information, including copies of key investor information documents. The home regulator then completes a notification file which is sent in a regulator to regulator transmission, following which the UCITS can be sold in the other member state.

Under AIFMD, marketing is defined as a direct or indirect offering or placement at the initiative of AIFM or on behalf of the AIFM of units or shares in an AIF it manages to or with investors domiciled or with a registered office in the EU.

An AIFM may only market an AIF to EU investors if it is authorized by a relevant EU regulator – registration with one EU regulator opens access, subject to certain further limited conditions, to marketing to professional investors across the EU under a EU passport or if it complies with national private placement regimes (where available).

As the AIFMD’s passport regime for the marketing of non-EU AIFs by EU AIFMs and the marketing of AIFs by non-EU AIFMs, is not yet available, Articles 36 and 42 of the AIFMD allow the member states to permit such marketing if certain conditions are met. The Belgian legislator has decided to implement Articles 36 and 42 of the AIFMD. The private placement regime is therefore still available in case a passport is not yet available.

In accordance with Article 68 of the AIFMD, these grandfathering rules and the private placement regime in Belgium will be abolished on a date to be determined by the European Commission. It is expected that this abolition will not take place before the end of 2018.

In addition to these two laws, a number of other regulations have impacted the way that funds can be distributed in Belgium. These include the:

- Belgian moratorium on the marketing of particularly complex products to non-professional clients (which prohibits or limits the marketing of certain funds by distributors that have acceded to the moratorium);
- Royal Decree of 25 April 2014 on certain information requirements when marketing financial products to non-professional clients (which adopts a ‘transversal’ approach towards financial products); and
- Royal Decree of 24 April 2014 approving the regulation of the FSMA on the ban on the distribution of certain financial products to retail clients.

Are there any restrictions on managing a fund?

Alternative Investment Fund Managers (AIFM)/Undertakings for Collective Investment in Transferable Securities (UCITS) management companies are subject to prior authorization to be granted by the competent authorities of the management company’s home member state. Authorization granted to a management company shall be valid for all member states. A management company that does not benefit from an exemption pursuant to the AIFM/UCITS Law will need to obtain authorization from its home regulator (the Financial Services and Markets Authority (Autorité des services et marchés financiers/Autoriteit voor Financiële Diensten en Markten) (FSMA) in Belgium) in order to manage AIFs/UCITS. As part of the application procedure, the management company will need to provide certain information to the regulator.

Before granting an authorization to a management company, the FSMA may be required to consult with other member state regulators (for example, if the management company in question is associated with an entity regulated in another member state, such as an investment firm, a credit institution or an insurance undertaking).
Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

Unless an exemption or exclusion applies, a person entering into a derivatives contract by way of business in Belgium (such as investment firms) will in principle have to be authorized.

The distribution of certain financial derivatives among Belgian retail clients is restricted as from 18 August 2016. Certain derivatives such as binary options or contracts for difference (CFDs) with leverage, may not be distributed, and certain distribution practices are also prohibited. The Regulation drawn up by the Financial Services and Markets Authority (Autorité des services et marchés financiers/Autoriteit voor Financiële Diensten en Markten) (FSMA) on this matter was approved by Royal Decree of 21 July 2016 that approves the FSMA’s Regulation on the distribution of over-the-counter (OTC) derivatives (Regulation). The Regulation applies to derivative contracts distributed to consumers in Belgium, usually from abroad, via electronic trading platforms.

The Regulation consists of two elements which apply cumulatively:

- The first element is a ban on distribution of a few specific types of derivative contracts to consumers via electronic trading platforms. These are binary options, derivative contracts with a maturity of less than 1 hour, derivative contracts with leverage, such as CFDs and rolling spot forex contracts. The Regulation applies to unlisted or OTC derivatives. It does not apply to derivatives that are admitted to trading on a regulated market or on a multilateral trading facility. The Regulation supplements the distribution ban that was already in force for certain products, such as life settlements (traded life policies) and financial products with a virtual currency as their underlying.
- The second element is a ban on a number of aggressive or inappropriate distribution techniques (cold calling via external call centers, inappropriate forms of remuneration, fictitious gifts or bonuses etc) used when distributing OTC derivatives to consumers.

In addition, the European Market Infrastructure Regulation (EMIR) imposes obligations on EU derivatives market participants. EMIR applies to financial counterparties (banks, investment firms, insurance companies, registered funds (UCITS), pension funds and private funds) and non financial counterparties (any other undertaking established in the EU) that enter into derivatives, whether they do so for trading purposes, to hedge themselves against interest rate or foreign exchange risk or to gain exposure to certain assets as part of their investment strategy.

Certain EMIR obligations (clearing and risk mitigation) may also affect non EU entities in two sets of circumstances: EMIR can apply directly to those companies or indirectly impact them when they enter into derivatives with EU participants.

EMIR does not impose any new authorization or registration requirements for parties to derivatives contracts. EU dealers in OTC derivatives are already required to be authorized as investment firms under MiFID, unless an exemption applies.

EMIR imposes three main obligations on market participants:

- **Clearing** – Certain OTC derivatives entered into between certain market participants will have to be cleared via a central counterparty (CCP).
- **Reporting** – All derivatives (OTC and exchange traded, including derivatives entered into since, or that were outstanding on, 16 August 2012) will have to be reported to a trade repository.
- **Risk mitigation techniques** – OTC derivatives entered into between certain market participants and which are not cleared via a CCP are subject to risk mitigation obligations.

EU non financial counterparties that have 'systemically important' positions in 'non hedging' derivatives (whether at entity or group level) on any given day also have a notification obligation to their national competent authority and the European Securities and Markets Authority (ESMA).

Last modified 18 Dec 2019

What are common types of derivatives?
The definition of ‘derivative’ is not set out in full in the European Market Infrastructure Regulation (EMIR) but cross refers to a sub set of financial instruments listed in the Markets in Financial Instruments Directive (MiFID).

Broadly speaking, a ‘derivative’ includes any option, future, swap, forward and other derivative contract relating to securities, currencies, interest rates, financial indices, commodities, financial contract for differences and credit default swap. This definition is, however, limited to bilateral derivative contracts, such as exchange traded derivatives (ETDs) and over-the-counter (OTC) contracts and does not, as a rule, include derivatives embedded in other contracts, such as securities or loans.

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007 to 2008, derivatives, and particularly over the counter derivatives, have attracted significant regulatory attention. The European Commission has sought in particular, to:

- enhance transparency by requiring the provision of comprehensive information on over the counter derivative positions;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen, and continues to see, the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Lending is a regulated activity in relation to mortgage credit and consumer credit (Book VII of the Code of Economic Law).

Assuming none of the available exemptions apply, mortgage and consumer credit providers need to be authorized by the FSMA to conduct such business.

Mortgage and consumer loans are subject to a range of regulatory requirements that do not apply to unregulated loans. For example, for regulated mortgage and consumer contracts, specific obligations apply with respect to:

- conduct of business rules;
- provision of information;
- knowledge of the client/borrower; and
- assessment of the creditworthiness of the client/borrower.

There are no additional restrictions that apply to foreign lenders making loans to Belgian borrowers.

Providing financing to a company (excluding providing consumer credit and mortgage credit to individuals for residential purposes) (“commercial lending”) on a stand-alone basis does not require a licence nor any filing and/or registration.

However, specific rules of conduct apply for lending to SMEs, pursuant to the Act of 21 December 2013 on the Financing of SMEs. These rules of conduct include a duty of rigour, a duty of information, restrictions on a number of contractual terms, and a right of prepayment.
for the enterprise. SMEs are individuals or legal entities pursuing an economic purpose in a sustainable manner or liberal professions (eg, lawyers, notaries, etc) that have no more than one of the following criteria in their last and penultimate closed financial year: (i) 50 employees on an annual basis; (ii) annual turnover of EUR9 million; and (iii) a total balance sheet of EUR4.5 million.

Commercial lending sometimes activity requires a licence – ie, if it is undertaken in combination with deposit taking (which requires a licence as a credit institution) or if it is funded with crowdfunding (which may require a licence as a crowdfunding platform).

**Borrowing**

While borrowers are generally not regulated, it is advisable for borrowers to consider whether either the mortgage or consumer lending regimes apply to their activities, in which case they will benefit from the protections mentioned above.

_Last modified 18 Dec 2019_

**What are common lending structures?**

Lending in Belgium can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents which fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, equity bridge facilities, project facilities or letter of credit facilities.

**Loan durations**

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short term basis to solve short term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

**Loan security**

A loan can either be secured, unsecured or guaranteed. For more information, see _Giving and taking guarantees and security._

**Loan repayment**

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

_Last modified 18 Dec 2019_

**What are the differences between lending to institutional / professional or other borrowers?**

There are no differences except for mortgage credit and consumer credit, which are regulated activities.
Do the laws recognize the principles of agency and trusts?

The principle of agency is recognized as a matter of Belgian law. It is possible to appoint an agent, who would act in the name and for the account of a single regulated undertaking (as opposed to a broker).

It also explicitly recognises the concept of a collateral agent/security agent, but only in relation to security taken over financial collateral and movable assets. This allows for the creation of security over such assets for the benefit of the agent (acting as representative of the secured parties), provided that the secured parties are determinable on the basis of the security agreement.

However, Belgian law does not recognise the concept of a security agent with respect to security over real estate. Therefore, when a mortgage is being granted to a security agent on behalf of a consortium of lenders, or in a situation where there is only one lender but the intention is to subsequently syndicate the facilities, a parallel debt structure can be considered. Although Belgian law does not recognise the concept of parallel debt as such, the use thereof has been common practice, and the concept and validity thereof has been supported by Belgian legal authors.

Belgian law does not recognize the principle of trusts. Belgian Courts would, however, recognize foreign trusts validly incorporated to the extent that they are not manifestly incompatible with Belgian mandatory laws.

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual principles. For example, Belgian courts may decide not to enforce a penalty or may decide to reduce the agreed amount. Lenders hence have to be careful about the rate of default interest charged on a loan.

Specific types of lending

Specific to the area of mortgage lending is the issue of whether a lender falls within the new Belgian mortgage regime. The Mortgage Credit Directive, implemented in Belgium through the law of 22 April 2016 amending the provisions on consumer credit and mortgage credit in the Code of Economic Law, aims to prevent the irresponsible lending and borrowing practices that were exposed during the global financial crisis. The Law imposes a number of requirements on lenders including the need to:

- assess the creditworthiness of the consumer;
- provide the consumer with the personalized information needed to compare the credits available on the market; and
- ensure that the relevant staff of creditors, credit intermediaries and appointed representatives possess an adequate level of knowledge and competence, in order to achieve a high level of professionalism.

Consumer credit is regulated in the Code of Economic Law. The Consumer Credit Directive (2008/48/EC) was implemented in Belgian law by the Act of 13 June 2010 and amended by the law of 22 April 2016 amending the provisions on consumer credit and mortgage credit in the Code of Economic Law. The Law also imposes a number of requirements on credit providers.

Are there any other notable risks or issues around borrowing?

Borrowers should be aware of the potential implications of the EU’s Bank Recovery and Resolution Directive (BRRD), which outlines certain measures for dealing with failing financial institutions.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.
Article 55 of the BRRD gives authorities the power to 'bail in' obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. ‘Bail in’ describes a variety of write-down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of Belgian or other EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

Furthermore, when a borrower, security provider or guarantor becomes insolvent, the related claims and security rights of lenders might lose value, because the lenders need to compete with other privileged creditors or the collateral is insufficient to cover the total debt. In addition, enforcement might be delayed or no longer possible.

In the case of bankruptcy, any payments or security granted to lenders might also become subject to claw-back actions, upon the opening of insolvency proceedings.

Certain transactions may be declared ineffective vis-à-vis third parties if they are concluded or performed by the debtor during the hardening period (a period of up to a maximum of six months prior to the date of the bankruptcy judgment). There is an exhaustive list of automatic and non-discretionary claw-back events, as follows:

- gifts and undervalued contracts;
- payments made for amounts that are not due at the date of payment;
- new security granted for existing debt; and
- all other payments made to creditors.

These can be challenged by the bankruptcy receiver if the creditor that accepted payment was aware of the financial distress of the company at the time of the event.

In addition, at the request of the bankruptcy receiver, the court can declare other transactions that have been entered into or performed during the hardening period ineffective, provided the counterparty was aware of the fact that the debtor was virtually bankrupt and the court determines that this declaration would benefit the bankruptcy estate (ie, the challenged transaction was detrimental to the rights of the creditors).

Moreover, “fraudulent transactions” (ie, abnormal transactions that are detrimental to the rights of the creditors and where there is fraud on the part of both the debtor and the other party) can be declared ineffective, regardless of whether they occurred during or before the hardening period.

If the lender acts as a credit institution, it has an obligation to inquire about its client's ability to repay his debt, and must evaluate the validity of the securities granted to him. If the institution does not comply with that provision, it may be ordered to reimburse the sums resulting from the call on the guarantee or the enforcement of the securities.

Last modified 18 Dec 2019

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

The main issues involved in a company granting any downstream, upstream or cross-stream guarantee/security in respect of any obligation of a company belonging to the same group concern the existence of a valid and direct corporate benefit for that subsidiary. Under Belgian law there is no legal concept of group interest and only showing that the security would be in the interest of the group is not sufficient.

The granting of an intra-group guarantee/security must also fall within the corporate purpose of that company. The corporate purpose of a Belgian company is set out in its articles of association and Belgian companies can only act within the boundaries of this corporate purpose.

In the context of a target being acquired, the target is restricted from granting guarantees or security (financial assistance) for the acquisition of its own shares. However, this can be permitted following the adoption of a particular procedure. Given the cumbersome nature of such procedure, it is not common that companies choose to comply with the procedure and they will usually structure a
transaction avoiding financial assistance.

Other conditions and/or restrictions depend on the type of guarantees/security.

All security interests under Belgian law can be created by means of a private agreement, except mortgages and mortgage mandates that must be created by means of a notarial deed and, in case of a mortgage, registered at the competent mortgage registry.

**General validity requirements that are applicable to all agreements**

- Consent of the parties
- Capacity of the parties
- Determination of the object of the security taking (a determined or determinable asset)
- Legitimate cause (the cause of the agreement must not be prohibited by law or contrary to morals and public order)
- In the case that security is granted by an individual – restrictions on security granted without consideration and limitations resulting from the marital status (which may require spousal consent)
- In the case that security is granted by a legal entity – authorization by the competent bodies, conformity with corporate interest, no violation of specific restrictions (eg financial assistance rules or prohibition on ‘misuse’ of corporate assets

**Specific validity requirements**

- **Mortgages** – formal notarial deed, secures a specific amount, must accurately define the mortgaged real estate
- **Register pledge** – all moveable assets, tangible and intangible, in whole or in part, can be pledged by private agreement (a register pledge will be valid between the parties to it from the date it is concluded but, in order to be valid and enforceable against third parties, the pledge should be registered in the yet to be established National Pledge Register)
- **Pledge over receivables** – effected by private agreement (under Belgian law, a pledge over receivables is valid between parties and enforceable against third parties (other than the debtor of the receivables) as from the date of its conclusion; in order to be valid and enforceable against the debtors of the receivables the debtors must be notified of the pledge)
- **Pledge over bank account** – an acknowledgement by the bank holding the pledged accounts is required in order to protect the pledgee against risks arising out of rights afforded to the bank pursuant to its standard account terms and conditions or otherwise
- **Pledge over shares** – articles of association must be reviewed, may contain restrictions to the granting of a pledge over shares; pledge needs to be registered in the shareholders register of the company

_Last modified 18 Dec 2019_

**What are common types of guarantees and security?**

The most common forms of guarantees and security are:

- security interest *in rem*:
  - pledge over tangible assets
  - pledge over receivables, bank accounts, securities or business);
  - title transfer as security interest;
  - mortgage over real estate;
  - mortgage mandate (however, the mortgage mandate does not provide for an actual security right on the assets but only gives the right to establish a mortgage at a later point in time);
  - security interest over ships and planes; and
- personal security interest – a third party (such as a guarantor) will secure the claim of the creditor on the debtor, by committing its estate or by granting one of the security interests listed above.
Are there any other notable risks or issues around giving and taking guarantees and security?

All sums security interests

A security interest on conditional or future debts is valid under Belgian law as long as the future debt is sufficiently determined or determinable which is the case if the agreement creating the security interest allows to define and identify the debt, and it results from the elements of the cause that the (future) debt was part of what the parties intended to secure.

Mortgages

Mortgage requires registration of the mortgage with the appropriate local mortgage register for it to be effective vis-à-vis third parties.

Other

Other security interests may require specific perfection requirements.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Relevant EU legislation

BANKING SUPERVISION

Directive 2013/36/EU of the European Parliament and of the Council of 26 June 2013 on access to the activity of credit institutions and the prudential supervision of credit institutions and investment firms

FINANCIAL MARKETS AND INVESTMENT SERVICES

The Markets in Financial Instruments Directive (Directive 2014/65/EU; "MiFID II")

Commission Delegated Directive (EU) 2017/593 of 7 April 2016 supplementing Directive 2014/65/EU of the European Parliament and of the Council with regard to safeguarding of financial instruments and funds belonging to clients, product governance obligations and the rules applicable to the provision or reception of fees, commissions or any monetary or non-monetary benefits; and Regulation on markets in financial instruments (Regulation n° 600/2014; "MiFIR")

Regulation (EU) 2017/1129 of the European Parliament and of the Council of 14 June 2017 on the prospectus to be published when securities are offered to the public or admitted to trading on a regulated market, and repealing Directive 2003/71/EC

INSURANCES

REGULATED CREDIT AND CONSUMER PROTECTION

OTHER KEY LEGISLATIONS

The Law of 18 September 2017 on the prevention of money laundering and terrorist financing and on the restriction of the use of cash.

Last modified 18 Dec 2019

Regulatory authorization

Who are the regulators?

Supervision is organized according to the ‘Twin Peaks’ model, with two autonomous supervisors, namely the National Bank of Belgium (Banque Nationale de Belgique/Nationale Bank van België) (NBB) and the Financial Services and Markets Authority (Autorité des services et
marchés financiers/Autoriteit voor Financiële Diensten en Markten) (FSMA), each of which has a specific set of objectives.

The NBB performs macro prudential supervision of ‘system relevant’ financial institutions and is also responsible for the individual prudential supervision (including compliance with anti-money laundering legislation) of financial institutions authorized to hold funds on behalf of their clients.

The FSMA is the supervisor with respect to financial markets, investment products and the rules of conduct that apply to financial institutions. It is also responsible for contributing to the financial education of savers and investors.

Beside the national authorities, the European Central Bank (ECB) is the competent authority in Belgium for carrying out its micro-prudential tasks within the single supervisory mechanism (SSM) under Regulation (EU) No 1024/2013 in respect of Belgian credit institutions and (mixed) financial holding companies that are classified as significant. The ECB is also the competent authority to authorize these institutions and to withdraw their authorizations subject to the relevant provisions laid down in Regulation No 1024/2013.

**What are the authorization requirements and process?**

A financial institution is required to obtain an authorization before commencing any regulated activities, unless certain exclusions or exemptions apply. Depending on the type of firm, a firm must apply to the National Bank of Belgium (Banque Nationale de Belgique/Nationale Bank van België), European Central Bank or the Financial Services and Markets Authority (Autorité des services et marchés financier/Autoriteit voor Financiële Diensten en Markten) for authorization.

- Credit institutions/stockbroking firms: NBB
- Insurance and reinsurance undertakings: NBB
- Payment institutions and electronic money institutions: NBB
- Settlement and clearing institutions: NBB
- Consumer/mortgage credit’ lenders: FSMA
- Portfolio management and investment advice companies: FSMA
- Intermediaries in banking and investment services: FSMA
- Platform of crowdfunding: FSMA
- Management companies of UCIT/AIF: FSMA
- Independent financial planner: FSMA

The authorization requirements and process depend on the institution concerned.

The competent authority must assess whether the application meets the required threshold conditions. Generally, in order to obtain an authorization, the institution needs to submit an application file which includes among other information:

- a program of operations;
- a business plan including a forecast budget calculation which demonstrates that the applicant is able to employ the appropriate and proportionate systems, resources and procedures to operate soundly;
- a description of the applicant’s governance arrangements and internal control mechanisms;
- a description of the applicant’s structural organization;
- the identity of persons holding in the applicant, directly or indirectly, qualifying holdings;
- the applicant’s legal status and articles of association; and
- the address of the applicant’s head office.

The applicant can only obtain a license if it is financially sound and meets the minimum initial capital and own funds requirements. These
What are the main ongoing compliance requirements?

Financial institutions must at all times comply with the authorization requirements. Threshold conditions (such as having adequate financial resources and structural and compliance arrangements in place) are an ongoing compliance requirement for authorized firms.

Failure to comply with the threshold conditions and with the applicable laws and regulations can result in sanctions for the institutions concerned and can even lead to the revocation of the authorization.

Investment firms, management companies of undertakings for collective investment, undertakings for collective investment which have not designated a management company, credit institutions and insurance companies governed by Belgian law and the branches of such institutions established in Belgium governed by the laws of third countries, shall appoint compliance officers of good repute and with the requisite knowledge and experience with a view to ensuring compliance with the rules referred to in the laws.

What are the penalties for failure to be authorized?

Failure to be authorized may result in payment penalties, administrative or criminal sanctions.

Regulated activities

What finance and investment activities require authorization?

A person must not perform any regulated activities in Belgium unless authorized or exempt.

The following businesses would usually be deemed to be carrying on regulated activities and require authorization under Belgian law:

- credit institutions;
- investment firms: stockbroking firms, portfolio management or investment advice companies;
- insurance or reinsurance undertakings;
- payment institutions and electronic money institutions;
- settlement institutions and institutions equivalent to settlement institutions;
- consumer credit providers;
- intermediaries in banking and investment services;
- intermediaries in consumer credit and mortgage credit;
- intermediaries in insurance and reinsurance;
- Undertakings for Collective Investment in Transferable Securities (UCITS) and their management company; and
- Alternative Investment Funds (AIFs) and their management company.

Are there any possible exemptions?

For each type of regulated activity there are a number of specific exemptions that could also apply, such as the provision of investment
services on an ancillary basis.

Last modified 18 Dec 2019

**Do any exchange controls or other restrictions on payments apply?**

Belgian law does not impose specific restrictions on exchange controls, except in exceptional situations (e.g., as with UN sanctions). Article 63 Treaty on the Functioning of the European Union (TFEU) expressly prohibits restrictions between EU member states and between member states and third countries.

Therefore, there are no exchange control rules for foreign investors and no restrictions on the repatriation of profits either. However, withholding tax (roerende voorheffing/précompte mobilier) may apply under certain circumstances.

Belgian residents which fall within one of the following categories should inform the National Bank of Belgium (Banque Nationale de Belgique/Nationale Bank van Belgie) (NBB) of their professional foreign transactions:

- the 1,050 biggest companies;
- coordination centers; or
- the financial sector.

In addition, Belgian residents outside those categories should provide the NBB (if requested to do so) with information with respect to their transactions with countries abroad.

There are also anti money laundering, cash control and tax considerations to take into account.

Last modified 18 Dec 2019

**What are the rules around financial promotions?**

Financial promotions are not generally defined in Belgian law.

A financial promotion refers to a communication of an invitation or inducement to engage in investment activity made by a person in the course of business. Since such communications can influence consumers, a person is restricted from communicating such promotions unless they are an authorized person, or the content of the communication has been approved by a competent authority, or the promotion falls within one of the exemptions.

**Rules**

Different laws and regulations regulate financial promotions, such as the Belgian Code of Economic Law, the Law of 2 August 2002, the Prospectus Law, the UCITS Law, the AIF Law, the Royal Decree of 25 April 2014 on certain information requirements in relation to marketing of financial products with non-professional clients and circular letters from the Financial Services and Markets Authority (Autorité des services et marchés financier/Autoriteit voor Financiële Diensten en Markten) in this respect.

Below an overview of the rules governing the distribution of financial instruments in force in Belgium:

- Belgian prospectus law

Under the Belgian prospectus law, marketing is defined very broadly as the presentation of a financial product, in any manner, to encourage the client or potential client to buy or subscribe the relevant financial product (article 11).

Pursuant to article 60 of the Belgian prospectus law, ex ante/a priori supervision by the FSMA of advertising is required for investments instruments offered to the public that are subject to the requirement of a prospectus.

The advertising or marketing materials shall observe the following principles:

- they shall state that a prospectus has been or will be published and indicate where investors are or will be able to obtain it;
- they shall be clearly recognizable as such.
• the information contained in advertising or marketing materials shall not be inaccurate, or misleading. This information shall also be consistent with the information contained in the prospectus;

• Marketing Royal Decree

The Royal Decree of 25 April 2014 regarding certain information obligations for the marketing of financial products to retail clients (the "Marketing Royal Decree") also provides rules on marketing documents for financial products marketed to retail clients in Belgium.

The rules apply to the retail marketing of any financial product in Belgium. Accordingly, foreign entities conducting activities in Belgium on a cross-border basis (or through a branch) also fall under the rules. It should be noted that they only apply to marketing addressed to MiFID retail clients.

Marketing is again defined very broadly as the presentation of a financial product, in any manner, to encourage the client or potential client to buy, subscribe, adhere, accept, sign or open the relevant financial product. This covers both public offers and private placements. The new regime creates an obligation regarding the content and presentation of marketing documents.

The Marketing Royal Decree sets forth a series of rules on the content and presentation of marketing materials including general principles such as fair and not misleading content, minimum criteria with regard to the content of marketing materials, the presentation of future and past performance information, disclosures on award and rating and comparisons between financial products.

All marketing materials must be approved beforehand by the FSMA.

• Book VI of the Code of Economic Law

Book VI of the Code of Economic Law on "Market practices and consumer protection" sets forth general rules applicable to advertising. Book VI regulates abusive advertising, misleading advertising and comparative advertising.

• Ban on the marketing of certain financial products

In Belgium, the marketing of certain financial products to retail clients in Belgium is banned by a Royal Decree of 24 April 2014 that applies to financial products that are based on so-called non-mainstream or non-standard assets.

The Regulation bans the marketing of several classes of products:

• financial products that depend on a life settlement, in other words, traded life assurance policies;

• products that consist essentially of derivatives based on virtual currencies such as Bitcoin.

• notes and class 23 insurance contracts where the return depends on an alternative investment fund that invests in non-standard assets and to class 23 insurance contracts whose return depends on an internal fund invested in such non-standard assets (such as commodities, artworks, and consumer products like wine or whisky).

Depending on the financial product concerned, non-authorized financial promotions can be sanctioned by criminal, administrative and civil penalties.

Exemptions

Exemptions include certain promotions when certain safe harbor conditions are met, such as the offer of investment instruments to qualified investors.

Last modified 18 Dec 2019

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally
The most common types of legal entities are limited companies, which are body corporates with separate legal personality and limit the liability of their members.

Limited companies can either be private (private limited liability company, société à responsabilité limitée/besloten vennootschap) or public (public limited company, société anonyme/naamloze vennootschap), depending on whether their shares are offered to the public.

Usually, regulated entities are incorporated as public limited companies which is the legal entity favored by large enterprises.

Funds

Investment funds mostly take the form of public limited companies, partnerships limited by shares or contractual schemes.

Fund managers should be public limited companies.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

To the extent that it concerns activities subject to mutual recognition, European Economic Area (EEA) credit institutions and other financial institutions authorized to offer such activities in their home member state, can start these activities in Belgium, either under the freedom to provide services or via the establishment of a branch.

Non EEA entities need to be authorized to conduct regulated lending or investment business through a branch or establishment.

Foreign companies carrying on a trade in Belgium through a 'permanent establishment' or 'Belgian establishment' will be subject to Belgian corporation tax.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

Peer-to-peer lending as such is forbidden by law in Belgium. On one hand, the Prospectus Law prevent individuals to raise funds publicly, even through an intermediary platform. This means that a borrower candidate cannot invite other people publicly to lend him money. On the other hand, one needs to be a regulated lender to grant loans and to get access to the Central Individual Credit Register.

Crowdfunding is regulated by the Law of 18 December 2016, which introduced a bespoke crowdfunding regime for platforms in Belgium. This regime applies only to crowdfunding entailing a financial return for investors. This specific form of crowdfunding can itself be broken down into two types: debt-based and equity-based crowdfunding.

Blockchain, smart contracts and cryptocurrencies

What is Blockchain?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm
functions called 'hashes'.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the block using sophisticated algorithms and add the verified block to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. The process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as Bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more complex interactions with the outside world using so called ‘Oracles’. With Oracles the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?
ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

**Artificial intelligence and robo advisory systems**

Automated financial advice tools, also known as 'robo advisors,' are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms, which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

**Data analysis and cloud computing**

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

*Last modified 18 Dec 2019*

**Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?**
Regulation of payments services

Businesses that aim to provide payment services require prior authorization from the NBB under the Law of Law of 11 March 2018 transposing the Second European Union Payment Services Directive (PSD II). In order to become authorized, payment service providers need to meet certain criteria, including in relation to the business plan, initial capital, processes and procedures in place for safeguarding relevant funds, sensitive payment data and money laundering and other financial crime controls.

Application of data protection and consumer laws

The European General Data Protection Regulation (GDPR) entered into force with direct effect on 25 May 2018. The GDPR offers citizens a wider control around the use of their personal data.

Money laundering regulations

The Law of 18 September 2017 on the prevention of money laundering and terrorist financing and on the restriction of the use of cash implements the Fourth Anti Money Laundering Directive (4AMLD). Suspicious transactions have to be reported to the Belgian Financial Intelligence Processing Unit. As mentioned above, the Belgian Minister of Justice intends to bring virtual currency exchanges into the scope of the Belgian Anti-Money Laundering Act in the future.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals, (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING

The crowdfunding sector is well established, and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform (the so-called 'alternative financing platforms'). The FSMA website currently shows 6 registered alternative financing platforms.

There are three main types of crowdfunding: equity-based, debt-based and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Debt-based crowdfunding (also known as crowdlending): funders lend money to a company and look for interest payments as well as the full repayment of the principal.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

ACCELERATORS

There are various incubators or accelerators in the Belgian market, which offer support and facilities for startups. Several competitions are being organized by financial market players in order to attract ideas, which may in turn be rewarded with initial financing.

Banks are equally keen to keep an eye on promising projects in the Belgian market. ING Belgium in 2017 offered a full FinTech incubator experience to startups in search of professional guidance and early stage advisory. The ING FinTech Village was a four-month scheme to
which startups or scale-ups could apply in order to develop FinTech applications, while being provided with appropriate accommodation, support and advice offered by board level professionals from across the financial sector.

**Venture capital and debt**

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund, a Belgian example of which is the FinTech platform B-Hive. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor. In Belgium, FPIM (Federal Holding and Investment Company), a government investment body, made considerable contributions to B-Hive's fundraising, thus stressing the state's intentions to stimulate the sector's early development. More government capital funding initiatives are expected to be launched in the near future.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), secured against a company's assets and including an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

**Warehouse and platform funding**

Warehouse financing may be suitable for (typically larger scale) FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

Another internationally available alternative form of funding is by way of peer-to-peer (P2P) lending platforms, which bring individual borrowers and lenders together without the involvement of traditional banks. P2P lending does not involve equity investments, and instead, interest is paid on the money borrowed. However, as mentioned above, this type of lending is currently not available in the Belgian market, given the hostile regulatory environment.

**Senior bank debt and capital markets funding**

**SENIOR BANK DEBT**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis, depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**CAPITAL MARKETS FUNDING**

Belgium has both debt and equity capital markets which are accessible to businesses (usually of a certain size). The Belgian capital market, however, is not readily available to companies in startup or scale-up stages. In recent years, IPOs and especially securitizations have been scarce. There is a tendency for successful Belgian startups to move abroad in their early stages.

**CONVERTIBLE BONDS/LOAN NOTES**

Another funding tool for fast-growing FinTech businesses, is to issue convertible bonds or loan notes which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

**Incentives and reliefs**

Under Belgian law, a tax shelter is available for investors in startup companies including FinTech initiatives. Depending on the size of the company receiving funding, the Belgian taxpayer-investor is entitled to a 30% or 45% tax reduction. Companies are therefore being divided into micro-enterprises and SMEs, with the number of employees being one of the decisive factors (less than 10 for the former and less than 50 for the latter).
Private equity funds are more open to companies envisaging a steep growth trajectory. Both private and public debt is available in every region of Belgium. Often government subsidies can be obtained for innovative initiatives with a solid business prospect.

In early 2017 a new FinTech focused investment fund was set up to provide funding to FinTech initiatives in the Belgian market. Such funds often benefit from government contributions. More similar initiatives have been announced for the near future.

**Portfolio sales**

**Loan transfers and portfolio sales**

*What are common ways of buying and selling loans?*

Buying and selling loans is not very common.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are:

- **Novation** – A novation is a full legal transfer of the party's rights and obligations. It is a tripartite arrangement between the existing parties and the transferee and results in a fresh contract being formed between the continuing party and the transferee and the transferor being released from its obligations.

- **Cession** – A cession is a full legal transfer of the party's rights. It is an arrangement whereby the existing lender transfers his rights to a transferee. The latter thus takes over the rights under the existing contract which is to be continued.

- **Sub-participation** – The original lender will remain the only creditor of the borrower, and the only beneficiary of the security package. Based on the sub-participation agreement, the sub-participant has a contractual right to amounts received by the principal lender, but no direct in rem right against the borrower, nor over the security assets.

- **Belgian law LMA standard documentation** – In case of large syndicated loans, it is market practice to use the LMA standard contracts, with the necessary amendments so that it can be governed by Belgian law. For the transfer of rights created thereby the transfer mechanisms provided in this documentation can be used.

Loan transfers are commonly documented using standard form contracts made available by the Loan Market Association. For more complex transactions, a more bespoke form of sale and purchase agreement would tend to be used. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

*What are the main considerations when transferring a loan and related security?*

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller's legal advisors. Key considerations include the following.

**Notification**

A transfer via cession is valid and enforceable against third parties following the agreement between the lender and the transferee. However, the borrower needs to be notified or has to acknowledge the cession.

**Transfer security interest - novation**

In case of a transfer by way of novation, all security rights relating to the initial debt are extinguished, unless explicitly preserved. A clause containing this preservation can be included in the original facility agreement.
Transfer security interest – cession

In principle, all security rights that have been put in place in connection with the transferred debt are automatically transferred. However, for each transfer of (part of) a loan secured by a mortgage, a marginal note (kantmelding/inscription marginale) in the Mortgage Registry must be made, which will involve the payment of a 1% registration tax (calculated against the secured amount) unless the transfer is made between certain categories of lenders (such as an EEA-licensed credit institution or mobilisation institutions).

Confidentiality

Consider whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser.

Data protection

Consider whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser.

Lender eligibility

Consider whether there are any restrictions around the type of entity to which the loan can be transferred.

Undrawn commitments

Consider whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee.

Transfer mechanics

Consider whether there are any steps that need to be taken to transfer the loan in accordance with its terms.

Consent

Consider whether a transfer requires the consent or notification of any other parties.

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

The ownership of energy and infrastructure assets in Belgium varies according to the asset class. The main asset classes are usually considered to be:

- economic infrastructure (energy, aviation, rail, telecommunications, water, roads and waste); and
- social infrastructure (education, health and justice/prisons, housing).

Key sectors are considered below.

The gas and electricity industries in Belgium are privatized, with generation, transmission, distribution and supply services provided by a number of private sector companies. The relevant private sector companies own the generation, transmission and distribution assets. Notably two listed public companies (albeit heavily regulated) play major roles:

Last modified 18 Dec 2019
Elia, the transmission network manager, owns all of the electricity transmission lines. Fluxys, the transport network manager, owns all of the gas transmission lines. Transmission and transport networks are thus owned by these two companies.

For the distribution of energy however, Belgium relies on distribution network managers, each of whom owns its respective distribution network. Most of these distribution network managers leave the exploitation of their networks to be handled by one of the three recognized working companies (Fluvius and ORES).

The private sector finances and delivers most of the required infrastructure but there are a number of government policy mechanisms (adopted through legislation) which are used to incentivize investment in eligible energy generation technologies. In certain instances, including on major energy infrastructure, projects may be procured by the public sector and depending on the terms of the procurement, the asset may either be publicly or privately owned.

The pricing and tariffs of transmission and transport network managers are monitored by the the Commission de Régulation de l’Électricité et du Gaz/Commissie voor de Regulering van de Elektriciteit en het Gas (CREG). This federal agency equally controls the technical functioning of these networks.

Telecoms infrastructure

The telecommunications networks (fixed and mobile) in Belgium are privately owned by three service providers: BASE, Orange and Proximus. However, Proximus (responsible for most of Belgium’s broadband infrastructure) may be distinguished from BASE and Orange, because (unlike BASE and Orange) its majority shareholder is the Belgian government.

The Institut belge des services postaux et des télécommunications (IBPT)/Belgisch Instituut voor Postdiensten en Telecommunicatie (BIPT) is the regulator of Belgium’s telecommunications sector. It also has responsibility for radio and television broadcast services and postal or wireless communications services.

Transport infrastructure

HEAVY RAIL

The rail market in Belgium is semi privatized but its composition (which is complex) involves both ‘autonomous public’ and private entities. The principal elements to the rail sector in Belgium are as follows.

The main player in Belgian railway infrastructure is the Société nationale des chemins de fer (SNCB)/Nationale Maatschappij van Belgische Spoorwegen (NMBS). This is a 100% state owned company which is set up to operate independently from governmental instructions, as an ‘autonomous governmental company’. Therefore, it is led by an autonomous board, to resemble a private sector participant.

Infrabel, another autonomous governmental company, manages the Belgian railway infrastructure. The SNCB/NMBS is Infrabel’s most important customer. It is equally responsible for the maintenance, renovation or renewal and development of the Belgian railway network.

All railway operators in Belgium need an Infrabel license to use their infrastructure. At the end of 2019 Infrabel has granted access to 15 railway companies involved in transport of passengers or goods.

LIGHT RAIL

Tram networks in Belgium are owned by regionally owned public transportation companies:

- De Lijn (in Flanders);
- MIVB (in Brussels); and
- TEC (in Wallonia).

Since their revenues are consistently too low to cover their operating costs, the respective regional governments annually provide subsidies in respect of these deficits.

PROJECT FINANCE
In most construction deals the project will be procured through a project finance model.

An example of a recent railway PPP is the Antigoon tunnel, the construction of which was completed in 2014. This has been built through a Design Build Finance Maintain (DBFM) construction by a private consortium receiving public financing from Infrabel and the Flemish government. The remainder of funds were provided by the European Investment Bank and a small syndicate of credit institutions. After the 38 year maintenance period the ownership will be transferred to Infrabel.

Since 2010 it has become common practice for tramway or bus construction projects as well to be conducted as PPPs.

The rail sector is regulated by the Regulatory Body for Railway Transport and for Brussels Airport Operations. Its objectives and responsibilities are to supervise the market, to guard the interests of the users and the general public and to advise participants on certain sector related topics.

ROADS, BRIDGES AND TUNNELS

In Belgium the regional authorities (through their main agencies AWV and DG1) are responsible for constructing and maintaining roads, bridges and tunnels.

Regional government entities are in charge of operating, maintaining and improving the major highways and all secondary roads in Belgium. Some local roads are the responsibility of local authorities or municipalities. The public sector may outsource the construction, operation and maintenance (sometimes on a project financed basis) of such assets to the private sector. Belgium has no privately owned or exploited toll roads.

AVIATION

Aviation in Belgium is mostly privatized, although government financing remains substantial. As regards airport infrastructure, there are a number of ownership structures in the Belgian market, including private ownership, local government ownership and public private ownership. Belgium’s main airports are Ostend, Antwerp, Brussels (Zaventem), Charleroi and Liège.

PORTS

The Belgian ports sector comprises a number of companies and regional ports, all operating on commercial principles, all to a certain extent benefiting from public subsidy.

Belgium's largest port is the Port of Antwerp, which is operated by the Antwerps Havenbedrijf, a public state owned company. Other large and heavily industrialized ports include Zeebrugge, Ostend, Ghent, Brussels and Liège.

Other infrastructure

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS/PRISONS)

Typically, these are owned by the public sector, with private sector operators responsible for aspects such as the design, build, financing, operation and maintenance of the infrastructure. The majority of social infrastructure assets in Belgium are directly financed by the government. Subject to value for money considerations, private finance may also be used in the procurement of social infrastructure assets. In relation to some of these specific sectors:

Education

The ownership of a school's infrastructure depends upon which category of school it belongs to. For example, in the case of a local authority maintained school, the school and playing fields will be owned by the local authority. The program for new schools currently being implemented is called Scholen voor Morgen. This is a large scale DBFM based infrastructure program of the Flemish government in order to improve educational infrastructure region wide based on private sector financing.

Hospitals

Ownership of hospitals is vested in various public sector bodies. The Belgian regions have competency in respect of the provision of healthcare services in their respective jurisdictions, so the majority of hospitals in Belgium operate under their supervision. However, most hospital funding is provided at a federal level, with additional regional government subsidies, often complemented by private financial sector loans. In general, hospitals equally contribute to the repayment of such loans through their own funds.
Social housing

This is a diverse sector involving many different organizations and individuals including housing developers, building contractors, mortgage lenders, local authorities, housing associations, landlords, owner occupiers, private renters and those in the social rented sector. Typically, on a social housing project, government led social care institutions own and exploit the relevant housing stock. Where similar projects are run by private sector participants, their activities tend to be constrained by public sector regulation.

Defense

Typically, defense assets are owned by the public sector.

Waste

Waste collection is typically coordinated and provided at a public sector level, whereas waste processing is handled primarily by private sector players. Waste processing facilities developed and operated by private sector entities typically serve both public sector and private sector customers and various waste processing initiatives such as car wreck, waste oil and waste medication reclamation can be subsidized with either federal or regional government budgets, depending on the intergovernmental competences.

Water

In Belgium drinking water, industrial water and wastewater services are provided by state-owned companies. These are regionally organized but can also have a subdivision at local levels. All are typically funded through public means.

Are there special rules for investing in energy and infrastructure?

Generally

There is no specific regime governing or restricting investment in energy or infrastructure projects in Belgium over and above existing regulation for investors and funders more generally but a particular proposed investment may be subject to legislative or regulatory control (e.g., merger control rules). As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory position relevant to that project must be considered. For example, a project involving development on land will require planning permission or a development consent order; and a project may require environmental authorizations/permits and/or sector specific regulatory consents or licenses. If a public body (e.g., a government department, a local authority or an autonomous government company) is procuring a project using private finance, and the public body is to benefit from central government funding towards the cost, the project will be subject to central government approval. Key sector specific issues are flagged in the sections below.

Whether an investor can invest will depend on the terms of the procurement of that project if it is a public sector project and, in respect of an existing/operational project, that will depend on whether there are any contractual restrictions on “Change of Control.” This is less of a concern on private sector infrastructure although investors would need to consider whether any licenses/consents/permits would be affected by their acquisition of an interest.

Energy

The energy markets in Belgium have a complex system of arrangements between suppliers, generators, transmission and distribution network managers which are heavily regulated. In particular, there are complex arrangements in respect of licensing, subsidies and demand/charging mechanisms with suppliers, customer and the layered energy operator system. These are subject to change/regular updates meaning that investors will need to have a good understanding of the current framework and the potential directions in which the market may move. Both market participants and investors regularly point out the lack of stable regulatory framework which hampers large-scale investments in the Belgian energy market. In particular, uncertainty surrounding the longevity of nuclear plants and fiscal regulations continues. Mild political instability has proven to be an additional cost in this equation.

Telecoms infrastructure

Given the dispersed nature of this sector, various pieces of legislation need to be read jointly to get a sufficient understanding of the
applicable regulations. The interplay of competences is not to be underestimated, since the main legislation is to be found at both regional and national levels, in decrees and laws combined. Different permits/licenses may need to be obtained for the performance of various activities in the separate regions.

The industry is largely privatized, therefore investors should consider if any permits/consents/licenses will be affected by their interest.

**Transport infrastructure**

**RAIL**

There is an extensive and complex regulatory framework to consider in respect of a practical and operational involvement in this sector. Key areas include understanding the regulatory regime for certification for train use and acceptance. As stated above, every service provider needs an Infrabel license in order to operate on the Belgian tracks.

The difficulty of investing in an existing rail project depends upon the nature of the investment and the specific type of entity or asset the investor wishes to invest in/acquire.

**ROADS**

A procuring public sector authority (a federal, regional or local authority) may delegate certain of its statutory duties in respect of certain types of road projects to private sector partners. In assuming these duties, private sector partners will, therefore, need to understand those duties and whether they are able to subcontract those duties to an appropriate person. There is usually a restriction on the change of control of the private sector partner during the construction period. Following the construction period, the private sector may be allowed a change of control provided that they do not fall within a definition of an 'Unsuitable Third Party' (which may include concerns about national security or tax avoidance). The precise scope of the restrictions will depend on the contractual terms.

**What is the applicable procurement process?**

Public procurement in Belgium is, for the time being, in most instances governed by the Law, which is based on EU Directives. There are some sector specific regulations such as the Royal Decree of 10 January 1996 on the public procurement of commissions of works, deliveries and services in the sectors of water, energy, transport and postal services.

The key principles are that contracts procured by the public sector are awarded fairly, transparently and without discrimination on the grounds of nationality and that all potential bidders are treated equally.

**Investing in energy and infrastructure**

Public procurement is relevant where one of the Belgian governments (whether national or regional), or a branch of them, is seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset. The relevant procurement legislation applies to certain public bodies including central government departments, local authorities, police and fire authorities, various non governmental bodies and autonomous governmental companies. A regulated procurement is required where certain financial thresholds are met and on most major infrastructure projects (where limited exclusions do not apply), it is likely that those thresholds will be met, so a regulated procurement would need to take place.

In most cases, the public sector will need to publish a contract notice in the Official Journal of the European Union (OJEU) and typically run one of the following procedures:

- **Open procedure** – This is suitable for easy to evaluate projects and tenderers simply submit a tender in response to the OJEU notice. Change and negotiations to the tender are not permitted. This is the most common procedure for relatively small-scale projects.

- **Restricted procedure** – There is a shortlisting of at least five tenderers following an expression-of-interest stage and tenderers submit a bid. Again, no negotiation is permitted other than clarification and finalization of the contract terms.

- **Competitive dialogue** – This is often the most common procedure for complex infrastructure projects and involves a shortlisting of at least three bidders who are invited to dialogue with the public sector to develop detailed solutions which are capable of being accepted by the public sector. Clarification and further negotiations are allowed following final tender but only on the basis of
confirming the financial and other commitments in a tenderer’s bid.

- **Competitive procedure with negotiation** – This is sometimes described as a hybrid procedure as it allows dialogue with bidders but also allows the public sector to award a contract on the basis of an initial tender (or further stages) but clarification and negotiation is not allowed following final tender.

An investor may choose, however, to seek to invest in a project (by acquiring an interest in a private sector partner) that has already been procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the original awarded contract rather than procurement regulations themselves.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement related considerations that need to be borne in mind.

### Financing energy and infrastructure

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector.

*Last modified 18 Dec 2019*

## What are the most common forms of funding / investing in energy and infrastructure?

The principal forms of private sector funding/investment in energy and infrastructure in Belgium (including in relation to public private partnerships) are:

### Funding

Common forms of funding in energy and infrastructure include:

- loans made on a corporate finance basis (balance sheet debt);
- loans made on a project finance basis (to a special purpose project company) on medium to long term bases – such loans may later be syndicated to other funders.
- mezzanine debt (in some sectors);
- refinancing of the debt in operational projects; and
- asset financing.

Most commonly a small syndicate of national and/or international banks, and since recently, institutionalized investors (eg insurance companies), will be gathered to finance larger scale projects.

Funding is also, sometimes, provided by the European Investment Bank and export credit agencies.

### Investing

Common forms of investing in energy and infrastructure include:

- ‘equity’ investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of ‘equity’).

*Last modified 18 Dec 2019*

### Restructuring
Enforcement and sanctions

When can there be regulatory investigations?

When the Financial Services and Markets Authority (Autorité des services et marchés financier/Autoriteit voor Financiële Diensten en Markten) (FSMA) or the National Bank of Belgium (Banque Nationale de Belgique/Nationale Bank van Belgie) (NBB) considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. This may result in administrative sanctions.

Last modified 18 Dec 2019

What regulatory penalties may apply?

When a legal or regulation provision is breached, the Financial Services and Markets Authority (Autorité des services et marchés financier/Autoriteit voor Financiële Diensten en Markten) (FSMA) or the National Bank of Belgium (Banque Nationale de Belgique/Nationale Bank van Belgie) (NBB) may impose a financial penalty or withdraw the entity’s authorization. The regulator will publicize these penalties.

Last modified 18 Dec 2019

What criminal penalties may apply?

Following formal investigation, the regulators have powers to impose criminal penalties in certain cases, including:

- insider dealing and misleading statements and practices;
- breaches under the Money Laundering Regulations; and
- engaging in regulated activities without proper authorization.

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

ADVANCE OF A LOAN

No stamp, registration, transfer or other similar taxes are payable on the advance of a loan.

The granting of a loan attracts a notional documentary tax of €0.15 per original document executed in Belgium if the loan is granted by a bank or by a (natural or legal) person who usually holds money on deposit.

TRANSFER OR ASSIGNMENT OF A DEBT UNDER A LOAN

No stamp, registration, transfer or other similar taxes are payable on the transfer or assignment of a debt under a loan. Additional taxes may, however, apply depending on whether security was taken or not.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?
TAKING OF A MORTGAGE, DEBENTURE OR OTHER SECURITY

Documents evidencing a mortgage over Belgian real estate attract (apart from notional documentary taxes) a 1% registration duty and a mortgage duty of approximately 0.3%.

Depending on the value of the secured debt, a retribution of €20 – €500 is due upon the registration or renewal of a pledge. Such retribution will also be due in case the pledge is modified (€12 - €300) or in case the pledge deregistered.

TRANSFER OR ASSIGNMENT OF MORTGAGE, DEBENTURE OR OTHER SECURITY

The transfer of a mortgage is subject to a 1% or 0.5% registration duty if the mortgage or the pledge concerns Belgian real estate. The transfer of a pledge is subject to a retribution of €10.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

ISSUE OF A DEBT SECURITY

No stamp, registration, transfer or other similar taxes are payable on the issue of a debt security.

TRANSFER OF DEBT SECURITY

The transfer or assignment of a debt security will give rise to a 0.12% tax if it is performed with the intervention of a professional intermediary established inside or outside of Belgium. This tax is capped at €1,300.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

Secured lenders and secured debt security holders take priority over the tax authorities on enforcement of security.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Yes, Belgium levies withholding tax on interest payments under a loan.

If so:

What is the rate of withholding?

The current rate of Belgian withholding tax (ie the basic rate) is 30%.

What are the key exemptions?

Belgian domestic law provides for numerous withholding tax exemptions regarding interest payments. The following exemptions may be considered as key exemptions:

- the exemption for interest payments made between Belgian companies;
- the exemption for interest paid by Belgian resident professional investors to credit institutions established in the European Economic Area or in a country with which Belgium has concluded a double tax treaty; and
- reliance on the EU Interest and Royalties Directive as implemented by Belgian law.
A withholding tax exemption may also be obtained, in whole or in part, by virtue of double tax treaties concluded by Belgium.

**Would the same analysis apply to interest payments under a debt security (e.g., a bond)?**

Yes, the analysis described above is applicable to both interest payments under a loan or other form of debt security.

There are also withholding tax exemptions that specifically apply to interest payments under a debt security. For example, there is an exemption for interest paid by the issuer of Belgian registered bonds to 'non-resident savers' and interest paid on registered non-capitalization bonds and on securities cleared through the X/N clearing system (managed by the National Bank of Belgium).

**Are foreign lenders and debt security holders subject to tax on interest payments?**

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g., by virtue of incorporation, residence or local branch)?

No.

**Would the same analysis apply to interest payments under a debt security (e.g., a bond)?**

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under Brazilian law, in general, and Brazilian Securities Commission (CVM) regulation, specifically.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Brazil or to request that they are admitted to trading on a regulated market operating in Brazil unless:

- an approved prospectus has been made available to the public; and
- the offer is registered with CVM.

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Brazil are shares and debentures. Shares may be voting (ordinárias) or non-voting (preferenciais). Debentures may be unsecured, secured, benefiting from a floating charge or subordinated. They may also be convertible into shares.

Many different types of debt securities are offered in Brazil. Some common forms include:

- commercial papers and promissory notes, which are short term securities;
- credit bank notes (céduas de crédito bancário), which represent loans from banks and may be secured or unsecured;
- quotas of investment funds;
- derivative instruments such as securities linked to the value of one or more reference assets including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- depositary receipts (a security issued by a depositary conferring on the holders beneficial ownership of certain underlying assets held by the depositary for the holders); and
- warrants (bônus de subscrição), which are securities giving the holders the option to purchase the equity of the issuer or a related company.

There is also a number of types of securities in Brazil used to finance certain industries, in particular agribusiness and housing finance.
What are the differences between offering debt securities to institutional/professional or other investors?

Institutional/professional investors benefit from an exemption from registration of a public offer with the Brazilian Securities Commission (CVM). On January 16, 2009, CVM enacted Instruction No. 476 which establishes that a public offering of certain securities will no longer be subject to registration with CVM or have to comply with CVM provisions relating to public offerings of securities, as established by Instruction No. 400, dated as of December 29, 2003 if they comply with the following requirements:

- involve one of the securities mentioned in Instruction No. 476, including, but not limited to: commercial notes, banking credit certificates that are not the responsibility of a financial institution, debentures not convertible or not exchangeable into shares, real estate or agribusiness rights certificates issued by securitization companies registered with the CVM as publicly-held companies, quotas of close-ended investment funds and financial notes (letras financeiras);
- be only targeted to qualified investors (as defined in the applicable regulation of CVM);
- be intermediated by members of the securities distribution system;
- be marketed to a maximum of 75 qualified investors and subscribed or acquired by no more than 50 qualified investors; and
- not involve marketing efforts through stores, offices and establishments open to the public or public communication services.

Public offers to any other type/number of investors are not covered by that exemption and have to comply with the applicable requirements of CVM.

When is it necessary to prepare a prospectus?

Unless an exemption applies, a prospectus is necessary when there is a public offer of securities.

The sale, the sale commitment, the sale or subscription offer and the acceptance of a sale or subscription offer of securities shall be considered public distribution acts if involving any of the following elements:

- the use of sales or subscription lists or bulletins, leaflets, prospectus or advertisements addressed to the public by any means;
- the complete or partial search for undetermined subscribers or purchasers, even if attempted through standard communications directed to individually identified addressees, through employees, representatives, agents, or any individual or legal entity, whether they take part in the securities distribution system or not, or the consultation on the offer feasibility or the collection of an investment commitment with subscribers or undetermined purchasers if said consultation or collection is not in compliance with the applicable Brazilian Securities Commission (CVM) regulation;
- negotiations made in stores, offices or branches open to the public and addressed, in whole or in part, to undetermined subscribers or purchasers; or
- the use of oral or written marketing, letters, advertisements or notices, especially through mass or electronic media (pages or documents on the internet or other open computer networks and e-mail), which contain any communication addressed to the general public aiming at promoting, directly or through third parties acting on behalf of the offer or of the issuer, the subscription or disposal of securities.

For such purposes, a class, category, or group of people, even if individualized, with the exception of those who have had a close and regular previous commercial, credit, partnership or work relationship with the issuer, shall also be considered general public.

What are the main exchanges available?

The main exchanges are the São Paulo Futures and Stock Exchange (B3 - Brasil Bolsa Balcão S.A.).
Is there a private placement market?

Private placements are possible under Brazilian law, but, except for derivative transactions, there is no organized private placement market in the country.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers and, to a certain extent, brokers, are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil and criminal liability under Brazilian law. Brazil has various investor protection statutory provisions relevant to liability for an inaccurate offering memorandum. There are also general fraud statutes and liability may also arise under common law through a civil action for deceit, negligent misstatement or misrepresentation.

Investing in debt securities

There are a number of considerations that the investor has to bear in mind before investing debt securities. For instance, debt security terms and conditions typically contain provisions for meetings of investors to consider matters affecting the investors’ interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Establishing a fund, offering fund securities and operating a fund, among other things, are regulated activities and therefore subject to regulation by the Brazilian Securities Commission (CVM). According to Law No. 10,303 of 31 October 2001 the regulation and supervision of financial and investment funds (originally regulated and supervised by the Central Bank) were transferred to CVM.

What are common fund structures?

Under Brazilian law, funds are considered to be as an ownership right shared by more than one person or legal entity (referred to under Brazilian law as condominiums), with no legal personality. Usually, they are established either as open ended condominiums (in which an investor may require the amortization of its quotas at any time, as provided for in the rules of the fund) or closed ended funds (in which the quotas are only amortized by the end of the life of the fund).

What are the differences between offering fund securities to professional / institutional or other investors?

Retail funds

The distribution of securities representing an interest in the capital of open-ended funds (referred to under Brazilian law as quotas) does
not require advance registration with the Brazilian Securities Commission (CVM). However, the public distribution of quotas of closed-ended funds do require advance registration with CVM and must comply with all of the formalities applicable to the public offer of securities in Brazil.

Institutional/professional funds

The offer of quotas of closed-ended funds directed only to professional investors are automatically granted by CVM, provided certain documents are delivered to CVM through its internal internet system. The distribution of quotas of closed-ended funds to professional investors with limited marketing efforts also benefit from the registration exemption set out in CVM Instruction No. 476, provided the following additional requirements are complied with:

- quotas are marketed to a maximum of 75 qualified investors and subscribed or acquired by no more than 50 qualified investors; and
- no marketing efforts through stores, offices, establishments open to the public or public communication services are used.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

In order for a fund to be established in Brazil it has to comply with the applicable rules of and be registered with the Brazilian Securities Commission (CVM). In accordance with the applicable regulation, the fund must have a manager and an independent accounting firm. The manager must be a Brazilian entity authorized by CVM for the performance of professional management of securities portfolios, in accordance with Article 23 of Law No. 6.385.

Investing in funds

Prospectuses for funds that are offered to the public in general must specify risk factors applicable to that type of investment.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

The distribution of quotas of funds (both open-ended or closed-ended) may only be done by entities authorized to operate in the securities distribution system in Brazil (eg brokers or investment banks).

The distribution of quotas of open-ended funds does not require advance registration with the Brazilian Securities Commission (CVM). However, the public distribution of quotas of closed-ended funds do require the previous registration with CVM and must comply with all the formalities applicable to public offer of securities in Brazil.

In any event, marketing materials of any type of funds in Brazil have to follow the applicable regulation of CVM, in particular Instruction No. 555.

Are there any restrictions on managing a fund?

The management of a fund is defined as the group of services directly or indirectly related to the functioning and maintenance of the fund. Those services may all be rendered directly by the manager of the fund or by third parties hired by the manager on behalf of the fund.

The manager is a legal entity duly authorized by the Brazilian Securities Commission (CVM) to provide securities portfolio management services, in accordance with Article 23 of Law No. 6.385 and other related regulations.
The manager may hire, on behalf of the fund, third parties duly authorized to render the following services to the fund (among others):

- portfolio managers;
- investment advisors;
- treasury services to manage the accounting for and control of financial assets;
- distribution of quotas;
- custody of financial assets;
- rating agencies; and
- market makers.

The management of the portfolio may be done by individuals or legal entities duly registered with CVM as professional portfolio managers.

**Entering into derivatives contracts**

*Are there any restrictions on entering into derivatives contracts?*

Derivatives may be traded over-the-counter or on an organized exchange.

Multiple banks, commercial banks, investment banks, foreign exchange banks, broker dealers and securities dealerships are allowed to enter into swap, option, and future transactions in the Brazilian over-the-counter market on their own behalf and on behalf of their clients. Other financial institutions are only allowed to enter into this type of transaction on their own behalf. Those transactions have to be registered with an authorized clearing system in Brazil.

The Central Bank regulates the parameters for the calculation of the underlying indexes and prices for those transactions.

Brazilian companies may only enter into derivatives transactions in the international market for hedging purposes in connection with commercial or financial transactions which are subject to fluctuations in the international market of interest rates, foreign exchange or commodities prices. Those transactions have to be registered with a clearing system in Brazil.

Last modified 4 Dec 2019 | Authored by Campos Mello Advogados

**What are common types of derivatives?**

Derivative contracts are entered into in Brazil for a range of reasons including hedging, trading and speculation.

All of the main types of derivative contract are widely used in Brazil:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying assets seen in Brazil are:

- equity;
- interest rates;
- commodities;
currencies; and

- credit.

Are there any other notable risks or issues around entering into derivatives contracts?

Netting arrangements have to be expressly agreed by the parties of any given transaction to be valid. This arrangement has to be documented in a specific agreement, either through a public or a private instrument. Alternatively, the financial institutions may have a global netting agreement with the client, covering all derivatives transactions entered into by then.

Those agreements have to be registered either with the Registry of Deeds and Documents or an authorized clearing system in Brazil within 15 days of their execution. The agreements must set out the conditions for an event of default to occur and the methodology for the calculation, set-off and liquidation of the transactions.

Although the new Brazilian Bankruptcy Law (Law No. 11.101 dated 9 February 2005) has brought additional protections for netting arrangements, there are still a number of risks involved in the exercise of netting in a bankruptcy situation.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Pursuant to the applicable regulation, financial institutions are prohibited to carry out credit operations with related parties, except in some limited circumstances. For this purpose, the law defines as a financial institution's related party the following:

- its controlling shareholders, directors and members of other statutory bodies (fiscal, advisory and others) and their respective spouses and relatives up to second degree;

- individuals or legal entities that hold a qualified interest (as per current regulations) in their capital;

- legal entities in which they have qualified interest (direct or indirect);

- legal entities in which they have effective operational control or preponderance in the deliberations, regardless of the equity interest; and

- legal entities with common directors or members of the board of directors.

The restrictions with respect to transactions with related parties do not apply to: (i) transactions carried out under conditions compatible with the common market (including, but not limited to, in respect of limits, interest rates, grace periods, guarantee requirements and risk classification criteria), which shall be similar to those conditions that the financial institution adopts in transactions with unrelated parties; (ii) arms-length transactions with entities controlled by the Union, (iii) credit operations whose counterparty is a financial institution that is part of the same prudential conglomerate, provided that they contain a subordination clause; (iv) certain interbank deposits; (v) setoff obligations; and (vi) other situations authorized by the CVM.

Moreover, there are currently certain restrictions imposed on financial institutions limiting the extension of credit to public sector entities, such as government subsidiaries and governmental agencies. These are in addition to certain limits on indebtedness to which these public-sector entities are already subject.

Borrowing

Borrowers are generally not regulated. Borrowers under consumer and housing financing usually benefit from the protection of the
What are common lending structures?

Lending in Brazil can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents and trustees which fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, project facilities and letter of credit facilities.

Loan durations

The duration of a loan can vary between:

- a term loan, provided for an agreed final period of time;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Loan security

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

Loan commitment

A loan can be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

Loan repayment

A loan can be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

What are the differences between lending to institutional/professional or other borrowers?

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

Last modified 4 Dec 2019 | Authored by Campos Mello Advogados
**Do the laws recognize the principles of agency and trusts?**

Brazilian law does not recognize the concept of a trust. Although not specifically regulated, agency is not a prohibited activity in Brazil and may be structured through other Brazilian law instruments, such as the combination of a power-of-attorney and a service agreement.

Last modified 4 Dec 2019 | Authored by Campos Mello Advogados

**Are there any other notable risks or issues around lending?**

**Generally**

Loan agreements and other finance documents are subject to general contractual law regulation (set out in the Brazilian Civil Code). For example, Article 192 of the Brazilian Constitution, enacted in 1988, established a 12% per year ceiling on bank loan interest rates. However, since the enactment of the Constitution, this rate had not been enforced, as the regulation regarding the ceiling was pending. Several attempts have been made to regulate the limitation on bank loan interest, but none of the proposals has been implemented. On 29 May 2003, Constitutional Amendment No. 40 (EC 40/03) was enacted and revoked all subsections and paragraphs of Article 192 of the Brazilian constitution. This amendment allowed the Brazilian financial system to be regulated by specific laws for each sector of the system rather than by a single law relating to the system as a whole. With the enactment of the new Brazilian Civil Code (or Law No. 10,406 of 10 January 2002), unless the parties to a loan have agreed to use a different rate, in principle the interest rate ceiling has been pegged to the base rate charged by the National Treasury Office (Tesouro Nacional). However, there is presently some uncertainty as to whether the target rate set by Special Clearance and Escrow System (Sistema Especial de Liquidação e Custodia, or SELIC) or the 12% per annum interest rate established in the Brazilian tax code should apply.

The impact of EC 40/03 and the provisions of the new Civil Code are uncertain at this time but any substantial increase or decrease in the interest rate ceiling could have a material effect on the financial condition, results of operations or prospects of Brazilian financial institutions.

Consumer loans are also generally subject to the restrictions of the Consumer Defense Code and certain other related regulation from the Central Bank. In 1990, the Brazilian Consumer Defense Code was enacted to establish rigid rules to govern the relationship between product and service providers and consumers and to protect final consumers. In June 2006, the Brazilian Supreme Court of Justice ruled that the Brazilian Consumer Defense Code also applies to transactions between financial institutions and their clients. Financial institutions are also subject to specific regulation of the National Monetary Council (CMN), regulating the relationship between financial institutions and their clients. CMN Resolution No. 3,694 dated 26 March 2009, as amended, established new procedures with respect to the settlement of financial transactions and to services provided by financial institutions to clients and the public in general, aiming at improving the relationship between market participants by fostering additional transparency, discipline, competition and reliability on the part of financial institutions. The new regulation consolidates all the previous related rules. The main changes introduced by the Consumer Defense Code are described below:

- Financial institutions must ensure that clients are fully aware of all contractual clauses, including responsibilities and penalties applicable to both parties, in order to protect the counterparties against abusive practices. All queries, consultations or complaints regarding agreements or the publicity of clauses must be promptly answered, and fees, commissions or any other forms of service or operational remuneration cannot be increased unless reasonably justified (in any event these cannot be higher than the limits established by the Central Bank);

- Financial institutions are prohibited from transferring funds from their clients’ various accounts without prior authorization.

- Financial institutions cannot require that transactions linked to one another must be carried out by the same institution. If the transaction is dependent on another transaction, the client is free to enter into the latter with any financial institution it chooses.

- Financial institutions are prohibited from releasing misleading or abusive publicity or information about their contracts or services. Financial institutions are liable for any damage caused to their clients by their misrepresentations.

- Interest charges in connection with personal credit and consumer directed credit must be proportionally reduced in case of anticipated settlement of debts.

- Adequate treatment must be given to the elderly and physically disabled.

**Specific types of lending**
Payroll loans are a type of financial product under which the interest and repayment charges are deducted directly from employees' or retirees' pay checks. Since the repayment of payroll deduction loans is directly deducted from the salaries of public servants and private sector employees or from INSS (Brazilian Social Security System) retiree or pension benefits, in practice the credit risk is that of the entity to which borrowers are related. This feature enables banks to extend loans at rates lower than those charged in connection with other products offered by financial institutions in Brazil. This payment deduction mechanism is regulated by a number of laws and regulations, at the federal, state and municipal levels, which establish deduction limits and provide for the irrevocability of the authorization given by a public servant, private sector employee or INSS beneficiary to deduct the amount for purposes of settlement of the loan.

In addition, the extension of payroll deduction loans to public servants and social security service (INSS) retirees and pensioners depends on the authorization by public entities to which these persons are related.

If an employee's employment contract terminates, whether through termination by the employer, voluntary departure or death, repayments under the loan will depend mainly on the financial ability of the borrower or his/her successors to repay the loan. In certain instances, the borrower can offer their severance package as collateral. However, such security may not be able to cover the amount borrowed since there are some limitations on the amount to be offered as collateral. Similarly, if a private employer suffers losses or enters financial distress or bankruptcy, it may not be able to pay the salaries on which the payroll deductions depend. Any of these events could increase the risk in payroll loan portfolios and increase the need for measures to control default through restrictions on new loans, which may adversely affect a company's financial condition and results. Finally, under Brazilian law, if a borrower whose payments are deducted from his salary gets divorced or separated from his spouse, alimony payments may be directly deducted from his salary. These deductions may have priority over other liabilities (including over amounts owed to banks), thus potentially limiting a bank's ability to receive repayment.

**Standard form documentation**

The Brazilian market does not have standard form documentation for loans.

---

**Are there any other notable risks or issues around borrowing?**

Borrowers should be aware of the potential implications of the laws dealing with failing financial institutions.

In case of bankruptcy or liquidation of a financial institution, certain credits, such as credits for salaries up to 150 minimum wages (salários mínimos) per labor creditor (ie a creditor deriving from labor relationships with the employees), among others, will have preference over any other credits.

The Brazilian market has a deposit insurance system (FGC) which guarantees a maximum amount of R$250,000 of deposits and credit instruments held by an individual against a financial institution (or against financial institutions of the same financial group) and a maximum amount of R$20 million of deposits for banks with deposits, up to R$5 billion per bank. The FGC is funded principally by mandatory contributions from all Brazilian financial institutions that work with client deposits. The payment of unsecured credit and client deposits not payable under the FGC is subject to the prior payment of all secured credits and other credits to which specific laws may grant special privileges.

---

**Giving and taking guarantees and security**

**Are there any restrictions on giving and taking guarantees and security?**

Some of the key areas affecting the giving of guarantees and security are as follows.

**General comments**

The creation of a security interest (in rem guarantee) is a very formal procedure under Brazilian law. In order for it to be valid and enforceable in Brazil, the underlying obligation being guaranteed and, if such obligation is related to, or part of, a more complex transaction, the transaction as a whole must be considered legal, valid and binding under the relevant applicable laws. If the underlying
obligation, the transaction generally or just elements of the transaction are not valid, the guarantee or security is also invalid. Additionally, the security agreement must comply with certain conditions (which are considered below) and the parties to it must perform all required formal acts.

The conditions that a transaction (negócio jurídico – a term which includes security documents) must comply with are set out in Article 104 of the Brazilian Civil Code. The conditions concern the capacity of the parties, the existence of an object of the transaction and the form of the documents).

Capacity of the parties

Capacity relates to the power and authority of a given party to enter into a transaction. The parties to the security agreement must be properly represented and duly authorized and empowered to enter into the transaction and create a security interest over certain assets. Capacity is determined by reference to matters such as restrictions under the constitutional documents of the entity entering into the security agreement.

Object

Brazilian law prevents parties from entering into agreements in which the object is not possible or considered to be illicit under Brazilian law. An example of something that is not possible would be an agreement by two private parties to sell an asset owned by the state. An illicit object could be, for example, the exploitation of a casino in Brazil.

Form and other requirements

Security agreements must follow a form established or not forbidden under Brazilian law in order to be capable of being enforced in Brazil. For example, Article 1,452 of the Brazilian Civil Code and Article 127 of the Public Registries Law require that a pledge of shares be constituted by means of a written agreement (private or public) duly registered in the competent Registry of Documents and Deeds in Brazil.

Furthermore, the security agreement must be drafted in order to comply with the other formal requirements of Brazilian law, such as including a detailed description of the assets being pledged and the main financial terms and conditions of the obligation being secured, including:

- the principal amount of the debt;
- the repayment dates; and
- the applicable interest rate.

Economic benefit

In addition to the formalities for the creation of a security interest, the economic benefit generated or a commercial justification for the granting of such security interest by a given issuer of a security interest will have to be analysed. Although this aspect would not generally affect the validity or enforceability of the security agreement, if there is no economic benefit for the guarantor there is a risk of claims being filed by interested third parties, such as minority shareholders or other creditors of the guarantor upon the bankruptcy of the guarantor, as explained below.

Minority shareholders

As a general rule, minority shareholders of an issuer of a security interest may challenge the execution of a security agreement on the basis that the relevant transaction was not entered into in the best interests of the company. Any claim to be brought by minority shareholders on this basis would most likely relate to the fact that there was an abuse of power by the controlling shareholder and/or that the managers carried out acts that conflicted with the company’s best interests. The grounds supporting any such claim for damages placed by minority shareholders may be strengthened to the extent that the security interest is enforced.

Creditors’ claims

Creditors of an issuer of a security interest may also challenge the execution of a security agreement if the transaction is not justifiable from an economic or commercial point of view. A Brazilian court will take into account the current credit strength (ie solvency) and the
What are common types of guarantees and security?

Common forms of guarantees

Generally, there are two types of personal guarantees: surety (fiança) and the so-called ‘aval’. Under a surety, an individual or a legal entity undertakes to perform/repay an obligation if the obligor fails to do so. Aval is a specific guarantee used to secure debt instruments. Personal guarantees are always formalized in writing.

Common forms of security

There is more than one type of in rem guarantee. The nature of the assets that support the guarantee affect which type of in rem guarantee is used. Under Brazilian law, assets can be divided into the following categories:

- movable assets, eg shares and equipment; and
- immovable assets, eg land and buildings.

Certain assets such as aircraft and ships, although considered to be movable assets, are subject to the requirements applicable to immovable assets (such as registration requirements).

The two most usual types of in rem guarantees are:

- pledge (penhor), which relates to movable assets and credit rights; and
- mortgage (hipoteca), which relates to immovable assets.

In the case of in rem guarantees, each asset given as security must be duly referred to in the relevant agreement.

The Brazilian Civil Code provides for another form of guarantee in respect of movable assets which are not fungible. This type of guarantee results in the ownership of the asset and the indirect possession of it being transferred to the creditor, while direct possession remains with the guarantor. The guarantor assumes the duties and liabilities of a bailee in relation to that asset.

Are there any other notable risks or issues around giving and taking guarantees and security?

Upstream and cross-stream guarantees

Upstream and cross-stream guarantees are not prohibited by Brazilian law. Where a guarantee is given in respect of the obligations of a non-Brazilian holding company, certain foreign exchange restrictions may apply.

Financial assistance

Financial assistance (which under Brazilian law includes assistance by way of loans, guarantees, security or reduction of liability) is not specifically regulated by Brazilian law. However, depending on the legal status of the company (regulated entity, financial institution, publicly or privately held corporation, limited liability etc), and the relationship between the grantor and the beneficiary of the financial assistance, restrictions may apply.

For example, financial institutions are prohibited to carry out credit operations with related parties (as defined in specific regulation), except in some limited circumstances.

Additionally, if financial assistance involves a company located outside Brazil, certain foreign exchange rules will have to be observed.

It will be necessary to take advice on a case-by-case basis as to whether restrictions apply to a particular scenario.
Notarization and apostillation or consularization

If security agreements are signed by a party outside Brazil, it must be duly apostilled (apostilado) by the competent authority of the place the foreign judgement was issued or, in case the country in which the place the foreign judgement was issued is not a party to the 1961 Hague Convention Abolishing the Requirement of Legalization for Foreign Public Documents of 5 October 1961, be legalized by a consular official of Brazil having jurisdiction over the place of issuance.

Translation into Portuguese

Only Portuguese language documents may be registered with Brazilian public registries. If the security agreements are not drafted in Portuguese, they must be translated into Portuguese by a certified translator and registered with the competent Brazilian Registry of Deeds and Documents or Real Estate Registry, as the case may be.

Registration

In order to be valid against third parties (and to ensure priority in a bankruptcy proceeding), the security agreements must be registered with the appropriate Brazilian public registries. The relevant register depends on the nature of the asset secured. For example, security over moveable assets other than planes, trains and ships is registrable at the appropriate Registry of Deeds and Documents in Brazil. Security over real estate should be registered at the appropriate Real Estate Registry. Other registrations may be required according to the type of asset that is secured. For example, security over shares in a Brazilian company would need to be registered in that company's share registry book.

Fees

The registries in Brazil will charge a fee to perform the registration of the security agreements or any amendments to them. The amount to be charged by the registries will depend on the:

- location in which the security agreement must be registered in (for instance, mortgages must be registered in the place where the real estate asset is located); and
- amount being secured.

There will also be the cost related to the translation of the security agreements into Portuguese, which will be charged by the certified translator based on the number of pages to be translated, as well as the cost related to the apostillation or consularization of the signatures.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Law No. 4.595 (Brazilian Financial System Law) 31/12/1964
Law No. 10.406/2002 (Brazilian Civil Code - Código Civil) 10/01/2002

Consumer credit

Law No. 4.595 (Brazilian Financial System Law) 31/12/1964
Law No. 8.078 (Brazilian Consumer Defense Code – Código de Defesa do Consumidor) 11/09/1990
Mortgages

Law No. 9.514 (Brazilian Real Estate Financial System) 20/11/1997  
Law No. 10.406/2002 (Brazilian Civil Code - Código Civil) 10/01/2002

Corporations

Law No. 6.404 (Brazilian Corporation Law – Lei de Sociedades por Ações) 15/12/1976

Funds and platforms

Brazilian Securities Commission (CVM - Comissão de Valores Mobiliários) Instruction No. 555 17/12/2014

Other key market legislation

Law No. 4.728 (Brazilian Stock Markets Law) 14/07/1965  
Law No. 6.385 (Brazilian Securities Law) 07/12/1976

Last modified 4 Dec 2019 | Authored by Campos Mello Advogados

Regulatory authorization

Who are the regulators?

The basic structure of the Brazilian financial system (Sistema Financeiro Nacional) was established by Law No. 4.595, which created the CMN (as defined below) and granted the Central Bank, among other things, the powers to issue money and control credit.

Main regulatory agencies

The Brazilian financial system consists of the following regulatory and fiscal bodies:

- the National Monetary Council (Conselho Monetário Nacional or CMN);
- the Central Bank of Brazil;
- the Brazilian Securities Commission (Comissão de Valores Mobiliários or CVM);
- the Superintendence of Private Insurance (Superintendência de Seguros Privados or SUSEP); and
- the Complementary Pensions Secretariat (Superintendência Nacional de Previdência Complementar - PREVIC).

The CMN and the Central Bank regulate the Brazilian banking sector. The CVM is responsible for the policies of the Brazilian securities market. Below is a summary of the main attributes and powers of each of these regulatory bodies.

The CMN

Currently, the CMN is the highest authority in the system and is responsible for Brazilian monetary and financial policy and for the overall formulation and supervision of monetary, credit, budgetary, fiscal and public debt policies. The CMN is responsible for:

- adjusting the volume of forms of payment to the needs of the Brazilian economy;
- regulating the domestic value of the currency;
- regulating the value of the currency abroad and the country's balance of payments;
- regulating the constitution and operation of financial institutions;
- directing the investment of the funds of financial institutions, public or private, taking into account different regions of the country and favorable conditions for the stable development of the national economy;
supervising Brazil's reserves of gold and foreign exchange;

- enabling the improvement of the resources of financial institutions and instruments;
- monitoring the liquidity and solvency of financial institutions;
- coordinating monetary, credit, budgetary, fiscal and public debt policies; and
- establishing the policy used in the organization and operation of the Brazilian securities market.

The Central Bank

Law No. 4.595 granted the Central Bank powers to implement the monetary and credit policies established by the CMN, as well as to supervise public and private sector financial institutions and to apply the penalties provided for in law, when necessary. According to Law No. 4.595, the Central Bank is also responsible for, among other activities, controlling credit and foreign capital, receiving mandatory payments and voluntary demand deposits from financial institutions, carrying out rediscount operations and providing loans to banking institutions, in addition to functioning as the depository for official gold and foreign currency reserves. The Central Bank is also responsible for controlling and approving the operations, the transfer of ownership and the corporate reorganization of financial institutions, as well as the establishment of transfers of principal places of business or branches (whether in Brazil or abroad) and requiring the submission of periodical and annual financial statements by financial institutions.

The President of the Central Bank is appointed by the President of Brazil, subject to ratification by the Federal Senate, and holds office for an indefinite period of time.

The CVM

The CVM is a government agency of the Ministry of Economy, with its headquarters in Rio de Janeiro and with jurisdiction over the whole Brazilian territory. The agency is responsible for implementing the securities policies of the CMN and is able to regulate, develop, control and supervise this market strictly in accordance with the Brazilian Corporate Law and securities laws.

The CVM is responsible for regulating the supervision and inspection of publicly-held companies (including with respect to disclosure criteria and penalties applicable to violations in the securities market), the trading and transactions in the securities and derivatives markets, the organization, functioning and operations of the stock exchanges and the commodities and futures exchanges and the custody of securities.

What are the authorization requirements and process?

The Central Bank's approval process

The incorporation of a financial institution in Brazil requires the prior approval of the Central Bank.

On 2 August 2012, the National Monetary Council (CMN) enacted Resolution No. 4.122, which regulates, amongst other things, the requirements and procedures for the authorization for organization and operation of financial institutions and other types of financial institutions.

In general terms, the incorporation process must begin with a written request to be filed with the Central Bank containing a number of required documents. After the documentation mentioned is received by the Central Bank, it will summon the future controlling persons of the financial institution for a technical interview so that they can present their proposal. According to Resolution 4.122, the Central Bank may, at its sole discretion and on a case-by-case basis, waive the need for a technical interview, if it believes that the venture proposal is sufficiently explained in the executive summary and that the future controlling persons have demonstrated sufficient knowledge on the business field and in the sector that the financial institution intends to operate.

If the Central Bank does approve the transaction, the applicant will have to comply with several requirements imposed by Resolution No. 4.122 within a certain period of time. Once the Bank of Brazil considers that all the requirements have been properly met, it will be in position to grant the necessary approval for the financial institution to operate in Brazil. The entire process may take from eight months to one year (or more) to be completed.
The regulator will also approve key individuals (e.g., senior management) in their roles.

**Foreign banks**

The Brazilian Constitution prohibits foreign financial institutions from establishing new branches or subsidiaries in Brazil, except when duly authorized by the Brazilian government (by means of a presidential decree). A foreign financial institution duly authorized to operate in Brazil through a branch or a subsidiary is subject to the same rules, regulations, and requirements that are applicable to any Brazilian financial institution.

**Foreign investment in Brazilian financial institutions**

Notwithstanding the above, foreign investors may acquire publicly traded non-voting shares of Brazilian financial institutions negotiated on a stock exchange, or depositary receipts offered abroad representing non-voting shares without specific authorization. However, the acquisition by a foreign investor of voting shares of Brazilian financial institutions requires the authorization by the Brazilian government (by means of a presidential decree). In addition to that, the acquisition of a material interest or control of a financial institution (either by a foreign or local investor) requires the prior approval of the Central Bank.

Nevertheless, on September 26, 2019, the Presidency of the Republic issued Decree 10,029, empowering the Central Bank to authorize, among others, the increase of foreign equity interest into financial institutions authorized to operate in Brazil. In other words, a presidential decree authorizing investment in financial institutions is no longer necessary considering that the Central Bank has powers to recognize as of interest of the Brazilian government an increase in the percentage of equity in the capital of financial institutions headquartered in Brazil, held by individuals or legal entities resident or domiciled abroad.

*What are the main ongoing compliance requirements?*

The activities carried out by financial institutions are subject to several limitations and restrictions. In general terms, such limitations and restrictions are related to granting credit, risk concentration, investments, conditional operations, loans in and trading with foreign currency, administration of third-party funds and microcredit finance and payroll deduction credit.

*What are the penalties for failure to be authorized?*

Carrying on activities that are not of financial institutions and other entities authorized to operate by the Central Bank and the Brazilian Securities Commission (CVM) may subject the offender to criminal sanctions, in addition to civil and administrative penalties.

**Regulated activities**

*What finance and investment activities require authorization?*

The main types of financial institution in Brazil are as follows.

**Investment banks**

Investment banks are financial institutions of a private nature specializing in:

- operations of temporary equity participation;
- financing production activities, providing fixed or working capital; and
- managing third parties' assets.

Investment banks are also allowed to:
• practice, on their own account or at the request of a third party, sale and purchase operations of (a) precious metal and (b) bonds and securities;
• operate, on their own account or under the request of a third party, in stock exchange and future exchange markets (under a specific authorization from the Brazilian Securities Commission (CVM));
• operate under all kinds of credit granting to finance fixed or working capital;
• participate in bonds and securities issuance, subscription to resale and distribution processes (under a specific authorization from CVM);
• operate in the foreign exchange market (under a specific authorization from the Central Bank);
• coordinate the reorganization of companies or group of companies by means of consulting services, acquisition of equity stake and/or financing; and
• manage companies, the corporate purposes of which are directly linked with financial market operations.

Commercial banks

Commercial banks are financial institutions, of private or public nature, specializing in:
• short- and medium-term financing for the supply of capital to individuals, commerce and industry;
• cashing of drafts;
• granting credit facility;
• collecting cash and time deposits;
• fund raising to perform on lending operations; and
• acting as service providers, including services provided through convention with other institutions.

Securities brokers (CTVM)

Securities brokers are financial institutions of a private nature specializing in:
• operating in stock exchanges;
• subscribing solely or jointly with other authorized companies to resale bonds and securities;
• intermediating public offers and distributing bonds and securities;
• purchasing and selling bonds and securities for themselves or for third parties, with due regard to the regulation issued by CVM and Central Bank;
• managing portfolios and the custody of bonds and securities;
• being responsible for the subscription, transfer and authenticity of:
  • endorsement;
  • split of portfolios;
• receipt and payment of redemption proceeds; and
• interest and other incomes related to bonds and securities;
• acting as trustee;
• incorporating, organizing and operating funds and investment clubs;
• incorporating investment companies – foreign capital and administration of their respective portfolios of bonds and securities;
• acting as issuer agents of certificates and share book entering services;
• issuing certificates of deposit for shares;
• intermediating foreign exchange transactions;
• purchasing and selling precious metal, for themselves or for third parties, according to Central Bank's regulation;
• operating in commodities and future exchange, for themselves or for third parties, according to Central Bank's and CVM's regulation;
• intermediating, advising and giving technical assistance to transactions and activities related to the capital and financial markets; and
• practicing other activities authorized by CVM and Central Bank.

Securities dealerships (DTVM)

Securities dealerships are financial institutions of a private nature specializing in:

• subscribing solely or jointly with other authorized companies to resale bonds and securities;
• intermediating public offers and distribution of bonds and securities;
• purchasing and selling bonds and securities for themselves or to third parties, with due regard to the regulation issued by CVM and Central Bank;
• managing portfolios and the custody of bonds and securities;
• being responsible for the subscription, transfer and the authenticity of
  • endorsements;
  • splits of portfolios;
  • receipt and payment of redemption proceeds; and
  • interest and other related to bonds and securities;
• acting as trustee;
• incorporating, organizing and operating funds and investments clubs;
• incorporating investment companies – foreign capital and administration of their respective portfolios of bonds and securities;
• acting as an issuer agent of certificates and share books entering service;
• intermediating foreign exchange transactions;
• purchasing and selling precious metals, for themselves or for third parties, according to Central Bank's and CVM's regulation;
• operating in the barter exchange for themselves or for third parties, according to Central Bank's and CVM's regulation;
• intermediating, advising and giving technical assistance to transactions and activities related to the capital and financial markets; and
• practicing other activities authorized by CVM and Central Bank.

Are there any possible exemptions?

No.

Do any exchange controls or other restrictions on payments apply?

Where loans (and certain other financial transactions) are entered into with Brazilian companies as borrowers, the main financial terms of the loan must be registered with the Central Bank under the Module of Registry of Financial Transaction (Módulo de Registro de Operações...
Financeiras – ROF) of the Central Bank Data System and the funds must be paid into Brazil. This registration with the Central Bank allows borrowers to make payments of principal, interest, cost, fees, expenses and commissions in relation to the loan.

Investments made by foreign residents in the Brazilian financial or capital markets have to be registered with the Central Bank in the ‘Portfolio’ Module of the Central Bank Data System once funds enter into Brazil. This registration allows foreign investors to repatriate the principal of the investment and any gain relating thereto.

Investments made by foreign residents in the capital of Brazilian companies outside the Brazilian financial or capital markets have to be registered with the Central Bank in the Module of Foreign Direct Investment (Módulo de Investimento Estrangeiro Direto – IED) of the Central Bank Data System once funds enter into Brazil. This registration allows foreign investors to repatriate the capital and receive payments of dividends and other related payments abroad.

Other payments involving remittances of funds abroad have to be carried out by institutions authorized by the Central Bank to operate in the foreign exchange market and are subject to certain controls.

There are no currency controls expressly applicable to the Brazilian real.

What are the rules around financial promotions?

Rules

A communication of an invitation or inducement to engage in investment activity made by a person in the course of business may only be done by an entity authorized for such purpose by the Central Bank of Brazil or the Brazilian Securities Commission (CVM).

Exemptions

Brazilian securities legislation does not specifically regulate the offer, to Brazilian resident investors, of securities issued, placed, distributed and negotiated abroad (Foreign Securities). As a result of Brazilian legal restrictions as to the public offer of securities, Foreign Securities may not be offered/negotiated in the Brazilian capital markets. Foreign Securities may only be offered to investors resident in Brazil on a private basis, by means of individual/specific identification and assessment, as an opportunity for investment abroad, provided that the relevant private offer does not involve any kind of public communication services, any type of offices/premises open to the public in general or any brokers/dealers that indiscriminately contact investors.

On 30 September 2005 CVM enacted the Guidance Opinion No. 32 (“Opinion 32”) aiming at, generally speaking, reporting its understanding on the qualification of an offer of securities as public when the Internet is adopted as a means of communication.

The Opinion 32 restates CVM’s understanding that the use of the Internet to disclose an offer of securities qualifies, as a general rule, the offer as a public one. Some situations may, however, be taken into consideration so that the offer will not be regarded as public. Among them, Opinion 32 refers to the following: (a) the webpage is protected in order to avoid the access of the public in general to information contained therein; (b) the non-existence of advertising about the webpage to the public by any means of communication; and/or (c) existence of clear indication that the webpage was not created to the public in general.

On that same date, CVM further enacted the Guidance Opinion No. 33 (“Opinion 33”) aiming at reporting its understanding on the:

- qualification of a securities offer as public when the issuer is located outside Brazil; and
- need of a registration at CVM of those agents that intend to mediate, in Brazil, transactions involving securities issued and negotiated outside Brazil to investors residing in Brazil.

According to Opinion 33, the mediation of securities issued and distributed abroad to Brazilian investors by entities incorporated and located abroad is only authorized – without the need of any registration or notification – on a private basis and provided that the:

- approach activities aiming at the Brazilian investors are carried out abroad; and
- operation is not characterized as a public offer.

If entities incorporated and located abroad intend to mediate securities issued and distributed abroad to Brazilian investors with regard to activities carried out in Brazil, they must:
be registered with CVM; or

contract a member of the so-called securities distribution system to perform the operation in Brazil.

If the offer qualifies as public, both the issuer and the issuance are subject to Brazilian registration rules.

Opinion 33 further clarifies that, for an offer of securities issued abroad not to qualify as addressed to the public residing in Brazil when made through the internet, the following situations, in addition to those provided for in Opinion 32, would be taken into consideration:

- the existence of a notice of clear content and easy access clarifying that the offer is addressed only to the countries where the information provider or the issuer is authorized to offer securities (listing the relevant countries);
- effective measures to prevent access by Brazilian investors;
- a direct or indirect indication (provided that it is sufficiently clear) that the webpage was not created for Brazilian investors (the disclosure of economic forecasts in Brazilian currency or the inclusion of Brazil among the listed countries on any form or, furthermore, the comparison between the issuer of securities and Brazilian issuers are all considered an indication that the page is also directed to investors residing in Brazil); and
- the non-existence, even in a language other than Portuguese, of text to target Brazilian investors.

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

**Generally**

In very broad terms there are two main types of legal entities in Brazil: the limited liability partnership (limitada) and the corporation (sociedade anônimo), both of which are body corporates with separate legal personality and which limit the liability of their members. Corporations can be privately held or publicly held depending on whether their shares are offered to the public.

Usually, the type of legal entity used to incorporate a financial institution is regulated by the Central Bank of Brazil (eg commercial banks may only be incorporated as a corporation)

**Funds**

Under Brazilian law, funds are considered as an ownership right shared by more than one person or legal entity (referred to under Brazilian law as condominums). There is a variety of different funds that are regulated by the Brazilian Securities Commission (CVM). The main difference between them is the type of investments they are allowed to make: for example, there are real estate funds, general investment funds, private equity funds and securitization funds among others.

**Is it possible to conduct lending or investment business through a branch or establishment?**

Yes, with the approval of the Central Bank of Brazil and other approvals, as the case may be (eg the approval of the President in the case of foreign investment).

**FinTech**
FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Before the enactment of CMN Resolution No. 4,656 and CMN Resolution No. 4,657, both dated as of April 26, 2018, which regulated the activities of financial technology companies that operate in the credit market, a financial institution duly authorized by the Central Bank of Brazil was required to mediate the transactions between lenders and borrowers, while the non-bank lending platform only acted as a corresponding agency of the bank. However, with the enactment of the above-mentioned resolutions, these startups were allowed to grant credit without the intermediation of a bank. These regulations came to create a healthier framework for the development and strengthening of FinTechs in Brazil. In addition, by regulating this kind of activity, the Central Bank hopes to encourage competition within this sector and, consequently, offer more competitive interest rates.

Also, as per the approved regulation, FinTechs could be structures as (i) Direct Credit Companies, which will carry out operations with their own resources through an electronic platform; or (ii) Interpersonal Loans Company, focused on financial intermediation (peer-to-peer). Furthermore, on October 29, 2018, the Federal Government enacted Decree No. 9,544, authorizing the foreign investment up to 100% in the capital stock of Direct Credit Companies or Interpersonal Loans Company.

Blockchain, smart contracts and cryptocurrencies

What is Blockchain?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called "hashes".

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the block using sophisticated algorithms and add the verified block to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or
third-party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that, once authorized can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced more-complex interactions with the outside world using so called ‘Oracles’. With Oracles the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

Brazilian Law No. 12,865/2013 defines cryptocurrency as the value stored in electronic devices or systems that allowed the user to make a payment in a transaction. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

Initial coin offerings (ICOs) are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture. ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security, or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical
server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

On April 26, 2018, the CMN enacted CMN Resolution No. 4,658, as amended, which provided for the obligation of financial institutions and other institutions authorized to function by the Central Bank, including Credit FinTechs, to implement cyber security policies and established requirements to hire data, computing processing and storage services in the so-called “clouds”.

This Resolution became effective on the date of its publication and financial institutions and other institutions authorized to function by the Central Bank, including Credit FinTechs, had a deadline of May 6, 2019 to implement the new security, course of action and prevention policies for incidents related to cyber environment.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The basic structure of the Brazilian financial system (Sistema Financeiro Nacional) was established by Law No. 4.595, which created the CMN (as defined below) and granted the Central Bank, among other things, the powers to issue money and control credit.

MAIN REGULATORY AGENCIES

The Brazilian financial system (Sistema Financeiro Nacional) consists, among others, of the following regulatory and fiscal bodies:

- National Monetary Council (Conselho Monetário Nacional or CMN);
- Central Bank of Brazil;
- Brazilian Securities Commission (Comissão de Valores Mobiliários or CVM);
- Brazilian Council of Private Insurance (Conselho Nacional de Seguros Privados – CNSP);
- Superintendence of Private Insurance (Superintendência de Seguros Privados or SUSEP); and
- Complementary Pensions Secretariat (Superintendência Nacional de Previdência - PREVIC).

The CMN and the Central Bank regulate the Brazilian banking sector. The CVM is responsible for the policies of the Brazilian securities market. Below is a summary of the main attributes and powers of each of these regulatory bodies.

THE CMN

Currently, the CMN is the highest authority in the system and is responsible for Brazilian monetary and financial policy and for the overall formulation and supervision of monetary, credit, budgetary, fiscal and public debt policies.

THE CENTRAL BANK

Law No. 4,595 granted the Central Bank powers to implement the monetary and credit policies established by the CMN, as well as to supervise public and private sector financial institutions and to apply the penalties provided for in law, when necessary. According to Law No. 4,595, the Central Bank is also responsible for, among other activities:

- controlling credit and foreign capital;
- receiving mandatory payments and voluntary demand deposits from financial institutions;
- carrying out rediscount operations and providing loans to banking institutions;
- functioning as the depositary for official gold and foreign currency reserves;
controlling and approving the operations, the transfer of ownership and the corporate reorganization of financial institutions;

- the establishment of transfers of principal places of business or branches (whether in Brazil or abroad); and

- requiring the submission of periodical and annual financial statements by financial institutions.

The President of the Central Bank is appointed by the President of Brazil, subject to ratification by the Federal Senate, and holds office for an indefinite period of time.

**THE CVM**

The CVM is a government agency of the Ministry of Economy, with its headquarters in Rio de Janeiro and with jurisdiction over the whole Brazilian territory. The agency is responsible for implementing the securities policies of the CMN and is able to regulate, develop, control and supervise this market strictly in accordance with the Brazilian Corporate Law and securities laws.

The CVM is responsible for regulating the supervision and inspection of publicly-held companies (including with respect to disclosure criteria and penalties applicable to violations in the securities market), the trading and transactions in the securities and derivatives markets, the organization, functioning and operations of the stock exchanges and the commodities and futures exchanges and the custody of securities.

**Electronic payments platforms and regulation of peer-to-peer lenders**

**ELECTRONIC PAYMENT PLATFORMS**

Law No. 12,865/2013 regulates the payment schemes and payment institutions, which have become part of the Brazilian Payments System. A number of FinTech businesses are offering electronic payment platforms to rival the traditional payment systems.

**PEER-TO-PEER LENDERS**

The CMN approved on April 26, 2018, resolutions No. 4,656 and 4,657, regulating the activities of financial technology companies that operate in the credit market and enabled these companies, which used to operate as banking correspondents in the credit market, to grant credit without the intermediation of a bank. The new rules applied immediately to these entities and allowed interested companies to start the authorization process.

As per the approved regulation, FinTechs could be structures as (i) Direct Credit Companies, which will carry out operations with their own resources through an electronic platform; or (ii) Interpersonal Loans Company, focused on financial intermediation (peer-to-peer).

Furthermore, on October 29, 2018, the Federal Government enacted Decree No. 9,544, authorizing the foreign investment up to 100% in the capital stock of Direct Credit Companies or Interpersonal Loans Company.

**Regulation of payment services**

**GENERAL OVERVIEW**

A payment institution in Brazil is a legal person subject to the Central Bank's provisions, adhering to one or more payment schemes, having as main or ancillary activity one or more of the following (a Payment Institution):

- providing cash-in and cash-out services of the funds held on payment accounts;

- performing or facilitating payment instructions related to definite payment service, including transfers originated from or intended for a payment account;

- managing payment accounts;

- issuing payment instruments;

- acquiring payment instruments;

- remit funds;

- converting physical or book-entry currency into e-money, or vice-versa, acquiring the acceptance or managing the use of e-money;
and

- other activities related to payment services, designated by the Central Bank.

LEGAL FRAMEWORK

Payment Institutions in Brazil are subject, primarily, to the following laws and regulations:

- Law No. 12,865/2013, as amended, regulates the payment schemes and payment institutions, which have become part of the Brazilian Payments System (SPB);
- Resolution No. 4,282/2013 presents a guideline for the regulation of the Central Bank regarding payment schemes and payment institutions;
- Central Bank Circular No. 3,680/2013, as amended, regulates payment accounts;
- Central Bank Circular No. 3,681/2013, as amended, regulates the risk management, minimum capital requirements and governance of payment institutions, among others;
- Central Bank Circular No. 3,682/2013, as amended, regulates payment schemes within the SPB;
- Central Bank Circular No. 3,885/2018, as amended, regulates payment institutions;
- Central Bank Circular No. 3,856/2017 provides for the internal audit activity in the institutions of payment;
- Central Bank Circular No. 3,704/2014 regulates the account held at the Central Bank regarding e-money and the performance of the payment institutions and transfer of reserves system (Sistema de Transferência de Reservas – STR);
- Central Bank Circular Letter No. 3,949/2019 provides clarifications and models regarding the procedures to request authorization for payment schemes;
- Central Bank Circular Letter No. 3,897/2018 provides models of necessary documents to support the proceedings addressed in Central Bank Circular No. 3,885/2018;

CATEGORIES

Under Article 4 of Circular No. 3,855, payment institutions are classified in the following categories, according to the services that will be rendered:

<table>
<thead>
<tr>
<th>CATEGORY</th>
<th>SERVICES RENDERED</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issuer of e-money</td>
<td>• Manages pre-paid payments account of final users</td>
</tr>
<tr>
<td></td>
<td>• Provides e-money payment transactions</td>
</tr>
<tr>
<td></td>
<td>• Accredits the acceptance of e-money with settlement in payment account managed by the issuer</td>
</tr>
<tr>
<td></td>
<td>• Converts the resources into physical and scriptural currencies, or vice versa</td>
</tr>
<tr>
<td>Issuer of post-paid payment instrument</td>
<td>• Manages post-paid payment account of final payer users</td>
</tr>
<tr>
<td></td>
<td>• Provides payment transactions</td>
</tr>
<tr>
<td>Accrediting entity</td>
<td>• Does not provide payment account</td>
</tr>
<tr>
<td></td>
<td>• Enables recipients to accept payment instruments issued by a payment institution or financial institution member of a same payment scheme</td>
</tr>
</tbody>
</table>
OPERATIONS

According to Circular No. 3,855, the essential conditions for a Payment Institution to operate are:

- due incorporation according to the current rules and regulations;
- Central Bank authorization (only for payment institutions that operate with a volume greater than R$500 million in payment transactions or R$50 million in funds held in prepaid payment account for any given period of 12 months); and
- compliance with the minimum capital requirements in case the payment institution is authorized by the Central Bank.

Application of data protection and consumer laws

BRAZILIAN CONSUMER DEFENSE CODE

Financial activities are also generally subject to the restrictions of the Consumer Defense Code and certain other related regulations from the Central Bank. In 1990, the Brazilian Consumer Defense Code was enacted to establish rigid rules to govern the relationship between product and service providers and consumers with the overall aim to protect final consumers. In June 2006, the Brazilian Supreme Court of Justice ruled that the Brazilian Consumer Defense Code also applies to transactions between financial institutions and their clients. Financial institutions are also subject to specific regulation from the National Monetary Council (CMN), which regulates the relationship between financial institutions and their clients. CMN Resolution No. 3,694 dated March 26, 2009, as amended by CMN Resolution No. 3,919 dated November 25, 2010 and CMN Resolution No. 4,283 dated November 4, 2013, established new procedures with respect to the settlement of financial transactions and to services provided by financial institutions to clients and the public in general, aimed at improving the relationship between market participants by fostering additional transparency, discipline, competition and reliability on the part of financial institutions. The new regulation consolidates all the previous related rules. The main changes introduced by the Consumer Defense Code are described below.

- Financial institutions must ensure that clients are fully aware of all contractual clauses, including responsibilities and penalties applicable to both parties, in order to protect the counterparties against abusive practices. All queries, consultations or complaints regarding agreements or the publicity of clauses must be promptly answered, and fees, commissions or any other forms of service or operational remuneration cannot be increased unless reasonably justified (in any event these cannot be higher than the limits established by the Central Bank).
- Financial institutions are prohibited from transferring funds from their clients' various accounts without prior authorization.
- Financial institutions cannot require that transactions linked to one another must be carried out by the same institution. If the transaction is dependent on another transaction, the client is free to enter into the latter with any financial institution it chooses.
- Financial institutions are prohibited from releasing misleading or abusive publicity or information about their contracts or services. Financial institutions are liable for any damage caused to their clients by their misrepresentations.
- Interest charges in connection with personal credit and consumer directed credit must be proportionally reduced in case of anticipated settlement of debts.
- There must be adequate treatment for the elderly and physically disabled.

DATA PROTECTION

Brazil enacted the Brazilian General Data Protection Law (Federal Law no. 13,709/2018 or "LGPD") on August 15, 2018. The LGPD is Brazil's first comprehensive data protection regulation and it is largely aligned to the EU General Data Protection Act ("GDPR"). Certain LGPD provisions were later amended to, among other modifications, create the National Data Protection Authority ("ANPD") and postpone its effectiveness to August 2020, rather than February 2020, as set forth when the LGPD was first published.

The LGPD applies to any processing operation carried out by a natural person or a legal entity, of public or private law, irrespective of the means used for the processing, the country in which its headquarter is located or the country where the data are located, provided that:

- The processing operation is carried out in Brazil;
• The purpose of the processing activity is to offer or provide goods or services, or the processing of data of individuals located in Brazil; or

• The personal data was collected in Brazil.

LGPD provides rights to data subjects and several obligations to the processing of personal data (defined as any information related to an identified or identifiable natural person). LGPD also imposes obligations to be observed prior to international transfer of personal data as well as notification requirements in scenarios of data breaches which may cause relevant risk or damage to data subjects.

Prior to the LGPD, data privacy regulations in Brazil consisted of various provisions spread across Brazilian legislation. For example, Federal Law no. 12,965/2014 and its regulating Decree no. 8,771/16 (together, the Brazilian Internet Act), which imposes some requirements regarding on security and the processing of personal data and other obligations on service providers, networks and applications providers, as well as rights of Internet users.

Furthermore, general principles and provisions on data protection and privacy are set forth in the Federal Constitution, in the Brazilian Civil Code and other specific laws and regulations that address particular types of relationships (eg Brazil's Consumer Defense Code and labor laws), particular sectors (eg financial institutions, health industry and telecommunications) and professional activities (eg medicine and law).

Specially in relation to finance institutions, Resolution no. 4,658/2018 of the Central Bank imposes cyber security requirements and set forth standards for contracting data processing services, such as storage and cloud computing services. The provisions of such Resolution must be observed by financial institutions and other institutions authorized to operate by the Central Bank of Brazil.

Money laundering regulations

Brazilian Law No. 9,613, of March 3, 1998, as amended by Law No. 12,683, of July 9, 2012 (the Anti-Money Laundering Law) plays a major role for those engaged in banking and financial activities in Brazil. The Anti-Money Laundering Law sets forth the definition and the penalties to be incurred by persons involved in activities that comprise the laundering or concealing of property, rights and assets, as well as a prohibition on using the financial system for these illicit acts.

In addition, the Brazilian Anti-Money Laundering Law created the Financial Activity Control Council (Conselho de Controle de Atividades Financeiras or “COAF”). The main role of the Financial Activity Control Council is to promote cooperation among the Brazilian governmental bodies responsible for implementing national anti-money laundering policies, in order to stem the performance of illegal and fraudulent acts. Their activities also include imposing administrative fines and examining and identifying suspected illegal activities pursuant to the Anti-Money Laundering Law.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

ACCELERATORS

There are various incubators or accelerators in the Brazilian market which offer support, facilities and funding for startups, often in return for an equity stake. For example, Bradesco, one of the largest private banks in Brazil, has an innovation program that selects startups producing solutions adjustable to the financial market (known as inovaBra) and maintains a corporate venture (through an investment fund) to invest in such companies. Other banks have similar initiatives, such as the Cubo coworking by Itaú and Redpoint eVentures and the competition Fintech Venture Day sponsored by Santander InnoVentures (the bank's FinTech investment fund), or the recently launched “Labbs” by Banco do Brasil (which is a platform developed to connect the bank to start-ups).
Venture capital and debt

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), which is secured against a company’s assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

Warehouse and platform funding

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV) or a fund (FIDC). The loan is secured on the assets acquired by the SPV or the FIDC from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

Senior bank debt and capital markets funding

Senior bank debt

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

Capital markets funding

Brazil has both debt and equity capital markets which are accessible to businesses (usually of a certain size and as long as it is incorporated as a corporation (sociedade anônima), as opposed to a limited liability company (limitada)).

Furthermore, a FinTech company may decide to offer either a full public offer of securities or a public offer with limited marketing efforts.

On 16 January 2009, CVM enacted Instruction No. 476 which establishes that a public offering of certain securities will no longer be subject to registration with CVM or have to comply with CVM provisions relating to public offerings of securities, if they comply with the following requirements (limiting, in general, their marketing efforts) namely:

- involve one of the securities mentioned in Instruction No. 476, including, but not limited to commercial notes, banking credit certificates that are not the responsibility of a financial institution, debentures not convertible into shares, real estate or agribusiness rights certificates issued by securitization companies registered with the CVM as publicly-held companies, quotas of close-ended investment funds and financial notes (letras financeiras);
- be only targeted to qualified investors (as defined in the applicable regulation of CVM);
- be mediated by members of the securities distribution system;
- be marketed to a maximum of 75 qualified investors and subscribed or acquired by no more than 50 qualified investors; and
- not involve marketing activity through stores, offices and establishments open to the public or public communication services.

Public offers to any other type/number of investors are not covered by that exemption and have to comply with the applicable requirements of CVM, including the preparation of a full prospectus on the issuer and the transaction.

Incentives and reliefs

Recently, Brazilian tax authorities have regulated angel investors through the application of tax regimes in respect of the capitalization of companies. Under Normative Ruling RFB No. 1,719/2017, the seed investor is entitled to earn income from capital it has invested which is subject to withholding income tax at rates varying from 15% to 22.5%, depending on the length of the investment. This type of angel investment is treated like a financial market investment and not as an equity contribution, as would be the norm and which otherwise...
would make it subject to dividend payments which are not subject to withholding tax.

With respect to tax incentives for FinTechs, there are no specific tax benefits for this sector but some general tax incentives may apply, such as:

- FinTech businesses with annual (12-month period) gross revenue of up to BRL$4.8 million (four million and eight hundred thousand Brazilian Reais) may be subject to taxes over its gross revenues under a simplified tax regime called 'Simples Nacional', provided that certain thresholds set in the legislation are complied with. Simples Nacional is an optional taxation regime designed to simplify the collection of taxes of micro or small businesses which allows the collection of municipal, state and federal taxes at simplified standard rates based on the monthly gross revenue of the company.

- Certain Brazilian municipalities grant reduced service tax rates from 5% to 2% to attract new businesses. FinTechs which are typical service providers (and not financial institutions) may take advantage of this incentive by setting up operations in those municipalities.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

In Brazil, there are three potential pieces of regulation that affect this market. First, there is the general rule for the assignment of rights set out in the Brazilian Civil Code. In relation to financial institutions, certain resolutions and circulars from the Central Bank of Brazil also impose restrictions on this type of activity. Finally, as most of the purchasers of this type of asset are investment funds (known as investment funds in credit rights (Fundo de Investimento em Direitos Creditórios, or FIDC), the applicable regulation of the Brazilian Securities Commission (CVM) is also relevant.

The Brazilian Civil Code allows creditors in general to assign their rights, provided there is no limitation arising out of the nature of the credit, the applicable laws or the contractual relationship between them and the debtor. It also imposes certain formalities in relation to the transaction documentation. In this respect, an assignment is only binding as against third parties if it is executed through a public document (ie a document issued by a competent Registry) or a private instrument with the place and date of its execution indicated, the purpose of the business specified and the parties (assignee and assignor) clearly identified. Also, the agreement (or another document evidencing the assignment) has to be registered with the competent Registry of Deeds and Documents in Brazil. Finally, the Brazilian Civil Code prescribes that the assignment is only valid as against the underlying debtor that is notified of the assignment. It is important to stress that, unless otherwise provided for in the original agreement, the prior approval of the debtor is not necessary. The debtor has only to be notified of the assignment, by any means legally possible.

Brazilian Central Bank regulation also plays an important role. Central Bank Regulations are basically divided into two categories: regulations relating to situations where the assignee is another financial institution and those relating to situations where the assignee is not a financial institution. There are some important differences between the two categories. First, if the assignee is not a financial institution, the assignment may not benefit from the co-obligation of the assignee (ie the assignee is not responsible for the default of the underlying debtor). Secondly, the purchase price paid by a non-financial institution may not be in instalments. In this case, the payment has to be made with immediately available funds at the date of the financial settlement of the transaction. Finally, and maybe most importantly, the repurchase of the assigned credits is not allowed. These restrictions are generally not applicable to transactions with FIDCs.

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan or a portfolio of loans. These issues are often covered as part of a due diligence exercise. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and
- **consent** – whether a transfer requires the consent or notification of any other parties.

In addition, Resolution No. 3,533 from the National Monetary Council (CMN) dated 31 January 2008, provides changes to the manner in which assigned credit rights are to be treated in the books of financial institutions (pursuant to CMN Resolution No. 3,809 of 28 October 2009). In accordance with Resolution No. 3,533, if the assignor substantially retains the risks and benefits of the assigned credits, such credits may not be recorded as off-balance sheet loans. This provision is applicable to:

- assignments with repurchase commitments;
- assignments in which the assignor undertakes the obligation to compensate the assignee for losses; and
- assignments made jointly with the acquisition (or subscription) of subordinated shares in FIDCs by the assignor.

---

**Projects**

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

**Generally**

The ownership of infrastructure assets varies in Brazil according to the class of the assets. Some assets are completely owned by the government and some assets are owned by private companies. As state-owned companies are facing difficulties for investing in infrastructure, the government is opening space for investment in the sector to private entities, by means of concessions and public-private partnerships. Currently, approximately two thirds of the total invested in infrastructure in Brazil comes from the private sector.

Even with the increase in the participation of private companies, a large part of the funding for infrastructure projects is still provided by public banks, especially the Brazilian Development Bank (Banco Nacional de Desenvolvimento Econômico e Social, or BNDES).

The key sectors are considered below.

**Energy**

In the energy infrastructure, the private companies already have a significant role. The government does not invest directly in energy, providing the investments through the state-owned companies, especially PETROBRAS and ELETROBRAS, companies that hold a large influence in energy projects.

In several cases, investments in energy projects are provided by means of partnerships between the state owned companies (PETROBRAS and ELETROBRAS) and private companies, increasing the influence of the private companies in energy projects.

Since PETROBAS and ELETROBRAS are passing through a moment of crisis, private investment in energy projects is increasing, a trend which is likely to continue in the coming years.

Notwithstanding the above, in November 2019, President Jair Bolsonaro signed a bill of law authorizing and establishing the rules of ELETROBRAS’ privatization. The Brazilian government intends to capitalize on ELETROBRAS, which has been losing market share in the generation and transmission market. This privatization is expected to take place in the second half of 2020, however, this bill of law must fulfil all legislative rite until its enactment.
Telecoms infrastructure

Brazilian telecommunications infrastructure is privatized. The privatization took place at the end of the 1990s and reduced the public investments. It is now one of the infrastructure sectors where government intervention is lowest.

Recently the bill of law PLC 79/2016 was converted into Law 13,789, dated as of October 3, 2019 (“Law 13,789”), which promoted several changes to the Brazilian General Telecommunications Law and allowed the Brazilian Agency of Telecommunications (ANATEL) to transform current fixed telephone concessions into authorizations, more flexible and less bureaucratic. With the enactment of Law 13,789 important investment values are expected in the coming years.

Transport infrastructure

In transport infrastructure, private investment is predominant. In railroads and ports, public sector investment is secondary, even though still prevalent in railroads investments amounts. In the roads, several concession programs have increased the participation of private companies, but the presence of the public sector is still significant. In the airports, the development of the concession programs is similar to that of the roads. Both the Federal government and private companies provide some investment in waterways as it is a sector with high growth potential during the next years.

The predominance of the private sector in the transport infrastructure is increasing, as the concessions and privatizations are being fostered in roads, railroads, ports and airports.

Other infrastructure

SANITATION

Brazilian state-owned companies and concessions play a dominant role in sanitation infrastructure assets. It is likely that the state-owned companies will face more difficulties with investment in sanitation in the coming years, considering the problems with water resources and the impact of the fiscal adjustments in public investments. In view of this situation, it is anticipated that private investment in sanitation will keep increasing over the coming years. However, the level of difficulty on these projects should be mentioned. In instances, whether by technical issues, abandonment of the concessionaire or other causes, 60% of stalled infrastructure projects are related to sanitation projects. Nonetheless, the sanitation infrastructure projects consist on 9% of the total amount of stalled projects.

HEALTH

In Brazil, investment in the health sector is provided by the government and by private entities, with private investment slightly more prevalent.

EDUCATION

The investments in Brazilian primary education are mainly provided by the public sector. Private investment in primary education corresponds to approximately 20% of the total investment in education assets. However, in higher education, private investment is dominant, corresponding to 75% of the total investment in education. The tendency for the next few years is for higher private sector investment in education.

Are there special rules for investing in energy and infrastructure?

Generally

In Brazil, there are several governmental agencies regulating investment in energy and infrastructure. Every company (including the state-owned companies) which intends to invest in energy and infrastructure is subject to the rules of such governmental agencies.

The governmental agencies have the purpose of establishing internal rules (Decrees and Normative Instructions) for the regulation and supervision of the activities performed by the investors in the specific sectors of Brazilian economy.

Below is the list of the agencies responsible for certain key sectors.
Energy

The main regulatory authorities regarding energy sector include:

- Ministry of Mines and Energy (MME);
- National Policy Council of Energy (CNPE);
- Electricity Sector Monitoring Committee (CMSE);
- Operator of the National Electricity System (ONS);
- Energy Research Company (EPE);
- Electric Power Commercialisation Chamber (CCEE);
- National Water Agency (ANA);
- National Agency of Petroleum, Natural Gas and Biofuels (ANP); and
- Brazilian Electricity Regulatory Agency (ANEEL);

Telecoms infrastructure

The sector of telecommunications is privatized and the private companies are subjected to the rules established by the Brazilian Agency of Telecommunications (ANATEL).

Transport infrastructure

- Waterway transportation is regulated by the National Waterway Transportation Agency (ANTAQ);
- Railroads and roads transportation are regulated by the National Agency of Land Transportation (ANTT); and
- Airways transportation is regulated by the National Civil Aviation Agency (ANAC).

Other infrastructure

The social infrastructure is also regulated by governmental agencies.

Health infrastructure is regulated by the Health Ministry and by the agencies bounded to it, such as the National Agency for Supplementary Health Services (ANS); and the National Health Surveillance Agency (ANVISA).

Education Infrastructure is regulated by the Ministry of Education, which is assisted by the National Education Board.

Last modified 4 Dec 2019 | Authored by Campos Mello Advogados

What is the applicable procurement process?

The procurement process for Energy and Infrastructure in Brazil is provided by means of concessions and public-private partnerships. Both processes are used by the government to increase private investment in energy and infrastructure assets, as state-owned companies are facing severe financial difficulties for new investments.

Below is a more detailed explanation about the forms of investment and funding in energy and infrastructure assets.

Investing in energy and infrastructure

Infrastructure and energy projects may be implemented under several regimes, depending on their nature and in particular whether they legally qualify as public services, activities within the constitutional attribution of the Union or of the States or regulated private activities. Considering the involvement of public and private sectors, all the projects and activities may be defined as a partnership between the government and private entities, which may be formalized under the following regimes:
COMMON CONCESSIONS

The activities designated as public services by the applicable law can only be transferred to private parties through long-term concession agreements or, exceptionally, through permissions (which may be perceived as less stable, but without substantive differences in practice). In both cases, the concession will be a result of a formal public bidding procedure. This procedure is governed by the Federal Law No. 8,987 of 1995.

In common concessions, the private entities are responsible for obtaining the remuneration for the provided services, in a direct relationship with the users of the contracted services.

PUBLIC-PRIVATE PARTNERSHIP

The public-private partnership is governed by the Federal Law No. 11,079 of 2004 and consists of an agreement entered into by and among the government and a private entity for works or services in an amount higher than R$20 million and for a period of more than five years and less than 35 years.

Public-private partnerships are different from the common concessions because of the way the private entities are remunerated. In public-private partnerships, the remuneration of the private entities is usually paid by the public entity which hired the private entity.

There are activities in the infrastructure sector not designated as public services and usually not involving scarce resources or natural monopolies, which may be carried out by private agents with more flexibility. Such activities may be conducted by private entities without the need for a concession or a public private partnership, being subject only to sector-specific regulation and a non-discretionary authorization, on the top of environmental and other legal requirements applicable to business activities in general.

Financing energy and infrastructure

The Brazilian Development Bank (BNDES) plays a dominant role in financing energy and infrastructure assets. Caixa Econômica Federal and Banco do Brasil, the other two large state-owned banks, increased their market share. However, the finance provided by these entities is not sufficient for the investment in infrastructure planned by the government for the coming years, and the investment provided by private companies has become necessary for the execution of the infrastructure projects.

What are the most common forms of funding / investing in energy and infrastructure?

Funding

The most common forms of funding in Brazilian Infrastructure and energy assets include:

- project-finance loans;
- corporate-finance loans; and
- infrastructure debentures.

The majority of the investments in Brazilian energy and infrastructure assets are provided by BNDES. Even in the projects developed under concessions and public-private partnerships, the presence of the state-owned bank is still high.

Investing

Private companies investments in energy and infrastructure assets are usually provided by means of equity.

Restructuring
Enforcement and sanctions

When can there be regulatory investigations?

When the Central Bank considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

The Central Bank also carries out regular audits of authorized firms.

Furthermore, the Resolution No 4,595/2017 sets forth that the implementation of a Compliance Program is mandatory to all the financial institutions or other institutions regulated by the Central Bank.

There is no specific penalty prescribed in this Resolution on institutions that do not implement the Compliance Program. However, it establishes that the Central Bank is authorized to enact other rules and other measures in order to guarantee the enforcement of the mentioned Resolution No 4,595/2017.

The CVM is also entitled to investigate, by launching an administrative procedure, illicit acts and non-equitable practices of administrators, board members and shareholders of listed companies, intermediaries and other participants of the market, pursuant to Law 6,385/1976. This may also result in regulatory sanctions applied by CVM.

What regulatory penalties may apply?

Penalties range from warnings to the intervention or liquidation of the financial institution, depending on the infraction.

The Central Bank may intervene in the operations of a financial institution not controlled by the Brazilian government if there is a material risk for creditors, or if the financial institution frequently violates applicable regulations. The Central Bank may also intervene if liquidation can be avoided or it may perform administrative liquidation or, in some circumstances, require the bankruptcy of any financial institution, except those controlled by the Brazilian government.

In addition to the aforesaid procedures, the Central Bank may also establish the Temporary Special Administration Regime (Regime de Administração Especial Temporária or RAET) which is a less restrictive form of intervention by the Central Bank in private and non-federal public financial institutions and which allows institutions to continue to operate normally.

The RAET may be imposed by the Central Bank in the following circumstances:

- continuous practice of transactions contrary to the economic and financial policies established by federal law;
- the institution fails to comply with the Compulsory Reserves rules established by the Central Bank;
- suffers losses that put its creditor at risk due to inadequate management;
- repeatedly breaches Brazilian banking rules and regulations;
- the institution reckless or fraudulent management;
- the institution faces a shortage of assets; and
- the occurrence of any of the events described above that may result in a declaration of intervention.

The main objective of the RAET is to assist with maintaining the solvency and financial conditions of the institution under special administration and avoid intervention and/or liquidation. Therefore, the RAET does not affect the day-to-day business operations, liabilities or rights of the financial institution, which continues to operate in its ordinary course. The RAET also immediately results in the loss of the term of office of the administrators and members of the Audit Committee of the institution.

There is no minimum term for a RAET, which may cease upon the occurrence of any of the following events:

- acquisition of share control of the financial institution by the Brazilian federal government;
- corporate restructuring, merger, spin-off, amalgamation or transfer of the controlling interest of the financial institution;
• when, at the discretion of the the Central Bank, the institution's situation has normalized; or
• declaration of extra-judicial liquidation of the financial institution.

An administrative liquidation of any financial institution (with the exception of public financial institutions controlled by the Brazilian government) may be carried out by the Central Bank if it can be established that:

• the institution's economic or financial situation is at risk, particularly when the institution ceases to meet its obligations as they become due, or upon the occurrence of an event that indicates a state of insolvency under the rules of Law No. 6,024; the financial institution is deemed insolvent;
• the financial institution has incurred losses that could abnormally increase its unprivileged and exposure of the unsecured creditors;
• management of the relevant financial institution has materially violated Brazilian banking laws, rulings or regulations; or
• upon cancellation of its authorization to operate, the financial institution does not initiate ordinary liquidation proceedings within 90 days or, if initiated, the Central Bank determines that the pace of the liquidation may represent a risk to its creditors. Liquidation proceedings may otherwise be requested, on reasonable grounds, by the financial institution's officers, if its respective bylaws entitle them to this jurisdiction, or by the intervener appointed by the Central Bank in the intervention proceeding, with an indication of the causes of the request.

What criminal penalties may apply?

Following formal investigation, the offenders are subject to criminal penalties in certain cases, including, but not limited:

• insider dealing and misleading statements and practices;
• breaches of the Money Laundering Regulations; and
• conducting regulated activities when not authorized.

These penalties are mainly set out in the Acts on Crimes Against the National Financial System (Act No. 7,492/86); in the Act on Tax Evasion and Crimes Against the Economic Order (Act No. 8,137/90) and in the Anti-Money Laundering Act (Act No. 9,613/98). The penalties may range from fine to imprisonment.

Apart from the above-mentioned criminal Acts, companies are also subject to the administrative and civil sanctions set forth in the Brazilian Clean Company Act (Act No. 12,846/2013), in case of illicit acts committed against the Brazilian or foreign public administration.

According to the mentioned Act 7,492/86, both Central Bank and CVM are entitled to assist the Federal Prosecution Office in the course of the criminal action whenever the crime is practiced in the context of the activities that are subject to the regulators' discipline and inspection.

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

There are no stamp, registration or transfer taxes in Brazil. However, financial transactions are subject to the financial transactions tax (IOF), which applies to a variety of transactions, including loans, its transfer or assignment. IOF rates and basis vary depending on the nature of the transaction. The rates range from 0% to a maximum of 25%, depending on the type of financial instrument. The federal
government can modify these rates at any time.

**Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?**

There are no stamp, registration or transfer taxes in Brazil. However, the IOF rules explained above also apply to the taking, transfer or assignment of a mortgage, debenture or other security. Specific exemptions may apply and a case by case analysis is recommended.

**Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?**

There are no stamp, registration or transfer taxes in Brazil. However, the IOF rules explained above also apply to the taking, transfer or assignment of a debt security. Specific exemptions may apply and a case by case analysis is recommended.

**Do tax authorities take priority on enforcement?**

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?

Yes, Brazilian tax authorities take priority over any other creditor, except creditors under labor law and labor accident law. However, in the event of a bankruptcy, tax authorities do not take priority over creditors with security over real estate property (i.e. a mortgage).

**Is withholding tax on interest payments applicable?**

Is there withholding tax on interest payments under a loan?

Interest paid under a loan transaction is subject to withholding tax in Brazil.

*If so:*

**What is the rate of withholding?**

For interest payments made under loans granted by Brazilian legal entities, withholding income tax applies at the following rates, which vary in accordance with the term of the loan agreement:

- 22.5% for loans with a maturity term of up to 180 days;
- 20% for loans with a maturity term of between 181 and 360 days;
- 17.5% for loans with a maturity term of between 361 and 720 days; and
- 15% for loans with a maturity term longer than 720 days.

Please note that the payment, credit or remittance of interest amounts outside of Brazil is subject to withholding income tax at a 15% rate, or at a 25% rate, if the lender is domiciled in low haven jurisdictions.

**What are the key exemptions?**

A 0% withholding income tax rate applies to interest amounts paid, credited, or remitted to recipients not resident in Brazil in connection with loan agreements entered into with the sole purpose of stimulating export transactions.

Under certain double tax treaties entered into by Brazil, a lower withholding tax rate applies to the payment, credit, or remittance of interest to a resident of the treaty partner country.

**Would the same analysis apply to interest payments under a debt security (e.g. a bond)?**
In general, interest payments under debt securities are also subject to the same withholding income tax rules as described above.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

The transfer of funds into Brazil by way of loan between a foreign lender and a domestic borrower is subject to the financial transactions tax (IOF), at a 6% tax rate, if the loan's average maturity term is 180 days or less. For loans with an average maturity longer than 180 days, the IOF is currently reduced to 0%.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

*Are there any restrictions on issuing debt securities?*

There are restrictions on the issuance of debt securities in all Canadian jurisdictions.

The rules relating to the issuance of debt securities are the same as those relating to the issuance of equity. Debt securities may not be issued to the public unless a prospectus has been filed with the securities commission of each province and territory in which the securities are proposed to be sold. Debt securities may be issued without filing a prospectus by way of a private placement.

*Last modified 2 Jan 2020*

*What are common issuing methods and types of debt securities?*

Debt securities may be publicly issued by filing a prospectus, or by way of private placement pursuant to an offering memorandum or a term sheet.

Debt securities are usually issued under a trust indenture entered into between the issuer and an indenture trustee that acts as a representative of the subscribers.

Common types of debt securities include bonds, secured and unsecured notes, convertible and non-convertible debentures, and asset-backed securities.

*Last modified 2 Jan 2020*

*What are the differences between offering debt securities to institutional/professional or other investors?*

Prospectus requirements do not create a distinction between institutional/professional or other investors. Investors that meet the prescribed eligibility criteria as an ‘accredited investor’ or a ‘permitted client’ may purchase debt securities offered by way of private placement.

*Last modified 2 Jan 2020*

*When is it necessary to prepare a prospectus?*

Any offering of debt securities requires a prospectus, unless an exemption from the prospectus requirement applies.
What are the main exchanges available?

Most debt securities in Canada are not listed on a securities exchange but trade over-the-counter through alternative trading systems, such as:

- CanDeal;
- CBID/CBID Institutional; and
- Market Axess.

The two principal stock exchanges in Canada both list debt as well as equity securities:

- Toronto Stock Exchange (TSX); and
- TSX Venture Exchange (TSXV).

Issuers seeking to list on either the TSX or TSXV must complete a listing application and various listing requirements.

Is there a private placement market?

Yes, in Canada there is an active private placement market for both bank and non-bank issued debt securities.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers filing a prospectus are responsible for statements made in prospectuses and any misleading statement, omissions or failure to make full, true and plain disclosure could result in civil and criminal liability. Further, purchasers of securities offered by a prospectus that contains a misleading statement also have a right of rescission and a right to bring a civil action against the issuer as well as the directors, the underwriters, the auditors etc.

Issuers must also ensure that the issuance of debt securities does not contravene any covenants made to other lenders or the terms and conditions of any agreement to which the issuer is a party.

Investing in debt securities

Where debt securities are issued under a trust indenture, the indenture trustee usually has the authority to permit certain changes to the terms and conditions without the consent of the security holders. Further, significant changes may be made with the approval of a majority of security holders.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

The establishment and operation of a fund and the offering of fund securities is subject to regulation under the securities legislation and the oversight of the securities commission of each province. Private equity funds and hedge funds are only indirectly regulated unless they file a prospectus; however, such funds may only sell their securities in compliance with available prospectus exemptions, and must
comply with applicable dealer registration requirements.

Each of Canada's ten provinces and three territories has its own securities laws, administered by a local securities regulatory authority. However, in a growing number of areas, including investment fund regulation, the rules have been largely harmonised across the 13 jurisdictions.

The key regulatory instruments that apply to offering fund securities and operating a fund, among other things are:

- **National Instrument 81-101 – Mutual Funds Prospectus Disclosure** (NI 81-101) that regulates projects disclosure requirements for mutual funds;
- **National Instrument 81-102 – Investment Funds** (NI 81-102) that sets out core investment restrictions and fundamental operational requirements;
- **National Instrument 81-105 – Mutual Funds Sales Practices** (NI 81-105) that regulates the sale of mutual funds;
- **National Instrument 81-106 – Investment Fund Continuous Disclosure** (NI 81-106) that sets out continuous disclosure requirements for investment funds; and
- **National Instrument 31-103 Registration Requirements, Exemptions and Ongoing Registrant Obligations** (NI 31-103) that regulates registration requirements and the activities of registrants.

**What are common fund structures?**

Common forms of funds include:

- **Open-ended retail funds** – are also referred to as mutual funds and are pooled funds that generally issue securities or units continuously.
- **Closed-ended retail funds** – are also referred to as non-redeemable investment funds. These typically raise a fixed amount of capital through a public offering and many are listed on capital markets.

**What are the differences between offering fund securities to professional / institutional or other investors?**

**Retail funds**

Both closed-ended and open-ended funds that wish to sell securities to the public must file a prospectus and comply with continuous disclosure and other applicable regulatory requirements, as well as exchange rules and policies where the securities of the fund are publicly listed. The funds must also comply with applicable registration requirements under **NI 31-103**.

Foreign funds in many cases will be able to sell its foreign securities to Canadian investors without being registered in Canada, provided the fund:

- sells only to ‘permitted clients’;
- meets all requisite conditions; and
- complies with certain filing requirements (as set out under **NI 31-103**).

**Institutional/professional funds**

Institutional or professional funds are not recognized as a separate category and the offering of securities by an institutional fund would depend entirely on the form of the fund. Where the fund is marketing to the public, it must file a prospectus and comply with continuous
disclosure and other applicable regulatory requirements, as well as exchange rules and policies where the securities of the fund are publicly listed. Alternately, as is more often the case, funds targeted at institutional investors do not offer securities to the public and generally offer securities by way of a private placement under a prospectus-filing exemption.

**Last modified 2 Jan 2020**

**Are there any other notable risks or issues around establishing and investing in funds?**

**Establishing funds**

Managing investments is a regulated activity in Canada, and dealers and financial advisors must be registered with the applicable securities commission. Similarly, individuals acting on behalf of registered firms must also be registered under the applicable category.

**Investing in funds**

Investment in funds is subject to generally the same risks as investment in any other security.

**Last modified 2 Jan 2020**

**Managing and marketing debt / hedge funds**

**Are there any restrictions on marketing a fund?**

Retail funds can be marketed by registered dealers. Mutual funds are typically distributed to retail investors by either:

- investment dealers; or
- mutual fund dealers.

Exempt market dealers can also market prospectus qualified, open-ended funds to eligible investors under a prospectus exemption. The most common prospectus exemption is the accredited investor exemption. Under this prospectus exemption, securities can be distributed to a purchaser that qualifies as an accredited investor, including:

- an individual who alone or with a spouse has either CA$1 million in financial assets or CA$5 million in net assets;
- an individual who had net income before taxes exceeding CA$200,000 in each of the two most recent calendar years (or CA$300,000 when combined with income of a spouse);
- a Canadian financial institution or Schedule III bank;
- an advisor or dealer;
- the Government of Canada or a jurisdiction of Canada (including crown corporations and agencies);
- a municipality, public board or commission in Canada;
- certain pension funds; and
- certain investment funds.

Institutional investors that are 'permitted clients' may be less relevant for retail funds but are the focus of hedge and non-resident funds.

A firm registered as an investment dealer or mutual fund dealer must generally be a member of a self-regulatory organization. Investment dealers must generally become members of the Investment Industry Regulatory Organization of Canada (IIROC). Mutual fund dealers must generally become members of the Mutual Fund Dealers Association of Canada (MFDA).

Registered dealers, including mutual fund dealers, are subject to ‘know your client’ (KYC), ‘know your product’ (KYP) and suitability requirements that are collectively intended to ensure that purchases of securities are not incompatible with the client’s circumstances, risk tolerance and investment goals.
Under KYC requirements, dealers must take reasonable steps to establish the identity of a client and to ensure that they have sufficient information to meet their suitability obligation. Under suitability requirements, a dealer must obtain, understand and is expected to explain how a proposed investment is suitable for the client in light of the client’s investment needs and objectives, including the client’s:

- time horizon for its investments;
- financial circumstances (including net worth, income, current investment holdings and employment status); and
- risk tolerance for various types of securities and investment portfolios, taking into account the client’s investment knowledge.

Registrants must conduct their own product due diligence and be able to explain to clients the security’s:

- risks;
- key features; and
- initial and ongoing costs and fee.

Are there any restrictions on managing a fund?

NI 31-103 provides for the registration of persons in connection with trading or advising in securities, investment fund management and other related matters.

The key requirement is registration as an investment fund manager (IFM), which is defined as a person or company that directs the business, operations or affairs of an investment fund. IFMs are subject to a statutory duty to act in the best interests of an investment fund. The regulators considered extending this duty of care to other categories of registrants, however, subsequent to an extensive consultation period, the regulators published a set of proposed amendments which impose new requirements, codify best practices in existing guidance, and clarify the client-registrant relationship. These amendments are expected to come into force on December 31, 2019, subject to receiving required provincial approvals, with industry participants being required to comply over a two-year phased transition period.

An IFM that acts as a portfolio advisor or that distributes securities of its own funds must also register as a portfolio manager (PM) or as an exempt market dealer (EMD), respectively. All registrants, including EMDs, must:

- meet minimum capital and insurance requirements;
- adopt written compliance policies and procedures;
- file periodic reports with the principal securities regulator and maintain certain records; and
- identify, disclose and manage conflicts of interests.

Fund managers must disclose, on a quarterly basis, net asset value (NAV) adjustments. In addition, all registrants must file audited financial statements with the regulators. IFMs of funds that are reporting issuers must comply with the requirements of National Instrument 81-102 (NI 81-102), NI 81-106 and NI 81-107.

Dealers and advisors are subject to best execution requirements under NI 23-101 (Trading Rules) and rules regarding soft dollar arrangements under NI 23-102 (Use of Client Brokerage Commissions).

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

The regulation of derivatives in Canada, like securities, is governed by individual provincial regulators. However, provincial regulators have generally enacted uniform regulations in respect of derivatives, which are substantially similar to those in the US and in the EU, all as part of its G20 commitments following the global financial crisis in 2008.
Dealer registration requirements exist to the extent a party is engaged in the 'business of trading derivatives'. There are a number of indicia to indicate if and when a party is considered a dealer and whether or not they are subject to registration requirements.

Over-the-counter derivatives transactions in some jurisdictions in Canada are treated as trading in securities and are thus subject to securities laws. To be exempt therefrom (pursuant to blanket orders in individual jurisdictions), parties to over-the-counter derivatives transactions must represent that they are of a type of sophisticated counterparty that ensures they are aware of and have adequately assessed the risks associated with these types of transactions. There are a number of criteria included in such blanket orders for purposes of determining a party's ability to trade derivatives relating to the type of entity and net worth of any such individual or entity.

What are common types of derivatives?

Derivative contracts are entered into in Canada for a range of reasons including foreign exchange, currency, commodity, hedging and speculation.

Derivatives may be traded over-the-counter or on an organized exchange.

All of the main types of derivative contracts are widely used in Canada:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contract is based on the value of the underlying assets. The main classes of underlying assets seen in Canada are:

- equity;
- interest rates;
- commodities;
- foreign currency; and
- credit events.

Certain types of standardized over-the-counter derivatives, including interest rate swaps and foreign rate agreements, are also subject to mandatory clearing.

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007-to-2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. Canada, in line with the G20 Commitments, has sought in particular, to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative positions;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen and continues to see the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants. In particular, the new regulations are focused on trade reporting, dealer registration, mandatory clearing and margining to reduce credit and market risk.

In addition, derivatives are subject to normal market and counterparty credit risk and, as a result, are designed solely for sophisticated
Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending Banks

The operation of domestic and foreign banks is governed by the Bank Act (Canada) which requires that a bank receive authorization to carry on banking activities in Canada. The classification of the bank as a Schedule I Bank (Canadian-owned banks), Schedule II bank (foreign bank subsidiaries) or Schedule III bank (foreign banks operating through branches in Canada) determines which provisions of the Act apply to such bank.

Section 510(1) of the Bank Act (Canada) provides that:

‘Except as permitted... a foreign bank or an entity associated with a foreign bank shall not (a) in Canada, engage in or carry on (i) any business that a bank is permitted to engage in or carry on under this Act, or (ii) any other business; (b) maintain a branch in Canada for any purpose; (c) establish, maintain or acquire for use in Canada an automated banking machine, a remote service unit or a similar automated service, or in Canada accept data from such a machine, unit or service; or (d) acquire or hold control of, or a substantial investment in, a Canadian entity.’

An exemption to section 510(1) is found in section 524(1) of the Act which permits a foreign bank to establish a branch in Canada upon approval from the Minister of Finance.

A foreign bank can avoid the application of the Bank Act (Canada) while making loans to Canadian borrowers by ensuring that the bank's activities in Canada do not amount to engaging in or carrying on business in Canada. This is a question of fact and depends on the circumstances of each individual situation.

Foreign banks may also establish Representative Offices in Canada with the required approval under the Bank Act and may promote the services of the foreign bank and act as a liaison with non-Canadian Offices of the foreign bank, but may not otherwise carry on business.

Borrowing

Borrowers are generally not regulated; however, some regulations apply if the borrower is classified as a consumer, depending on the Province's consumer legislation.

What are common lending structures?

Lending in Canada can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents and trustees who fulfil certain roles for the finance parties) and are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.
Loans are structured to achieve specific objectives (e.g. term loans, working capital loans, project facilities and letter of credit facilities).

**Loan durations**

The duration of a loan can vary among:

- a term loan, which is provided for an agreed period of time, usually 3-5 years;
- a revolving loan, which allows for the loan amount to be withdrawn, repaid and redrawn until the maturity date;
- an overdraft, which is provided on a short-term basis to solve short-term cash flow issues; and
- a standby loan, where the lender gives a commitment to advance a specified amount of money on demand or at a future date.

**Loan security**

A loan can either be secured, unsecured or guaranteed. For more information, see [Giving and taking guarantees and security](#).

**Loan commitment**

A loan can also be:

- committed, which means that the lender is obliged to provide the loan if certain conditions are satisfied; or
- uncommitted, which means that the lender has discretion whether or not to provide the loan.

**Loan repayment**

A loan can be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or on scheduled repayment dates (usually meaning the loan is repayable in full at maturity).

**What are the differences between lending to institutional / professional or other borrowers?**

Generally, there are no differences between lending to institutional/professional borrowers and other borrowers. There may be additional considerations regarding the taking and enforcing of security for secured loans and execution requirements.

**Do the laws recognize the principles of agency and trusts?**

Yes, both principles are recognized as a matter of Canadian law.

For instance, it is possible to appoint an agent to act on behalf of other parties and a trustee to hold rights and other assets on trust for the lenders or secured parties.

**Are there any other notable risks or issues around lending?**

Generally

ENFORCEABILITY

Loan agreements and other finance documents are subject to general contractual principles. Enforcement of contracts is subject to applicable bankruptcy, insolvency, moratorium, reorganization and other similar laws relating to or affecting the enforceability of creditors’ rights generally; general equitable principles and the discretion of courts in granting equitable remedies.
INTEREST

Except with respect to mortgages on real property and, in Québec, hypothecs subject to the provisions of the Civil Code of Québec, a lender may charge any rate of interest pursuant to the Interest Act (Canada), provided that if the rate of interest is payable at a rate or percentage per day, week, month or for any period less than a year, the lender discloses in the agreement the yearly rate or percentage of interest to which the other rate or percentage is equivalent. If such disclosure is not included in the agreement, no interest exceeding the rate or percentage of 5% per annum is chargeable, payable or recoverable on any part of the principal money. In addition, the Criminal Code (Canada) prohibits the charging of annual interest that exceeds 60%. Any rate above 60% is a 'criminal rate' and is illegal. Debtors may use such a finding as a reason to avoid repayment. 'Interest' is broadly defined under the Criminal Code (Canada) and includes all charges and expenses, including fees, fines, penalties and commissions.

ENVIRONMENTAL ISSUES

Lenders must also be mindful of the various environmental liabilities and obligations that apply under federal, provincial and territorial laws to their debtors. In certain circumstances, these liabilities and obligation can extend to the lender. This can arise if the lender is found to have exercised control or direction over the day-to-day operations or financial management of the debtor or becomes the owner of a contaminated site by foreclosure or similar action.

Specific types of lending

For secured lending to individual debtors, lenders should consider the application of various provincial and territorial legislation which protects the rights of spouses. For more information, see Giving and taking guarantees and security.

Standard form documentation

Loan documents and other finance documents are generally the bank's standard form documentation.

Are there any other notable risks or issues around borrowing?

Borrowers should consider the risks associated with defaulting under the loan agreements and ancillary documents and the rights of the lender on such default.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the giving of guarantees and security are as follows.

Capacity

It is important to check the constitutional documents of a corporation giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors' powers that would be preventative. Canadian creditors generally rely on the legal opinions of debtors' counsel as to capacity and the enforceability of loan agreements and ancillary documents.

In Québec, the Civil Code of Québec provides various obligations pertaining to the right to grant a security, notably depending on whether the grantor is an individual or a business entity.

Insolvency

Guarantees and security may be at risk of being set aside under Canadian insolvency laws and under provincial fraudulent preference/conveyancing laws if the guarantee or security was granted by a corporation within a certain period of time prior to the onset...
of insolvency. This would be the case if the corporation giving the guarantee or security received considerably less consideration and, as such, the transaction was at an undervalue. Guarantees and security may also be challenged on other grounds relating to insolvency.

**What are common types of guarantees and security?**

**Common forms of guarantees**

Guarantees can take a number of forms. Two common forms are performance bonds and payment guarantees.

**PERFORMANCE BONDS**

A performance bond describes a financial undertaking used to protect a buyer against the failure of a supplier to deliver goods or perform services in accordance with the terms of a contract. The issuer of the bond undertakes to pay to the buyer a sum of money if the seller fails to deliver the goods or perform the contracted services on time or in accordance with the terms of the contract.

**PAYMENT GUARANTEES**

A payment guarantee provides that the guarantor will be obligated to pay either all outstanding monies owed under the primary contract or an amount up to a fixed amount if the debtor or obligor fails to make such payments.

**Common forms of security**

The common types of security agreements are as follows.

**GENERAL SECURITY AGREEMENTS (GSAS)**

A GSA normally charges all present and after-acquired personal property of the debtor, but can be limited to specific items of personal property and can include a floating or fixed charge against the debtor’s interest in real property. In Québec, the equivalent of a GSA is a hypothec which charges present and after-acquired movable property (ie personal property).

**PLEDGES**

Pledges require debtors to deliver certain assets, such as securities or negotiable instruments, to the creditor.

**MORTGAGES**

A mortgage charges the real property of the debtor. In Québec, the equivalent of a mortgage is a hypothec which charges immovable property (ie real property).

Additionally, it is possible to grant security over all of the assets of the debtor (which is called in Québec the universality of the assets of the debtor). Granting security over all of a corporation's assets will tend to be achieved by way of a debenture which will include:

- a mortgage over real property (and, in Québec, that would be a hypothec over the universality of all the immovable assets);
- a fixed charge over assets which are identifiable;
- a floating charge over fluctuating and less identifiable assets; and
- an assignment by way of charge over receivables and contracts.

**Are there any other notable risks or issues around giving and taking guarantees and security?**

**Giving or taking guarantees**
To be valid, a guarantee needs to be in writing, signed by the guarantor and provided for good consideration.

Consideration for a guarantee is subject to general contractual principles. In the case of a guarantee, the underlying obligations will usually be the consideration for the guarantee and so it is advisable to execute the guarantee at the same time as executing the underlying obligations to avoid any suggestion of past consideration. Often the guarantee is included in the loan agreement and so this should not be an issue. Also, it can be difficult to establish consideration for a guarantee as the primary obligations are between the underlying obligor and beneficiary, for example between the borrower and lender. Guarantees can be executed as deeds to avoid any argument about whether good consideration was provided. Deeds have particular execution requirements which need to be observed.

In Alberta, personal guarantees require compliance with the *Guarantees Acknowledgment Act (Alberta)*. In Saskatchewan, personal guarantees require compliance with *The Saskatchewan Farm Security Act (Saskatchewan)*. Generally, the guarantor needs to appear before a lawyer in Alberta or a lawyer or notary public in Saskatchewan and:

- acknowledge that he or she executed the guarantee; and
- execute the prescribed guarantee certificate in the presence of the lawyer or notary public.

The lawyer or notary public, as applicable, then must complete the prescribed guarantee certificate. Failure to comply with the applicable Act will result in the personal guarantee being unenforceable. In Québec, guarantees or suretyships must comply with the *Civil Code of Québec*.

In most Canadian jurisdictions, corporate legislation permits a corporation to give financial assistance by way of guarantee or otherwise to any person for any purpose, provided it discloses material financial assistance to its shareholders. In some provinces and territories, the corporation must meet the prescribed insolvency test in order to provide financial assistance to an intercorporate group. Under certain circumstances, creditors and minority shareholders may challenge the granting of a guarantee under the oppression provisions of the applicable corporate legislation.

### Giving or taking security

Once granted, security needs to be properly “perfected” before it is valid against third parties. Perfection formalities depend on the location and nature of property subject to the security and can range from having the secured asset delivered to the secured party, registering the security agreement or notice thereof in the applicable provincial registry system, providing notice of the security interest to third parties, or a combination thereof. The registry system and the requirements for registration vary among the provinces and territories. All of the common law provinces have enacted Personal Property Security Acts which have a great deal of similarity in purpose and content. The PPSAs are modelled on the U.S. UCC-9 provisions. Quebec has a comparable regime under the *Civil Code of Quebec*.

Additionally, the priority of a secured party's security interest may be governed by various provincial and federal laws which deal with the taking, perfecting and enforcing of security interests. The determination of priorities among interests created under the various Acts can be a cumbersome process. Generally, a creditor will conduct searches to ascertain whether there are any secured parties who will have priority over its interests in all provinces and territories in which a debtor carries on business or has assets.

There may also be unregistered interests which may take priority over a secured party, including statutory liens. Statutory liens commonly arise from a debtor's obligation to remit amounts collected or withheld on behalf of the government (eg employee deductions for income taxes, pension plan contributions, goods and services taxes, provincial sales taxes and property taxes). These liens are deemed trusts and are usually not registered in any registry system. As such, they may not be identified through conventional searches. Issues regarding statutory liens typically arise when a debtor becomes insolvent or commences a restructuring under the *Bankruptcy and Insolvency Act (Canada)* or the *Companies’ Creditors’ Arrangement Act (Canada)*.

For security interests granted by individual debtors, creditors should consider the application of various provincial and territorial legislation which protects the rights of spouses. Such legislation may affect a secured party's ability to enforce its security against a home or homestead. Generally, this risk can be mitigated by receiving the written consent of the spouse of the debtor at the time the debtor executes the security agreement.

### Financial regulation
Law and regulation

**What are the main laws and regulations that apply to entities that are involved in finance and investments generally?**

**Generally**

**FEDERAL**

Bank Act (S.C. 1991, c. 46)

Office of the Superintendent of Financial Institutions Act (R.S.C, 1985, c. 18 (3rd Supp.), Part I)

Canadian Securities Administrators (group that co-ordinates securities regulation among the 13 provincial and territorial regulators)

**PROVINCIAL**

Each province and territory has enacted its own securities legislation and has established a regulatory authority to administer it. Many provinces and territories interpret securities laws in the same manner through the adoption of National and Multilateral Instruments. These National and Multilateral Instruments can be found at each province's or territory's respective securities commission website.

Securities Act (Alberta) and Alberta Securities Commission

Securities Act (BC) and the British Columbia Securities Commission

Securities Act (Ontario) and Ontario Securities Commission

Securities Act (Québec), Derivatives Act (Québec) and the Autorité des marchés financiers

**Consumer credit**

**FEDERAL**

Financial Consumer Agency of Canada Act (S.C. 2001, c.9)

**QUÉBEC**

Consumer Protection Act-RSO c.P40

Civil Code of Quebec

**Mortgages**

**FEDERAL**

Canada Mortgage and Housing Corporation Act (R.S.C., 1985, c. C-7)

**QUÉBEC**

In Québec, the equivalent to a mortgage is a hypothec, which is the most common form of securities.

Civil Code of Québec

Regulation No. 29 respecting Mutual Funds Investing in Mortgages (V-1.1, r. 45)

**Corporations**

**FEDERAL**
Canada Business Corporations Act

PROVINCIAL

Each province and territory has its own provincial legislation.

Ontario Business Corporations Act

Alberta Business Corporations Act

Business Corporations Act (Québec) and Civil Code of Québec

Instruments 91-301 to 94-101
Regulatory authorization

Who are the regulators?

Provincial (Québec)

The Autorité des marchés financiers is the regulator of the Québec financial sector, notably in the areas of insurance, securities, derivatives, deposit institutions (other than banks) and the distribution of financial products and services, as well as products and services related to insurance, in both retail and wholesale markets. It is also responsible for any enforcement of market abuse and listing regimes.

Self-regulatory organizations (e.g. Montréal Exchange) receive certain delegation of powers from the Autorité des marchés financiers in order to monitor and supervise the conduct of its members, including development of rules and compliance control in respect of these rules.

What are the authorization requirements and process?

Provincial (Québec)

Subject to certain exemptions, any firm/person wishing to act as a dealer, advisor or investment fund in Québec must register with the Autorité des marchés financiers.

In that regard, the Autorité des marchés financiers maintains the Register of firms and individuals authorized to practise.

Certain fees may apply and are payable to the Autorité des marchés financiers depending on the type of services and products, or on the type of registration.

What are the main ongoing compliance requirements?

People who sell or give advice about mutual funds must be registered through the sponsorship of a dealer, with the provincial securities commission in each province where they want to sell mutual funds.

A dealer, or retail distributor, must be registered with the appropriate securities commission(s) and, depending on the jurisdiction and the types of securities the dealer can sell, it may have to be a member of the Mutual Fund Dealers Association (MFDA) or Investment Industry Regulatory Organization of Canada (IIROC). The advisors sponsored by a dealer are also regulated by the MFDA or IIROC, except in Québec where they are regulated by the Chambre de la sécurité financière.

What are the penalties for failure to be authorized?

Provincial (Québec)
Anyone undertaking any regulated activity without being authorized or registered, commits an offence (sometimes criminal) and is liable to be subject to a fine (and in some cases to imprisonment).

Last modified 2 Jan 2020

Regulated activities

What finance and investment activities require authorization?

Generally

Foreign investment in certain industry sectors such as telecommunications, transportation, broadcasting and banking will generally require prior approval by the applicable regulatory authority.

INVESTMENT CANADA ACT (CANADA)

Foreign investment in Canada is regulated by the Investment Canada Act (Canada). Non-Canadians who propose to acquire control of an existing Canadian business must either (depending on whether certain prescribed monetary thresholds for the investment are exceeded):

- file a notification prior to the implementation of the investment or within 30 days thereafter; or
- file an application for review prior to implementation of the investment.

Non Canadians who establish a new Canadian business must file a notification.

With certain exceptions, an application for review triggers a pre-closing waiting period (which may be several weeks or longer), meaning that approval of the Minister of Innovation, Science and Industry is required before the transaction may close. [If the investment involves acquisition of control of a cultural business, approval is required from the Minister of Canadian Heritage.] Such approval will be provided if the relevant Minister is satisfied that the transaction will result in a 'net benefit' to Canada. Investors normally must provide commitments in order to secure such approval.

The federal cabinet, in consultation with the Minister of Innovation, Science and Industry, may also order a review of an investment by a non-Canadian where there are reasonable grounds to believe the investment could be injurious to national security. Such a review is possible for foreign investments constituting less than an acquisition of control and regardless of financial thresholds. This applies to a non-Canadian that acquires an interest in or establishes a Canadian business or, in certain circumstances, an entity carrying on all or part of its operations in Canada.

COMPETITION ACT (CANADA)

Where the prescribed financial thresholds are exceeded, the parties must notify the Commissioner of Competition (head of the Competition Bureau) about the proposed transaction and observe the prescribed waiting periods. Completion of the transaction cannot take place unless and until the Commissioner issues an Advance Ruling Certificate (ARC) or waives the requirement to notify, or the statutory waiting period has expired.

Before closing and for up to one year thereafter, the Commissioner may challenge a merger of any size where it is likely to lessen or prevent competition substantially. The Commissioner's challenge is made by way of an application to the Competition Tribunal. The Commissioner typically seeks an order to block a merger or to require divestiture of assets. Parties to a merger may voluntarily seek approval from the Commissioner (in the form of an ARC or “no-action letter”) if there are concerns with respect to the competitive impact of the transaction.

INVESTMENT IN REAL PROPERTY

In Alberta, Saskatchewan, Manitoba and Québec, the investment in farm land by non-Canadians is regulated and restricted. Each province has a different definition of who is considered to be a non-Canadian. In Québec, the investment in farm land by non-residents of Québec
and foreign-controlled entities is also regulated and restricted.

In Prince Edward Island, the investment in land by non-residents of Prince Edward Island is regulated and restricted.

SECURITIES

Any regulated financial activity in Québec requires an authorization from the Autorité des marchés financiers. For instance, any firm providing money or insurance services has to be registered with the Autorité des marchés financiers.

Consumer credit

In addition to federal consumer protection laws, each province and territory in Canada has enacted consumer protection legislation. Generally, consumer protections cannot be waived and the prescribed disclosure must be provided to the consumer prior to entering into an agreement with the consumer (e.g., the total cost of credit or borrowing, as well as any particular fees, must be disclosed to the consumer). Consumer protection laws in some provinces also prohibit clauses that provide that a foreign law governs the consumer agreement or that provide that the consumer is not permitted to bring a class action or be a member of a group bringing a class action.

Are there any possible exemptions?

The Investment Canada Act (Canada) and the Competition Act (Canada) each contain limited exemptions from the application of the Act. Generally, the applicable legislation in each of Alberta, Saskatchewan, Manitoba, Québec and Prince Edward Island set forth certain exemptions regarding the investment in farm land or land, in case of Prince Edward Island. If one of the exemptions does not apply, non-Canadians can apply for an exemption or authorization from the regulatory authority responsible for administering the relevant regime.

Do any exchange controls or other restrictions on payments apply?

There are no exchange controls in Canada and no restrictions on the repatriation of profits (other than requirements relating to withholding tax on dividends etc).

What are the rules around financial promotions?

Rules

‘Financial promotions’ is not a concept used in Canada.

Under Canadian securities laws, a distribution of securities may only be made by way of a prospectus that complies with Canadian securities laws and that has been filed with the Canadian securities regulators, unless a prospectus exemption is available. The securities laws of a province of Canada will apply if securities are sold to a purchaser who is resident in such province or to a purchaser who has sufficient connections to such province to trigger the application of its securities laws.

Canada also has anti-spam legislation (Canada’s Anti-Spam Law (CASL)). Generally, express opt-in consent is required to send commercial electronic messages (including emails, text messages and other electronic messages) to any person in Canada. There must also be compliance with certain content requirements, including those relating to sender details and unsubscribe requests.

Exemptions

Issuers can offer or issue their securities in a manner that is exempt from the prospectus requirements (under National Instrument 45-106 Prospectus Exemptions). The most commonly used prospectus exemption is the exemption that permits a sale of securities only to investors who qualify as accredited investors under Canadian securities laws. There are also the family-and-friends exemption, employee
exemption and the offering memorandum exemption, in addition to others.

Under CASL, there are a few relationships in which there will be implied consent to receive commercial electronic messages, including existing business relationships (i.e., where the person has made a transaction, an inquiry, an application or a written contract for the purchase or barter of products, goods or services). Emails must still comply with the content requirements, including those relating to sender details and unsubscribe requests.

Last modified 2 Jan 2020

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common types of legal entities are general partnerships, limited partnerships, limited corporations and unlimited liability corporations. Other legal structures available in Canada for businesses include contractual relationships, such as franchises, joint ventures and license agreements.

Limited liability and tax consequences tend to be the main considerations for most businesses when choosing the appropriate means for undertaking financial or investment activity.

Partnerships

A partnership generally exists when two or more persons carry on business together with a view to profit. The income and losses of the partnership generally flow through to the partners of the partnership.

In a general partnership, each partner is jointly liable for the debts and obligations of the partnership. In a limited partnership, the general partner is liable for the debts and obligations of the partnership and the limited partners are only liable to the extent of their capital contributions (provided they do not take part in the management or control of the business of the partnership).

Corporations

Corporations are considered to be separate legal entities. Shareholders of a limited corporation (denoted by Limited or Ltd., Incorporated or Inc., or Corporation or Corp.) have limited liability and shareholders of an unlimited liability corporation (denoted by Unlimited Liability Corporation or ULC) have unlimited liability. Incorporation can be effected at the federal, provincial or territorial level; however, only the provinces of British Columbia, Alberta and Nova Scotia allow for the creation of an unlimited liability corporation.

A corporation incorporated either provincially or federally must be extra-provincially registered in each province where such corporation carries on business. The ‘carrying on business’ test is specific to each jurisdiction, but typical indicia include whether an entity has any physical presence or assets, resident employees or agents, local phone numbers or traditional advertising activities in the jurisdiction. The registration process in each jurisdiction is relatively straightforward and generally involves some combination of submitting an application, paying a fee, appointing an agent for service, and providing proof of the entity’s existence (e.g., a certificate of status).

Funds

Investment funds tend to take the form of limited partnerships, limited companies and trusts. Persons who act as investment fund managers are generally required to register in the provinces or territories in which the investment fund managers do business. If an investment fund manager does not have a place of business in Canada, it may be exempt from this registration requirement in certain circumstances.

Last modified 2 Jan 2020

Is it possible to conduct lending or investment business through a branch or establishment?
Yes.

A non-Canadian entity may conduct business in Canada through a branch office of the non-Canadian entity. The non-Canadian entity will be required to register (with the appropriate authority) as an extra-provincial entity in each province where it carries on business.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Overview

In Canada, FinTech products and services are continually evolving and commonly include, among others, peer-to-peer (P2P) lending platforms, crowdfunding platforms, virtual credit cards, online lenders, robo advisors (i.e. algorithm-driven wealth management and advisory services), online money transfer services and the implementation of digital currency initiatives. These new products and services may use artificial intelligence (AI), machine learning, distributed ledger technology or other technologies to offer a compelling service to clients and customers.

Marketplace lending

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes P2P-type structures often operated through an electronic platform provider, crowdfunding platforms that connect investors with companies looking to raise capital (including from retail investors) and various other financing mechanisms.

It is not uncommon for a marketplace lending platform to raise capital from venture capital funds and/or private equity funds or institutional sponsors.

ISSUES FOR STARTUP MARKETPLACE LENDERS

Following the initial incorporation and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform. As the startup lender will not have an established track record, deposit base or asset pools, deriving an effective funding structure will be particularly important.

A significant issue for any marketplace lender will be navigating the Canadian (and potentially international) regulatory regime(s). For example, depending on the nature of the activities and the manner in which they are conducted, some or all of the following legal regimes, among others, may be relevant to the business:

- securities law (e.g., robo advisory firms, crowdfunding platforms and P2P lending platforms may all be subject to applicable securities laws);
- consumer protection legislation (this may govern the relationship between the lender and its customers);
- payment processing regulation (either by federal or provincial legislation or industry standards and codes);
- anti-money laundering legislation (including the Proceeds of Crime (Money Laundering) and Terrorist Financing Act);
- privacy legislation; and
- data security legislation.

It is imperative that startup marketplace lenders engage appropriate legal counsel and other advisors to assist in establishing a business structure that is both efficient and regulatory compliant from the outset as this will assist the startup in attracting investment and
ensuring it is positioned to reduce potential issues during its growth phase.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the block using sophisticated algorithms and add the verified block to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a 'proof of work' process.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open ('permissionless' or 'unpermissioned') or structured within a private group ('permissioned'). Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an 'address'). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called 'smart contracts'. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called 'Oracles'. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

There are various definitions of cryptocurrency and many individuals use it in a colloquial sense; however, it can be considered to be a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is
issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a ‘security’ for purposes of applicable laws.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper (or an offering memorandum or prospectus if the token offering constitutes an offering of securities) available to potential purchasers. Any person contemplating an ICO should consult with global legal counsel to ensure that they are complying with all applicable laws, including securities laws, sanctions, anti-money laundering, tax and consumer protection legislation.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by AI that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years. Any business contemplating the use of cloud computing must ensure it has appropriate regulatory, privacy and data security procedures in place.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The regulation of financial products and services is a combination of both federal and provincial regimes, which can often be divergent and overlapping.

GENERAL

There is not currently a comprehensive regime which specifically regulates FinTech in Canada. However, a person carrying on business in the area of financial products and services will be required to comply with a variety of banking, securities, consumer protection and privacy laws.

COMPETITION BUREAU OF CANADA’S MARKET STUDY REPORT: TECHNOLOGY-LED INNOVATION IN THE CANADIAN FINANCIAL SERVICES SECTOR
After conducting an 18 month long study which included holding a FinTech workshop for stakeholders, founders and regulators held in February 2017, the Competition Bureau of Canada published its market study report in December 2017. The report set out 30 recommendations for regulators and policy makers. 19 of the recommendations identified specific, technical improvements in the areas of retail and payment systems, investment dealing and advice, P2P lending and equity crowdfunding while 11 of the recommendations focused on how to strike the right balance between regulation and innovation. Some of the broader recommendations that the Competition Bureau had for regulators are as follows:

- **Principles based regulation** – Regulators should adopt a principles-based approach instead of prescribing exactly how a service must be carried out, which would allow for more flexibility with regards to enforcement as technology continues to change.
- **Function focused regulation** – Regulators should focus on the function that an entity carries out which will ensure that all entities that perform the same function carry the same regulatory burden and consumers have the same protections when dealing with competing service providers.
- **Collaboration** – Regulators should encourage collaboration throughout the sector, using mechanisms such as regulatory sandboxes and innovation hubs.
- **FinTech Policy Lead** – Regulators should identify a FinTech policy lead for Canada in order to facilitate FinTech development to provide industry participations with a one-stop resource for information and encourage greater investment in innovative businesses.
- **Access, Harmonization and Review** – Regulators should promote greater access to core infrastructure and services, continue their efforts to harmonize regulations across jurisdictions in Canada and continue to review their regulatory frameworks frequently.

**CANADIAN SECURITIES ADMINISTRATORS BUSINESS PLAN 2019-2022**

In June 2019, the Canadian Securities Administrators (CSA) published the CSA Business Plan 2019-2022, which includes considering the development and adaptation of the regulatory framework to address challenges brought by emerging technologies as one of the strategic goals. This goal consists of (i) identifying emerging regulatory issues which require regulatory action or clarity, and (ii) developing a tailored and effective regulatory response.

**Electronic payments platforms and regulation of peer-to-peer lenders**

**ELECTRONIC PAYMENT PLATFORMS**

Federally-regulated financial institutions (FRFIs) must comply with payment rules and standards set out in the federal Bank Act. The Office of the Superintendent of Financial Institutions (OSFI) regulates, among other things, the payment processing services of FRFIs. FinTech mobile payment providers are not usually FRFIs, and therefore not subject to OSFI oversight. However, FinTech companies are required to comply with various codes of conduct and standards in Canada’s payment industry, including the Code of Conduct for the Credit and Debit Card Industry in Canada and the Canadian NFC Mobile Payments Reference Model.

In July 2017, the federal Department of Finance issued a consultation paper entitled ‘A New Retail Payments Oversight Framework’, which outlined various aspects of a proposed new framework for regulating retail payments. With limited exceptions, the new proposed framework would apply to any payment service provider (PSP) that is engaged in the following payment functions:

- **provision and maintenance of a payment account** – providing and maintaining an account in the name of one or more end-users for the purpose of making electronic fund transfers;
- **payment initiation** – enabling the initiation of a payment at the request of an end-user;
- **authorization and transmission** – providing services to approve a transaction and/or enabling the transmission of payment messages;
- **holding of funds** – enabling end-users to hold funds in an account held with a PSP until it is withdrawn by the end-user or transferred to a third party through an electronic fund transfer; and
- **clearing and settlement** – enabling the process of exchanging and reconciling the payment items (clearing) that result in the transfer of funds and/or adjustment of financial positions (settlement).

The new oversight framework would only apply to retail payments carried out solely in fiat currencies and not virtual currencies.

The Government of Canada’s 2019 Budget “Investing in the Middle Class” included plans to legislate first measures of a new retail
payment oversight framework, drawn from the Department of Finance's 2017 consultation paper discussed above. These commitments to legislate include end-use fund safeguarding and operational standard requirements, however new legislation has not yet been published to introduce the aforementioned measures.

PAYMENTS MODERNIZATION

Modernization is a multi-year Payments Canada initiative to modernize the systems and rules that are essential to Canada's payments ecosystem. In April 2016, Payments Canada published the initial Vision for the Canadian Payments Ecosystem (the “Vision”) and in December 2016 published an Industry Roadmap & High Level Plan which discusses how Payments Canada and the industry can modernize the Canadian payments ecosystem to advance the Vision. On December 21, 2017, Payments Canada published the Modernization Target State, which provides an in-depth view of the target end state for payment system modernization in Canada, including the infrastructure, rules and standards that will benefit Canadians and businesses from coast-to-coast.

Most recently, on December 19, 2018, Payments Canada published the Modernization Delivery Roadmap 2018 Update (the “Roadmap”). The Roadmap provides an update on Canada's progress on its payments modernization program, which includes implementing a new credit risk model for Canada's retail payment system and enhancing Automated Funds Transfer. The Roadmap provides revised timelines for the implementation of the modernization initiative.

The Roadmap discusses:

- **High-value payments system - Lynx:** The appointment of a prime vendor for hosting and system integration services as an additional step to manage risk and effectively deliver on Payments Canada's commitment to meet the highest international security, resiliency and operating standards. The prime vendor will support the end-to-end delivery and operations of Lynx, including oversight of SIA, the application provider for Lynx.

- **Real-time rail:** Clearer articulation of the release schedule for the new real-time payments system in Canada. The first release (referred to as R1) of Canada's new real-time payments system is a foundational release that will deliver the real-time processing of transactions, real-time deposit and real-time availability of funds. R1 will include an enhanced risk model using collateral pledged through the Bank of Canada to support final and irrevocable real-time payments, which will lower settlement risk and support broadening access to new participants; an alias management capability that allows for the routing of payments using an email address or mobile phone number; the capability to carry additional payment information based on ISO 20022 message standards; and the availability of standardized APIs. Future releases of Canada's new real-time payments rail will build on this foundation, creating opportunities for innovation and competition in the Canadian marketplace.

- **Retail batch payments:** The prioritization of additional improvements to the current retail batch payments system in advance of progressing to a new, centralized system, which will reduce system risk and support broadening access to members. The additional enhancements to the current system will build on the series of enhancements introduced in 2018. In 2018, modifications were implemented to the existing retail batch payments system, the Automated Clearing and Settlement System (ACSS), that allow Canadian businesses to move funds more frequently and make same day settlements. The delivery date of an enhanced centralized retail batch system has been extended beyond the R1 launch of the Real-Time Rail (RTR) and Lynx. Focus has shifted to the delivery of regulatory enhancements that will reduce system risk including increasing collateral coverage and implementing value caps on individual transactions.

Please see below the Roadmap providing revised timelines for Lynx, the real-time rail and the retail batch payment system.
PEER-TO-PEER LENDERS

The scope of regulation and legislation applicable to peer-to-peer (P2P) lenders will depend on the specific nature of the operations; however, P2P lending platforms will typically fund loans or portion of loans and operators of such a platform and will need to be aware of, among other things, Canadian securities law requirements (including prospectus and registration requirements as well as available exemptions) and applicable money laundering, criminal activity and terrorist financing legislation such as the Proceeds of Crime (Money Laundering) and Terrorist Financing Act (PCMLTFA).

Regulation of payment services

See Electronic payment platforms above.

Application of data protection and consumer laws

In Canada, the federal Personal Information Protection and Electronic Documents Act (PIPEDA) governs the way private sector organizations may collect, use and disclose personal information in the course of commercial activity. Where provincial privacy legislation governing the private sector's collection, use and disclosure of personal information has been deemed as ‘substantially similar’ to PIPEDA, the provincial legislation will apply instead. Alberta, British Columbia and Quebec each have provincial legislation that supersedes PIPEDA in regulating personal information collection, use and disclosure in the private sector.

Canada's federal Bank Act also contains provisions regulating the use and disclosure of personal financial information by FRFIs.

Money laundering regulations

The PCMLTFA gives the Financial Transactions and Reports Analyst Centre of Canada (FINTRAC) responsibility for supervising anti-money laundering controls of businesses in Canada that engage in foreign exchange dealing, remittance or transmission of funds, securities dealing, portfolio management and investment advice.

Pursuant to PCMLTFA, businesses are required to verify their clients’ identities, maintain certain records, and report suspicious
transactions to FINTRAC.

On July 10, 2019, Canada's Department of Finance published amendments to the regulations made under the PCMLTFA which are set to come into force on June 1, 2020 and 2021. Among these regulations is an expanded definition of money services businesses to include domestic and foreign business that are dealing in virtual currency (see What is a Cryptocurrency? above). Accordingly, person and entities dealing in virtual currencies will soon be subject to similar obligations as other reporting entities.

Last modified 2 Jan 2020

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake or some other form of interest such as a convertible note. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital (VC) providers, which permits the founder to pursue the growth of the business as the founder and its advisors envision.

CROWDFUNDING

The crowdfunding sector may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform. Crowdfunding activities in Canada are typically subject to applicable securities laws (including in respect of the platform as well as the equity security being offered).

There are two three main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares or other securities being issued in exchange for investment in the company.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access; however, crowdfunding has not had significant success and adoption as a means to finance startup businesses in Canada, with most FinTech startups pursuing the other methods of financing referred to below.

ACCELERATORS

There are various early-stage business incubators and accelerators in the Canadian market which offer support, facilities and funding for startups, often in return for an equity stake.

Venture capital and debt

VC funding is a type of equity investment usually targeted at early stage FinTech companies. VC provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of VC and involves an equity investment by a funding division of a corporation. The benefit of having a CVC as an investor for a FinTech startup is that, among other things, the investor is able to share its sector knowledge and expertise with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a fixed term loan (or series of loans), which is secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company at a discounted price upon certain events or otherwise. There are also other financing alternatives that may be put in place with venture investors or lenders such as a simple agreement for future equity. The merits of these structures should be discussed with your legal and financial advisors.
Senior bank debt and capital markets funding

SENIOR BANK DEBT

Typically, once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

CAPITAL MARKETS FUNDING

Canada has both debt and equity capital markets which are accessible to businesses of varying sizes. For example, a FinTech company may elect to become a reporting issuer in one or more of the provinces and territories of Canada through an initial public offering of its securities (IPO). In Canada, an IPO involves the issuance and sale of securities of the company and a concurrent listing on a stock exchange. An IPO may be completed in different ways, including by way of a reverse take-over of an existing public company.

CONVERTIBLE BONDS/LOAN NOTES

A popular funding tool for fast-growing FinTech businesses is to issue convertible bonds or loan notes which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances (for example, upon the completion of an IPO or the raise of a certain amount of investment).

Incentives and reliefs

The Canadian provinces and territories as well as the federal government, offer various tax credits, tax benefits and other incentives. These include the Scientific Research and Experimental Development Tax Incentive Program (SRED) or research and development (R&D) tax credit, to provide qualified Canadian companies with funds to undertake capital expenditures to reduce costs and generate marketing dollars to promote commercialization efforts. Depending on where in Canada the FinTech business is established and/or operates, certain other credits and incentives may be available, such as e-commerce credits and technology and innovation credits. In addition to various incentives and reliefs that may be available, the Federal Government also supports certain venture funds with FinTech companies as desired investments and there are government funds designed to do the same.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are as follows.

Novation

A novation is a tripartite arrangement among the original parties to a contract and a transferee seeking to replace the transferor to the contract. It is a full legal transfer of the transferor's rights, benefits and obligations to the transferee. All parties to the original contract need to consent to the new contract and the non-transferring party must accept the new contract in full satisfaction of, and as substation for, the old contract.

Assignment
An assignment is a transfer of rights and benefits of the transferor only, not its obligations under the contract. Subject to any contractual restrictions, assignments generally can be done without the consent of the non-assigning party to the contract. The burden under the original contract remains with the assignor and, as such, the assignor can be held liable if the assignee fails to perform the obligations under the contract. An assignment does not replace the original contract and does not create a new contract.

Generally, loan transfers will be documented using the bank's standard form documentation. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

Last modified 2 Jan 2020

**What are the main considerations when transferring a loan and related security?**

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller's legal advisors. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and
- **consent and notification** – whether a transfer requires the consent or notification of any other parties.

**Projects**

**Financing / investing in energy / infrastructure**

**To what extent are energy and infrastructure assets publicly or privately owned?**

**Generally**

The ownership of energy and infrastructure assets in Canada varies according to the asset class.

The main asset classes include:

- energy, including both electricity and gas distribution, as well as oil and gas production;
- public transit;
- trade and transportation, including roads and bridges;
- telecommunications;
- municipal, including water and wastewater and waste disposal; and
- social infrastructure, including education, health and justice/prisons, housing.

Key sectors are considered below.

**Energy**

The ownership of gas and electricity supply utilities varies significantly from province to province and in some cases from asset class to...
asset class. Long distance pipeline and gas transmission infrastructure crosses provincial and national boundaries and is privately owned. Gas distribution networks within provinces are generally also privately owned, with a small group of established utilities dominating the market.

In the electricity sector, each province has its own transmission grid, with a somewhat modest level of ‘east-west’ intertie capacity between provinces and, in some provinces, with significant ‘north-south’ intertie capacity with US systems. Provincial transmission systems are either owned by private entities and/or by publicly-controlled Crown corporations. For example, Alberta's transmission system is owned by several large private utilities. The majority of Ontario's transmission system is owned by Hydro One, which was historically a 100% provincially owned Crown corporation, but now privatized (Hydro One had an initial public offering in 2015. The Province of Ontario directly owns 47.4% of the shares of Hydro One. The remaining 52.6% of its shares now trade publicly (although provincially-owned Ontario Power Generation holds about 1.5%). British Columbia's transmission system is owned by BC Hydro, also a provincially owned Crown corporation.

Local distribution systems may also be privately or publicly-owned. Alberta is characterized by private and municipal ownership, whereas Ontario's distribution systems have historically been operated by municipally owned utilities or, in rural and some urban areas, by Hydro One. Generation assets may also be privately or publicly owned. Ontario offers an illustrative mix, in that some large hydro and nuclear baseload facilities are owned by a Crown corporation (Ontario Power Generation), some nuclear facilities are privately owned (e.g., Bruce Power), and most gas-fired, wind and solar facilities are privately owned. British Columbia's largest generating facilities are owned by BC Hydro, while several smaller cogeneration facilities as well as wind and hydroelectric facilities are owned by private investors. Alberta's generation fleet is owned by private investors and by municipally-owned utilities.

Oil and gas infrastructure in Canada, including both exploration and production of petroleum and gas and pipeline infrastructure, is almost entirely privately owned. While at one time the Canadian federal government and some provincial governments maintained some ownership interest in the oil and gas industry, those interests have been entirely sold off. There are many hundreds of companies in the exploration and production space, ranging in size from vertically integrated global majors to very small venture firms. There are several dozen companies active in the transmission and distribution pipeline space.

There is one significant exception to private ownership in the oil and gas space. The Trans Mountain pipeline, which carries a variety of crude oil and refined products from Edmonton to Vancouver, was purchased by the Canadian federal government in 2018 in the midst of an expansion project stalled in court challenges and regulatory delays. It is widely expected that the Trans Mountain pipeline will be privatized after the completion of the expansion project, expected in mid-2022.

The National Energy Board regulates aspects of the energy system that cross inter-provincial and international borders. For example, the NEB regulates the construction and operation of interprovincial and international oil and gas pipelines (including tolls and access), international power lines and designated interprovincial power lines, the export of oil, natural gas and electricity, and the import of electricity. Provincial regulators are responsible for similar matters which take place entirely within a province. For example, in Ontario, the Ontario Energy Board regulates electricity and gas rates, licenses generators and distributors, and grants leave to construct certain gas and electricity distribution lines, while the Independent Electricity System Operator manages the transmission grid and runs the wholesale electricity market. In Alberta, the Alberta Energy Regulator regulates oil and gas matters and the Alberta Utilities Commission regulates utility matters such as electricity transmission and distribution.

Telecoms infrastructure

Telecommunication infrastructure, including telecommunication and broadcast systems, is primarily privately owned in Canada. Three incumbent carriers (Bell, TELUS and Rogers) own the majority of the landline, wireless, and internet networks, with some smaller and regional carriers attempting to gain market share. There are a number of privately owned Canadian broadcasters, as well as the publicly owned Canadian Broadcasting Corporation (CBC).

The telecom sector is extensively regulated, including by the Canadian Radio-television and Telecommunications Commission (CRTC) and by Industry Canada (which, for example, manages wireless spectrum).

Transport infrastructure

ROAD INFRASTRUCTURE

The majority of Canadian highways are the responsibility of provincial or territorial jurisdictions and the provincial or territorial governments are primarily responsible for the planning, design, construction, operation, maintenance, rehabilitation and financing of the
road network. There are limited exceptions to this general rule. Highways which run through National Parks are the responsibility of the federal government and a small percentage of highways fall under municipal jurisdiction.

In comparison to other countries, Canada's use of tolling on its highway infrastructure is limited. The main exception to this is international bridge crossings between Canada and the US, which are tolled (although the current federal government has committed to removing tolls from the replacement Champlain Bridge International Crossing under construction in Montreal, Quebec). One example of a tolled highway is Highway 407 to the north of Toronto, Ontario, which is owned and operated by a private consortium.

While the responsibility for highway infrastructure falls to the provincial and territorial governments, the federal government does invest significantly in highway and road infrastructure through funds administered by Transport Canada and Infrastructure Canada. Federal government also owns and maintains a number of strategic bridges in Quebec and manages the Canadian portion of several international bridges.

In recent years, significant spending has been incurred in relation to road transportation infrastructure and this has encouraged the development of alternative means of procurement for such infrastructure, including public-private-partnerships dependent on private financing.

RAIL TRANSPORT

Canada has a large rail network including two major publicly-traded Class I freight railway companies, Canadian National Railway Company and Canadian Pacific Railway Company, as well as shortline railways that connect to them; and deliver traffic to and from them. Passenger rail services are provided nationwide by VIA Rail, a federal Crown Corporation. Commuter services are also provided at various locations by urban transit authorities owned or controlled by different levels of government.

Within urban municipalities, subway and light rail systems have been a particular focus of investment. LRT systems exist in a number of Canadian cities, including Toronto, Ottawa, Calgary and Edmonton.

Rail transportation is regulated at the federal level for both national and inter-provincial railways. Short line railways operating intra-provincial rail systems are generally subject to provincial regulation, although responsibility and oversight for parts of their operations are sometimes ceded by a province to federal authorities.

For subway and light rail systems that operate within municipal boundaries, the municipalities have responsibility and a number of the recent subway and LRT projects have been procured by municipal authorities albeit with significant amounts of provincial and federal funding.

Social infrastructure

Healthcare infrastructure in Canada is primarily the responsibility of the relevant province and healthcare expenditure is a significant portion of the budgets of each of the provinces across Canada. Hospitals are almost entirely public with relatively limited availability of private healthcare facilities.

Similarly, provinces are responsible for the organization, delivery and assessment of education at the elementary and secondary levels and for post-secondary education. A number of jurisdictions have procured ‘bundled’ school projects through alternative financing processes and public-private-partnerships. Most notably, Alberta has procured three sets of bundled schools through PPPs and Saskatchewan has also implemented a bundled school project.

Are there special rules for investing in energy and infrastructure?

Generally

There is no specific regime governing or restricting investment generally in infrastructure projects in Canada. Depending on the nature of an investment and the parties involved, a particular investment may be subject to rules of general application. For example, significant mergers may be reviewable under the federal Competition Act and acquisitions of control by foreign entities may be subject to notification and/or substantive review under the federal Investment Canada Act, which has jurisdiction to determine whether an investment by a
foreign entity is of ‘net benefit to Canada’. There is closer scrutiny where the investment by a foreign entity may raise issues of national security or where the investing entity is controlled by a foreign government (a ‘state-owned enterprise’). Projects may also be subject to a variety of types of approval ranging from environmental approvals or municipal permitting requirements.

**Energy**

There are no special rules for investing in oil and gas. As noted above, certain large investments by foreign entities may be reviewed under the Investment Canada Act or Competition Act, and investments by state-owned enterprises may attract additional scrutiny. In particular, the purchase of oil sands projects by state owned enterprises will generally be forbidden.

The electricity markets in Canada are heavily regulated. In some cases, these regulations are directly relevant to investment in electricity infrastructure. As one example, in Ontario, severe tax consequences can arise if a municipally owned distribution sells distribution assets to a private-sector entity or undergoes significant investment by a private-sector partner. These consequences have been a significant barrier to private-sector investment in the distribution sector but have recently been the subject of partial, time-limited exemptions (currently set to expire January 1, 2023) that are intended to spur consolidation in the sector.

As discussed further below, the manner in which electricity infrastructure (generation in particular) varies significantly across the country, with jurisdictions like Alberta traditionally preferring deregulated approaches based on merchant market pricing while jurisdictions like Ontario have historically run highly structured procurements that resulted in long-term power purchase agreements at fixed prices. Investors wishing to make greenfield investments in a province therefore need to acquire an intimate understanding of that province’s procurement regime. Ontario’s evolving market is an illustrative case: after running a feed-in tariff (FIT) program for many years that spurred significant private-sector investment in new renewable generation, the province has recently brought that FIT program to an end, is exploring ways to move to more market-based procurements of capacity and energy, and is even exploring options for reducing the cost of legacy power purchase agreements. While Alberta has traditionally pursued a deregulated approach to generation (requiring investors to pursue their own long-term offtake contracts), it has recently started to encourage the development of renewable energy projects by providing long term price supports for selected renewable electricity projects. Investors wishing to invest in existing projects must also review the applicable regime carefully, including for restrictions on changes of control and requirements to retain levels of community and aboriginal equity participation.

**Telecoms infrastructure**

The federal Telecommunications Act places Canadian ownership and control requirements on telecommunications common carriers. As a starting point, telecommunications common carriers must be at least 80% beneficially owned by Canadians with at least 80% of the board comprising Canadian individuals. In 2014, in response to calls to increase competition, the Canadian government introduced an exception to these requirements for carriers having less than 10% market share. Given overwhelming concentration of market share with the large incumbents, this exemption only applies to a very small number of carriers.

Canadian broadcasters are subject to similar Canadian ownership and control requirements. The voting shares and votes of the broadcaster must be 80% owned by Canadians, Canadians must comprise at least 80% of the board of directors, the CEO must be Canadian, and the broadcaster cannot be controlled in fact by non-Canadians. Some companies that have integrated telecommunications and broadcasting businesses may be subject to the requirements applicable to broadcasters even if they qualify for the exemption available to smaller telecommunications carriers.

As it currently stands, Canadian ownership and control requirements do not apply to over-the-top video (OTT) broadcasters that distribute programming only through the Internet or on mobile devices in accordance with the CRTC’s Exemption order for digital media broadcasting undertakings. Given the growth of this type of business, the applicable regulations have the potential to evolve in the coming years.

**Transport infrastructure**

For rail infrastructure, while there are rules requiring licensing and other regulatory approvals under federal legislation and regulations, in systems which are operated by municipalities or public agencies, private entities can participate through the provision of infrastructure, including rail systems and rolling stock. A wide range of private entities participate in the market for the design, construction, operation, maintenance and rehabilitation of rail systems and vehicles.

Since 2004, provinces and municipalities have increasingly looked to alternative procurement models, particularly public-private
partnerships for the procurement of rail and LRT projects.

Similarly, in road transportation there are no special rules for investing in entities which are involved in the design and construction of highways or in their maintenance and rehabilitation. Again, a number of provinces have utilized public-private partnerships as the procurement model for new highways, key road, and bridge infrastructure.

Social infrastructure

While hospitals are primarily publicly owned, they are designed, constructed and maintained by private entities and in numerous provinces, public hospitals have been the subject of public-private-partnerships and alternative forms of procurement, notably in British Columbia and Ontario.

Similarly to jurisdictions outside Canada, on infrastructure projects, whether transportation or social, which are procured by the public sector, there is regularly a ‘change in ownership’ restriction which applies in relation to the private entity or consortium carrying out the construction of a publicly procured project. This restriction on change in ownership is often, but not always, removed within a year of two of successful operation of the public facility to enable recycling of capital by entities involved in infrastructure development. This also promotes the development of an active secondary market in infrastructure assets.

What is the applicable procurement process?

Investing in infrastructure

While there is no legislative regime specifically covering the public procurement of infrastructure assets, a body of law has developed relating to the procurement of such projects by public sector organizations. The principles that underpin this jurisprudence are primarily directed at fairness and transparency on the part of the public authority in relation to bidding entities. The development of a two-stage request for qualifications/request for proposals process has emerged as a very common means of conducting such procurement. Following initial qualification, usually based on experience of similar or related projects, the public authority selects a relatively small number of bidders to proceed to the request for proposals stage. Under the relevant Canadian jurisprudence, the documentation setting out the rules of engagement for the procurement establish an offer, which is accepted and converted into a contract (Contract A) when a proponent submits a compliant bid. This is distinguished from the contract for the development of the facility or asset (Contract B), which is ultimately entered into between the authority and the proponent when it is selected as the winning bidder.

Investing in energy

The construction of new oil and gas infrastructure, such as pipelines and distribution systems, being privately owned, is not subject to public tendering or procurement processes.

There is an element of public procurement to the awarding of leases for oil and gas exploration. Most oil- and gas-producing lands in Canada are owned by the provinces, which conduct periodic sales of the right to explore for and produce petroleum from those lands. The sales are generally conducted via an open, public auction. A party wishing to purchase lands for oil and gas exploration may either participate in one of these auctions (which are generally for the sale of unexplored and unproven lands) or may purchase existing, proven oil and gas leases from existing producers.

The methods by which new electricity infrastructure is procured vary from province to province and also evolve with time.

Many transmission projects are undertaken by the incumbent utilities without a public procurement process. For example, the reinforcement of the Bruce-to-Milton line in Ontario was undertaken by Hydro One has part of its system planning. While an aboriginal group received an equity stake in the project, the opportunity was not generally open to outside equity investors. Some large transmission projects are initiated through a public procurement process open to all prospective developers, not just the regional incumbent. For example, the Alberta Electricity System Operator ran a competitive develop-design-build-finance-own-operate-maintain process for the construction of a 500km, 500kV line serving Fort McMurray.

Distribution projects tend to be undertaken by existing distribution utilities. While procurement process may be run to obtain design, construction and other services, the projects as a whole are usually managed by the utilities.

Generation projects may be, but are not universally, publicly procured. Alberta has historically taken a ‘hands off’ approach to generation,
allowing private sector developers to undertake new projects in response to wholesale pricing and other negotiated offtake agreements. However, it has recently prioritized the development of renewables - as described above, the Alberta government has provided price supports for the generation of renewable electricity from projects selected in a competitive bidding process conducted over several rounds in 2017-2019. Ontario’s approach continues to evolve. The Feed-in Tariff (FIT) program introduced in 2009 offered 20-year power purchase agreements at guaranteed rates to developers of wind, solar, hydro and biomass/gas projects. Development of grid-connected projects boomed, but that boom is now over as the Independent Electricity System Operator (at the behest of the Province of Ontario) cancelled the FIT program, terminated hundreds of FIT version 5 contracts that were pre-construction, announced a zero-tolerance policy for delays projects that are under construction, and commenced a review of the contracts of existing projects to identify cost savings opportunities. The IESO has recently shifted to a transitional capacity auction market to procure generation, but the IESO’s long-term strategy for generation procurement continues to evolve.

Financing infrastructure and energy

Financing for infrastructure and energy projects is not generally the subject of a separate public procurement process. The manner in which a particular project has been procured will, however, have a significant impact on financing terms.

What are the most common forms of funding / investing in energy and infrastructure?

Funding

Common forms of funding in energy and infrastructure include:

- loans made on a corporate-finance basis (balance sheet debt);
- loans made on a project-finance basis (to a special purpose project company) on medium to long-term bases – such loans may later be syndicated to other funders;
- bond finance;
- hybrid financing, particularly on long term projects where the initial design and construction activities or a portion thereof are paid for through one or more progress or milestone payments. In these cases, the design and construction activities are financed by short-term construction facilities from commercial banks, whereas the long term debt is provided by way of bond financing, either underwritten or privately placed;
- mezzanine debt (in some sectors); and
- refinancing of the debt in operational projects.

Infrastructure financing

The financing of infrastructure will largely depend on the nature of the contract which is being let for the development of the relevant facility. Standard construction financing is available from commercial banks in the Canadian domestic market for design-build contracts for the construction of facilities. These are predominantly short-term facilities that are paid off through milestone or progress payments as the construction develops or through a substantial completion payment towards the end of construction.

If the procurement of the relevant facility involves operation, maintenance or rehabilitation of the facility throughout its useful life, then long-term financing is regularly utilized. Until 2008, European lenders regularly lent long-term debt into the Canadian market. Canadian commercial banks are reluctant to provide long-term tenors and so Canadian commercial bank debt is not available for long-term financing. However, with the shorter tenors being offered by European lenders after 2008, the Canadian capital markets have largely replaced long-term commercial bank debt. There are two primary forms of long-term financing used in infrastructure development. The first is the private placement of long-term debt, usually through bond or note facilities to long-term institutional investors such as life insurance companies. These debt instruments may be rated or unrated. The second predominant mode of financing for long-term debt is the broadly marketed underwritten bond, which is usually a rated product. Each of the main six Canadian banking institutions will provide underwriting for such a capital markets issuance. Bonds are usually sold down to long-term bondholders with life insurance companies again being major investors in this class of debt.

Investing
Common forms of investing in energy and other infrastructure include:

- ‘equity’ investment in special purpose vehicles or entities that may have a portfolio of interests, including share capital, limited partnership interests, and/or subordinated shareholder/unitholder loans; and
- secondary market investment in operational projects (acquisition of ‘equity’).

Unlike other markets (in particular the US), tax equity structures are not typically employed for electricity projects as Canada does not have the same focus on tax incentives as a means of promoting these projects. Similarly, tax-exempt banks are not a feature of debt financing in the Canadian market.

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

There is no single body that investigates regulatory non-compliance. Each regulatory statute generally establishes an enforcement body charged with enforcing the statute.

When the applicable regulatory authority considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch an investigation. This may result in regulatory sanctions or penalties.

What regulatory penalties may apply?

The scope of the applicable regulatory authority's powers are set out in the governing legislation. Generally, when a breach has taken place the applicable regulatory authority may impose a financial penalty or censure, or withdraw regulated status against the firm or regulated individuals.

What criminal penalties may apply?

Depending on the nature of the breach, the applicable regulatory authority may disclose cases of non-compliance to law enforcement, including, but not limited to, cases relating to:

- insider dealing;
- breaches of the Proceeds of Crime (Money Laundering) and Terrorist Financing Act (Canada); and
- fraud.

Criminal penalties may include fines and/or imprisonment.

Tax

Tax issues
**Are stamp, registration, transfer or other similar taxes applicable?**

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

No stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

No stamp, registration, transfer or other similar taxes are payable on the taking, transfer or assignment of a mortgage, debenture or other security. There may be nominal registration fees required to perfect a security interest.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

No stamp, registration, transfer or other similar taxes are payable on the issue, transfer or assignment of a debt security.

**Do tax authorities take priority on enforcement?**

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

Generally, secured lenders and secured debt security holders take priority over the Canada Revenue Agency on enforcement of security, provided that the Canada Revenue Agency has not previously taken steps to register itself as a secured creditor. However, the Canada Revenue Agency has a 'super priority' right over secured creditors (other than holders of a mortgage over real property) with respect to taxes collected by the debtor on behalf of the Canada Revenue Agency (including employee source deductions, non-resident withholding tax and goods and services tax (GST)). This 'super priority' does not extend to GST if the tax debtor is in a proceeding under the Bankruptcy and Insolvency Act or the Companies' Creditors Arrangement Act.

**Is withholding tax on interest payments applicable?**

Is there withholding tax on interest payments under a loan?

Canada does not impose withholding tax on interest payments under a loan from a Canadian resident lender unless the loan is part of a back-to-back loan arrangement. Generally, a back-to-back loan arrangement is one in which a third party (whether resident in Canada or not resident in Canada) is interposed between a Canadian borrower and a lender not resident in Canada in an attempt to avoid the application of withholding tax that would otherwise apply.

Canada does not impose withholding tax on interest payments under a loan from an arm's length lender not resident in Canada unless either:

- the interest is 'participating debt interest'; or
- the loan is part of a back-to-back loan arrangement (as described above).

'Participating debt interest' is defined as interest that is contingent or dependent on the use of or production from property in Canada or is computed by reference to revenue, profit, cash flow, commodity price or any other similar criterion or by reference to dividends paid or payable to shareholders of any class of shares of the capital stock of a corporation.

Canadian withholding tax generally applies to interest payments to a non-arm's length lender not resident in Canada.
If so:

What is the rate of withholding?

If applicable, the current rate of Canadian withholding tax on interest is 25%.

What are the key exemptions?

Where Canadian withholding tax does apply to interest payments, the primary exemption is under a double tax treaty (such treaty may only provide for partial exemption). For instance, under the Canada-United States tax treaty, interest paid to a non-arm's length US resident lender is exempt from Canadian withholding tax. However, under the Canada-United Kingdom tax treaty, the withholding tax rate is 10% on interest paid to a non-arm's length UK resident lender.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes, the analysis described above is applicable to both interest payments under a loan or other form of debt security.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

In the debt market, debt securities have to be issued by institutions accredited by the CMF. In addition, the issuance is regulated by the CMF.

What are common issuing methods and types of debt securities?

The most common securities issued in Chile are:

- **subordinated bonds** – bonds issued by banks which have a lower priority for the creditor;
- **promissory notes and bonds issued by the Chilean Central Bank and the General Treasury of the Republic** – instruments issued by the two aforementioned entities, with the purpose of regulating the money supply, supporting the exchange policy, financing state projects or replacing external debt;
- **convertible bonds** – issued by corporations and SpA to finance investment projects, which are convertible into shares of the issuing company;
- **corporate bonds** – issued by corporations to finance long-term investment projects, or to comply with financial commitments of the issuer, such as the refinancing of liabilities;
- **securitized bonds** – issued by securitization companies with the objective of anticipating the flows of certain financial assets of a company or financial institution, such as mortgage or automobile loans; and
- **mortgage letters** – issued by banks or financial institutions, to finance mortgages or various productive activities.

What are the differences between offering debt securities to institutional / professional or other investors?

In most cases there are no differences in the recipient of the offer, with the exemption of the offer made to certain ‘qualified investors’, which – under compliance of certain rules – can be done privately (in opposition to the general rule which is the public offering).
When is it necessary to prepare a prospectus?

According to General Rule (Norma de Carácter General) No 30 of the CMF, the public offering of debt securities requires the submission of a prospectus (which is pre-drafted by the CMF and must be filled by the issuer). Before it can be published, the prospectus must be previously submitted before the CMF.

In case of public tender offers, the offeror must prepare a prospectus containing all the terms and conditions of the offer, and make it available to the interested parties, in the places mentioned in the Securities Law, from the date of the notice of initiation and during the validity of the public tender offer.

What are the main exchanges available?

The main exchanges are the:

- Stock Exchange (Santiago and Valparaiso);
- Electronic Exchange; and
- Products Exchange.

Please note that the Santiago Stock Exchange forms part of the Latin American Integrated Market (MILA), which is the result of the agreement signed between the Santiago Stock Exchange (Chile), the Colombian Stock Exchange, the Lima Stock Exchange (Peru) and the Mexican Stock Exchange, as well as the related central securities depositories (DCV in Chile, Deceval in Colombia, Cavali in Peru and Indeval in Mexico). This establishes a regional market for the trading of equities in the four countries, making MILA the Pacific Alliance Securities Market. MILA's mission is to integrate the securities markets of member countries and foster the growth of financial businesses for participants, offering the best alternative for investment, diversification, liquidity and financing.

Is there a private placement market?

Yes.

The CMF allows the private offering of securities in very specific cases, as stated in the General Rule (Norma de Carácter General) No 336. The regulations establish that the offering of securities shall not be considered as public (and thus, not subject to the strict regulations set forth in the Securities Act) in the following cases, when they:

- contain all the relevant and detailed information about the offer;
- are addressed to qualified investors (inversionistas calificados) according to certain rules; and
- are not published in mass media (press, TV, mass e-mails etc).

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

The issuance of debt securities is the responsibility of the issuer, as stated in the prospectus (which states explicitly the responsibility of the issuer regarding the information stated in it). Discrepancies in the information published to the public in the prospectus or other misleading information when issuing debt securities may lead to severe sanctions (even imprisonment).

Investing in debt securities
In financial terms, debt securities are not considered high risk (they are low risk securities, since they have a fixed profitability). However, it is advisable when investing in these kinds of securities, to fully revise the prospectus and check the issuer’s background and its qualifications.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Law No. 20,712 regulates the administration of third parties' funds (Law). The Law regulates mutual funds, public and private investment funds, foreign capital investment funds and foreign risk capital investment funds. Please note that there is no explicit regulation on hedge funds, which may adopt one of the aforementioned funds form, depending on its particular characteristics.

In general terms, restrictions on establishing a fund depend on the type of fund to be established.

The Law distinguishes between two types of funds that are subject to registration and supervision of the CMF, which are:

- mutual funds, which are the ones in which redemption is made in less than 10 days; and
- investment funds, distinguishing between the ones (x) in which redemption is available in less than 180 days, or (y) in which there is no redemption available (fondos de inversión no rescatables).

A separate category of funds which are not subject to registration nor supervision of the CMF is private investment funds, which are required to have less than 50 investors.

The above-mentioned distinction between mutual and investment funds, which is based on how the investment is redeemed, follows the traditional distinction between closed-end and open-end funds in the US. Since both mutual funds and investment funds (other than private investment funds) are subject to registration with the CMF, they can be also listed on the local stock exchanges or traded over-the-counter in a secondary market.

Additionally, please note that there are some restrictions regarding investments, which refer to minimum conditions of information, regulation and supervision of such investments. Such restrictions are not applicable to funds for qualified investors, as long as such exemption is expressly set forth in the fund’s internal regulation.

What are common fund structures?

Funds in Chile are not corporations, but, in general terms, each fund is a separate pool of assets destined exclusively to be invested in securities or assets authorized by law.

The ownership of a fund is not represented by shares (as in LPs or LLCs), but by ‘quotas’ and investors are commonly referred to as ‘quota holders’.

Each fund must be managed by a separate corporation called an Administradora, or fund manager, which is registered and supervised by the CMF. The fund manager has the exclusive responsibility for a fund’s administration.

Please note that the fund manager is quite different from a general partner, as it only manages but usually does not own any quotas of the fund.

Fund managers must be incorporated as stock corporations (Sociedad Anónima), which, except for private investment fund managers, should be registered and subject to the supervision of the CMF. Private investment funds are managed by special purpose stock corporations which must only be registered with the CMF in a special registry of reporting entities.

As explained, common types of fund structures other than private investment funds include mutual funds, public investment funds, foreign capital investment funds and foreign risk capital investment funds. Hedge funds are not explicitly regulated, and may adopt one of the aforementioned structures depending on its particular characteristics.
Each fund structure has its own restrictions and limits, but they are all subject to registration and supervision by the CMF. In general terms, they differ on the rules applicable to redemption of the investment and permitted investments. They can all be listed on the local stock exchanges or traded OTC in secondary markets. All of the above funds must be managed by a Fund Manager.

**What are the differences between offering fund securities to professional / institutional or other investors?**

As previously explained, the difference lies not in the type of investor, but in the type of fund. Private investment funds are non-regulated funds that may not make public offering of their quotas. As a consequence, they are far more flexible than regulated investment funds, which conversely are entitled to make public offering of their quotas.

**Are there any other notable risks or issues around establishing and investing in funds?**

Fund management is a regulated and supervised activity and therefore subject to reporting requirements, depending on the type of fund managed.

**Managing and marketing debt / hedge funds**

**Are there any restrictions on marketing a fund?**

Marketing restrictions depend on the type of fund. Private investment funds may not make public offering of their quotas. Mutual and regulated investment funds are entitled to make public offering of their quotas.

Please note that funds’ ownership (funds in Chile are not corporations, but a pool of assets) are not represented by shares (as in LPs or LLCs), but by quotas instead. That is why investors are commonly referred to as ‘quota holders’.

**Are there any restrictions on managing a fund?**

Restrictions depend on the type of fund to be managed, and refer in basic terms to the type of entity the Fund Manager is required to be, and the registration and reporting requirements imposed over such Fund Managers.

**Entering into derivatives contracts**

**Are there any restrictions on entering into derivatives contracts?**

Non-regulated companies (limited liability companies or corporations) may freely enter into derivative transactions, including for speculative purposes, solely with any limitations under their by-laws.

Certain special entities (banks, pension fund administrators, mutual funds administrators, brokers etc) can only enter into certain derivatives transactions, which are determined by the relevant regulator. For example, the so-called Securities Agents (*Agente de Valores*) can only act as securities intermediaries regarding forward agreements over foreign currencies and indexation units and swaps agreements over interest rates, according to the rulings of the CMF.

Moreover, Chapter IX of the Compendium of Foreign Exchange Regulations enacted by the Chilean Central Bank regulates derivative
transactions that involve foreign currency flows from Chile to abroad or vice versa, which consist of futures, forwards, swaps or options agreements, credit derivatives or combinations of the same. The main obligations are:

- reporting certain information to the Central Bank of Chile; and
- that both the remittance of foreign currency abroad as well as its return to Chile must be performed through the Formal Foreign Exchange Market.

The general rule is that set-off rights in Chile do not apply in case of bankruptcy, unless the obligations arise from a derivatives agreement. Please note that the Chilean Central Bank establishes certain requisites and conditions that the derivatives agreements must contain in order that the set-off may apply.

**What are common types of derivatives?**

The most common derivatives in Chile are futures and forward agreements. There are also option agreements and swap agreements.

The main classes of underlying assets are (depending on the type of entity that enters into the specific derivative transaction):

- local currencies;
- goods, commodities and instruments representing such assets;
- interest rates;
- stock index and other indexes;
- foreign currencies; and
- indexation units (such as Unidad de Fomento).

**Are there any other notable risks or issues around entering into derivatives contracts?**

As a regulated entity, there are many risks regarding compliance with the regulation thereof (the CMF have issued a high amount of regulations regarding which derivatives they can enter into, with whom they can deal with and which underlying assets are acceptable). Therefore, regulated entities (banks, pension fund administrators, mutual funds administrators, brokers etc) must comply with this strict regulation if they do not want to be sanctioned by the CMF.

**Debt finance**

**Lending and borrowing**

**Are there any restrictions on lending and borrowing?**

Banks shall not grant credits, directly or indirectly, to one person or legal entity, for an amount that exceeds 10% of its capital; or grant credits, to one person or legal entity involved directly or indirectly to the property or administration of the bank in more favorable terms (eg interest or guarantees); or grant, directly or indirectly credit with the purpose to of habilitate a person in order to pay the bank with shares of its own issuance; or grant, directly or indirectly, credit to a director, or any other person that performs as general lawyer; and shall not become liable for obligations of third parties, but in the cases expressly stated in the law. In addition, banks are not authorized to grant mortgages or pledges over physical assets, unless these agreements are granted in order to guarantee payment of the purchase price of such assets.

In addition, suppliers of services and financial products have several obligations regarding information and marketing such as in respect
of their quotes, which shall last at least 7 business days; and reporting rates, charges, commissions, costs tariffs, conditions and term of the products offered, among others.

Borrowing is not generally regulated; however, they have the benefit granted by the National Consumers Service in order to, for example, not be tied with different products or services not requested by a financial institution.

**What are common lending structures?**

Lending in Chile can be structured in several ways depending on the commercial needs of the parties and the features of the project being financed. Common structures used in Chile are the term loan and the revolving loan.

**Loan durations**

The terms of the loans generally depend on the features of the corresponding transaction and the policy of each financial institution. However, over five years is considered a long term.

**Loan security**

Regarding project financing, usually the bank will secure lending obligations with several types of securities (i) over assets (pledge and mortgage agreements), (ii) personal guarantees such as sureties and joint and several guarantees and (iii) conditional assignment of rights regarding the main agreements of the relevant project. Please note that in Chile guarantees are accessory to the main obligation and may not exceed the amount of such obligation.

**Loan commitment**

May be committed or uncommitted.

**Loan repayment**

Can be repaid on demand, on an amortization basis, scheduled, or even by means of a bullet loan, where the entire loan is due at the end of the loan term.

Last modified 6 Dec 2019 | Authored by BAZ| DLA Piper

**What are the differences between lending to institutional / professional or other borrowers?**

Lending to institutional/professional borrowers is subject to less regulatory oversight and less burdensome from a compliance perspective not being applicable consumer protection rights.

Last modified 6 Dec 2019 | Authored by BAZ| DLA Piper

**Do the laws recognize the principles of agency and trusts?**

Yes, Chilean framework recognizes the appointment of a collateral agent.

Last modified 6 Dec 2019 | Authored by BAZ| DLA Piper

**Are there any other notable risks or issues around lending?**

Generally

Loan agreements and other finance documents are subject to general contractual principles.
Specific types of lending

MORTGAGE LOANS

Typically, each financial institution states its conditions and performs an assessment of the debtor. The conditions usually include, for example, the amount and regularity of the income of the debtor, their age, number of dependents, and financial background. Usually the loan also involves insurance taken in favor of the debtor (fire and for surviving dependents). If a financial institution includes any abusive clause within the loan agreement, and such clause affects the consumer, a claim may be submitted before the National Consumer Service.

Standard form documentation

Most of the financial transactions standard templates are prepared by banks in-house.

Are there any other notable risks or issues around borrowing?

Normally banks perform a sound assessment of the borrower, requiring its financial background or assets they owned that may be used as security.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Yes.

According to the Chilean Civil Code, the agents acting on behalf of an entity shall act within the limits of its mandate. If the agent acts without sufficient power of attorney the principal shall not be obliged toward third parties by acts or agreements entered into by agent.

In addition, corporate authorizations in some cases are needed. For example, in order to guarantee third party obligations, and if the guaranteed obligation exceeds 50% of the corporation’s assets, an extraordinary shareholders’ meeting must be held to approve the transaction. However, if the company is a subsidiary, board of director approval is sufficient.

What are common types of guarantees and security?

The Chilean framework establishes ‘guarantees over assets’ (which is a type of security arrangement) and ‘personal guarantees’.

Common forms of guarantees

In Chile, there are different kinds of guarantees; however, both performance or payment guarantees are widely used. These are generally known as ‘personal guarantees.’ The personal guarantees regularly used are the fianzas (sureties) and fianza y codeudas solidarias (joint and several guarantees).

Through the fianzas one or more parties are obliged to pay the obligations of the debtor in the event that the latter does not pay the secured obligation. The fianza y codeuda solidaria, in turn, the liability for non-compliance is applicable directly against all debtors and guarantors as a group or against any of them individually at the creditor’s choice.

Common forms of securities

Guarantees over assets may be divided between two groups. They are guarantees over moveable assets and over real estate.

The guarantee over moveable assets is performed through pledge agreements such as:
• civil pledge, which applies to any movable property, including all kind of personal rights and credits;

• commercial pledge, which secures merchant or commercial nature obligations;

• banking pledge over moveable assets over instruments of any kind, credit payable to the order and shares in favor of banks; and

• pledge without conveyance over any kind of corporeal or incorporeal, present or future, moveable asset to secure own or third party obligations, present or future.

Regarding guarantees over real estate, they are granted by means of mortgage agreements, by which it is possible to secure not only existing and determined obligations but also to secure all present and future obligations of the debtor (**cláusula de garantía general**). Mortgages also can be granted over mining concessions and water rights.

In addition, the parties can agree a conditional assignment of rights which is a mechanism to safeguard creditors’ rights, for example, in connection to the main agreements in a project (such as EPC and O&M). If a debtor fails to fulfill its obligation under the financing documents, the creditor would be entitled to exercise step in rights regarding the project agreements.

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

Consideration for guarantees is subject to general contractual principles.

Giving or taking security

In the case of some securities, such as pledges, there is a requirement for such securities to be executed by way of a public deed before a Chilean notary public and to be registered in different registries, for example:

• Pledge Over Money and Permitted Investments in the Registration in the Registry of Pledges Without Conveyance (**Registro de Prendas sin Desplazamiento**) kept by the Civil Registry and Identification Service (**Servicio de Registro Civil e Identificación**); and

• Pledge over Equipment Registration in the Registry of Pledges Without Conveyance (**Registro de Prendas sin Desplazamiento**) kept by the Civil Registry and Identification Service (**Servicio de Registro Civil e Identificación**); and to the extent applicable, registration in the **Registro de Vehículos Motorizados** (Vehicle Registrar) kept by the Civil Registry and Identification Service (**Servicio de Registro Civil e Identificación**).

In the case of mortgage agreements, they must be executed by means of a public deed between the owner of the asset and the mortgagee. Later, an abstract of such public deed needs to be registered in the relevant Mortgage Lien Registry and in the Prohibition Registry of the correspondent Real Estate Registry.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Decree with Force of Law No 1, Chilean Civil Code (2000) (**Fija texto refundido, coordinado y sistematizado del Código Civil**)
Chilean Commerce Code (1865) (Código de Comercio) (regulates commercial obligations and commercial contracts in general)

Law No 18,010, Establishes rules for credit operations (1981) (Establece normas para las operaciones de crédito y otras obligaciones de dinero) (establishes rules for credit operations and other monetary obligations)

Decree with Force of Law No 3, General Banking Act (1997) (Fija texto refundido, sistematizado y coordinado de la Ley General de Bancos) (regulation of banking activity and financial institutions and establishes the Financial Market Commission (CMF) (formerly known as Superintendence of Securities and Insurance /"SVS").

Law No 20,848, Establishes the framework for the Direct Foreign Investment in Chile (2015) (Establece marco para la inversión extranjera directa en Chile y crea la institucionalidad respectiva)

### Consumer credit

Law No 20,555, establishes protection of rights of consumers, in order to grant financial powers to the National Consumer Service (SERNAC) (2012) (Modifica Ley N° 19.496, sobre protección de los derechos de los consumidores, para dotar de atribuciones en materias financieras, entre otras, al Servicio Nacional del Consumidor) (establishes protection of rights of consumers, in order to grant financial powers to the National Consumer Service)

### Mortgages

Law No 20,855, Regulates the cancellation of mortgages and pledges that guarantee credits (2015) (Regula el alzamiento de hipotecas y prendas que caucionen créditos)

### Corporations

Law No 18,046, Corporations Act (1981) (Ley de Sociedades Anónimas) (establishes regulations to corporations)

Law No 18,045, Chilean Securities Act (1981) (Ley de Mercado de Valores) (regulates securities issuers, securities trading and other activities related to securities)

### Funds and platforms

Law No 20,712, Third party funds and individual portfolios (2014) (Administración de fondos de terceros y carteras individuales)

Law No 6,640, Establishes the Chilean Economic Development Agency (CORFO) (1941) (Texto refundida, creación de las corporaciones de reconstrucción y auxilio y de fomento a la producción)

Decree Law No 211, Establishes the regulation for the Chilean Development Agency (1960) (fija normas porque se regirá la Corporación de Fomento de la Producción)

### Other key market legislation

Chapter XIV of the Compendium of Foreign Exchange Regulation of the Chilean Central Bank (Capítulo XIV del Compendio de Normas de Cambios Internacionales del Banco Central de Chile, sobre Normas aplicables a los créditos, depósitos, inversiones y aportes de capital provenientes del exterior) (rules applicable to credits, deposits, investments and capital contributions from abroad)

Last modified 6 Dec 2019 | Authored by BAZ|DLA Piper

### Regulatory authorization

**Who are the regulators?**
The Financial Market Commission (CMF) (formerly known as Superintendence of Securities and Insurance ("SVS")) is in charge of the supervision of the banking enterprises, irrespective of their nature, and the financial entities whose control is not otherwise entrusted by the laws of a different institution. The CMF is also in charge of the supervision of the companies whose corporate purpose consists of the issuance or operation of credit cards or any other similar system, provided the said system considers that the issuer or operator ordinarily assumes monetary obligations to the public or certain sectors or specific groups thereof. Furthermore, the CMF has the main objective of ensuring the transparency of the markets by monitoring and publishing the public information it maintains and collaborating in the knowledge and education of investors, insured persons and the public in general.

The Financial Market Commission, was created by Law No. 21,000, published in the Official Gazette on 23 February 2017, constituting the collegial and technical institution which replaced the SVS.

Additionally, since June 1, 2019, the Superintendence of Banks and Financial Institutions ("SBIF") was integrated to the CMF. The main effect of the integration was that the SBIF ceased to exist and the CMF assumed all the faculties and responsibilities of the SBIF.

The National Consumers Service (SERNAC), strengthens the rights of consumers of financial products and services, and imposes obligations on companies of this sector.

The Chilean Central Bank looks after the stability of the currency, that is, to keep inflation low and stable over time. The Chilean Central Bank must also promote the stability and efficacy of the financial system and the normal functioning of internal and external payment systems, to generate a predictable environment for decision making of economic agents contributing to reduce the ups and downs of the economic cycles, thus providing a solid basis for the country’s permanent growth.

The Fuel and Electricity Superintendence (SEC) is a supervisory body that, among other things, is in charge of monitoring and supervising the compliance of legal and regulatory dispositions as well as technical norms on generation, production, storage, and distribution of liquid fuel, gas and electricity, as well as the administrative interpretation of the norms in the electrical sector. The SEC’s duties include ensuring the correct operation of the electricity, gas and fuel services in terms of safety, quality and price.

The Agency of Promotion of Foreign Investment is the authority in charge of qualifying and granting the certificate of ‘foreign investor’ under the Direct Foreign Investment in Chile Law.

What are the authorization requirements and process?

Banks

The legal entity shall be constituted as a stock corporation and shall comply with its requirements by submitting a prospect before the CMF according to the regulation, particularly the General Banking Act, and complying with the rules about minimum amount of capital, number of shares and number of directors, among others. The CMF must authorize by resolution the existence and functioning of the corporation. The CMF shall authorize the establishment of a foreign bank’s representative office in Chile, in order to act as agents of the main offices.

Securities

The public offering of securities and shares of publicly traded corporations require that both the issuer and the securities have been previously registered in the Securities Registry of the CMF.

The intermediaries of securities that operate in the Stock Exchange has to be registered in the Stock Brokerage Registry and Securities Agents that is held by the CMF once they meet the requisites of suitability established in the Securities Act.

Funds

In order to manage a fund (mutual or investment fund) you should be incorporated as a corporation whose exclusive purpose must be managing third party funds. An authorization from the CMF shall be obtained and minimum amount of capital must be maintained.

What are the main ongoing compliance requirements?
The regulated entities are under ongoing compliance requirements. They must maintain the thresholds that allow them to operate and they also have to continuously submit certain information to the CMF. For example, the regulated entities shall inform any amendments to their by-laws within a short time of them becoming effective.

In addition, in the case of the banks, they must maintain minimum reserves of cash that are to be determined by the Chilean Central Bank.

**What are the penalties for failure to be authorized?**

The persons or legal entities engaging in banking activities, such as accepting deposit in a customary manner from the public or as broker, commits a criminal offence and is liable to imprisonment (from 541 days up to five years) and can also face charges as author of fraud.

Regarding the registry of securities, any person or legal entity that fails to obtain the proper authorization is liable and obliged to compensate damages due to the breach and shall be subject to administrative and criminal sanctions (imprisonment). In addition, in case of misleading information submitted before the CMF, criminal sanctions such as imprisonment may apply.

**Regulated activities**

**What finance and investment activities require authorization?**

**Generally**

- Accepting deposits in a customary manner from the public
- Acting as a principal or on behalf of a third party in the brokerage of money or loans represented by securities or any other credit titles
- Exhibiting in store or offices signs of advertisement containing any expressions indicating to be a financial company
- Public offer of securities
- Management of third party funds and individual portfolios.

**Consumer credit**

Regarding granting consumer credits, such activities are only regulated in connection to interest rates (they do not require special authorization).

**Are there any possible exemptions?**

Even though it is a regulated activity, there are exceptions such as non-banking factorings whose focus is to provide capital to small- and medium-sized enterprises.

**Do any exchange controls or other restrictions on payments apply?**

**Direct foreign investment**

The transfer of foreign capital or assets owned or controlled by a foreign investor into Chile, for a sum equal to or greater than US$5 million or its equivalent in (i) other currencies, (ii) physical goods in all its forms or states, (iii) profit reinvestments, (iv) capitalization of
credits, (v) technology in its various forms that is susceptible to be capitalized, or (vi) credits associated with foreign investment from related companies.

In addition, the above-mentioned is applicable to all investments that are conducted through the purchase of shares in the capital of a Chilean company, in which the foreign investor acquires at least 10% of the voting shares of said company, whether directly or indirectly.

Chapter XIV of the foreign exchange regulations of the Central Bank of Chile

It regulates all foreign loans, deposits, investments and capital contributions from abroad and others referred to foreign obligations, for an aggregate amount higher than US$10,000. These rules are not applicable to transactions of this nature performed by banks.

All transfer of funds into Chile from abroad as loans, deposits and investment or capital contributions, shall be made through the Chilean Formal Foreign Exchange Market (MCF) and shall be informed by commercial banks to the Chilean Central Bank by means of a standard form. However, according to the regulations currently in force, no access to the MCF is guaranteed to the foreign investor or capital contributor and the Chilean borrower, as applicable, for the repatriation of the capital investment and/or profits, or the payment of the principal and/or interest of the foreign loan, respectively.

Notwithstanding the information included in the above-mentioned standard form, any party to an international credit transaction equal to or higher than US$1 million or its equivalent in a different currency, shall inform the Chilean Central Bank in writing about the execution of such transaction.

What are the rules around financial promotions?

The National Consumers Service (SERNAC) grants certificates in respect of those contracts that it has reviewed and verified that comply with the Consumer Protection Law and regulations (which for example, require that such contracts do not contain any clause that may be abusive). The suppliers that promote or distribute financial pre-formulated standard agreement or financial services without the SERNAC certificate as they had it, shall be sanctioned up to US$70,000. In case of a second offence, the fine could be up to US$140,000.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

For the purposes of banking activities and managing funds the legal entity shall be incorporated as a corporation.

Regarding private investment, in the vast majority of cases, the form of organization can be freely chosen, with the exception of specifically regulated business areas such as insurance companies or some utilities providers, who are required to follow a specified legal structure.

For example, in Chile it is common to use the following vehicles.

CORPORATIONS

Corporations in Chile can vary in nature, and because of this, are regulated accordingly. The main difference exists between corporations being publicly or closely held.

PARTNERSHIP LIMITED BY SHARES (SPA)

SpAs are a special type of corporation with a basic structure resembling a closely held corporation. The SpA structure is more flexible and has fewer formalities as well as less economic and administrative costs.
LIMITED LIABILITY COMPANIES

Limited Liability Companies follow generally the structure of a partnership, with the main difference that the liability of the owners of a Limited Liability Company is restricted to the capital amounts subscribed by its partners.

Is it possible to conduct lending or investment business through a branch or establishment?

Foreign companies can also act in Chile through a branch or agency, which is to be considered as the foreigner itself and not as a different entity, so as a consequence, rights and/or obligations of the branch in Chile are deemed to be rights and obligations of the foreign entity.

Foreign banks operating in Chile will enjoy the same rights that national banks of equal category and will be subject in general to same laws and regulations, unless it is provided otherwise.

Pursuant to the General Banking Law, the CMF may authorize foreign banks to maintain representations that act as business agents of their parent companies and will have over them the same inspection powers that such law confers on the banking companies.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
- consumer loans;
- student lending products;
- small and medium-sized enterprises (SME) lending; and
- residential property and commercial property mortgage lending.

Marketplace lending in the form of FinTech initiatives such as peer-to-peer (P2P) platforms is in its early stages of development in the Chilean market. Some examples of FinTech applications and products which are currently operating in Chile are as follows:

- Broota is in an equity-based crowdfunding platform, and a leader in the finance and investment marketplace in Chile.
- ConsenSys is a venture production studio which builds decentralized applications and end-user tools for blockchain ecosystems,
primarily focused on ethereum. ConsenSys coordinates, incubates, accelerates and spawns ventures by helping venture enterprises to develop, including by way of resource sharing, investing in ventures themselves, and acquiring them outright and through the formation of joint ventures.

- Godzillion is an entity which is currently operating on blockchain. Through the Godzillion platform people can vote, fund, and trade startups without limitations.

**Blockchain, smart contracts and cryptocurrencies**

**WHAT IS BLOCKCHAIN?**

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a 'proof of work' process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

**WHAT IS A CRYPTOCURRENCY?**

While there is no official definition of a cryptocurrency, in the global market it is understood that cryptocurrency is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large, developing infrastructure for holding, pricing and exchanging currency).

**EXAMPLES IN THE CHILEAN MARKETPLACE**

On May 2018, the Ministry of Treasury indicated that the market capitalization of the cryptocurrency in Chile is around US$400.000 million. Some examples of cryptocurrency-based platforms which operate in Chile include SurBTC and TradeBTC. CryptoMKT is another example of a marketplace service provider which is based on the cryptocurrency ethereum. On May 2017, the Santiago stock exchange (Bolsa de Comercio de Santiago) announced that it is developing a private hyperledger using blockchain technology with IBM, which is a great indication of the level of interest and enthusiasm there is for this type of technology in Chile.

**Initial coin offerings and token-based products**
WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

We have seen the first example of an ICO launch in Chile on 23 August 2017 by a FinTech company called Godzillion. The Godzillion ICO is projected to create 300 million Godzillion tokens, known as GODZ, based on ethereum.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as 'robo advisors' are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Although we have no substantial information about AI and robo advisory systems being used in Chile by corporate companies, banks and financial institutions have been known to use this kind of technology in their internal risk-assessment systems. In Chile, public and private universities have played a very substantial role in the study of AI which continues to be a developing technology. The only known example of locally developed tested AI is AIRA, an AI software which is used for the recruitment and selection of personnel worldwide.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Data managing cloud based systems, such as Cloudera and data analysis software such as SAS are used in Chile particularly in the banking and retail sectors and to assist with public sector projects.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

Most of the regulatory regime for banking and financial services in Chile is established through the General Banking Law, and the regulatory rules of the Chilean Central Bank and the CMF, which prevents non-banking institutions from performing banking activities.

Electronic payments platforms and regulation of peer-to-peer lenders
In Chile there are two well-established electronic payments platforms: Transbank (which is controlled by banks) and Multicaja (which is owned by a private company). There have been several attempts from other non-banking entities to provide similar services, but large financial institutions have been reluctant to partner up with them, making it a difficult area of the market for smaller market players to penetrate.

Banks have further challenged non-banking entities which were providing electronic payment services which they argued constituted performing placement operations, an activity which can only be carried out by regulated banks; however, this claim did not succeed in trial and non-banking entities were permitted to continue providing such services.

**Regulation of payment services**

In Chile, low cost payment systems, or retail payment systems, are used to carry out transactions among individuals and/or companies. This kind of payment can be made through a variety of methods such as cash, checks, credit and debit card and electronic transfers. Currently in Chile, only certain institutions are allowed to issue this means of payment; however, a new law which allows the issuance and operation of different means of payment by non-banking entities was enacted in October 2016.

Payment services transactions are regulated mainly by the SBIF, which has established a series of technical criteria to ensure that all payment services are reliable and secure.

**Application of data protection and consumer laws**

Data protection and consumer laws apply equally to FinTech operations. Furthermore, there are specific laws that regulate terms and conditions of consumer loans and financial contracts with consumers (Law No 20,555). There is also a non-privacy and security regulation which is specific to banks, established in article 154 of General Law of Banks. The regulation aims to maintain the confidentiality of the transactions that individuals perform with and through the banks, by classifying them into the following two categories:

- operations covered by secrecy, meaning that they are private and it is therefore not possible to make them known; and
- operations covered by reserve, which imposes a significant limitation on the reporting of such transactions.

**Money laundering regulations**

The Finance Analysis Unit (UAF) is the dedicated public entity whose purpose it is to prevent the use of the financial systems to commit crimes such as money laundering and financing of terrorism. The UAF is aimed at controlling certain subjects related to financial activities and establishing a series of information obligations, such as:

- keeping registries;
- declaring corporate legal changes;
- reporting cash transactions and transactions that exceed the US$10,000 limit;
- reporting of suspicious activities;
- due diligence and knowledge of their clients (know your customer (KYC));
- keeping records for at least five years;
- training employees; and
- appointing a compliance officer.

The SBIF has also established a series of rules with similar aims.

_Last modified 6 Dec 2019_

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**
SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

There are several entities that provide funding for technology in Chile, the most important ones are:

- **Corporación de Fomento de la Producción de Chile** (Production Development Corporation or CORFO) acts through its startup-oriented programs, such as:
  - **Capital Semilla** (seed money) – for innovative businesses which can reach sales for amounts above US$1 million in three years and have the ability to grow afterwards;
  - **Semilla de Asignación Flexible** (flexible seed money assignment);
  - **Start-Up Chile** (a Chilean accelerator); and
  - **Sercotec** (Servicio de Cooperación Técnica).

- **Comisión Nacional de Investigación Científica y Tecnológica** (National Commission for Scientific and Technological Research or CONICYT) acts through their technology incentives, such as:
  - **FONDEQUIP** (technologic and scientific fund);
  - **EXPLORA** (national program for science and technology);
  - **REGIONAL** (regional program for scientific and technological research); and
  - **FONDEF** (promotion fund to scientific and technological fund).

- There are also several angel investment networks operating in Chile. The Angel Investors program is assisted by **Innovachile** (a CORFO agency in charge of providing Chilean enterprises access to technology).

Venture capital and debt

CORFO provides funding through its venture capital programs, such as:

- **Programa de Aceleración de Emprendimientos en Sectores Estratégicos** (which supports business incubators and accelerators that execute programs with technological ventures associated to strategic industries); and

- **Scale Up Expansión** (for innovative ventures with growth potential).

Several private funds provide financing for these kinds of undertakings.

Senior bank debt and capital markets funding

CORFO also funds the Early Stages Funds (FET), which provide credit lines to investment funds investing in technology industries. One such example is the **Fondo Etapas Tempranas Tecnológicas Perfil Administradoras**, which promotes the development of risk capital investment funds, focusing on Chilean enterprises in their early stages of development and present a growth potential in technology-related industries.

Standard bank arrangements can also be negotiated for this kind of funding.

Incentives and reliefs

The following are examples of laws designed to help small, early-stage companies:

- The Research and Development Law, Law No 20,241 (I+D Law) aims to contribute to improve the competitive capacity of the Chilean corporations, establishing a tax incentive for I+D investment, which allows qualifying entities to reduce first category taxes of 35% of the resources that were allocated towards research and development activities.
Portfolio sales

Loan transfers and portfolio sales

*What are common ways of buying and selling loans?*

Due to the fact that loans are agreements (contracts) there are only a few legal ways to transfer (buy or sell) them.

In Chile, the transfer of loans can be conducted mainly in two ways:

- **novation** – transfer of the legal rights and obligations of the debtor to a person that shall become the new debtor. It requires the acquiescence of the creditor; and
- **assignment** – transfer of the contract from the creditor to another person, who becomes the new creditor. It requires a contract and the transfer of the previous contract (which contains the original loan). Unless agreed otherwise, it does not require acquiescence of the debtor.

*What are the main considerations when transferring a loan and related security?*

General rules regarding the transfer of agreements must be fulfilled, so the transfer can effectively operate, otherwise, the transferor shall remain liable for the loan.

Regarding novation, please consider that a new obligation is generated; therefore, the previous existing guarantees will not be effective any more, unless expressly stated by all parties.

In addition, there are usual contractual clauses that need to be considered and addressed properly such as transfer mechanics and representations and warranties among others.

Projects

Financing / investing in energy / infrastructure

*To what extent are energy and infrastructure assets publicly or privately owned?*

Generally

Regarding infrastructure, Chile has decided to include private capital in several areas of the public infrastructure, by means of privatization processes, concessions of public works or long term agreements. The infrastructure related to the energy, sanitary industry and transport infrastructure is mainly privately owned. For example, the electric infrastructure, highways, roads, ports, airports and sanitary services are operated through concessions generally.

It is important to note, that the Ministry of Public Works can finance the construction of some works with public resources, in which case
such works belongs to the State. This system allows for the construction of that infrastructure which has social relevance but is less attractive for the private entities considering the economic returns.

The concession of public works is the main modality in Chile for contracting through a public-private association. The State makes a private entity responsible for the execution, conservation, reparation and exploitation of a public work in exchange for the right to receive incomes as agreed in the concession contract. Once the concession agreement finishes, the responsibility for the works returns to the State in order to be reassigned as appropriate.

The concession system has been implemented in Chile since the beginning of the 90s, with positive results mainly because of the respect for the rule of law duly guaranteeing the interests of all the parties involved, including third parties that are related with the parties directly involved in the concession contract.

Energy and telecoms infrastructure

In general terms, the energy and telecom market in Chile has been designed so that the investment and operation of the infrastructure can be entirely controlled by private actors, promoting economic efficiency as well as new technologies through competitive markets in all of the non-monopolistic segments, while the administration only carries out regulation, control and planning functions.

Transport infrastructure and other infrastructure

The Chilean Ministry of Public Works (MOP) has a set of rules and regulations that regulate the procedures for the participation of private actors – national or foreign in the construction and maintenance of public roadworks. Such works can be financed directly by the MOP (Decree N° 75/2004) or can be built by means of private resources through the public-private alliance that represents the concession system. This set of rules and regulations constitutes a harmonious whole, under the principles of transparency and efficiency of the public resources involved.

The concession system regulated by the Public Works Concession Law applies to public works that are the direct competence of the MOP or by means of delegation. Article 39 of the Public Works Concession Law establishes that ‘The Public Work Ministry is competent to give in concession every public work, the equipment provision or the associate services provision, except in the case where those works are delivered to the competence of another Ministry, public service, municipality or public company or other organism that integrates the State administration. In these cases, this public bodies are allowed to delegate through a mandate convention signed with the Public Work Ministry, the concession of those works under its competence, with the purpose that then they delivered its concession, regulated by this law’.

Are there special rules for investing in energy and infrastructure?

Generally

Generally, there are no special rules regarding investing in energy. However, please note that some electrical installations and electrical services need prior electrical concession for their development (article 2° of the General Electric Service Law). Such concessions can be provisional (for study) or definite (for constructing the project or providing the service), and are granted directly to the interested party.

Regarding public infrastructure developed through the concession system, generally the invitation to tender defines the objective parameters and the State offers several guarantees such as guaranteed minimum returns, which minimize the risks involved in the projects. The Chilean banking institutions finance these kinds of concessions.

Energy

Our electrical legislation regulates, in different categories, the generation, transmission and distribution activities introducing certain limitations when the participants have interest in more than one segment. It is expected that the decisions of the different economic agents, operating in each of the generation, transmission and distribution phases, tend to higher efficiency levels than the ones vertically integrated operators could achieve.

Overall energy policy is based on a competitive model for power generation and wholesale commercialization, while energy distribution is considered a regulated monopoly with tariff setting processes based on a target return on asset set by law and efficient theoretical model
companies.

Ultimately, the Chilean electricity market encourages competition so that prices reflect the supply and demand balance, in an open market context in the segments which the economic conditions allow.

**Telecoms infrastructure**

All projects involving the use of radio electric spectrum will be within a regulated framework. Therefore, they will require landing rights to operate, which can be granted either by concessions, licenses or permits, depending on a series of elements, such as services providers and recipients, among others. Thus, once the specifics of a particular project have been settled, it will be possible to define precisely the kind of authorization required.

The radio electric spectrum is submitted to a bidding process, which is evaluated by reviewing the technical characteristics of the project. In fact, the award of the radio electric spectrum does not depend on the economical offers proposed by the interested parties, but only on technical criteria.

**Transport infrastructure and other infrastructure**

The transport infrastructure can be developed directly by the MOP with public resources and shall be award through a public tender process, considering the technical and economic factors stated in the applicable invitation to tender.

It is important to note, participation in the tender process requires the prior registration of the interested party in the Official Contractor Registry of the MOP, which considers different categories and specialties, depending the characteristics to the works and the investment involved.

In addition, the transport infrastructure can be developed through private resources by means of the concession system.

**What is the applicable procurement process?**

Regarding public concessions, the bidding process is an administrative procedure constituted by a set of formal acts by the authority and investors, legally regulated according to the applicable regulation and expressed through this predetermined proceeding, through which the State selects the bidding that offers the most advantageous conditions for the public interest, ensuring in every case the respect to the fundamental principles such the biddings publicity, the secrecy of each offer, equality among proponents and strict subjection to the bidding conditions.

**Investing in energy and infrastructure**

As a result of the privatization processes, Chile now presents an efficient, transparent and sophisticated electricity market with a regulatory framework based on a highly efficient model of free-market principles.

**GENERATION**

Generation is organized according to a competitive market model with several generating companies competing in the contract market and interacting amongst each other through the spot market, based on short term margin costs of the electric system.

**TRANSMISSION**

As an isolated segment, this is an activity that presents large scale economies regarding its particular cost structure which is why the procedures to establish payments for the use of transmission facilities is regulated in the energy regulation, according to a procedure that seeks to cover capital and operational costs.

**DISTRIBUTION**

Due to its monopolist nature and to the existence of economies of scale, this activity is organized around concessionary companies, with the obligation to provide services in their specific concession area and subject to the fixing of their tariffs by authorities, prices which are obtained from the analysis of capital costs and efficient model company operations.
Financing energy and infrastructure

Even though the energy market in Chile is highly complex and regulated, there are no specific rules in financing companies related to this industry.

However, the states provides several benefits, for example, in order to promote certain energy sectors, incorporating guaranteed minimum returns.

What are the most common forms of funding / investing in energy and infrastructure?

Funding

Through project finance and long-term agreements.

Investing

Through a special purpose vehicle that owns the project and is the holder of the permits involved in the same.

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

Among others, there can be a regulatory investigation when:

- entities engage in regulated activities without the relevant authorizations;
- regulated entities publish misleading information regarding themselves or the securities they issue;
- brokers engage activities they are not allowed to, or fail to pass the relevant knowledge tests of the CMF; or
- financial institutions or banks issue financial promotions without the proper authorization from National Consumers Service or when they are misleading or false.

What regulatory penalties may apply?

The CMF is entitled to cancel the registry of a regulated entity if they violate the regulations contained in the Securities Act (whether if they are issuers or brokers). Fines can be applied and even suspension of the profession for the persons involved.

In addition, the General Banking Law establishes that the directors and managers of an institution subject to the supervision of the CMF who, knowingly, make false representation with respect to the ownership and capital contribution of the enterprise, or approve or submit a misstated or false balance sheet, or feign its situation, especially the amounts advanced to directors or employees, shall be punished with imprisonment.

In addition, the General Banking Law states that anyone who obtains loans from credit institutions, either public or private, supplying or providing false information or maliciously incomplete with respect to his or her identity, activities or statements of situation or equity, causing damage to the institution, shall be penalized with imprisonment.
What criminal penalties may apply?

The persons or legal entities engaging in banking activities, such as accepting deposit in a customary manner from the public or as broker, commits a criminal offence and is liable to imprisonment (from 541 days up to five years) and can also face charges as author of fraud.

Regarding the registry of securities, any person or legal entity that fails to obtain the proper authorization is liable and obliged to compensate damages due to the breach and shall be subject to administrative and criminal sanctions (imprisonment). In addition, in case of misleading information submitted before the CMF, criminal sanctions such as imprisonment may apply.

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

Stamp taxes are mainly applicable to documents evidencing indebtedness for borrowed money, including loans (between residents of Chile or cross-border), notes and bond issuances. The tax rate will depend on the characteristics of the debt but the tax rate will not exceed 0.8% of the principal amount of the debt.

Stamp tax must be paid on loans between residents of Chile when the contract or the documents are executed.

Stamp tax must be paid on cross-border loans when the document or contract is legalized in Chile or when the loan is accounted for in Chile (i.e. when the loan is recognized in the accounts of the borrower).

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

Yes. The tax rate will depend on the term of the associated loan or credit. If the associated loan or credit provides for a fixed term, the mortgage, debenture or other security will be taxed at a rate of 0.066% per month. The maximum stamp tax rate is 0.8%. If the associated loan or credit does not have a fixed term, the mortgage, debenture or other security will be taxed at a rate of 0.322%.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?

Yes, see above.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?

According to the Chilean Civil Code, the tax authority takes priority over secured lenders and secured debt security holders for outstanding withholding taxes and surcharges.
Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Interest paid by borrowers resident in Chile to lenders not resident in Chile are subject to withholding tax in Chile. Repayments of loan principal are not subject to withholding tax.

If so:
What is the rate of withholding?

The withholding tax rate is generally 35%.

What are the key exemptions?

Interest paid to a lender not resident in Chile may benefit from a reduced withholding tax rate if:

- there is a double taxation treaty in force between Chile and the country of residence of the lender; or
- the interest payments are made to certain entities eg banks, financial institutions, insurance companies or pension funds.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

Under Colombian law there are no restrictions on offering and selling debt securities but there are some requirements, including the following, that supervised financial institutions shall comply with.

- Debt securities must be registered in the National Registry for Securities and Issuers (Registro Nacional de Valores y Emisores (RNVE)).
- The Superintendency of Finance shall approve the specific regulations (ie rules and offering memorandum) for the issuance of securities by means of a public offer.
- For the issuance of notes convertible into shares or notes with the option for the subscription of shares, the issuing company shall have its shares listed on the Colombian Stock Exchange (CSE), in which its notes also have to be listed. Unsecured notes issued by the public offer shall also be listed.
- In case the issuance of debt securities is going to be made exclusively among the shareholders or between the creditors in order to capitalize the obligations of the issuing company, the securities do not need to be listed on the CSE.
- The value of the credit represented by the notes should not be less than 2,000 monthly legal minimum wages (approximately US$ 491,156 using an exchange rate of COP$ 3,004).
- The bond’s maturity period shall not be less than one year.

What are common issuing methods and types of debt securities?

Many different types of debt securities are offered in Colombia. Some common types are:

- **unsecured notes**: they are not secured by a specific asset;
- **notes convertible into shares**: this type of note can be converted into a predetermined amount of the company’s equity;
- **risk notes**: these instruments are issued by companies performing its corporate purpose under a restructuring agreement and represent the capitalization of liabilities of such companies;
- **syndicated notes**: notes issued by several companies;
- **secured notes**: Issued by a public warehouse and secured with a specific asset;
- **notes issued by multilateral lending institutions**;
• mortgage securities: Issued by credit institutions and backed with a real estate asset; and

• treasury notes: Colombian government debt securities.

What are the differences between offering debt securities to institutional/professional or other investors?

Colombian law does not make any distinction between offering debt securities to institutional/professional and other investors.

When is it necessary to prepare a prospectus?

Under applicable law, unless an exemption applies, it is necessary to prepare and publish a prospectus where there is an offer of securities to the public or an application for the securities to be admitted to trading on a regulated market.

An offer would not be deemed to have been made to the public if it is made solely to qualified investors, addressed to fewer than 100 identified investors; or is addressed to the issuer’s shareholders, so long as there are less than 500 shareholders; or if the issuer is a public utilities company which is offering its shares to investors who will benefit from investments in infrastructure.

What are the main exchanges available?

Trading system transactions are conducted through a stock exchange (currently the Colombian Stock Exchange – Bolsa de Valores de Colombia (CSE)), with the participation of an authorized broker, or through securities trading systems. The CSE provides its own set of regulations (for example, short selling, derivatives and listing regulations). The main securities trading platforms in Colombia are as follows.

• CSE manages and regulates three trading systems:
  • the Colombian Electronic Market (Mercado Electrónico Colombiano), through which securities other than public debt securities are traded;
  • the Colombian equity market; and
  • the standardized derivatives market.

• Electronic Trading System (Sistema Electrónico de Negociación) is one through which mainly public debt securities are traded, and which is managed by the Colombian Central Bank.

• Foreign Securities Quoting System (Sistemas de Cotización de Valores Extranjeros (SIC)) is one through which foreign securities are sponsored by a local broker for listing and trading. Only stock exchanges and administrators of securities trading systems that are under the Superintendency of Finance’s surveillance may administer the SIC. Retail investors are able to conduct transactions through this system.

• Over-the-Counter Market, different from the foregoing, covers securities transactions that are not conducted through the CSE or through a securities trading system and must be registered through a different registration system.

Please note that a Latin American exchange is the most significant recent project to enhance the local capital markets. Mercado Integrado Latinoamericano (MILA) is a project to unify the stock exchanges markets of Colombia, Chile, México and Peru in order to create a single stock market that will allow the negotiation of stocks of the most representative companies in the region. It is the result of an agreement signed among the aforesaid exchanges and its most important feature is that none of the entering exchanges compromises its autonomy or independence in regulatory or administrative issues as a result of the agreement. Instead, investors may benefit from MILA through an intermediary by using the local platform in local currency, but reaching the companies listed on any of the exchanges involved.
Is there a private placement market?

Yes, under applicable law a private placement should meet any of the following conditions:

- The offering is addressed to less than 100 identified investors.
- The offering is addressed to the issuer’s shareholders, so long as there are less than 500 shareholders.
- The issuer is a public utilities company which is offering its shares to investors who will benefit from investments in infrastructure.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers are required to take responsibility for all the information incorporated in the prospectuses for debt securities. Misleading statements in, misrepresentations, or omissions from, any applicable offering document or information can give rise to both regulatory and criminal liability under Colombian law. Colombian regulation has various investor protection statutory provisions relevant to liability for an inaccurate offering memorandum.

Investing in debt securities

Debt security terms and conditions typically contain provisions which may permit their modification without the consent of all investors and confer significant discretions on the trustee (Fiduciary Institution), which may be exercised without the consent of investors and without regard to the individual interests of particular investors. The conditions also provide for at least one ordinary meeting of investors, to be carried out during the first three months of each calendar year, to consider matters affecting the investors' interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Under Decree 2555 of 2010 (Decree 2555), investment fund administration is a task that only brokers, investment administration corporations and trusts companies can perform. Moreover, in Colombia the securities of investment funds are not negotiated on the same platform used to negotiate stocks as a specific negotiation platform has been developed for listed investment fund securities. There is also regulation for specific types of investment fund, such as currency market, real estate, speculation and margin.

What are common fund structures?

Pooled funds

Decree 2555 sets forth the regulation of pooled funds (Carteras Colectivas) as financial vehicles created for raising and managing money or other assets from third parties to achieve collective economic results. These vehicles may only be managed by a fiduciary entity (Sociedad Fiduciaria), authorized brokers (Comisionista de Bolsa) or investment management companies (Sociedad Administradora de Inversión), which are responsible for the investments and the back-office activities on behalf of investors.

Decree 2555 establishes four different kinds of pooled funds:
• open-end, in which the participation units may be redeemed before the expiration of the fund's term;

• close-end, in which the units can only be redeemed upon expiration of the fund's term;

• staggered pooled funds through which placement rules define different terms for the redemption of the units before the expiration of the fund's term; and

• exchange traded funds.

Pooled funds are subject to the supervision and special regulation of the Superintendency of Finance and their shares are automatically registered with the National Registry for Securities and Issuers (RNVE).

Private equity funds

Private equity funds (PEFs) are special purpose vehicles, which are close-end funds (Carteras Colectivas Cerradas) that cannot invest more than one third of the fund's assets in publicly traded securities registered with the RNVE.

Venture capital

The venture capital industry is currently organized as a high-risk investment made through PEF, under the management of general partners, and with the concourse of angel and institutional investors.

What are the differences between offering fund securities to professional/institutional or other investors?

Colombian law does not make any distinction between offering fund securities to institutional/professional and other investors.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

The incorporation of private equity funds (PEFs) is not subject to the authorization of the Superintendency of Finance. Nonetheless, the management company of the PEF must deliver certain documents to the Superintendency of Finance at least 15 business days before the final closing date of the fund. Additionally, the placement terms of the PEF may establish that the investment decisions of the fund may be delegated to a general partner, whom must credit at least five years of experience in the administration of private equity assets to the PEF be deemed as an eligible investment for local pension fund managers and insurance companies.

Managing and marketing debt/hedge funds

Are there any restrictions on marketing a fund?

No, there are no restrictions on marketing a fund. However, the marketing of a fund is carried out by the management company of the fund and/or by the general partner.

Are there any restrictions on managing a fund?

The incorporation of private equity funds (PEFs) is not subject to the authorization of the Superintendency of Finance. Nonetheless, the management company must deliver certain documents to the Superintendency of Finance at least 15 business days before the final
closing date of the fund.

Additionally, the placement terms of the PEF may establish that the investment decisions of the fund may be delegated to a General Partner, which must credit at least five years of experience in the administration of private equity assets to the PEF be deemed as an eligible investment for local pension fund managers and insurance companies.

Pension funds are also allowed to invest in offshore PEFs managed by general partners that should credit five years of experience and additionally at least US$1 billion assets under management.

**Entering into derivatives contracts**

*Are there any restrictions on entering into derivatives contracts?*

The derivatives contracts must be executed with entities under the supervision of the Superintendency of Finance (including commercial banks or broker institutions) duly authorized by such Superintendency to enter into derivatives operations. Also, the derivatives operations made through the Colombian Stock Exchange (CSE), shall comply with the all the rules set forth in the General Rules of the Derivatives Market of the CSE (Reglamento General del Mercado de Derivados).

Last modified 20 Oct 2017 | Authored by DLA Piper Martinez Beltrán

**What are common types of derivatives?**

Under applicable Colombian law, derivatives are classified in two categories:

- **standardized** – traded through the Colombian Stock Exchange (CSE), nonexistent counterparty risk because of the Central Counterparty Clearing House and constant liquidity (Market creators scheme); and

- **non-standardized** – traded outside the CSE (Over the Counter), existing counterparty risk, the contracts are created taking into account the client’s needs, and do not operate within a transactional system.

All of the main types of derivative contracts are widely used in Colombia:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying asset seen in Colombia are:

- equity;
- interest rate;
- commodities;
- foreign currency; and
- shares.

Last modified 20 Oct 2017 | Authored by DLA Piper Martinez Beltrán

*Are there any other notable risks or issues around entering into derivatives contracts?*

There are no specific risks or issues around entering into derivatives contracts.
Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Pursuant to applicable Colombian law, commercial banks cannot lend to a single person, directly or indirectly, a sum greater than 10% of their Tier 1 Capital (Patrimonio Técnico) if the only security for such operation is the borrower’s equity. Nevertheless, commercial banks can lend to a single person an amount equivalent to 25% of their Tier 1 Capital (Patrimonio Técnico), as long as such loan is secured by eligible collateral and sufficient to secure a risk exceeding 5% of such equity.

Notwithstanding the general rule set above regarding the lending limit of 10%, Decree 816 of 2014 was issued to promote the financing of fourth generation road concessions (Concesiones de Cuarta Generación), and establishes that commercial banks can lend to a single borrower who is pursuing a fourth-generation concession, a sum up to 25% of the Tier 1 Capital (Patrimonio Técnico).

Borrowing

Liabilities acquired by a Broker firm and intended to finance the acquisition of securities may not exceed three times its Tier 1 Capital (Patrimonio Técnico).

What are common lending structures?

The common structures of bank loans in Colombia are local or foreign loans, whether syndicated or not. Local loans are documented in a simple template promissory note and secured by personal guarantees. However, it is common to have foreign project finance structures for infrastructure projects with some complex guarantee structures covering assets and personal guarantees.

With respect to bank financing in Colombia for individuals, it is common to have mortgage loans, consumer credits, vehicle secured loans and leasing for housing or vehicles.

Loan durations

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid; and
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Loan security

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

Loan commitment

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled under the corresponding loan
agreement; or

- uncommitted, meaning that the lender has discretion whether or not to provide the loan if the conditions provided in the corresponding loan agreement are not fulfilled.

**Loan repayment**

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan), scheduled (usually meaning the loan is repayable in full at maturity), or prepaid.

---

**What are the differences between lending to institutional / professional or other borrowers?**

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

---

**Do the laws recognize the principles of agency and trusts?**

Yes, both principles are recognized as a matter of Colombian law.

For instance, it is possible to appoint an agent to act on behalf of other parties and a trustee to hold rights and other assets and goods on trust for the lenders or secured parties.

---

**Are there any other notable risks or issues around lending?**

**Generally**

The rate of default interest charged on a loan or on finance documents cannot exceed the maximum default interest rate authorized by the Superintendency of Finance for each calendar year.

**Specific types of lending**

Some of the most common specific types of lending are:

- mortgage loans;
- consumer credits;
- leasing for housing or vehicles; and
- vehicle-secured loans.

Please note that loans are not subject to registration. However, the granting of a mortgage over real estate requires the issuance of a public deed by a notary and the registration of the mortgage with the applicable land registry office, which triggers the corresponding registration tax as well as the fees charged by the notary plus the applicable VAT.

**Standard form documentation**

Most Colombian law finance transactions, including loan agreements are governed by documentation based on standard forms previously approved by the Superintendency of Finance.
Are there any other notable risks or issues around borrowing?

The personal information of the borrower and the information regarding the loan, payments, prepayments, accrued and due interest, and unpaid interest are sent by the financial institutions to the Risk Centrals (Centrales de Riesgo), for its custody. Such information will remain on the databases of the Risk Central, for a period determined by the applicable law.

Last modified 20 Oct 2017 | Authored by DLA Piper Martinez Beltrán

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Guarantees are commonly used in transactions where the borrower is a special purpose vehicle, a shell company or a vehicle with a limited balance sheet that is part of a group of companies that may provide stronger financial support. In this case, a parent guarantee or a guarantee from one or more affiliates is common.

Guarantees are generally created by a written agreement between the guarantor and the secured creditor.

Last modified 20 Oct 2017 | Authored by DLA Piper Martinez Beltrán

What are common types of guarantees and security?

Common forms of guarantees

In general terms, a guarantee can take the form of policies issued by authorized insurance companies domiciled in Colombia or abroad; or bonds issued by authorized commercial banks domiciled in Colombia or abroad.

If the policy or bond is issued by an insurance company or commercial bank domiciled abroad, the policy and the bond, as the case may be, must be confirmed by a local insurance company or local commercial bank.

A particular distinction is between a performance guarantee and a payment guarantee:

- A performance guarantee is a term used to describe both performance bonds and performance policies. A performance guarantee describes an undertaking used to protect a buyer and/or a contracting party against the failure of a supplier or contractor to deliver goods or perform services in accordance with the terms of a contract. The issuer of the bond or policy, as the case may be undertakes to pay to the buyer and/or contracting party a sum of money if the seller, supplier or contractor fails to deliver the goods or perform the contracted services on time or in accordance with the terms of the contract.

- A payment guarantee (whether policy or bond) covers the payment of money rather than other contractual obligations.

Additionally, the compliance policies may include some other protections such as: protection for wages and social benefits; and protection for the stability of the work.

Another common policy is the extra-contractual civil liability policy that has the following common protections: employer liability; contractors and subcontractors liability; cross liability; medical expenses; civil liability of owned and not owned vehicles; adjacent properties, cables and underground tubes.

Common forms of security

OVER REAL ESTATE

Mortgage

A mortgage allows the creditor to enforce it regardless of a transfer of ownership. The creditor cannot directly take ownership of the secured real estate. More than one mortgage can be granted over the same real estate, in which case the secured creditors are paid on a first-registered, first-served basis.
Security trust

The owner transfers the real estate to a professional trustee (entities supervised by the Superintendency of Finance) for the benefit of the secured creditors. Upon an event of default, the trustee must dispose of the real estate according to the instructions in the security trust agreement, and use the proceeds to pay the secured debt.

OVER MOVABLE ASSETS

Law 1676 of 2013 (Law 1676) unifies the legal framework for all kinds of security interest over movable assets, regardless of whether it is a conditional sale, security trust, pledge, title retention clause, or other form of security interest over movable property.

Law 1676 provides for different types of security interest, as follows:

- fixed security interest;
- purchase-money security interest; and
- floating security interest.

OVER DEMATERIALIZED SECURITIES

Security is created through both:

- a pledge agreement; and
- recording of the pledge through a book entry by the relevant securities' depository (generally, DECEVAL or DCV).

OVER SHARE CERTIFICATES

A security interest is created through a security agreement. The security interest is perfected by both:

- the secured creditor taking possession of the share certificates or registration with the National Registry of Security Interests; and
- registration in the company's stock ledger.

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

In general terms, a guarantee can take the form of policies issued by authorized insurance companies domiciled in Colombia or abroad; or bonds issued by authorized commercial banks domiciled in Colombia or abroad.

If the policy or bond is issued by an insurance company or commercial bank domiciled abroad, the policy and the bond, as the case may be, must be confirmed by a local insurance company or local commercial bank. For more information, see Giving and taking guarantees and security – types.

Giving or taking security

Under applicable law, the options to secure loans are limited to mortgages, pledges, trusts over certain tangible and in existence assets, liens over other intangible, future assets and other movable assets and movable guarantees, including rights and actions.

Movable guarantees may be granted by means of an agreement executed by and between the guarantor and the creditor identifying the secured obligation, the amount and description of the assets subject to the guarantee. For this agreement to be opposable to third parties it must be registered in the public registry of movable guarantees. Notwithstanding the above, a movable guarantee will also be opposable by means of the tenancy of the asset by the creditor or the execution of an account control agreement for moneys deposited with financial institutions.
Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Organic Statute of the Financial System (Estatuto Orgánico del Sistema Financiero) (general statute of the financial system)

Law 964/2005 (Ley 964 de 2005) (structure and institutions of the financial system)

Decree 2555/2010 (Decreto Único) (structure of the financial system, securities and securities trading)

Legal Basic Circular (Circular Básica Jurídica - C.E. 029/2014)

Basic Accounting and Financial Circular (Circular Externa 100/1995 - Circular Básica Contable y Financiera)

Consumer credit

Financial Consumer Protection Regime (Régimen de Protección al Consumidor Financiero) (consumer protection regime)

Mortgages

Colombian Civil Code (Código Civil Colombiano)

Law 1555/2012 - Advance Payment of Credit Operations (Pago anticipado de operaciones de crédito)

Corporations

Colombian Code of Commerce (Código de Comercio Colombiano)

Legal Basic Circular (Circular Básica Jurídica - C.E. 029/2014)

Funds and platforms

Decree 2555/2010 (Decreto Único) (structure of the financial system, securities and securities trading)

Other key market legislation

Financial Consumer Protection Regime (Régimen de Protección al Consumidor Financiero) (consumer protection regime)

Anti-trust and Competition (Protección de la Competencia)

Habeas Data and Management of Information (Habeas Data y Manejo de la Información) (protection and management of the financial consumer information)

Regulatory authorization

Who are the regulators?
Central Bank

The Colombian Central Bank exercises the customary functions of a central bank, including price stabilization, legal currency issuance, regulation of currency circulation, credit and exchange rate monitoring and administration of international reserves. Its board of directors is the regulatory authority for monetary, currency exchange and credit policies, and is responsible for the direction and execution of the Colombian Central Bank duties. The Colombian Central Bank also acts as a last resort lender to financial institutions.

Ministry of Finance

The Ministry of Finance designs, coordinates, regulates and executes economic policy, seeking to create an optimal administration of public finances for the economic and social development of the country. The Ministry of Finance regulates all aspects of finance, securities and insurance activities, pursuant to powers conferred by the Colombian Constitution. As part of its duties, the Ministry of Finance issues decrees related mainly to financial, taxation, customs, public credit and budgetary matters that may affect banking transactions in Colombia. In particular, the Ministry of Finance is responsible for regulations relating to financial institutions' capital adequacy, risk limitations, authorized transactions, disclosure of information and accounting.

Superintendency of Finance

The Superintendency of Finance is a technical entity affiliated with the Ministry of Finance that acts as the inspection, supervision and control authority of persons involved in financial, insurance and securities exchange activities, and any other operations related to the management, use or investment of resources collected from the public. The Superintendency of Finance is responsible for supervising the Colombian financial system with the purpose of preserving its stability and trustworthiness, as well as promoting, organizing and developing the Colombian securities market and protecting the users of financial and insurance services and investors in general.

Financial institutions must obtain the authorization of the Superintendency of Finance before commencing operations. In addition, all public offering of securities requires the prior approval of the Superintendency of Finance.

Securities Market Self-Regulatory Organization

Self-regulation in the capital markets was formally introduced in Colombia by Law 964 of 2005, and the Securities Market Self-Regulatory Organization (Autoregulador del Mercado de Valores de Colombia, or SRO) was created in 12 June 2006.

The SRO is a private entity that has the power to supervise, sanction and regulate the entities subject to self-regulation (ie including securities intermediaries and any entity that voluntarily submits itself to self-regulation).

The SRO's supervisory powers entitle it to review compliance with applicable laws and regulations and impose sanctions in the case of violations. The SRO may also propose regulation aimed at various matters, including conflicts of interest and improving the integrity and quality of the capital markets.

What are the authorization requirements and process?

Depending on the type of entity, an entity must apply to the Superintendency of Finance for authorization.

The Superintendency of Finance must assess whether the application meets the minimum capital requirements and the other required conditions set forth by the applicable law, within six months of the submission of the complete application.

The Superintendency of Finance will also approve agents and professional individuals of the stock exchange market in their roles.

Authorized entities and individuals are listed on the National Registry for Securities and Issuers (Registro Nacional de Valores y Emisores), National Registry for Agents of the Stock Exchange Market (Registro Nacional de Agentes del Mercado de Valores) and on the National Registry for Professionals of the Stock Exchange Market (Registro Nacional de Profesionales del Mercado de Valores).

What are the main ongoing compliance requirements?
Minimum capital requirements are an ongoing compliance requirement for authorized entities.

On 24 August 2012, the Colombian government enacted Decree 1771 of 2012 which amended certain capital adequacy requirements for Colombian credit institutions set forth in Decree 2555 of 2010. Decree 1771 of 2012 maintains the requirement for a credit institution's technical capital to be at least 9% of that institution's total risk-weighted assets.

Since 1 August 1 2013, technical capital has consisted of the sum of basic capital (Patrimonio Básico), or primary capital (Tier I), and secondary capital (Patrimonio Adicional), or secondary capital (Tier II); however, primary capital (Tier I) will also consist of the sum of ordinary basic capital (Patrimonio Básico Ordinario), or Common Equity Tier 1, and a new category of additional basic capital (Patrimonio Básico Adicional), or Additional Tier 1.

In addition, Decree 1771 of 2012 introduced a new measure of 'core solvency' for Common Equity Tier 1, which requires higher quality capital and is set at a minimum of 4.5% of risk-weighted assets.

By means of Decree 1771 of 2012, the Colombian Government implemented some Basel III accords into the legal regime applicable to Colombian credit institutions, specifically with regard to the capital adequacy requirements as mentioned above.

What are the penalties for failure to be authorized?

A person undertaking a regulated activity without being authorized or exempt commits a criminal offence and is liable to imprisonment and economic sanctions.

Regulated activities

What finance and investment activities require authorization?

Generally

- Credit institutions (which are further categorized into banks, finance corporations, financing companies and finance cooperatives)
- Financial services entities
- Capitalization corporations
- Insurance companies
- Insurance intermediaries

Consumer credit

No financial, banking or credit institution may operate in Colombia without the prior approval of the Superintendency of Finance.

Subject to prior approval of the Superintendency of Finance, foreign banks may operate in Colombia through their subsidiaries established and incorporated in Colombia.

Under Law 1328 of 2009, foreign banks, as of 16 July 2013, are permitted to operate through their 'branches' and are not obligated to incorporate a Colombian subsidiary. Operations through these branches will be subject to prior approval by the Superintendency of Finance. Among others legal requirements, branches have to meet the same minimum capital requirements as independent entities do.

Each credit institution must be separately authorized by the Superintendency of Finance before it may develop and provide financial services. Furthermore, the activities of credit institutions are subject to limitations and restrictions, including limitations and restrictions relating to the extension of credit, risk concentration, investments, conditional operations, foreign currency loans and negotiations, and the administration of third-party funds. One of the principal restrictions on financial activities is that banks may not acquire or hold products, merchandise, shares of corporations, income bonds, or other similar securities, except:
• when the bank has received those goods or securities as collateral for loans it has made; or
• with respect to shares, when they are issued by companies where banks are permitted to hold investments (mainly financial affiliates).

Banks are also subject to other limitations, including limitations on lending activities.

Are there any possible exemptions?

No financial, banking or credit institution may operate in Colombia without the prior approval of the Superintendency of Finance.

The incorporation of private equity funds is not subject to the authorization of the Superintendency of Finance.

Do any exchange controls or other restrictions on payments apply?

General rule

According to the Colombian Exchange Code, the following operations must be channeled through the exchange market:

• importation and exportation of goods;
• foreign indebtedness of Colombian residents and financial costs inherent to these operations;
• foreign investments and their corresponding profits;
• Colombian investments abroad as well as their corresponding profits;
• foreign investments in securities or assets located abroad, unless said investment is made with funds that do not have to be channeled through the exchange market;
• securities and guarantees in foreign currency; and
• derivative operations.

The above-mentioned operations must be made through a foreign market intermediary and/or through a compensation account. Foreign market intermediaries are commercial banks, mortgage banks, financial corporations, commercial financing companies, Financiera Energética Nacional, Banco de Comercio Exterior de Colombia S.A., financial cooperatives, stock broker companies and foreign exchange agents. Such operations must be registered with the Colombian Central Bank through the filing of the corresponding form depending on each kind of transaction.

Prohibition to pay in foreign currency between Colombian residents

In general terms, Colombian residents should pay their mutual obligations in Colombian legal currency. However, since Resolution 1 of 2013, Colombian residents can pay and receive payments in foreign currencies as long as they do it through their compensation accounts.

What are the rules around financial promotions?

Financial promotions can only be done by financial, banking or credit institution duly authorized to operate in Colombia by the Superintendency of Finance.

Entity establishment
What types of legal entity are generally used to undertake financial or investment activity?

Pursuant to applicable Colombian regulation, financial and investment activities must be undertaken exclusively by legal entities under the form of Corporations (Sociedad Anónima) or Cooperative Associations (Asociaciones Cooperativas).

Corporations are body corporates with separate legal personality and limit the liability of their members.

Is it possible to conduct lending or investment business through a branch or establishment?

Under Law 1328 of 2009, foreign banks, as of 15 July 2013, are permitted to operate through their 'branches' and are not obligated to incorporate a Colombian subsidiary. Operations through these branches will be subject to prior approval by the Superintendency of Finance. Among other legal requirements, branches have to meet the same minimum capital requirements as independent entities do.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
- consumer loans;
- student lending products;
- small and medium-sized enterprises (SME) lending; and
- residential property and commercial property mortgage lending.

MARKETPLACE LENDING IN COLOMBIA

Colombian lawmakers and regulators are currently drafting regulations regarding marketplace lending platforms. It is likely that the volume of lending as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.
Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a peer-to-peer mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the block using sophisticated algorithms and add the verified block to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a 'proof of work' process.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (e.g. in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example, relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open ('permissionless' or 'unpermissioned') or structured within a private group ('permissioned').

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an 'address'). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

BITCOIN IN COLOMBIA

Law 31 of 1992 sets forth that the Colombian peso is the only legal means of payment with unlimited releasing power. Thus, currently under Colombian law, bitcoin is not an asset that can be considered as equivalent to the legal currency and it has not been recognized as an authorized currency.

The Financial Superintendence of Colombia (SFC) considers that bitcoin can represent a risk to the Colombian financial sector as follows.

- Platforms are anonymous. Virtual currencies can be used in illicit or fraudulent activities, which may include unauthorized funding, money laundering and financing of terrorism.
- There are operational risks. Consumers may be exposed, as digital wallets can be hacked and unauthorized transactions cannot be reversed.
- There is a lack of guarantee. Consumers of virtual currencies are not covered by any type of private or public guarantee and their operations are not covered by any deposit insurance.
- There is a lack of enforceability. Currently there are no mechanisms to enforce transactions that include virtual currencies, which significantly increases the possibility of a default risk.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called 'smart contracts'. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as
blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

SMART CONTRACTS IN COLOMBIA

Currently, smart contracts are not regulated under Colombian law. Smart contracts in Colombia are still in an early stage but they are expected to be found in different kinds of operations such as voting for a publication in a forum or actions with a higher level of complexity, such as loan guarantees and futures contracts, as well as transactions such as setting payment priorities in structured notes.

WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

CRYPTOCURRENCIES IN COLOMBIA

Currently, cryptocurrencies are not part of the Colombian stock market or any other platform and thus are not a valid investment for the regulatory authorities. There are at present no operators authorized to offer transactions that include cryptocurrencies.

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
nature of the project to which the tokens relate;

- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

ICOS IN COLOMBIA

Currently, ICOs are not regulated under Colombian law. As cryptocurrencies are not valid in Colombia, the offering of initial coins will be illegal.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms, which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

AI IN COLOMBIA

Although in Colombia, AI has not been regulated, there are firms that provide an AI service. For instance, customers may order products such as credit cards and insurance through an AI machine.

ROBO ADVISORY SYSTEMS IN COLOMBIA

In Colombia, while businesses offering such services are not closed to the use of algorithms and models that can provide a more efficient and adequate service, this type of advice is not yet fully automated. Currently it is the client who must still make their own portfolio adjustment or rebalance.

There are two main challenges regarding the implementation of robo advisory systems in Colombia:

- Most of the small financial entities do not have the required technology that allows them to connect with a robo advisory system.
- The lack of regulation means that financial entities are uninformed about this type of advice system.

Data analysis and cloud computing

WHAT IS DATA ANALYSIS?

According to the Organization for Economic Co-operation and Development (OECD), data analysis is the process of transforming raw data into usable information, often presented in the form of a published analytical article, in order to add value to the statistical output.

Data analysis provides the following support to a FinTech:

- mining data from various sources;
- using data to understand current consumer behaviors and predict future consumer behavior (this is known as ‘predictive analytics’);
- using data to predict what specific type of consumer will effectively purchase; and
- analyzing data from both internal sources and external sources.
WHAT IS THE DIFFERENCE BETWEEN BIG DATA AND DATA ANALYSIS

Big data is defined by the United Nations as the mass volume of data, structured and unstructured, that is too difficult to process within a traditional database and with traditional software. Big data platforms provide the ability to process mass volumes of data and to access and analyze information. For instance, data analysis's main objective is to examine raw data with the purpose of finding patterns in sets of specific information through the use of algorithms.

Under Colombian law, the National Development Plan law assigns to the National Planning Department the responsibility to design and regulate a big data strategy, which will become public policy with two main objectives, being to:

- use big data in the coordination of national planning, therefore maximizing public investment; and
- promote the participation and collaboration of the private sector in the design of the big data in order to resolve private social complexities.

BIG DATA IN COLOMBIA

Currently, many sectors are applying big data day to day, in order to improve production and efficiency. An example is rice production in Colombia. By working with Fedearroz, the rice producers' association in Colombia and the international center for tropical agriculture, the rice sector is developing strategies for using and sharing big data to make decisions on when to produce, how to produce, and how to use inputs more efficiently.

WHAT IS CLOUD COMPUTING?

The Ministry of Technology Information and Communications (MINCIT) defines the term 'cloud computing' as a technology that offers services within the internet, updating the traditional model of computing. MINCIT refers to the definition given by the National Institute of Standards and Technology, which indicates that cloud computing is a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources that can be rapidly provisioned and released with minimal management effort or service provider interaction.

CLOUD COMPUTING IN COLOMBIA

Currently in Colombia there are multiple cloud computing options (from Claro, Google, Microsoft and Amazon). According to the Colombian Chamber of Electronic Commerce (CCCE) the lack of cloud uptake is attributed to overregulation in the sector. Nonetheless, the Colombian government has initiatives to promote cloud computing and is procuring cloud services using Colombia Compra Eficiente Portal. Yet, CCCE determines that government agencies are reluctant to allow further development of cloud computing as it is still perceived as unsafe.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

REGULATORY ENTITY

The Financial Superintendence of Colombia (SFC) is a technical entity affiliated with the Ministry of Finance that acts as the inspection, supervision and control authority of persons involved in financial, insurance and securities exchange activities, and any other operations related to the management, use or investment of resources collected from the public. The SFC is responsible for supervising the Colombian financial system with the purpose of preserving its stability and trustworthiness, as well as promoting, organizing and developing the Colombian securities market and protecting the users of financial and insurance services and investors in general.

Financial institutions must obtain the authorization of the SFC before commencing operations. In addition, all public offerings of securities require the prior approval of the SFC.
A person must not carry on a regulated activity in Colombia, unless authorized by the SFC. The SFC authorizes the incorporation and operation of all financial institutions. Authorization of the SFC shall be obtained whenever FinTech products or applications involve any financial activity which requires regulatory authorization.

A person undertaking a regulated activity without being authorized or exempt commits a criminal offence and may be liable to imprisonment and economic sanctions.

**PROJECT REGTECH**

The SFC has a FinTech division that seeks to create and develop applications that support regulatory compliance. Currently, the main focus of the FinTech division is to optimize the transmission of information among the different financial controlled entities (i.e., banks, stock exchange, fiduciaries, and financial institutions). This initiative is known as ‘project RegTech’.

**FINTECH SUBCOMMITTEE**

In 2016, the Financial Regulation Unity (URF) formed the FinTech subcommittee to provide a formal space in which the public and private sectors may participate and contribute in the construction of FinTech regulations.

The remit of the FinTech subcommittee includes the following:

- robo advisors;
- cloud computing;
- blockchain; and
- algorithm tradition.

The FinTech subcommittee has not yet issued formal guidelines in connection with the abovementioned matters, although it is expected that it will issue these guidelines no later than December 2017.

**ASOCIACIÓN COLOMBIANA FINTECH**

Asociación Colombiana FinTech is a group of entities whose aim is to create a proactive place for the development of FinTech business in Colombia. This association is working in the following areas:

- international transmission of data;
- digital identity;
- digital consultancy;
- digital payment;
- crowdfunding;
- InsurTech;
- bitcoin and blockchain;
- open data for the financial sector; and
- sandboxes.

**Electronic payments platforms and regulation of peer-to-peer lenders**

**ELECTRONIC PAYMENT PLATFORMS**

E-commerce is regulated by Law 527 of 1999, known as the Electronic Commerce Law. E-commerce is defined as all issues arising from a commercial relationship, whether contractual or not, originating from the use of one or more data messages or other similar media. Commercial relationships include the following transactions:

- supply or exchange of goods and services;
distribution agreements;
agency of mandate agreements;
all types of financial, securities and insurance operations;
infrastructure and construction agreements; and
licensing.

Electronic security is a component of the SFC’s operational risk review. Supervised firms are required to design and implement electronic security policies and contingency plans. The SFC establishes minimum requirements for security and quality of information transmitted through electronic channels.

Colombia has adopted measures aimed at reducing regulatory burdens on the financial sector with the aim of encouraging the expansion of access to financial services and to engage in online commerce. As an example, the financial inclusion law allows the creation of nonbank deposit entities known as specialized companies in deposits and electronic payments (SEDPE). SEDPEs are intended to give individuals access to a savings account, and facilitate safe, quick and cheap money transfers. SEDPEs help individuals who do not necessarily own credit or debit cards to carry out online purchases. Moreover, the law allows mobile phone operators to obtain financial licenses from the SFC to operate SEDPEs.

PEER-TO-PEER LENDERS

Peer-to-peer lenders are not currently regulated under Colombian law.

Regulation of payment services

The Financial Superintendence of Colombia has regulatory and supervisory authority over financial entities regarding payment services.

In addition, the Banco de la Republica (Central Bank or BR) is responsible for monetary policy and foreign exchange. It has the authority to adopt certain macroprudential measures, manages and exercises surveillance functions over the payment system, provides liquidity to markets, and acts as a lender of last resort.

Application of data protection and consumer laws

DATA PROTECTION AND CONSUMER REGULATIONS

Law 1266 of 2008, Law 1581 of 2012 and Decree 1337 of 2013, each regulate data collection and processing by any financial, commercial and credit institution. The regulations differentiate between the controller and the processor of the data. The data controller is any individual or legal, public or private entity, which by itself or in association with others, makes decisions regarding the database or the treatment of the data and is responsible for it. The data processor is any natural or legal, public or private entity, which by itself or in association with others, processes personal data on behalf of the controller.

DIFFERENCE BETWEEN TRANSFERRING OF DATA AND TRANSMISSION OF DATA

Regulations differentiate between the transferring of data and the transmission of data. The transferring of data is the operation in which the data controller of the personal data within Colombia sends the information to a receptor (in Colombia or abroad). In this case, the receptor also becomes responsible for the data processing, and therefore shall comply with all applicable laws. Transferring data to foreign countries is prohibited, unless the recipient foreign country is deemed to provide an adequate level of data protection. The transferring prohibition shall not apply, however, in the following cases:

- the owner of the data has authorized the transfer;
- exchange of medical information;
- bank transfers;
- transfers in accordance with international treaties;
- transfer is required due to the existence of an agreement between the owner of the information and the data controller; and
- legally required transfer in order to safeguard public interest.
Any event different from the above mentioned, requires the authorization of the Colombian Superintendence of Industry and Commerce (SIC).

For instance, the transmission of data is the communication between the data controller and the data processor in which the data is sent by the data controller and processed by the data processor on behalf of the data controller. International transmission does not require the authorization of the data owner, as long as an agreement has been executed between the data controller and data processor.

**Money laundering regulations**

Firms that are supervised and controlled by the SFC must implement an asset laundering and financing terrorism risk management system (SARLAFT) in order to prevent money laundering and terrorist financing. The SFC has the responsibility to report to the Special Administrative Unit and Financial Analysis (UIAF) any operations conducted by controlled or supervised firms that may be categorized as suspicious, in order for the UIAF to initiate an investigation.

The UIAF has the responsibility to detect, prevent and overcome practices related to money laundering and financing of terrorism by centralizing and analyzing all of the information collected in the exercise of its faculties.

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**

**SEED INVESTMENT**

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

**CROWDFUNDING**

The crowdfunding sector is well established, and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform, such as Crowdcube or Crowdfunder.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

**ACCELERATORS**

There are various incubators or accelerators in the Colombian market which offer support, facilities and funding for startups, often in return for an equity stake. For example, INNPulsa Colombia, a governmental entity created in 2012, promotes and supports startups that are mainly focused in the productivity and business sector. Bancoldex, another governmental entity, finances any credit required by entities for working capital, fixed investments, and corporate capitalization.

**ISSUES OF CROWDFUNDING IMPLEMENTATIONS IN COLOMBIA**

Currently Colombian regulations do not permit crowdfunding services. However, mindful of the potential benefits of crowdfunding platforms, the Financial Regulation Unity (URF) is proposing reform to the current legal framework in order to allow crowdfunding in Colombia and, at the same time, ensure investor protection and stability for the financial system. The URF proposes three main strategies for a future regulation of crowdfunding in Colombia:
a clear definition in the law of ‘financial crowdfunding’;

to regulate the activity in order for it to be performed, exclusively, by entities under the surveillance and control of the Financial Superintendence of Colombia; and

to establish duties and conditions to be complied with by all parties that interact in the crowdfunding market.

**Venture capital and debt**

**VENTURE CAPITAL AND DEBT**

Venture capital (VC) is equity capital or loan capital provided by private investors or specialized institutions. It is a type of funding used to acquire new or growing businesses, including FinTech businesses. The VC firm provides funding to the startup company in exchange for equity in the startup. VC provides a viable alternative to traditional lending, given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

In Colombia, the VC industry is currently organized as a high-risk investment through private equity funds, under the management of general partners and involving angel and institutional investors.

**DIFFERENCES BETWEEN VENTURE CAPITAL AND CROWDFUNDING**

The principal difference between VC and crowdfunding is equity. Investors acquire equity in the startup, crowdfunders do not. Generally, crowdfunding has a higher risk as it acts as a pre-order platform where there is a reasonable probability that the startup may fail to deliver the pre-order.

**Warehouse and platform funding**

Warehouse financing is a form of inventory financing in which loans are made to manufacturers and processors on the basis of goods or commodities held in trust as collateral for the loans. The goods may be held in public warehouses approved by the lender, or may be held in field warehouses located in the borrower’s facilities but controlled by an independent third party. A financial institution engaged in warehouse financing will usually designate a collateral manager who issues a warehouse receipt to the borrower that certifies the quantity and quality of the stored goods or commodities.

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Some FinTech companies may see warehouse funding as a temporary form of financing to be followed by a larger capital markets transaction at a later date.

Law 1676 of 2014 provided a new legal framework on security interest over movable assets. The law introduced many changes but among the most important are:

- an increase in the kinds of assets that may be subject to a security interest;
- the creation of a new centralized system where filing and searches of security interests may be conducted; and
- new methods to enforce security interests against third parties and debtors.

This law promotes the use of warehouse and platform funding in Colombia.

**Senior bank debt and capital markets funding**

**SENIOR BANK DEBT**

Senior bank debt is a debt financing obligation issued by a financial institution to a company or individual that holds legal claim to the borrowers assets ranking above all other debt obligations. The debt is considered senior to all other claims against the borrower, which means that in the event of a bankruptcy the senior bank debt is the first to be repaid before all other interested parties receive payment.

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis, depending on the creditworthiness and asset base of the business.
Capital markets are the markets where securities such as shares and bonds are issued to raise medium to long-term financing, and where securities are traded. Securities may be issued by a company issuing shares or bonds to raise money. Bonds could also be issued by other entities in need of long-term funds.

Currently, in Colombia, FinTech companies have not issued bonds to invite investors as a way of raising funding, due to the lack of regulation.

Incentives and reliefs

There are certain provisions that incentivize specific platforms for FinTech business. For example, the last amendment of the Colombian Tax Code includes an incentive for the cloud computing platforms; cloud computing platforms shall be exempt from value added tax.

In addition, taking into account that it is expected that Congress will introduce a law that regulates FinTech businesses, the Asociación Colombiana FinTech has proposed that the legal FinTech framework includes tax deductions for:

- companies' vehicles and or structures that have, as a main objective, crowdfunding services;
- investors' funders or resource generators who interact with crowdfunding providers; and
- any financing or investment through a lending, crowdfunding or entrepreneur platform.

Portfolio sales

Loan transfers and portfolio sales

*What are common ways of buying and selling loans?*

Loans are commonly traded in Colombia. The most common forms of loans and debt trading are as follows.

**Assignment and assumption agreements**

The most common form of loan trading is an assignment and assumption agreement between the original lender and the new lender.

**Novation agreements**

For facilities in which the lender's obligations (mainly disbursement of the loan) are pending, the substitution of one lender by another is made through a novation agreement, executed by the lender with the debtor and the substituted lender.

*What are the main considerations when transferring a loan and related security?*

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller's legal advisors. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and
Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

The ownership of energy and infrastructure assets on Colombia varies according to the asset's sector. In general, public utilities and infrastructure services must be provided by the state, but they can engage private sector investment through concession contracts that grant to a private individual or company the provision or operation of a public service or the construction of a work or good.

Additionally, the government issued the Public-Private Partnership's (PPP) regime (Law 1508 of 2012) to attract long-term investors with enough financial capacity to develop:

- the design and construction of infrastructure and its utilities;
- the construction, rehabilitation, improvement or equipment of infrastructure, including the operation and maintenance of the infrastructure; and
- infrastructure for providing public services.

Projects typically use a BOOT structure where at the end of the 30-year concession period, the infrastructure reverts to the public sector who will own and operate it, or grant it in concession again to a different investor. PPPs can be structured to develop infrastructure in any sector in which the provision of infrastructure and its related services are needed and to projects with a minimum investment of US$1.7 million. There are two type of PPPs:

- Public Initiative PPPs structured by the government that can be developed using private and/or public resources; and
- Unsolicited Proposals PPPs that are structured by a private company (only for new projects) which can be funded 100% with private resources or with private resources and a maximum of 20% public funds.

Colombia's main privatizations have occurred in the electricity, mining and hydrocarbon sectors. Under Law 226 of 1995, the state can privatize state-owned companies by alienating the shares or convertible bonds owned by the government in a company's capital by offering them to the company's cooperatives and workers associations in the first place. If they show no interest, the government can then proceed to offer them to the general public. In addition, the Constitution allows for the government to create mixed-economy companies that are jointly owned by the public and private sectors. These companies, organized under the structure of a joint-stock corporation, can own and operate infrastructure assets or provide infrastructure services.

Energy

The private sector finances and delivers most of the required infrastructure in the energy sector.

ELECTRICITY

The electricity sector in Colombia is a complex system comprised of generation, transmission, distribution, commercialization and interconnection activities. The economic agents who can participate in this sector's activities are public-owned companies, private companies and mixed-economy companies.

The construction of energy generation facilities and its connecting power lines to the interconnection and transmission networks can be performed by any economic agent, which maintain the ownership of the assets. In addition, companies that own power lines, substations and facilities that are part of the National Interconnection Network, as well as electricity transmission and distribution assets, also maintain their ownership.
MINING AND HYDROCARBONS

Subsoil and mineral resources are owned by the state. However, the state doesn't participate in oil and gas production or mineral extraction as these activities are performed by private companies and ECOPETROL, a mixed economy company, through concession contracts (mining) and exploration and production contracts (hydrocarbons) granted by the National Mining Agency and the National Hydrocarbons Agency respectively.

The Regulation Commission for Energy and Gas (CREG) and the Mining and Energy Planning Unit (UPME) are the principal state agencies responsible for regulating the energy sector and market in Colombia.

Telecoms infrastructure

The telecommunications networks (fixed and mobile) in Colombia can be publicly or privately owned operators and service providers.

The electromagnetic spectrum is a public good subject to the state's administration and control. Law 182 of 1992 (modified by Law 335 of 1996) introduced a reform in this sector in Colombia by establishing the possibility for private companies to provide television services through national operation private channels. In addition, television services can be provided by public entities and organized communities.

Transport infrastructure

AVIATION

Air transportation in Colombia is considered a public service. There are several ownership structures in Colombia's aviation market, including private aerodromes and public aerodromes operated by territorial entities or by private companies that operate them under concession contracts. However, airports are owned by the state but constructed and operated by a private company under a concession agreement that usually lasts 20 years. These concessions were previously granted and managed by the Civil Aviation Authority but recently the National Infrastructure Agency (ANI) took over this task.

PORTS

Ports in Colombia are constructed and maintained by port-operating companies organized as joint-stock companies, which can be publicly owned, privately owned or jointly owned by a private company and a public entity. Only port-operated companies can be granted with a port concession contract for a 20-year period.

RAILWAYS

Two mining companies privately own the only two standard gauge railways that currently exist in Colombia. However, private initiative PPP projects have been presented to the ANI and are under study in its feasibility phase for financing and operating the currently inactive lines.

ROADS

Road and highways in Colombia can be classified into four categories:

- national road network under concession, financed and operated by private companies;
- non-concessional national road network financed by the national government and operated by the National Roads Institute;
- secondary road network, financed and operated by departments; and
- tertiary road network financed and operated by municipalities.

Road infrastructure in Colombia linking private participation has been developed through three generations of concession contracts to finance, design, build, operate and maintain highways. A fourth generation of concessions was launched in 2012 under the PPP scheme, where private investors can participate in public initiative PPPs bidding processes or present unsolicited proposals to be entirely founded with private resources or with both public and private funds.

PUBLIC TRANSPORTATION
The Massive Transportation Integrated Systems (SITM) were recently implemented in Colombia's major cities for improving urban public passenger transportation. The construction of the infrastructure (e.g., lanes, stations, stops) needed for the SITM’s was performed by private construction companies who were awarded with a public works contract by the city's government. For the operation of the systems, local governments award 10-year concession contracts, some for purchasing, maintaining and operating the buses and others to operate the payment collection systems.

Other infrastructure

RESIDENTIAL PUBLIC UTILITY SERVICES

Water supply, sewage, sanitation, electric energy (transportation to final user), natural gas distribution, basic public telephone and mobile telephone in rural areas are considered as residential public utility services, and must be provided by a Public Utility Company (Empresa de Servicio Público Domiciliario (ESP)), incorporated under the structure of a joint-stock corporation. ESP shareholders may be companies or individuals from the private sector, public sector entities or mixed economy entities. Even though a single ESP may provide more than one public utility service, the regulatory agencies (Water and Basic Sanitation, Energy and Gas and Telecommunications) may limit the ESP’s business to only one service to prevent monopolization.

DEFENSE AND NATIONAL SECURITY

Typically, defense assets are owned by the public sector. However, private companies can provide goods and services required for this sector to the government.

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, PENITENTIARIES, PUBLIC BUILDINGS)

Typically, infrastructure from these sectors is owned by the public sector. Most social infrastructure assets in Colombia are directly financed by the government. However, the goal is to attract private investment through PPPs to develop these sectors that have traditionally been left behind.

Are there special rules for investing in energy and infrastructure?

Generally

Whether a specific investor can invest in a particular project will depend on the terms of the project's procurement if it is carried out by the public sector. Regarding an existing/operating project, the possibility for a private company to invest will depend on whether there are any contractual restrictions on change of control or contract assignment.

On private sector infrastructure, the investor would need to consider the need of licenses (i.e., construction, environmental, planning), previous consultations, entity's consents or permits to carry out the project.

Energy

The energy sector in Colombia is highly regulated and controlled by the Regulation Commission for Energy and Gas (CREG) and the Mining and Energy Planning Unit (UPME) which are the principal state agencies responsible for regulating the energy sector and market in Colombia. These public entities are currently issuing new resolutions regarding regulated and non-regulated users, the tariffs to be charged to the final users, subsidies and the elaboration/update of the National Energy Expansion Plan. Investors should keep in mind if they will be developing in the regulated or non-regulated segments of the energy market, and the advances in the implementation of the regulation regarding alternative energy that was issued in 2001 but that has not had much development yet.

Telecoms infrastructure

Under the regime introduced by Law 1341 of 2009, all telecommunications services (ICTs) may be freely provided without any license or authorization; the only requirement is for the provider to be registered in a public record. The Communications Regulatory Commission is the state agency in charge of regulating the ICTs sector in Colombia.

Regarding television, all agents must have a license or contract granted by the National Television Agency for operating and providing
television services that usually lasts 10 years.

**Transport infrastructure**

For a private sector sponsor to carry out a highway project, the company must meet the enabling requirements established by the National Infrastructure Agency (ANI) in a prequalification stage previous to the bidding process: experience in financial investment or project structuring/development and financial capacity. Once the contract is awarded by the ANI, the private investor that will act as a sponsor must constitute a special purpose vehicle (SPV) to execute the specific project that constitutes the object of the contract awarded by the ANI. In addition, the SPV must constitute a trust fund that will manage the project's equity investments, the debt originated by the lenders, the toll-road collection funds, the commercial exploitation money and the government's resources when the project requires public funds (*Vigencias Futuras*).

There is usually a restriction on the change of control of a private sector sponsor in these highway projects: during the pre-operation phase (pre-construction and construction) and until the first year of the operation and maintenance phase, sponsors may assign their participation but the SPV has to maintain as a shareholder holding a 25% equity interest, a party that presented financial and experience requisites during the bidding process; and after the first year of the operation and maintenance phase until the end of the concession without restrictions.

**What is the applicable procurement process?**

Public Procurement in Colombia is governed by the General Statue for Public Procurement, composed by Law 80 of 1993, Law 1150 of 2007 and Decree 1082 of 2015. The following are the sector-specific regulations that are excluded from the application of the general regime:

- Residential Public Utility Services are governed by Law 142 of 1994 and subject to private law regime.
- Electric energy activities are governed by Law 143 of 1994 and subject to private law regime.
- Telecommunications are governed by Law 1341 of 2009; (iv) Ports are governed by Law 01 of 1991.

Contracts procured by the public sector must be awarded following the principles of objective selection, transparency, economic efficiency, planning, publicity and responsibility. All public contracts must be awarded through a public tender unless the regime establishes specifically that a given contract must be awarded following one of the exceptive procedures. However, in all cases the public entity will need to publish the procedure's terms of reference and contractual documents in the electronic system SECOP. The following are the five selection procedures for awarding public contracts:

- **Public tender** – This selection process is used by state agencies to select contractors through a public invitation that is extended to all people interested in entering into a contract with such entity so that they, on equal conditions and following an established objective criterion, submit their proposals, from which the most favorable will be selected.

- **Abbreviated selection** – This procedure is used in cases in which the characteristics of the object to be contracted, the circumstances of contracting, or the value or destination of the goods or services may be contracted by an expedited public tender. It is allowed in the following instances:
  - when the good to be acquired has uniform technical characteristics and are of everyday use by state entities;
  - for minor amount contracts, determined based on the annual budget of the contracting entity;
  - for celebrating contracts for the provision of health services;
  - in the cases when a public tender process has been declared deserted (without suitable bidders);
  - for the alienation of public assets;
  - for acquiring goods produced or intended for agricultural purposes that are offered on legally constituted product exchanges;
  - for celebrating contracts that have as an object the commercial and industrial activities inherent to industrial and commercial state entities;
  - the contracts of entities dedicated to the execution of programs regarding protection to individuals in risk, demobilization and
• reinsertion to civil life of people belonging to armed groups, displaced population, human rights protection, and population in high risk of vulnerability; and

• for acquiring goods and services required for national defense and security.

**Merits-based contest** – This selection process must be used only to select contractors for consultancy projects in which the work is mostly intellectual and so the public entity must consider the bidder's professional qualities or technical expertise instead of the price of the services.

**Direct contracting** – This is an exceptional selection mechanism since its application is restricted to the following events only:

  • when the public entity has declared that the contract must be celebrated to ensure the continuity of the service ('urgencia manifiesta');

  • for contracting loans;

  • for celebrating inter-administrative contracts;

  • for the confidential contracts celebrated to acquire goods and services required for national defense and security that must be kept under reserve;

  • contracts for the development of scientific and technological activities;

  • escrow agreements celebrated by regional entities;

  • when there are no other suppliers in the market for the provision of the good or service; and

  • for the provision of professional services and administrative support, or for the execution of artistic works that can be only entrusted to specific individuals.

**Investing in energy and infrastructure**

The selection mechanisms and rules for the celebration and execution of public-private partnership (PPP) contracts are also ruled by the General Statue for Public Procurement. However, the selection mechanism that applies depends on the project's initiative (public or private) and if it requires public funds, according to what is prescribed in Decree 1467 of 2012.

**PUBLIC INITIATIVE PPP**

The selection mechanism that must be selected by the public entity is the public tender. However, the entity can choose to open a prequalification round where the investor's financial and experience capacities will be evaluated when the project's estimated value exceeds US$17 million.

**UNSOLICITED PROPOSAL PPP**

**Funded 100% by a private investor**

Once the state entity approves the project presented by the originator in its feasibility phase, it must publish a public call for third parties to manifest if they are interested in the project structured by its originator. If no other companies show their interest, the state agency can award the contract directly to the project's originator. If other companies manifest an interest in the project, the state entity must open an abbreviated selection process to award the contract. During the public process, the originator has the right to present a second offer improving the value of the offer that was qualified in the first place. If, even by exercising its right, the originator doesn't obtain the first place, the company has the right to be compensated by the winning offeror for the costs incurred when structuring the project.

**Funded by a private investor with 20% public funds**

The investor has to be selected through a public tender process. The project's originator will have a 3% to 10% bonification in its final qualification during the tender process as a reward for its previous efforts in structuring the project.

An investor may choose, however, to seek to invest in a project that has already been procured and is operational. A special purpose vehicle (SPV) project company's shareholder may assign its contractual position to the shareholder, in which case such investments are controlled by the state entity who awarded the contract as procurement regulations establish that the assignment must be previously approved by the awarding entity. Moreover, an investor can also invest in an ongoing project by acquiring an interest in an SPV project.
company, where typically such investments are controlled by contractual mechanisms within the original contracts celebrated between the SPV's shareholders.

**Financing energy and infrastructure**

Publicly procured contracts include a disposition that states that the SPV must register the lenders before the public entity and any change on the funding arranged, requires consent from the public sector. In addition, contracts provide that if the SPV incurs in a breach of any of the financial documents or contracts entered with the lenders, these have a step-in right to control the project.

**What are the most common forms of funding / investing in energy and infrastructure?**

**Funding**

In Colombia, energy and infrastructure finance needs are met mainly by national or international commercial banks, nonbank finance companies (Corporaciones Financieras) and private equity funds that act together with multilateral agencies to serve as project lenders. Recently, insurance companies and private pension fund administrators have acted as financing sources for infrastructure projects.

Common forms of funding in energy and infrastructure include:

- syndicated bank loans made on a project-finance basis to a special purpose vehicle (SPV) project company, on medium- to long-term bases;
- private equity fund loans;
- project notes; and
- refinancing of the debt in the operation phase of the project.

Colombia's government has tried to expand the funding base and increase liquidity in the market by various means. Recently, the Financiera de Desarrollo Nacional was created as a mixed-economy financial company that offers financing, guarantee and advisory services for energy and infrastructure projects.

**Investing**

Large engineering and construction companies act as sponsors in the development of infrastructure projects, while oil producers and energy agents are the companies that invest in the energy sector.

Common forms of investing in these sectors include:

- equity investment in project's SPVs in the form of share capital or subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of 'equity').

**Restructuring**

**Enforcement and sanctions**

**When can there be regulatory investigations?**

Violations of the financial system rules and regulations are subject to administrative, and in some cases, criminal sanctions.

The Superintendency of Finance exerts its supervisory powers over the financial sector on a consolidated and comprehensive basis. The consolidated supervision extends to all financial institutions including banks operating in Colombia and their subsidiaries abroad, in the latter case to the extent permitted by the laws of the respective country of incorporation.
The Superintendency of Industry and Commerce is responsible for advancing administrative investigations of antitrust violations by financial and non-financial corporations, and has the power to impose corresponding sanctions.

What regulatory penalties may apply?

The Superintendency of Finance may inspect Colombian financial institutions on a discretionary basis and has the authority to impose sanctions including admonitions, fines, removals, or administrative takeovers on such institutions and their directors and officers for violations of Colombian laws or regulations, or such financial institutions’ by-laws.

If a financial institution exceeds the lending and investment limits as set forth in the applicable law, the Superintendency of Finance may impose a fine up to twice the amount by which any such loan exceeded the limit and, in some cases, there may be criminal sanctions.

What criminal penalties may apply?

The Colombian Criminal Code introduced criminal rules and regulations to prevent, control, detect, eliminate and prosecute all matters related to financing terrorism and money laundering. The criminal rules and regulations cover the omission of reports on cash transactions, mobilization or storage of cash, and the lack of controls.

Tax

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

There is no stamp, registration, or other similar tax payable on loan agreements, bonds or other debt instruments.

Documents granting security (e.g. mortgage instruments) that have to be registered either on the Public Deed Registry, or before a Chamber of Commerce, are subject to:

- a registry tax that ranges between approximately US$30 (for ‘documents without amount’) and 1% of the contract amount, depending on the specific characteristics of the document to be registered; and

- a registry fee which ranges from approximately US$6 (for ‘documents without amount’) to 0.5% of the contract amount.

In most cases, mortgage instruments are considered ‘documents with an amount’, and therefore subject to registry tax and fees calculated as a percentage (and not the fixed amounts mentioned above).

The execution of a public deed is subject to the payment of notary fees which, in the case of a mortgage, amount to 0.3% of the secured amount (plus a 19% value added tax on the notary fee). This also applies to instruments which are granted through public deed without a legal requirement to do so.

Liens over personal property such as shares, intangibles, and accounts receivable, are not subject to registry tax, as they are not inscribed in the Public Deed Registry or Chamber of Commerce but rather in the Personal Property Securities Registry, which charges a fixed registry fee of approximately US$10.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or
assignment of a mortgage, debenture or other security?

The transfer or assignment of a mortgage would, in principle, be subject to the registry taxes and fees, and notary fees since, in practice, these transfers or assignments are carried out through a cancellation of the pre-existing mortgage and the creation of a new mortgage.

The documentation of the substitution of mortgaged assets, without a change in parties or the secured obligations, is deemed by regulation as a ‘document without amount’ (such that the fixed amounts mentioned above are applicable).

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

The assignment of a security over personal property (eg shares, intangibles and accounts receivables) is subject to a fixed registry fee of US$10, payable to the Personal Property Securities Registry.

Bonds, promissory notes, loan agreements and similar debt instruments are not required to be registered with the Public Deed Registry or before a Chamber of Commerce, nor are they required to be incorporated on a public deed, and therefore are not subject to the aforementioned taxes and fees (which are normally charged upon securities and not upon debt instruments).

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

Under current applicable law, the liabilities of a borrower in insolvency proceedings are discharged in the following order of priority:

- expenses incurred after the start of the insolvency proceedings;
- pension liabilities;
- liabilities covered by a security interest up to the amount of the security interest;
- tax obligations (enforcement by the Colombian Tax Authority (Dirección de Impuestos y Aduanas Nacionales (DIAN)), or the local tax administration, depending on the tax due);
- other kinds of liabilities; and
- unsecured liabilities.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Interest payments made under a loan from Colombian source income are subject to withholding tax. According to Colombian tax law, the source of interest income depends on the domicile of the debtor.

If so:
What is the rate of withholding?

The general withholding tax rate for interest payments made by a person resident for tax purposes in Colombia to a recipient who is not resident for tax purposes in Colombia, is 15%. This rate is increased to 34% (33% from 2018) when the recipient is resident for tax purposes in a country listed by Colombia as a non-cooperative or low tax jurisdiction.

What are the key exemptions?
Interest payments on loans granted by persons not resident for tax purposes in Colombia to Colombian banks, financial cooperatives, commercial finance companies, financial corporations, the Colombian Nation and territorial authorities, as well as certain government-owned finance agencies (Bancoldex, Finagro and Findeter), are not considered Colombian source income and are, therefore, not subject to withholding taxes or income taxes.

Interest payments arising from loans intended to finance public infrastructure projects in Colombia, and granted for a term equal to, or longer than, eight years, could be subject to a reduced 5% withholding tax rate.

The double tax treaties entered into by Colombia may allow for a reduction of the general withholding tax rate (normally to 10%), provided that the conditions set forth in the applicable treaty are complied with (such as the recipient being the effective beneficiary of the interest, and not a mere conduit entity).

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes. However, the Colombian Tax Administration recently changed a doctrine that has been in place since 2013, to accept an exception from withholding tax for interest payments on bonds and other debt securities issued outside of Colombia by a Colombian resident, provided the bonds or other debt securities are not traded on the Colombian markets. According to this new interpretation, there would not be withholding taxes in these cases.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

Lenders who are not resident in Colombia and whose only Colombian source income are interest payments, are not required to file an income tax return in Colombia, provided that any applicable withholding tax has been adequately charged. In this event, the withholding tax becomes the final tax due in Colombia. If these conditions are not fulfilled, an income tax return is due and the tax has to be calculated according to the general rules (which tax the profits of foreign lenders on a net, rather than gross, basis at a rate ranging from 33% to 40%).

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes. However, if the exception from withholding tax for interest payments on debt securities issued and traded outside of Colombia applies, an income tax return would not be required.

Capital markets and structured investments
Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

Yes.

There are restrictions on offering and selling debt securities under both the Czech and EU law. The main restrictions under Czech law are contained in the Act No. 190/2004 Coll., on Bonds.

Any joint-stock company can issue debt securities unless forbidden by law, eg investment funds cannot issue debt securities.

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in the Czech Republic are corporate bonds. However, government bonds (issued either by state or municipalities) are also quite common and very favored by foreign investors, especially in recent years (their yield is not high, but they are considered a safe choice).

Different types of debt securities are offered in the Czech Republic:

- corporate bonds;
- state bonds (via ministry of finance);
- municipality bonds;
- ordinary shares;
- bank bonds (subtype of corporate bonds); and
- mortgage bonds (Hypotení zástavní listy in Czech).

Debt securities are also characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities and high-yield bonds.

What are the differences between offering debt securities to institutional / professional or other investors?
Differences are further described in Act No. 256/2004 Coll., on Capital Market Undertakings. The entity issuing debt securities is bound by Sections 15 to 15r when offering debt securities to professional investors, eg some information duties.

The Prospectus Directive does not make a distinction between professional and other investors for the purposes of its disclosure requirements but does include different disclosure regimes by reference to the minimum denomination of a single security. If the denomination of the securities is equal to or above €100,000 (or the equivalent in another currency), the ‘wholesale’ rules apply. If the denomination is under €100,000, the ‘retail’ rules apply. Additional disclosure requirements apply for retail securities.

**When is it necessary to prepare a prospectus?**

Under the Prospectus Directive, unless an exemption applies, it is necessary to publish a prospectus where there is an offer of securities to the public or an application for the securities to be admitted to trading on a regulated market.

An offer would not be deemed to have been made to the public if it is:

- made solely to qualified investors;
- addressed to fewer than 150 persons (other than qualified investors) per European Economic Area state; or
- where the minimum denomination per unit is at least €100,000.

If the offer is deemed not to be made to the public, a Prospectus Directive compliant prospectus may still be required if an application is made for the securities to be admitted to trading on a regulated market.

An exemption from both the offer to the public and the admission to trading on a regulated market is needed to avoid having to publish a prospectus.

**What are the main exchanges available?**

The Prague Stock Exchange has two principal markets on which debt securities are traded:

- Official Market; and
- Regulated Market.

**The Prague Stock Exchange Official Market**

The Official Market is intended exclusively for trade in the largest and most prestigious bonds issued by the entities coming from the public administration, corporate and financial sectors.

If they adhere to the statutory rules of the Official Market they must primarily meet the criterion of minimum issue value of €200,000.

**The Prague Stock Exchange Regulated Market**

The Regulated Market is intended for trade in the major bonds and other debt securities issued by the entities coming from the public administration, corporate and financial sectors.

The Regulated Market may accept the issues which meet the less demanding statutory requirements of the Regulated Market.

**Is there a private placement market?**
Yes, the Czech Republic has an active private placement market. Private placements are regulated by Act No. 240/2013 Coll., on Investment Companies and Investment Funds.

There is no dominant standard for documentation.

**Are there any other notable risks or issues around issuing or investing in debt securities?**

**Issuing debt securities**

Issuers are required to take responsibility for prospectuses for debt securities. The Czech National Bank supervises compliance with the legal regulations when issuing debt securities. The Czech National Bank has a wide range of powers.

In the case of breach of the legal regulations, it can impose forced administration and forbid the issuing of debt securities for a period of 10 days. In the Criminal Code, there is also a general crime of fraud. Where this applies, a criminal liability can also arise.

**Investing in debt securities**

There is a risk of the decline in the credit ranking of a company which issued the debt security. Corporate debt securities can also be more difficult to sell due to the prevailing market conditions.

**Establishing and investing in debt / hedge funds**

**Are there any restrictions on establishing a fund?**

**Generally**

Establishing a fund, offering fund securities and operating a fund, among other things, are regulated activities under the Act on Investment Companies and Investment Funds and therefore are subject to regulation by the Czech National Bank.

Collective investment is usually a business activity involving collection of financial funds from investors for investing into something based on a pre-defined investment policy for the benefit of people whose funds were collected for such purpose.

**What are common fund structures?**

Common forms of funds include:

- funds of collective investment, which can only be: common funds or joint-stock companies. They are divided into standard funds and special funds as well as open-ended and closed-ended funds;
- qualified investors structure, which can only be: common funds, trust funds, limited partnerships, limited liability companies, joint-stock companies or cooperatives; and
- foreign investment funds.

**What are the differences between offering fund securities to professional / institutional or other investors?**
Retail funds

Raising of funds on the basis of a public offer of securities or equity participation in domestic investment funds with variable capital (which are companies established in the Czech Republic) is prohibited.

Distribution of securities or equity participations in domestic investment funds with variable capital (which are companies or cooperatives established in the Czech Republic) can be carried out only by private offers and/or to professional investors.

Qualified Investors Fund

According to Section 272 onwards of the Act on Investment Companies and Investment Funds, a Qualified Investors Fund is a special fund of qualified investors and domestic investment funds, and is a company or a cooperative established in the Czech Republic. The creation of a Qualified Investors Fund is not subject to licensing in accordance with the Act on Investment Companies and Investment Funds but the Act regulates other aspects, such as the statute (or constitution) of the fund or requirements of audit and annual reports.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

The only other issue is the requirement that the fund must be registered with the Czech National Bank.

Investing in funds

Unlike bank deposits, the main risk regarding investing in funds is that they are not insured.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Under Czech Law, offering securities was formerly covered by either the Act No. 189/2004 Coll., on Collective Investment or the Act No. 591/1992 Coll., on Securities. Both of these Acts have, however, been replaced in the process of recodification in 2014 and the offer of securities is since been included in the Act on Investment Companies and Investment Funds. The definition of securities itself is in the Czech Civil Code.

Undertakings for Collective Investments in Transferable Securities (UCITS)

In the Czech Republic, standard funds (ie mutual funds or investment funds with variable capital) are considered UCITS.

Alternative Investment Funds (AIFs)

A management company which decides to distribute securities or equity participations in AIFs or European AIFs it manages in another member state, is required, prior to the commencement of such activity, to notify its intention to the Czech National Bank.

Are there any restrictions on managing a fund?

Any legal or natural person is prohibited from carrying on regulated activities, such as fund management, without authorization (which is granted by the Czech National Bank and includes financial, personnel and organizational conditions), unless any statutory exemptions apply.
The main administrator of a fund must own a base capital amount of at least €50,000 which must be maintained for the whole duration of the fund. The fund manager is obliged to act diligently in all matters and keep all evidence required by the Act on Investment Companies and Investment Funds.

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

Any person entering into a derivative contract in the Czech Republic (such as a financial agent) has to be authorized under the Act on Investment Companies and Investment Funds.

Both financial intermediation and provision of investment services include activities such as:

- forwards;
- futures;
- swaps; or
- options.

The European Market Infrastructure Regulation applies to all derivative transactions and requires transactions to be reported to regulators, for transactions between dealers to be cleared or subject to other risk mitigation techniques such as initial margin and variation margin requirements.

Last modified 20 Oct 2017

What are common types of derivatives?

Pursuant to the Act on Investment Companies and Investment Funds, all of the following main types of derivative contract are recognized under Czech law:

- forwards;
- futures;
- swaps; and
- options.

The value of derivative contracts is based on the value of the underlying assets. The main classes of underlying asset in the Czech Republic are:

- securities;
- interest rates;
- exchange rate indices of funds held in Czech Crowns or a foreign currency;
- securities contracts; and
- commodities.

Last modified 20 Oct 2017

Are there any other notable risks or issues around entering into derivatives contracts?

The biggest issue is the level of regulation which became more stringent after the global financial crisis in 2008, which was partially caused by mortgages and over-the-counter derivatives. Therefore, there is now more central counterparty clearing and more
standardized derivatives contracts, both to increase the transparency and safety of this kind of contracts.

It is likely that there will be even more regulation in upcoming years on both Czech national and EU levels.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Lending is only a regulated activity in relation to mortgages and consumer lending. In these circumstances, and assuming none of the available exemptions apply, a lender will need to be authorized by the Czech National Bank (CNB) to conduct such business.

Consumer credit is a specific area of regulation. The set of entities subject to consumer credit supervision by the CNB was recently widened with effect from 1 December 2016. Non-banking institutions can provide consumer credit only if they comply with conditions set in the Consumer Credit Act.

Consumer credit regulation pertains to:

- consumer credit providers;
- consumer credit intermediaries; and
- accredited entities organizing professional examinations pursuant to the Consumer Credit Act.

There are some additional restrictions that apply to foreign lenders making loans to Czech borrowers, eg a foreign bank which wants to create a branch in the Czech Republic has to submit a special statement from the institution carrying out bank supervision in the home country of that bank.

There is also the Central Credit Register (CCR) which is an information system that pools information on the credit commitments of individual entrepreneurs and legal entities, and facilitates the efficient exchange of this information between CCR participants. The participants are each of the banks and branches of foreign banks carrying on business in the Czech Republic, as well as other persons where so provided in a special legislative act.

Borrowing

Borrowing in general is regulated in large part by the Act No. 89/2012 Coll., Civil Code, as amended. Basic provisions regarding loans and credit can be found in Sections 2390-2400.

Last modified 20 Oct 2017

What are common lending structures?

Lending in the Czech Republic can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility). The loan as such can take two basic forms:

- **general loan** – used mainly between professionals in the course of business; or
- **consumer credit** – a special form of loan (governed by a specific regulation – Act No. 257/2016 Coll., on Consumer Credit), with increased protection for consumers.
Loan durations

The duration of a loan can also vary, as follows:

- short-term loan (maximum one-year repayment period);
- medium-term loan (one-to-five-year repayment period);
- long-term loan (more than five-year repayment period); or
- revolving loan – provided for an agreed period of time (usually for one year) with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid.

Loan security

A loan can be secured, unsecured or guaranteed.

Loan commitment

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

Loan repayment

A loan can also be repayable:

- on demand (this is not very common);
- on an amortizing basis (in instalments over the life of the loan); or
- scheduled (usually meaning the loan is repayable in full at maturity).

In the case of consumer credit, there is a special regulation regarding premature repayment of loans which protects consumers against disadvantageous contractual clauses.

What are the differences between lending to institutional / professional or other borrowers?

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

By contrast, lending backed by mortgages and lending to consumers is a regulated activity. The aim of the regulation is to protect the weaker party to the contract (consumer) and therefore the activity is subject to various legal conditions, which are set out mainly in the Act on Consumer Credit.

Do the laws recognize the principles of agency and trusts?

Yes, both principles are recognized as a matter of Czech law. For instance, it is possible to appoint an agent to act on behalf of other parties and a trustee to hold rights and other assets on trust for the lenders or secured parties.

Trust is a relatively new issue in Czech law, but is starting to be used more frequently not just for descendants (in the context of family trusts) but also as a tool to combat conflicts of interest by transferring some property into a trust.
Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual principles (with courts also partially mitigating the risks by their powers, eg by lowering an unjust contractual penalty and/or interest rate). The risks can also be reduced by various kinds of security.

Specific types of lending

Lending to consumers is regulated via the Act on Consumer Credit, which includes specific provisions governing loans for housing purposes. Therefore, there is no separate act on mortgages/housing loans in Czech law.

Company in crisis

Pursuant to the Act No. 182/2006 Coll., Insolvency Act (Insolvenní zákon), a company is considered 'in crisis' if it is:

- bankrupt (ie insolvent); or
- under the threat of bankruptcy.

A creditor who, during the crisis of a company, or until the declaration of bankruptcy or the grant of a restructuring permit, provided a loan to such company and at the time of creation of the company's obligation knew, or could have known, of its crisis, may satisfy its claim from the company's assets to the extent attributable to the amount of the loan as authorized by the insolvency administrator. Such creditor has to file his receivable in a standard way, within the deadline stipulated by the insolvency administrator.

Standard form documentation

Bilateral finance transactions are more likely to be documented on bank standard form documentation prepared in-house (each bank uses its own templates for such purpose).

Are there any other notable risks or issues around borrowing?

Borrowers should be aware of the potential implications of the EU's Bank Recovery and Resolution Directive (BRRD), which outlines certain measures for dealing with failing financial institutions.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to 'bail in' obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. 'Bail in' describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments.

In the case of English or other EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?
Some of the key areas affecting the giving of guarantees and security are as follows.

**Capacity**

It is important to check the constitutional documents of the company giving a guarantee/security to ensure that it is duly established and determine whether there are any requirements to obtain a prior separate resolution of shareholders for such a guarantee or security. All directors must be registered in the Commercial Register and act in accordance with such Commercial Register.

**Insolvency**

A guarantee or security must be granted by the company that has received adequate consideration. If this is not observed, the guarantee/security may be at risk of being contested in the bankruptcy proceedings. A guarantee or security may also be challenged on other grounds relating to insolvency.

**Financial assistance**

For private companies it is possible to provide financial assistance for the purchase of its own shares. This is regulated in the Czech Republic (since 2014) by the Act on Business Corporations and Act on Credit Unions and arises from the Directive No. 2012/30/EU and Regulation No. 575/2013 from the 26 June 2013.

**What are common types of guarantees and security?**

**Common forms of guarantees**

Guarantees can take a number of forms which are not specifically outlined in law. However, guarantees are most often created in written form.

**Common forms of security**

The basic types of security that can be created under Czech law include:

- a pledge;
- a secured transfer of a right; or
- a promissory note.

Under Czech law it is possible to grant security over all of the assets of a company or individual assets. Granting security will tend to be achieved by way of:

- a pledge over a business share (registered in the commercial register);
- a guarantee;
- a financial guarantee;
- a pledge over the real estate (registered in the land register);
- a pledge over the receivables;
- a pledge over assets which are identifiable and can be controlled by the creditors (such as equipment);
- a security assignment of receivables;
- a secured transfer of right to the property; or
- reservation of ownership of machines (registered in the land register).

In general, a cross-default and/or a cross-collateral can be used for strengthening of the creditor's position as well.
Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

To be valid, a guarantee (including a financial guarantee) must be in writing and signed by the guarantor. In the event there is more than one guarantor securing the identical obligations, each one of them is liable for fulfillment of the whole obligations. After the guarantee obligation has been fulfilled by one guarantor then that guarantor has a right of recourse towards the other co-guarantors.

Giving or taking security

Depending on the type of security, a security may have to be granted in writing.

Once granted, the security must be properly perfected before it is valid against third parties. Perfection formalities can range from having the secured asset delivered to the security holder, registration of the security and giving notice of the security to third parties.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Act No. 21/1992 Coll., on Banks (Zákon o bankách) (the regulation of banks, licensing, organization of banks, accounting rules, bank supervision and related fines etc)

Act No. 87/1995 Coll., on Credit Unions (Zákon o spoitelních a úvnních družstvech) (regulating creation of credit unions, crisis management, articles of association, bodies within credit unions, disclosure of information and other related topics)

Act No. 277/2009 Coll., on Insurance (Zákon o pojišovnictví) (regulating conduct in the field of insurance, including supervision, disclosure of information and related topics)

Act No. 15/1998 Coll., on Supervision of Capital Market (Zákon o dohledu v oblasti kapitálového trhu) (primarily regulating the competence of the Czech National Bank to supervise and regulate the capital market in the Czech Republic)

Act No. 256/2004 Coll., on Capital Market Undertakings (Zákon o podnikání na kapitálovém trhu) (regulating investment instruments and investment services, including the investment instruments market generally, the public auction of investment securities, prospectuses and its registration)

Consumer credit

Act No. 257/2016 Coll., on Consumer Credit (Zákon o spotebitelském úvru) (regulating the persons approved to provide consumer credit, its register, rules of conduct, conditions for agreement on consumer credit, supervision etc)

Act No. 284/2009 Coll., on Direct Debit (Zákon o platebním styku) (regulating the persons approved to provide payment services and issue electronic money, payment systems per se, rules and obligations for providing these payment services and related supervision)

Investment funds
Act No. 240/2013 Coll., on Investment Companies and Investment Funds (Zákon o investičních společnostech a investičních fondech) (regulating the positions of the administrator, deposit manager, investment funds, funds of collective investment, funds of qualified investors, investment offers, reporting obligations and supervision of the Czech National Bank)

Corporations

Act No. 90/2012 Coll., on Business Corporations (Zákon o obchodních korporacích) (the primary legislation for business law in the Czech Republic, regulating all kinds of business corporations – limited liability companies, joint-stock companies, companies limited by shares, partnerships etc, as well as their organizational/management arrangements)

Funds and platforms

Act No. 42/1994 Coll., on pension insurance with state contribution (Zákon o penzijním pipojiští se státním píspvkem) (regulating pension funds)

Other key market legislation

Act No. 89/2012 Coll., Civil Code (Obánský zákoník) (the primary legislation for private law in the Czech Republic, governing (among others) all contractual relationships between parties)

Act No. 300/2016 Coll., on Central Evidence of Accounts (Zákon o centrální evidenci út) (regulating the establishment of evidence, terms of use, including details for each account and conditions for entering data into the central register of accounts)

Capital Requirements Regulation (Regulation EU) 575/2013 (capital requirements) (Nářízení o obezatnostních požadavcích na úvěrové instituce) (regulating the rules concerning general requirements in relation to own funds requirements, requirements limiting large exposures, liquidity requirements, reporting requirements and public disclosure requirements)

European Market Infrastructure Regulation (Regulation (EU) 648/2012) (derivatives) (Nářízení o OTC derivátech, ústředních protistranách a registrech obchodních údajů) (setting out clearing and bilateral risk management requirements for over-the-counter derivative contracts, related reporting requirements and uniform requirements for the performance of activities of central counterparties and trade repositories)

Market Abuse Regulation (Regulation (EU) 596/2014) (market abuse) (Nářízení o zneužívání trhu) (regulating the insider trading, unlawful disclosure of inside information and market manipulation (market abuse) as well as measures to prevent market abuse)

Regulatory authorization

Who are the regulators?

The Czech National Bank (CNB) is the supervisory authority for the financial market in the Czech Republic.

CNB therefore supervises the banking sector, the capital market, the insurance industry, pension funds, credit unions, exchange offices and payment system institutions.

The CNB lays down rules to safeguard the stability of the banking sector, the capital market, the insurance industry and the pension scheme industry. It systematically regulates, supervises and, where appropriate, issues penalties for non-compliance with these rules.

What are the authorization requirements and process?

A company asking for authorization must apply to the Czech National Bank (CNB).

CNB must assess whether the application meets the required threshold conditions within six months of submission of the complete application.
The application fee depends on the type of application and ranges from CZK 5,000 to CZK 200,000.

The regulator will also approve key individuals (senior management) in their roles.

Regulated subjects are listed on the ‘lists of regulated institutions and registered financial market entities’, maintained by the CNB.

Last modified 20 Oct 2017

**What are the main ongoing compliance requirements?**

Threshold conditions (such as having adequate financial resources and compliance arrangements in place) are an ongoing compliance requirement for authorized companies.

Failure to comply with these threshold conditions and other more specific regulatory rules can result in sanctions for companies and other regulated individuals, and loss of authorization status.

Last modified 20 Oct 2017

**What are the penalties for failure to be authorized?**

A person undertaking a regulated activity without being authorized or exempt commits an administrative or criminal offence and is liable to sanction.

These are usually administrative sanctions, stipulated for example in Section 36a of the Act on Banks. There could also be penalties up to the amount of CZK 50 million for banks.

Last modified 20 Oct 2017

**Regulated activities**

**What finance and investment activities require authorization?**

**Generally**

A person must not carry on a regulated finance and investment activity in the Czech Republic unless authorized or exempt.

The activities of the entities that are supervised by the Czech National Bank (CNB) require authorization. As part of its supervision of the financial market, CNB performs supervision over: legal entities and natural persons, other property associations with a designated purpose and groups of persons and property associations with a designated purpose, and is charged with obligations under the Czech laws in the area of banking, capital market, insurance business, pension insurance or pension schemes.

**Consumer credit**

Consumer credit activities, including credit broking, operating an electronic system in relation to lending and entering into a regulated credit agreement as lender are regulated activities.

Unless exempt agreements (see below), these activities can only be offered by firms who are authorized and listed on the ‘lists of regulated institutions and registered financial market entities’.

The available exemptions relate to the nature of the agreement, the lender and the borrower, and the number of repayments to be made. For example, some credit agreements for the purposes of the repeated services or deliveries of goods are exempt agreements.

Last modified 20 Oct 2017

**Are there any possible exemptions?**

There are two types of exclusions available when regulated activities may be undertaken without authorization.
General exclusions

Certain persons may carry on a regulated activity without being authorized. For example, in certain cases regulated activities carried on by foreign (EU member-based) persons may be undertaken without authorization.

Specific exclusions

For each type of regulated activity there are a number of specific exemptions that could also apply, such as specific consumer credits.

Do any exchange controls or other restrictions on payments apply?

There are no currency controls in place in the Czech Republic, except for the standard requirement to declare the import of foreign currency to the Czech Republic territory. Also, the anti-money laundering rules and EU payment regulations have to be observed.

What are the rules around financial promotions?

Rules

A financial promotion is a communication of an invitation or inducement to engage in an investment activity made by a person in the course of business.

Since such communications can influence consumers, a person is restricted from communicating such promotions unless they are an authorized person, or the content of the communication has been approved by an authorized person, or the promotion falls within one of the exemptions.

It is both an administrative and a criminal offence for an unauthorized person to communicate a financial promotion.

Exemptions

Exemptions include certain promotions to overseas recipients, provided certain criteria are fulfilled. For example, promotions to overseas recipients are exempt from certain obligations in the case that the fulfillment of the obligation would be irreconcilable with the law of the recipient's country of origin.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common types of legal entities are joint-stock companies (akciová společnost abbreviated as 'a.s.' in Czech) and limited liability companies (společnost s ručením omezeným abbreviated as 's.r.o.' in Czech), which are corporations with a separate legal personality and limits on the liability of their members. Banks can be established only as joint-stock companies, as some activities require a certain type of legal entity to be used.

The liability of a company's shareholders can be limited by:

• shares, in which case they are liable to pay for their shares but not the company's debts; or
• guarantee, where they are also liable to pay a certain amount if the company is wound up.

The list of shareholders is kept by the Central Securities Depository. Joint-stock companies can be public or private. A public joint-stock company is one where all or some shares have been accepted for trading on a regulated market situated or operated in any of the State Parties to the Agreement on the European Economic Area. Private joint-stock companies can have a sole shareholder. The company must execute a memorandum of association (or founding deed, where there is a sole shareholder), which includes the company’s articles of association.

Funds

Investment fund is a term which is used for all types of funds, regardless of their legal form. Investment funds can take various legal forms, e.g., a joint-stock company with variable registered capital (SICAV), trust fund, a limited partnership with investment certificates, common fund, cooperative or a private limited company.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

A company can conduct lending or investment business in the Czech Republic through a registered establishment (also known as a branch). The foreign entity operating in the Czech Republic through its branch is considered to be a financial institution and generally must deliver to the Czech National Bank (CNB) relevant financial information (on a periodic basis).

Anyone permanently engaged in banking or financial services can be required to obtain the relevant license from the CNB. Institutions granted a banking license in any EU member state can operate in the Czech Republic on the basis of a European passport.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

• operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
• applying technology to leverage and optimize the lending platform and user experience; and
• connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending has started to develop recently in the Czech Republic and is now available to address some forms of traditional bank funding products, such as consumer loans and small and medium-sized enterprises (SME) lending.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.
Marketplace lending includes peer-to-peer (P2P) type structures often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

**ISSUES FOR STARTUP MARKETPLACE LENDERS**

Following the initial incorporation and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform. As the startup lender will not have an established track record, deposit base or asset pools, the funding structure will often follow the format of a warehouse securitization structure. Origination of new assets will be funded through drawings on a note issuance facility backed by security over the new assets. Each of the new assets will be subject to eligibility criteria determined by reference to the nature of the underlying asset. In order to provide an efficient financing structure the assets will typically be held through a SPV with origination and servicing provided by the marketplace lender. In order to cover expected losses on the asset pool, the senior facility will be subject to the lending platform maintaining sufficient subordinated capital in the form of equity, or a combination of equity and subordinated debt.

While the funding may be structured through a revolving loan or note program, if there is tranching of the debt this will typically result in the platform being treated as a securitization for the purposes of the European Union Capital Requirements Regulation, with the attendant requirements to hold risk retention and provide appropriate reporting and disclosures.

**Blockchain, smart contracts and cryptocurrencies**

**WHAT IS BLOCKCHAIN?**

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third-party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

**WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?**

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the
form of so-called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced more-complex interactions with the outside world using so-called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
• compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

**Artificial intelligence and robo advisory systems**

Automated financial advice tools, also known as 'robo advisors' are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

**Data analysis and cloud computing**

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

_Last modified 20 Oct 2017_

**Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?**

**General financial regulatory regime**

The Czech National Bank (CNB) is the conduct regulator for firms providing financial products and services in both retail and wholesale markets.

**GENERAL**

A person must not carry on a regulated activity in the Czech Republic unless authorized or exempt (known as the general prohibition). A financial activity requires regulatory authorization when it is identified as a specified activity in relation to a specified investment, it is carried on by way of business in the Czech Republic and it does not fall within any of the available exemptions. Where FinTech products and/or applications involve financial activity which requires regulatory authorization, the firms providing such products and/or applications must be authorized by the CNB.

**Peer-to-peer lending**

A person carries out a regulated activity (requiring authorization by the CNB) if they facilitate lending and borrowing between two individuals or between individuals and businesses in its ordinary course of business.

**Regulation of payment services**

Where a Czech business provides payment services as a regular occupation or business activity in the Czech Republic, it will require authorization by the CNB to become an authorized payment institution under the Payment Services Regulations 2017. Failure to obtain the required authorization is a criminal offence. The regulations implement the European Union Payment Services Directive II.

In order to become authorized by the CNB, a payment services business will need to meet certain criteria, including in relation to its business plan, initial capital, processes and procedures in place for safeguarding relevant funds, sensitive payment data and money laundering and other financial crime controls.

**Application of data protection and consumer laws**
The Czech Act No. 101/2000 Coll. on the Protection of Personal Data (DPA) regulates the processing of personal data within the Czech Republic. The DPA implements the European Data Protection Directive. Where a business determines the purposes and manner in which any personal data is processed, it will be regulated by the DPA and have certain notification and compliance obligations.

The European General Data Protection Regulation (GDPR) is due to replace the DPA from 25 May 2018 (which will result in a newly drafted Czech Act reflecting the provisions of the GDPR). The GDPR is more prescriptive and restrictive compared to the principles-based DPA, including mandatory notifications where a breach occurs and provides for severe monetary sanctions for breach.

Money laundering regulations

The Czech Act No. 253/2008 Coll. on certain measures against legalization of revenues from criminal acts and financing of terrorism, as amended, gives the CNB responsibility for supervising the anti-money laundering controls of businesses that offer certain services, such as lending, providing payment services and issuing and administering other means of payment. This act also implements the European Union's Fourth Money Laundering Directive.

Generally, where a firm is authorized and supervised by the CNB it will also be authorized and supervised by the CNB for complying with anti-money laundering requirements. Electronic currencies such as bitcoin and cryptocurrencies tend to represent a higher money laundering risk.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING

The crowdfunding sector is well established, and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an international intermediary platform, such as Crowdcube or Crowdfunder or local Czech platforms such as Hithit, Startovac or Crowder.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

ACCELERATORS

There are various incubators or accelerators in the Czech market which offer support, facilities and funding for startups, often in return for an equity stake. UP21, CreativeDock, Bolt or Air Ventures are the notable startup incubators active on the Czech market.

Venture capital and debt

Venture capital (VC) funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. VC provides a viable alternative to traditional lending given that the business is unlikely to have the tangible
asset base or long track record needed to attract traditional debt funding from financial institutions.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through VC.

**Warehouse and platform funding**

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

Another alternative form of funding is by way of peer-to-peer (P2P) lending platforms such as Zonky, which bring individual borrowers and lenders together without the involvement of traditional banks. P2P lending does not involve equity investments, and instead interest is paid on the money borrowed.

**Senior bank debt and capital markets funding**

**SENIOR BANK DEBT**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**CAPITAL MARKETS FUNDING**

The Czech Republic has both debt and equity capital markets which are accessible to businesses (usually of a certain size).

Raising finance by way of an Initial Public Offering (IPO) is a popular funding arrangement for FinTech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange, such as the Prague Stock Exchange.

FinTech companies have also started to access funding by issuing bonds to retail investors as a way of raising more competitive funding.

**CONVERTIBLE BONDS/LOAN NOTES**

A popular funding tool for fast-growing FinTech businesses is to issue convertible bonds or loan notes which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

*Last modified 20 Oct 2017*

---

**Portfolio sales**

**Loan transfers and portfolio sales**

*What are common ways of buying and selling loans?*

Buying and selling loans is very common and loans are usually transferred separately.

The most important ways of transferring a loan under Czech law are:

- **Assignment of receivables** – The assignment of receivables involves a transfer of rights, but not the related obligations, and can be done without the consent of the debtor. Rights connected with the receivables are transferred together with the main assigned receivable. This way is the most common method of transfer of a loan.

- **Assignment of a contract** – Under Czech Law, the whole contract can be assigned as well. The assignor transfers its rights and
obligations under the contract or part thereof to a third party (assignee) if:

- the transferred party (the other party to the contract) agrees with such assignment;
- the contract is not yet fulfilled; and
- such assignment is not excluded by the nature of the contract itself.

Some contracts can also be assigned by endorsement (rubopis).

- **Novation (with the accession of a third party)** - This is when the existing rights and obligations forming a contract are effectively replaced in full by a new contract. It is a tripartite agreement effecting the transfer of a loan to the third party and is entered into between the transferee and the existing parties.

There are many different forms of these kinds of contracts, however, for more complex transactions a more bespoke form of sale and purchase agreement would tend to be used.

**What are the main considerations when transferring a loan and related security?**

There are a number of issues to consider before transferring a loan (or portfolio of loans) and related security. These issues are often covered as part of a due diligence exercise by the seller’s legal advisors. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and
- **consent** – whether a transfer requires the consent or notification of any other parties.

**Projects**

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

**Generally**

The ownership of energy and infrastructure assets in the Czech Republic varies according to the asset class. The main asset classes are usually considered to be:

- economic infrastructure (energy, aviation, rail, telecommunications, water, roads and waste); and
- social infrastructure (education, health and justice/prisons, housing).

Key sectors are considered below.

**Energy**

The gas and electricity industries in the Czech Republic are privatized, with the generation and distribution and supply services provided
by a number of private sector companies. However, the dominant producer of electricity is EZ, a.s., a joint-stock company with the Czech Republic as the company's largest shareholder with a nearly 70% stake in the registered capital. The relevant private sector companies own the generation and distribution assets.

The Czech Transmission System Operator, a joint-stock company (česká energetická penosová soustava, akciová společnost) controlled by the Ministry of Industry and Trade, is the sole transmission- company and holds an exclusive license granted by the Energy Regulatory Office under the Act No. 453/2000 Coll., Energy Act.

The Energy Regulatory Office (Energetický regulaní úad in Czech) is the principal body with responsibility for regulation of the energy sector in the Czech Republic.

**Telecoms infrastructure**

The telecommunications networks (fixed and mobile) in the Czech Republic are privately owned by a number of service providers. A good example is T-Mobile which is responsible for most of the Czech broadband infrastructure but whose work is heavily regulated by the government. Czech Telecommunication Office (eský telekomunikaní úad) is the regulator of the Czech telecommunications sector. It also has responsibilities for the wireless communications services.

**Transport infrastructure**

**LIGHT RAIL**

Typically, light rail assets (such as trams and associated track) are owned by local public sector promoting bodies. For example, The Prague Public Transit Co. Inc. (Dopravní podnik hlavního msta Prahy, akciová společnost) owns the tubes, track and supporting infrastructure in Prague.

**HEAVY RAIL**

The rail market in the Czech Republic is in the early stage of liberalization and its composition (which is complex) involves both public and private entities. The principal elements of the rail sector in the Czech Republic are as follows.

- The owner of the majority of railway lines in the Czech Republic is the state represented by the Railway Infrastructure Administration, which is a state organization (Správa železní dopravní cesty, státní organizace). The Railway Infrastructure Administration is the guarantor of the operability, modernization and development of the railway system of the Czech Republic.
- Public transport authorities, ie central and devolved government bodies and some metropolitan bodies, specify, let and manage operating contracts and give Network Rail a significant proportion of the funding for infrastructure maintenance and enhancement.
- The majority of current passenger services are operated by the state company České dráhy, a joint-stock company (eské dráhy, akciová společnost). In 2011, the privately owned RegioJet became the first company to actively compete with České dráhy on a route. Other private companies own exclusive rights to run services on certain lines.

The rail sector is regulated by the Czech Rail Authority (Dražní úad in Czech).

**ROADS, BRIDGES AND TUNNELS**

A government entity, Road and Motorway Directorate of the Czech Republic, operates, maintains and improves the motorways and major A roads (ie the strategic road network) in the Czech Republic. Road and Motorway Directorate of the Czech Republic is regulated by the Ministry of Transportation and receives funding from the government for investment in the strategic road network (including additional road capacity).

Local roads in the Czech Republic are the responsibility of local authorities. The public sector may outsource the construction, operation and maintenance (sometimes on a project financed basis) of such assets to the private sector. In the case of tolled roads, the private sector has taken on roads/crossings on a full concession basis – namely, responsible for the design, build, financing, operation, maintenance and collection of tolls for a number of years with the main revenue stream being the collection of toll revenues from users (rather than any service payments from the public sector).

**AVIATION**

Aviation in the Czech Republic is (for the most part) privatized. As regards airport infrastructure, there are a number of ownership
structures in the Czech Republic market, including public or local government ownership and private ownership. All models are heavily regulated by government and the Civil Aviation Authority (Úad pro civilní letectví) is the aviation regulator in the Czech Republic.

**Other infrastructure**

**SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS/PRISONS)**

Typically, these are owned by the public sector. The majority of social infrastructure assets in the Czech Republic are directly financed by the government or by the local authority.

*Education*

The main responsibility for schools stays with the Ministry of Education, Youth and Sport, although more responsibilities were recently delegated to municipal and local authorities. However, existing private schools receive a state contribution towards running costs and are allowed to charge tuition fees. Higher education in the Czech Republic consists of public, state (police and military) and private universities, which also receive a state contribution.

*Hospitals*

Ownership of hospitals is vested in various public sector bodies and more recently also in private owners.

**DEFENSE**

Typically, defense assets are owned by the public sector.

**WASTE**

In the Czech Republic, the waste sector is operated by both public (municipal or local) and private companies and is regulated under the Act No. 185/2001 Coll., Waste Act (Zákon o odpadech).

**WATER**

In the Czech Republic, the water industry is regulated under the Act No. 274/2001 Coll., on Water Supply and Sewerage (Zákon o vodovodech a kanalizácích), but services are largely operated by private companies with exclusive rights for a limited period and a well-defined geographical space.

*Are there special rules for investing in energy and infrastructure?*

**Generally**

There are no specific legal regimes concerning the investment in the fields of energy and infrastructure. The necessary sector-specific regulatory aspects would apply mostly in the phase of planning and implementation itself and not regarding funding.

**Energy**

The energy markets in the Czech Republic have a complex system of arrangements between suppliers, generators, transmission and distribution, which are heavily regulated. In particular, there are complex arrangements in respect of licensing, subsidies and demand/charging mechanism with suppliers, customer and the Czech Transmission System Operator. These are subject to change/regular updates meaning that investors will need to have a good understanding of the current framework and the potential directions in which the market may move.

Investors need to understand how technology changes may impact on the overarching regulatory framework and vice versa. Investors should also consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with any license conditions or the granting of specific subsidies. In particular, if a breach of those conditions could lead to the revocation of a license/subsidy that might make the potential target less attractive or viable.
Telecoms infrastructure

The Czech Act. No. 127/2005 Coll., on Electronic Communications, regulates the telecom sector in a complex way, including definition of relevant parties, their rights and obligations, conditions for regulation, specifics of notification etc.

Transport infrastructure

RAIL

There is an extensive and complex regulatory framework also including the conditions for acquiring a license for provision of transport services which must be taken into consideration in respect of involvement in this sector. As mentioned above, after years of monopoly held by the national rail carrier Czech Railways, currently several train operators are in place. However, the tracks/bridges/some stations are still owned by the state-owned company SŽDC. SŽDC allows track access to all carriers complying with conditions set by the Act. No. 266/1994 Coll., the Railway Act.

The Track Access Conditions correspond to European standards and are equal for all carriers. SŽDC concludes a contract for rail transport operation with a carrier who has met conditions of the track access. For more details see Network Statement on national and regional rail issued by SŽDC.

The basic conditions for access to the railway infrastructure include to:

- be registered in the Company Register;
- hold a valid license to operate rail transport;
- hold a valid certificate of a carrier;
- effect liability insurance for damage incurred by the rail transport operation;
- conclude a rail transport operation contract with the rail operator; and
- be allocated track capacity.

For more details see Railway Act No. 266/1994 Coll., as amended and the Network Statement on national and regional rail issued by SŽDC.

ROADS

Administration of roads is in the hands of the state, municipal or other public sector entities. The relevant public sector entity is also responsible for carrying out the maintenance of the roads. However, such duties may be delegated to the private sector partners, based on the relevant procurement rules. With respect to the highways, an example of this is the private company Kapsch, which has installed the toll gates on highways and is in charge of collecting toll-fees in the Czech Republic.

What is the applicable procurement process?

Public procurement in the Czech Republic is regulated by Act No. 134/2016 Coll., on Public Procurement, as amended (Zákon o zadávání veřejných zakázek). This Act has implemented:

- Directive 2014/24/EU on public procurement (and repeals Directive 2004/18/EC); and

The following contracts are regulated under Czech law:

- below-the-threshold public contracts/concessions;
- small-scale public contracts/concessions;
- public contracts in the water, energy, transport and postal services sectors; and
Procurement processes

The various types of procurement processes regulated by the Czech Act on Public Procurement are as follows.

SIMPLIFIED BELOW-THRESHOLD PROCEDURE

A contracting authority announces to an unlimited number of suppliers its intention to award a public contract. Call for tenders can be sent directly to a tenderer, in which case the call has to be sent to at least five tenderers. There are shorter periods for application for and execution of the contract in this procedure.

OPEN PROCEDURE

A contracting authority announces to an unlimited number of suppliers its intention to award a public contract. The open procedure is a call for tenders and proof of qualification.

RESTRICTED PROCEDURE

The contracting authority announces to an unlimited number of suppliers its intention to award a public contract in the tender procedure. It then invites the suppliers to submit a request to participate in the restricted procedure and to send a proof of qualification. The call for tenders is sent directly to the suppliers selected by the contracting authority.

NEGOTIATED PROCEDURE WITH PRIOR PUBLICATION

The contracting authority announces its intention to award a public contract. The announcement is an invitation to apply for participation in the negotiated procedure with publication and to demonstrate its skills. Invited bidders submit a tender.

NEGOTIATED PROCEDURE WITHOUT PRIOR PUBLICATION

The contracting authority announces to candidates or a limited number of applicants its intention to award a public contract by tender. After concluding the contract, the contracting authority is obliged to issue the contract award notice.

COMPETITIVE DIALOGUE

The contracting authority announces to an unlimited number of suppliers its intention to award a public contract. The authority invites suitable suppliers to dialogue with the authority to develop the most suitable solution in respect of the public contract in question and all conditions needed to find the best way to perform the contract.

INNOVATION PARTNERSHIP

In cases where there are no technologies or methods readily available in the market, the contracting authority announces to an unlimited number of suppliers its intention to award a public contract involving an innovation partnership. The authority then discusses the most suitable process with all suitable suppliers.

CONCESSION PROCEDURE

The contracting authority announces to an unlimited number of suppliers its intention to award a public contract. This procedure is used in cases when the authority wishes to award a special concession from the authority to the supplier, typically construction work.

PROCEDURE TO AWARD A PUBLIC CONTRACT IN THE SIMPLIFIED REGIME

The contracting authority announces to an unlimited number of suppliers its intention to award a public contract in simplified regime for special services such as social services or low cost services. The authority determines the procedure it wishes to use and can determine special tender criteria according to the nature of the service needed.

The key principles are that contracts procured by the public sector are awarded fairly, transparently and without discrimination on the grounds of nationality (especially within the EU) and that all potential bidders are treated equally.
Investing in energy and infrastructure

Public procurement is relevant where the Czech government, or a branch of it, is seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset.

The relevant procurement legislation applies to certain public bodies including central government departments, local and municipal authorities, public-benefit corporations, Czech National Bank, various non-governmental public interest-purposed bodies or any entity, which is controlled by those previously mentioned bodies. A regulated procurement is required where certain financial thresholds are met. In the case of most major infrastructure projects (where limited exclusions do not apply), it is likely that those thresholds will be met so a regulated procurement would need to be run.

Financing energy and infrastructure

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector.

What are the most common forms of funding / investing in energy and infrastructure?

Funding

The common forms of funding in energy and infrastructure include:

- loans made on a corporate-finance basis;
- loans made on a project-finance basis;
- bond finance (this was used for example by the private rail operator Leo Express);
- mezzanine debt; and
- refinancing of the debt in operational projects.

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

When the Czech National Bank considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

What regulatory penalties may apply?

Please note that only the most serious offences and related penalties are listed below.

The Act on Banks establishes several contraventions and regulatory offences for violating the rules:

- Under Section 36a, if a natural person undertakes a regulated activity without the permission of the Czech National Bank, fails to fulfill a duty of informing the Czech National Bank or accepts a deposit contrary to the rules, that person may be fined up to twice the
amount of any unauthorized benefit (dvojnásobku výše neoprávněného prospěchu) or CZK 130 million.

• Under Section 36c, if a legal entity or a natural person-entrepreneur undertakes a regulated activity without the permission of the Czech National Bank, fails to fulfill a duty of informing the Czech National Bank or accepts a deposit contrary to the rules, that person may be fined up to twice the amount of any unauthorized benefit or CZK 130 million.

• Under Section 36e, if a bank fails to fulfill a duty of informing the Czech National Bank or fails to fulfill a duty in accordance with Article 99 of the Regulation (EU) 575/2013, that bank may be fined up to twice the amount of any unauthorized benefit or 10% of its annual turnover.

The Act on Credit Unions establishes several contraventions and regulatory offences for violating the rules:

• Under Section 27a, if a natural person undertakes a regulated activity without the permission of the Czech National Bank or takes over a Credit Union without previous permission of the Czech National Bank, that person may be fined up to twice the amount of any unauthorized benefit or CZK 130 million.

• Under Section 27b, if a credit union fails to fulfill a duty of informing the Czech National Bank or violates the rules relating to the determination of capital, that Credit Union may be fined up to twice the amount of any unauthorized benefit or 10% of its annual turnover.

• Under Section 27c, if a legal entity or a natural person-entrepreneur uses the term credit union contrary to the rules, initiates an activity without permission, fails to fulfill a duty of informing the Czech National Bank or takes over a Credit Union without the previous permission of the Czech National Bank, that person may be fined up to twice the amount of any unauthorized benefit, CZK 130 million or 10% of its annual turnover.

The Act on Insurance establishes several contraventions and regulatory offences for violating the rules:

• Under Section 119, if a natural person provides false information in its application or intends to increase its participation in an Insurance or Reinsurance Company and become a controlling entity without the previous permission of the Czech National Bank, that person may be fined up to CZK 1 million.

• Under Section 120, if a legal entity or a natural person-entrepreneur violates the secrecy, provides false information in its application or intends to increase its participation in an insurance or reinsurance company and becomes a controlling entity without the previous permission of the Czech National Bank, that insurance or reinsurance company and/or its controlling entity may be fined up to CZK 10 million.

• Under Section 120, if an insurance or reinsurance company undertakes an insurance or reinsurance activity without permission of the Czech National Bank or appoints a person who is untrustworthy or unprofessional to the key functions of the company, the Insurance or Reinsurance Company may be fined up to CZK 50 million.

The Act on Capital Market Undertakings establishes several contraventions and regulatory offences for violating the rules:

• Under Section 157, if an investment firm fails to fulfill a duty of informing the Czech National Bank in accordance with Article 99 of the Regulation (EU) 575/2013, the Investment firm may be fined up to twice the amount of any unauthorized benefit or 10% of its annual turnover.

• Under Section 158, if a regulated market operator fails to fulfill a duty of informing the Czech National Bank or violates a restriction or prohibition issued by the Czech National Bank, the regulated market operator may be fined up to CZK 20 million.

• Under Section 159, if a multilateral system operator fails to fulfill a duty of informing the Czech National Bank or violates a restriction or prohibition issued by the Czech National Bank, the Multilateral System Operator may be fined up to CZK 20 million.

• Under Section 161, if a central securities depository fails to fulfill a duty of informing the Czech National Bank in accordance with Article 27 of the Regulation (EU) 575/2013 or fails to fulfill a duty of informing the Czech National Bank in accordance with Article 40 of the Regulation (EU) 575/2013, the Multilateral System Operator may be fined up to twice the amount of any unauthorized benefit, CZK 550 million or 10% of its annual turnover.

• Under Section 162, if an issuer fails to publish an annual report, a biannual report, the issuer may be fined up to twice the amount of any unauthorized benefit, CZK 300 million or 5% of its annual turnover.

• Under Section 164, if a legal entity or a natural person-entrepreneur fails to fulfill a duty of informing the Czech National Bank in accordance with Article 30 of the Regulation (EU) 575/2013 or fails to fulfill a duty of informing the Czech National Bank in accordance
with Article 53 of the Regulation (EU) 575/2013, that person may be fined up to twice the amount of any unauthorized benefit, CZK 550 million or 10% of its annual turnover.

- Under Section 166, if a natural person fails to fulfill a duty of informing the Czech National Bank, the person may be fined up to twice the amount of any unauthorized benefit or CZK 60 million.

The Act on Supervision on the Capital Market establishes several Contraventions and Regulatory offences for violating the rules:

- Under Section 9b, if a legal entity or a natural person-entrepreneur fails to fulfill any duties connected with the acquisition of shares in a joint-stock company or acquisition by a controlled person, that person may be fined up to CZK 50 million.

- Under Section 9c, if a natural person fails to fulfill any duties connected with the acquisition of shares in a joint-stock company or acquisition by a controlled person, that person may be fined up to CZK 25 million.

**What criminal penalties may apply?**

In accordance with the Act No. 40/2009 Coll., Penal Code (Trestní zákoník), the criminal justice institutions have powers to impose criminal penalties in certain (finance and investment related) cases, including:

- **under Section 251** – criminal offence of unauthorized entrepreneurial activities, which may lead to up to eight years of imprisonment, monetary penalty, punishment by disqualification or the dissolution of a legal entity;

- **under Section 248** – criminal offence of violation of Regulations on Rules of Competition (eg misleading advertising or misleading labelling of goods and services), which may lead to up to eight years of imprisonment, monetary penalty, punishment by disqualification, forfeiture of items or the dissolution of a legal entity; and

- **under Section 216** – criminal offence of money laundering which may lead to up to eight years of imprisonment, monetary penalty, punishment by disqualification, forfeiture of property or the dissolution of a legal entity.

According to Sections 16, 17 and 18 of Act No. 418/2011 Coll., on the Criminal Liability of Legal Entities and Proceedings against them (Zákon o trestní odpovdnosti právnických osob a ízení proti nim), where the punished legal entity be a bank, credit union, insurance and reinsurance company, investment firm, pension fund, central securities depository, electronic money institution, payment institution or regulated market operator, a statement of the Czech National Bank is required.

**Tax**

**Tax issues**

**Are stamp, registration, transfer or other similar taxes applicable?**

**Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?**

No stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan. Certain administrative fees may, however, apply on the transfer or assignment of a debt under a loan.

**Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?**

No. However, individual registrations of these transactions may require the payment of administrative fees.

**Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?**
No stamp, registration or similar taxes are payable on the issue, transfer or assignment of debt securities. Various fees may apply.

Last modified 20 Oct 2017

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

No.

Last modified 20 Oct 2017

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Yes, withholding tax is imposed on interest payments under a loan.

If so:

What is the rate of withholding?

The rate of withholding tax on interest payments to both lenders resident in the Czech Republic and lenders not resident in the Czech Republic is, generally, 15%. A higher rate of 35% is applicable in some cases where interest payments are made to certain lenders resident in jurisdictions outside of the EU or resident in countries that are not party to a double tax treaty with the Czech Republic.

What are the key exemptions?

Interest payments to banks or to other financial institutions resident in the Czech Republic are not subject to withholding tax.

An exemption from the application of withholding tax on interest payments may be applicable, in whole or in part, under the terms of a double tax treaty entered into by the Czech Republic with the country of residence of the lender, provided that the requisite conditions are met.

An exemption may also be available under the EU Interest and Royalties Directive, as implemented under the domestic law of the Czech Republic.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes, the analysis described above is applicable to both interest payments under a loan or other form of debt security.

Last modified 20 Oct 2017

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

Double tax treaties and relevant EU Directives apply to any payments of interest from Czech Republic to lenders resident in other countries.

Would the same analysis apply to interest payments under a debt security (eg a bond)?
Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both Finnish and EU law. The Securities Markets Act regulates offering and selling debt securities in Finland.

Unless exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Finland or to request that they are admitted to trading on a regulated market operating in Finland unless a prospectus, that the Finnish Financial Supervisory Authority has approved, has been made available to the public.

Last modified 26 Nov 2019

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Finland are bonds or notes issued on a stand-alone basis or under a program.

Many different types of debt securities are offered in Finland. Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities and high-yield bonds;
- guaranteed securities, subordinated securities, perpetual debt securities (i.e. debt securities that have no specified redemption date);
- asset-backed securities;
- derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- hybrid securities (securities with both debt and equity features);
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer);
- exchangeable bonds (debt securities convertible into the equity of a third party);
- depositary receipts (a security issued by a depositary conferring on the holders beneficial ownership of certain underlying assets held by the depositary for the holders); and
- warrants (securities giving the holders the option to purchase the equity of the issuer or a related company).

Last modified 26 Nov 2019
What are the differences between offering debt securities to institutional/professional or other investors?

The Prospectus Regulation is implemented in Finland by Chapter 3 of the Securities Markets Act and the Decree of the Ministry of Finance on the Prospectus referred to in Chapter 3–5 of the Securities Markets Act. The Act does not make a distinction between professional and other investors for the purposes of its disclosure requirements, however, different methods of disclosure apply. In relation to the obligation to prepare a prospectus, see the following answers in Issuing and investing in debt securities.

According to the Act, anyone who offers securities to the public and seeks admission to trading on a regulated market of a security shall publish a prospectus of the securities prior to the entry into force of the offer or the admission to trading on a regulated market of a security and keep it available to the public while the offer is open.

When is it necessary to prepare a prospectus?

Under the Securities Markets Act, unless an exemption applies, it is necessary to publish a prospectus where there is an offer of securities to the public or an application for the securities to be admitted to trading on a regulated market.

An offer would not be deemed to have been made to the public if it is made solely to qualified investors, addressed to fewer than 150 persons (other than qualified investors) per European Economic Area state or where the minimum denomination per unit is at least €100,000.

If the offer is deemed not to be made to the public, a prospectus may still be required if an application is made for the securities to be admitted to trading on a regulated market.

According to Chapter 3, Section 2, however, a prospectus need not be published, for example, if the notification procedure as provided for in article 25 of the Prospectus Regulation is not applied to the offering, and the securities are offered in the EEA-area during a period of twelve months in an amount with a total consideration of a maximum €8 million. In addition it is required that the issuer publishes and delivers to the Finnish Financial Supervisory Authority a Key Investor Information Document, in cases where the securities are offered in an amount with total consideration of less than €1 million calculated in the EEA area over a period of 12 months.

Furthermore, a prospectus need not to be published, if the securities are offered:

- solely to qualified investors;
- calculated per each EEA member state, to fewer than 150 investors;
- to be acquired for a total consideration of at least €100,000 per investor and per offer or in units with a denomination or consideration of at least €100,000; or
- in an amount with a total consideration of less than €2.5 million calculated in the EEA over a period of 12 months.

What are the main exchanges available?

Nasdaq Helsinki is a regulated market licensed in Finland. Nasdaq First North is a market for smaller companies and growth companies.

Trading at Nasdaq Helsinki is governed by the Issuer Rules, the Member Rules and the Warrant Rulebook. Nasdaq First North is an MTF that is subject to separate rules.

Issuers on the Nasdaq Helsinki market are subject to the requirements of a number of EU Directives, including the Market Abuse Directive (implemented in Finland by several Acts, including the Markets Securities Act and the Act on Trading in Financial Instruments) and the Transparency Directive (implemented in Finland by the Markets Securities Act).

Is there a private placement market?
There is no definition of a private placement in Finnish legislation, but it is generally understood to mean an offering of securities that are exempted from, in case of transferable securities, the requirement to publish a prospectus. In our opinion, there is a private placement market in Finland.

Private placement may be qualified as offering of investment services under the Finnish Investment Services Act. The general provisions of Chapter 1 of the Act governing disclosure obligation and practices are applicable to all securities offerings (also where there is no obligation to publish a prospectus). The Act does not set any specific requirements as to the form of document with regard to a prospectus exempted offering, customarily a private placement memorandum/investor presentation is provided.

**Are there any other notable risks or issues around issuing or investing in debt securities?**

**Issuing debt securities**

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both administrative and criminal liability under Finnish law.

**Investing in debt securities**

The most significant risk related to debt securities is the issuer's repayment capacity, or the risk as to whether the issuer is able to perform its obligations on the maturity date (or other payment dates), that is, to repay the nominal capital and return to the investors. In order to enable the assessment of the issuer's repayment capacity, the bond prospectus or base prospectus describes the issuer's financial position and risks factors related to debt securities.

**Establishing and investing in debt / hedge funds**

**Are there any restrictions on establishing a fund?**

**Generally**

Establishing a fund, offering fund securities and operating a fund, amongst other things, are regulated activities under the Act on Mutual Funds (the MFA). The MFA governs common funds, which are Undertakings for Collective Investments in Transferable Securities (UCITS) funds as provided in the Undertakings for Collective Investments in Transferable Securities Directive.

Mutual fund activity is defined in the MFA as raising of funds from the public for their joint investment and the investment thereof mainly in financial instruments as well as the management of a common fund and the marketing of units in accordance with the UCITS Directive and the MFA.

Only a management company authorized as provided in the MFA may establish one or more common fund (UCITS fund) and carry out mutual fund activities.

Only a management company authorized or registered as provided in the Act on Alternative Investment Fund Managers may establish one or more special common fund or other alternative investment fund.

Custodial activity of a common fund, a special common fund or other alternative fund may only be carried out by a custodian, which has an authorization for the custodial activity.
What are common fund structures?

There are two main categories of funds: Undertakings for Collective Investments in Transferable Securities (UCITS) funds (common funds) and non-UCITS funds (special common funds and other alternative investment funds).

Risk in a special common fund does not need to be diversified as broadly as with UCITS funds. A special common fund is also an alternative investment fund as provided in the Act on Alternative Investment Fund Managers.

Common (UCITS) funds

Common funds are regulated by the Act on Mutual Funds, implementing the UCITS directive, which specifies the eligible investment types and the required diversification between investments in Chapter 11 of the Act. The Finnish Financial Supervisory Authority (FIN-FSA) approves the fund rules.

Special common (Non-UCITS) funds and other alternative investment funds

Special common funds are non-UCITS, alternative investment funds deviating from the principle of diversification of risk pursuant to Chapter 13 of the Mutual Funds Act. If the units of a special mutual fund shall be offered to non-professional clients, the risk must be diversified (but to a lesser amount than in an UCITS fund) and the rules of the fund must indicate the deviations from the principles of Chapter 13 of the MFA. The rules regulating the subscription and redemption of the units in a special common fund may also deviate from those of a UCITS fund. The name of the fund must indicate that it is a non-UCITS fund. The Finnish Financial Supervisory Authority has to be notified of the rules of a special common fund.

The investment operations of other alternative investment funds are not regulated, but the Act on Alternative Investment Fund Managers specifies the information that the funds must provide on themselves. Subject to certain exceptions as to e.g. family offices and business angel investors, alternative investment funds may be marketed to non-professional investors only, if the fund manager has been authorized and rules and a key investor information document (KIID) have been prepared for the fund. The FIN-FSA does not approve the rules of alternative investment funds.

What are the differences between offering fund securities to professional / institutional or other investors?

Retail funds

Undertakings for Collective Investments in Transferable Securities (UCITS) funds must be open for all investors and are therefore subject to substantial regulatory oversight and restrictions, including obligations with regard to independent custodian/depositary arrangements for assets, investment and borrowing powers specifications, concentration requirements and other matters. The information to be provided to investors in an UCITS fund is regulated by Mutual Funds Ac. The Act does not make a distinction between non-professional and professional/institutional investors in an UCITS fund.

Non-UCITS funds can restrict the scope of eligible investors in their fund rules. However, if the units of a special mutual fund shall be offered to non-professional investors, the risk must be diversified (but to a lesser amount than in an UCITS fund) and the rules of the fund must indicate the deviations from the principles of Chapter 13 of the MFA. As a main rule, a special mutual fund shall have a minimum of ten investors.

Subject to certain exceptions as to e.g. family offices and business angel investors, the units in an alternative investment fund may be marketed to non-professional investors only if the fund manager has been authorized, the rules and a key investor information document (KIID) have been prepared for the fund and all the required documents and information has been provided to the FIN-FSA. The legal forms and domiciles of alternative investment funds (AIFs) allowed to be offered to non-professional investors is restricted. Further, the AIF units may not be offered to non-professional investors if the subscription obligates to additional investments and any such obligations are non-binding on a non-professional investor.

Professional investors may waive their legal right to receive information from the alternative investment fund manager in writing. As mentioned, if the AIF units are only offered to professional investors the key investor information document (KIID) does not need to be prepared.

Last modified 26 Nov 2019
When offering and marketing the funds to consumers, also the provisions of the Finnish Consumer Protection Act shall also be adhered to.

Last modified 26 Nov 2019

**Are there any other notable risks or issues around establishing and investing in funds?**

**Establishing funds**

It can be noted that as a main rule, the fund documentation shall be drafted in Finnish or Swedish if no other language is approved by FIN-FSA, when the fund is marketed to non-professional investors.

Last modified 26 Nov 2019

**Managing and marketing debt / hedge funds**

**Are there any restrictions on marketing a fund?**

Several acts regulate marketing a fund; the Mutual Funds Act as well as the Act on Alternative Investment Managers regulate specifically the marketing of funds. Further, the Consumer Protection Act regulates all marketing directed at consumers and the Unfair Business Practices Act regulates marketing in general. All these regulations shall be taken into account when marketing a fund, as applicable.

The Finnish Financial Supervisory Authority (FIN-FSA) has also given instructions and regulations on marketing funds. These instructions contain, amongst other things, information on:

- what kind of language shall be used in marketing (a non-professional investor should be able to understand the language that is used);
- how comparisons between different funds shall be made; and
- how the funds shall be identified in marketing.

**Undertakings for Collective Investments in Transferable Securities (UCITS) funds**

The management company may not begin to market the units in a common (UCITS) fund to the public or receive funds from public into the common fund before the fund rules have been confirmed by the FIN-FSA.

A UCITS fund manager from another EEA country may market units in such fund in Finland if the competent authorities of its home Member State have submitted to the FIN-FSA a notification of the commencement of marketing.

**Special Common Funds and other alternative investment funds (AIFs)**

The management company may not market units in a special common fund or receive money to the fund before the board of directors of the fund management company has approved the rules and the FIN-FSA has been notified of the rules and the commencement of marketing of the fund.

The alternative investment fund manager may market the units in an AIF managed by after a notification to the FIN-FSA as regards the AIF and receipt of a notification from the FIN-FSA regarding the same. The same applies also to the marketing by an investment firm of the AIF units. However, subject to certain exceptions as to e.g. family offices and business angel investors, the units in an AIF may be marketed to non-professional investors in Finland only if the fund manager has been authorized, the rules and a key investor information document (KIID) have been prepared for the fund and all the required documents and information has been provided to the FIN-FSA.

The manager of an AIF from another EEA country or from a third country may market its units in Finland when it has submitted to the FIN-FSA a notification of the commencement of marketing and received a notification from the FIN-FSA regarding the same.

**Reverse solicitation and the definition of ‘marketing’**
‘Marketing’ is not defined in the Act on Alternative Investment Fund Managers. In the relevant government Bill, it has been viewed that in order to qualify an action as ‘marketing’, it has to be made by the alternative investment fund manager (AIFM) or on its behalf and it has to contain the offering of the units in an alternative investment fund managed by it. The offering can be direct or indirect.

It has been held in the government Bill that an action which does not include offering of units cannot be seen as marketing and, consequently, actions taken by the AIFM or on its behalf to map the interest of investors to invest in a certain type of investment (‘soft circling’) would not be qualified as marketing. Further, actions directed towards professional investors, which do not aim to a binding subscription to the fund units, should not be labelled as marketing in the context of the Act. These can include for example road shows initiated by the AIFM, provided such events do not include a specific sale or purchase offer of the AIF units (although comparable events initiated by issuers or investment service providers may qualify as marketing of securities). In addition, reverse soliciting i.e. the investor contacting the AIFM and the AIFM providing information on different investment opportunities, should not be seen as marketing.

Provision of offering documents related to an established fund managed by the AIFM is considered as negotiations on the terms of an investment and subject to prior FIN-FSA notification. Provision of various agreements related to a fund which has not been established yet does not, however, require that the AIFM must adhere to the provisions of law regarding marketing. When a binding subscription is made, the AIFM must be able to demonstrate that it has adhered to the marketing provisions of the AIFM Act and duly made a notification to the FIN-FSA.

**Are there any restrictions on managing a fund?**

Fund management is a regulated activity in Finland under the Mutual Funds Act. Managing a fund is subject to authorization granted by the Finnish Financial Supervisory Authority (FIN-FSA) that also supervises fund management companies. Under the Mutual Funds Act, each mutual fund must be managed by an authorized fund management company.

A fund management company must separate fund assets from its own assets by assigning the former to a custodian. Fund management companies may engage only in the fund activity and other essentially related business (as defined in the applicable legislation), if doing so does not materially conflict with the interests of holders of mutual fund shares. In addition, fund management companies may provide asset management services and investment advice as well as safekeeping and administration of shares in mutual funds and undertakings for collective investment in transferable securities (UCITS).

Fund management companies must have sufficient financial strength to operate effectively and must not be closely associated with companies or individuals that could prevent effective supervision of the management company. A management company shall carry out fund activity independently, in compliance with the applicable legislation, and with care and expertise and in the best interests of the common fund and its unitholders.

Alternative Investment Fund Managers (AIFMs) are also subject to regulation under the Act on Alternative Investment Fund. Under the Act, an AIF may only be managed by and AIFM authorized by the FIN-FSA. However, some AIFM can be exempted from full regulation on certain grounds, including managing assets under €500 million where assets are not leveraged and investors have no redemption rights for five years, and managing assets under €100 million including assets acquired through leverage. Exempted managers must still register with the FIN-FSA and are subject to limited reporting.

**Entering into derivatives contracts**

**Are there any restrictions on entering into derivatives contracts?**

Under the Act on Investment Services, investment services (including derivatives contracts) may only be offered by authorized entities, unless a specific exemption applies.

There are no general restrictions in relation to the counterparty, however, certain entity specific restrictions may apply (for example the Mutual Funds Act provides restriction on mutual funds when entering into derivatives agreement).

The European Market Infrastructure Regulation (EMIR) applies to all derivative transactions and requires transactions to be reported to regulators, for transactions between dealers to be cleared or subject to other risk mitigation techniques such as initial margin and
What are common types of derivatives?

The main types of derivatives contracts used in Finland include *inter alia*:

- swaps (such as interest rate and currency swaps);
- forwards;
- options;
- futures; and
- commodity-linked derivatives.

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying assets are:

- equity;
- fixed income instruments;
- commodities;
- foreign currency; and
- credit events.

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007-to-2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. The European Commission has sought, in particular, to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative position;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen, and continues to see, the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Lending is a regulated activity in relation to lending to consumers. The Consumer Protection Act regulates consumer credits and the Finnish Competition and Consumer Authority supervises lending to consumers.

Consumer loans are subject to a range of regulatory requirements. For example, there are particular restrictions around:
• how the loans are marketed;
• how to deal with borrowers who fall behind with their payments; and
• how payments may be claimed from the consumers.

Borrowing

Borrowing is generally not regulated in Finland. However, certain borrowers may benefit from specific protection provided to them under Finnish law (for example consumers).

Last modified 26 Nov 2019

What are common lending structures?

Lending in Finland can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents which fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, e.g. term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities.

Loan durations

The duration of a loan can also vary between:

• a term loan, provided for an agreed period of time but with a short availability period;
• a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
• an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
• a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Loan security

A loan can either be secured, unsecured or guaranteed.

Loan commitment

A loan can be:

• committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
• uncommitted, meaning that the lender has discretion whether or not to provide the loan.

Loan repayment

A loan can be paid back in instalments of the same size consisting of a loan repayment portion and an interest portion. The size of the monthly instalment changes in line with changes in interest rates, but the loan period remains unchanged (annuity loan).

It can also be paid back in instalments of the same size consisting of a loan repayment portion and an interest portion. The size of the
monthly instalment remains unchanged when interest rates change, but the loan period changes (fixed instalment loan).

It can also be paid back in instalments consisting of a fixed loan repayment portion and an interest portion that changes as interest rates change. When interest rates change, the size of the monthly instalment changes, but the loan period remains unchanged (fixed period loan).

It can also be paid back in one instalment consisting of the whole loan amount at the end of the loan period, and during the loan period only interest payment shall be made.

_Last modified 26 Nov 2019_

**What are the differences between lending to institutional / professional or other borrowers?**

Lending to legal persons is subject to less regulatory oversight and so less burdensome from a compliance perspective. It is mainly a matter of contract law.

The Consumer Protection Act (especially Chapters 7 and 7a) regulates lending to consumers and the provisions in the Act are mandatory.

_Last modified 26 Nov 2019_

**Do the laws recognize the principles of agency and trusts?**

Trusts are generally not recognized in Finland however, under the quite recent Act on Detecting and Preventing Money Laundering and Terrorist Financing, trust, as they are defined in Article 3, Section 7 of the Directive (EU) 2015/849, are recognized as legal entities for the purposes of the said Act.

The principle of agency is recognized in Finland and in accordance with the Act on Agent of Bondholders, it is possible to appoint an agent to act on behalf of other parties and to hold rights and other assets for the lenders or secured parties.

_Last modified 26 Nov 2019_

**Are there any other notable risks or issues around lending?**

**Generally**

Loan agreements and other finance documents are subject to general contractual principles. Consumer clients must be taken into consideration because the regulations regarding consumers are mandatory.

**Specific types of lending**

For instance, providing mortgages to consumers is subject to mandatory regulations. The Mortgage Credit Directive, which is implemented in Finland through chapters 6, 7 and 7a of the Consumer Protection Act, imposes a number of requirements on lenders. These requirements include, amongst other things, the lender's need to:

- conduct affordability tests before lending;
- provide standard information about the mortgage to enable borrowers to compare products; and
- ensure that staff are suitably trained.

**Standard form documentation**

Most Finnish syndicated finance transactions are governed by documentation based on recommended forms published by the Loan Market Association (LMA). These are often governed under English law, however. Bilateral finance transactions are more likely to be documented on bank standard form documentation prepared in-house and be governed by Finnish law.

_Last modified 26 Nov 2019_
Are there any other notable risks or issues around borrowing?

Borrowers should be aware of the potential implications of the EU’s Bank Recovery and Resolution Directive (BRRD), which outlines certain measures for dealing with failing financial institutions. It has been implemented in Finland through the Act on Resolution of Credit Institutions and Investment Firms (laki luottolaitosten ja sijoituspalvelu wymysten kriisin ratkaisusta) and the Act on the Financial Stability Authority (laki rahoitusvakausviranomaisesta).

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to 'bail-in' obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. ‘Bail-in’ describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of English or other EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Under Finnish law, a security interest shall be validly and bindingly given and established, provided that the following four requirements have been met:

- a pledge agreement between the parties;
- competence to give the pledge (i.e. security);
- an underlying obligation which is to be secured by the security; and
- the applicable perfection measures having been taken.

From these requirements, we would especially highlight requirements the second and last (ie competence and perfection measures) as worthy of consideration. When these four requirements are met, the pledge constitutes a valid and binding obligation of the party giving the security.

The following points should also be considered.

Capacity

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors’ powers that would be preventative. In some cases, it would also be advisable to request a copy of the decision of the board of directors (or an extract of it), in which it was decided to enter into the transaction in question. If it is not within the company’s capacity to enter into a security agreement, but such an agreement is entered into regardless, the agreement shall be binding unless the counterparty knew, or it ought to have known, that the signatories were acting against their capacity. It should also be noted, that Section 1 of Chapter 13 of the Companies Act states how a limited liability company may distribute it assets. According to this section, any distribution of assets which is contrary to the provisions of the Companies Act, constitutes unlawful distribution of assets. Under the Companies Act, distribution of assets includes all transactions which might affect the company’s liquidity. Further, under the Companies Act, a company must always ensure that entering into any transaction is in the best interest of the company.

Insolvency

In insolvency proceedings any security given may be set-aside if the provisions of the Recovery Act are met. Under Section 14 of the Recovery Act, a security may be set-aside if:
• the security was given for an already existing debt obligation; or
• if the relevant perfection measures were not taken without undue delay.

It is further required under both the above-mentioned situations that the security was given within three months prior to the beginning of the insolvency proceedings (or within two years for connected parties). It should be noted that any security given (and the related agreements) may also be subject to proceedings under alternative provisions of the Recovery Act to those listed here.

**Financial assistance**

Under the Companies Act it is unlawful for a limited liability company, including both private and public companies to provide financial assistance for the purchase of its own (or its holding company's) shares. Financial assistance in this context would include giving a guarantee or security in connection with the share purchase.

**Natural person**

If security or a guarantee is given by a natural person, there are some specific mandatory requirements which need to be taken into consideration. For example, under applicable legislation, the natural person must be given sufficient information about the pledge or the guarantee by the beneficiary.

*Last modified 26 Nov 2019*

**What are common types of guarantees and security?**

**Common forms of guarantees**

 Guarantees may be given for one's own debt or for someone else's. In both cases the guarantees may be either performance guarantees or payment guarantees. Performance guarantees guarantee the performance of the underlying obligations of the debtor. Such guarantees are typically given by a parent company for the performance obligations of its subsidiary. Payment guarantees on the other hand cover the payment obligations of the debtor rather than any contractual performance obligation. The specific terms and conditions applicable to guarantees are determined on a case by case basis.

**Common forms of security**

The most common forms of securities granted by a company of its assets are:

• a mortgage over real estate;
• a pledge over assets which are identifiable and can be controlled by the creditors (such as equipment and vehicles);
• a floating charge over the fluctuating assets of the company (Yrityskiinnitys); and
• a pledge of receivables (such as rental income) and bank accounts.

*Last modified 26 Nov 2019*

**Are there any other notable risks or issues around giving and taking guarantees and security?**

**Giving or taking guarantees**

The most notable risks are related to guarantees given by natural persons.

If a guarantee is given by a Finnish limited liability company for liabilities of a third party then the guarantee is subject to the condition that sufficient corporate benefit, as such concept is applicable under the Limited Liability Companies Act, is given to the guarantor or pledgor, and the requirement set out in Section 13:2 of the Companies Act that no distribution of funds should lead to insolvency will apply. The
existence of corporate benefit and the fulfilment of the requirement in Section 13:2 are ultimately questions of fact. Should the above referenced requirements not be fulfilled, any guarantee or other security provided for obligations owed by other parties, may be limited and funds or proceeds received may have to be returned to the guarantor.

**Giving or taking security**

A pledge is only valid and binding if it meets certain prerequisites (for more information, see Giving and taking guarantees and security – restrictions). Of these prerequisites, particular consideration should be had to perfection measures, as if these are not undertaken in accordance with the applicable law, the pledge might not be binding to third parties and it is also more likely to be subject to proceedings to have the pledge set aside. The perfection measures differ depending on the nature of the pledged assets (for example, with real estate mortgages the pledge has to be notified to the register at the Finnish land registry and with shares the pledge has to be written in the share and shareholder’s register and relevant share certificates must be given to the beneficiary).

In addition, we would recommend that pledge and guarantee agreements are made in written form signed by both parties. While this is not a mandatory requirement under Finnish law it is recommended for good order.

In addition, any security or guarantee may be subject to measures to have such guarantee or security set-aside under the Recovery Act.

**Financial regulation**

**Law and regulation**

*What are the main laws and regulations that apply to entities that are involved in finance and investments generally?*

**Generally**

- Securities Markets Act (746/2012, Arvopaperimarkkinalaki)
- Unfair Business Practices Act (1061/1978, Laki sopimattomasta menettelystä elinkeinotoiminnassa)
- Act on Trading in Financial Instruments (1070/2017, Laki kaupankäynnistä rahoituskäytännöillä)
- Act on Security Accounts (750/2012, Laki arvopaperitileistä)
- Act on Detecting and Preventing Money Laundering and Terrorist Financing (444/2017, Laki rahanpesun ja terrorismin rahoittamisen estämisestä ja selvittämisestä)
- The Act on Finnish Financial Supervisory Authority (878/2008, Laki Finanssivalvonnasta)

**Consumer credit**

- Act on Consumer Mortgage Brokers (852/2016, Laki asunto-omaisuuteen liittyvien kuluttajaluottojen välittäjistä)
- Consumer Protection Act (38/1978, Kuluttajansuojalaki)
- Act on Registration of Certain Loan Providers and Credit Brokers (853/2016, Laki eräiden luotonantajien ja luotonvälittäjien rekisteröinnistä)

**Credit institutions**

- Act on Credit Institutions (610/2014, Laki luottoaloitostainminnasta)
- Payment Services Act (290/2010, Maksupalvelulaki)
- Act on Payment Institutions (297/2010, Maksulaitoslaki)
Act on Foreign Payment Institutions' Actions in Finland (298/2010, Laki ulkomaisen maksulaitoksen toiminnasta Suomessa)

Act of Registration of Entities Undertaking Debt Collection (411/2018, Laki perintätoiminnan harjoittajien rekisteröinnistä)

Act on Agent of Bondholders (574/2017, Laki joukkolainanhaltijoiden edustajasta)

**Corporations**

Limited Liability Companies Act (624/2006, Osakeyhtiölaki)

Partnerships Act (389/1988, Laki avoimesta yhtiöstä ja kommandiittiyhtiöstä)

**Funds, platforms and investing**

Act on Crowd Funding (734/2016, Joukkorahoituslaki)

Act on Investment Services (747/2012, Sijoituspalvelulaki)

Act on Alternative Fund Managers (162/2014, Laki vaihtoehtorahastojen hoitajista)

Act on Mutual Fund (213/2019, Sijoitusrahastolaki)

**Other key market legislation**

Bank Recovery and Resolution Directive (2014/59/EU), implemented by the Act on Resolution of Credit Institutions and Investment Firms and by the Act on the Financial Stability Authority

Markets in Financial Instruments Directive (2004/39/EC), implemented by several national acts, mainly however, by the Act on Investment Services and by the Securities Markets Act

Capital Requirements Regulation (Regulation (EU) 575/2013) (capital requirements)

European Market Infrastructure Regulation (Regulation (EU) 648/2012) (derivatives)

Market Abuse Regulation (Regulation (EU) 596/2014) (market abuse)

**Regulatory authorization**

**Who are the regulators?**

Finanssivalvonta, or the Finnish Financial Supervisory Authority (FIN-FSA), is the authority for supervision of Finland's financial and insurance sectors. The entities supervised by the authority include banks, insurance and pension companies as well as other companies operating in the insurance sector, investment firms, fund management companies, virtual currency providers and the Helsinki Stock Exchange. The FIN-FSA identifies the problems encountered by the markets and supervised entities and takes appropriate action. The supervision supplements controls undertaken by supervised entities and markets themselves. The FIN-FSA ensures that the supervised entities are professionally managed and that they have adequate risk management systems in place and operate according to ethically and professionally qualitative business principles and practices.

Rahoitusvakausvirasto, or, the Financial Stability Authority protects depositors and taxpayers from the effect and expenses of financial crises. It also prevents financial crises and promotes bail-in as part of the Single Resolution Mechanism. It is responsible for the Finnish deposit guarantee system.

**What are the authorization requirements and process?**
Depending on the type of firm, a firm must apply to the Finnish Financial Supervisory Authority (FIN-FSA), Ministry of Finance, Ministry of Social Affairs and Health or the Finnish government for authorization. The FIN-FSA grants authorizations for credit institutions, Finnish life, non-life and reinsurance companies, investment firms, fund management companies and custodians.

The application forms, instructions and list of required appendixes are available at the FIN-FSA web page in Finnish and Swedish. The FIN-FSA shall assess whether the application meets the required threshold conditions within three to twelve months of the submission of the complete application.

Authorization is granted only when the entity seeking authorization meets the necessary regulatory requirements. The key pre-condition is that the entity is managed in a professional manner and in line with sound and prudent business principles. The entity must have sound internal governance and adequate financial resources. The entity's headquarters must be located in Finland.

The FIN-FSA authorizations fee depends on the type of the application ranging from €3,700 to €14,300.

Virtual currency providers must be registered in the register of virtual currency providers maintained by the Financial Supervisory Authority (FIN-FSA). A foreign service provider may conduct its activities in Finland either by establishing a branch or by providing its services across the border. Commencement of activities is contingent on the authorization or notification procedure by the FIN-FSA.

Supervised firms and registered insurance intermediaries as well as service providers that have submitted a notification are listed on the FIN-FSA's list. This information is public and may be accessed from the website of the FIN-FSA.

**What are the main ongoing compliance requirements?**

Fulfilment of the prerequisites of authorization (such as having adequate financial resources and compliance arrangements in place) and acting in accordance with the applicable legislation are ongoing compliance requirements for authorized firms. Authorized entities may also have to comply with specific compliance requirements applicable to certain entities.

Entities supervised by the Finnish Financial Supervisory Authority (FIN-FSA) shall report various information regularly to the FIN-FSA.

Failure to comply with the authorization prerequisites and applicable legislation can result in administrative sanctions for firms and regulated individuals, and loss of authorization.

**What are the penalties for failure to be authorized?**

A person undertaking a regulated activity without being authorized or exempt commits a criminal offence and is liable to a fine or to imprisonment.

**Regulated activities**

**What finance and investment activities require authorization?**

**Generally**

A person must not carry on a regulated activity in Finland unless authorized or exempt.

A financial activity requires regulatory authorization when it is identified as a specified activity in relation to a specified investment, it is carried on by way of business in Finland and it does not fall within any of the available exemptions.

The operations of a credit institution, investment firm, fund management company, alternative investment fund manager, custodian or insurance company can only be pursued by entities that have been granted authorization by the Finnish Financial Supervisory Authority (FIN-FSA). Virtual currency providers must be registered in the register of virtual currency providers maintained by the Financial
Supervisory Authority (FIN-FSA).

Authorizations are regulated in the Credit Institutions Act, Investment Firms Act, Alternative investment fund manager Act, Mutual Funds Act, Insurance Companies Act and Act on Virtual Currency Providers. However, some of these acts include provisions which include conditions which also apply when the operations are not regarded as authorized business.

Consumer credit

Consumer credit activities are regulated activities. These activities can only be offered by firms that have been authorized by the FIN-FSA or equivalent authority in another EEA member state or registered as loan providers in accordance with the Act on Registration of Certain Loan Providers and Credit Brokers. The Consumer Protection Act applies to provision of consumer credit. In addition, the Act on Residential Property Consumer Credit Intermediaries regulates providing residential property consumer credit to consumers.

Consumer is defined in the Consumer Protection Act as a natural person who acquires consumer goods and services primarily for a use other than his or her business or trade (elinkeinotoiminnassaan).

Are there any possible exemptions?

Authorizations are regulated in the Credit Institutions Act, Investment Services Act, Alternative Investment Fund Manager Act, Mutual Funds Act, Insurance Companies Act and Act on Virtual Currency Providers. However, some of these acts include provisions which include conditions which also apply when the operations are not regarded as authorized business.

Do any exchange controls or other restrictions on payments apply?

Finland does not operate any foreign currency controls.

Where money is transferred from non-EU member states, imports of foreign currency may need to be declared to customs, but there is no legal restriction on moving money in and out of the country.

There may be anti-money laundering (in accordance with EU Directives No. 2015/849/EU and No. 2015/847) and tax considerations to take into account.

What are the rules around financial promotions?

Rules

According to applicable Finnish Financial Supervisory Authority (FIN-FSA) guidelines, marketing of financial services and instruments means all actions and operations aiming to promote the selling of financial services and instruments. Financial services include all services provided by the various regulated and authorized financial services providers and financial instruments include all instruments provided by the same service providers.

The rules governing marketing and offering of various financial services and instruments are not found in a single piece of legislation but are scattered into service provider and/or financial instrument specific legislation (for more information, see Law and regulation). The objective of the rules is to promote the clarity and high quality of customer and investor information on products and services offered and to ensure appropriate code of conduct of service providers.

The FIN-FSA has issued regulations and guidelines on marketing financial services and instruments as well as regulations and guidelines on codes of conduct when offering financial services and instruments that apply to all service providers and instruments. As a general rule, the rules and guidelines apply both to domestic service providers, such as deposit banks, credit institutions, payment institutions, investment firms, fund management companies, managers of alternative investment funds and insurance companies, and to Finnish branches of EEA-authorized service providers as well as EEA-authorized service providers providing cross-border services in Finland.
In addition to the service provider and instrument specific legislation, the Unfair Business Practices Act includes general requirements on marketing and conducting business in Finland and the Consumer Protection Act regulates financial promotions directed to consumers. These apply also to providers of virtual currencies. The requirements aim to ensure that, among other things, a company's marketing is in accordance with good and acceptable practices, no improper procedures are undertaken and sufficient information is given to consumers prior to entering into a contract.

**Exemptions**

The applicable marketing and offering of financial services and products rules differ depending on the type of the customer. Marketing and offering to consumers and non-professional (private) clients is more strictly regulated than the same towards professional clients and eligible counterparties, which may be exempted from certain requirements.

As regards securities offering, offering securities to the public is more regulated than private placements. According to the Securities Market Act, offering securities to the public means a communication to persons presenting or intended to present sufficient information on the terms of the offer and the security offered, so as to enable to decide to purchase or subscribe to the security.

The Finnish rules are generally applicable also to Finnish branches of EEA-authorized service providers as well as EEA-authorized service providers providing cross-border services in Finland, but there are certain exemptions. For example, the FIN-FSA marketing guidelines do not apply to EEA-authorized service providers providing cross-border investment services in Finland.

---

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

**Generally**

The most common type of legal entity is a limited liability company regulated by the Limited Liability Companies Act. A limited liability company is a body corporate with separate legal personality and which limits the liability of its members. A limited liability company can be either private or public depending on whether or not the shares are offered to the public.

The liability of a company's shareholders is limited by shares (i.e. to the invested share capital), in which case they are liable to pay for their shares but not the company's debts. However, if the shareholders have given separate guarantees for the company's obligations they are also liable for the amount guaranteed if the company does not fulfil the guaranteed obligation.

In addition, many Finnish Banks (usually credit institutions) are established as cooperatives (osuuskunta). Cooperatives are owned by their members and are thus similar to limited liability companies.

In addition, limited partnerships can undertake investment activities. Limited partnerships are formed by a private agreement, which is signed by all of the partners.

**Funds**

Investment funds can take the form of limited partnership when they are classified as alternative investment funds. Mutual funds and special mutual funds are defined as a pool of acquired assets and they are not legal persons. They are managed by fund management companies, who manage the funds in their own name but on behalf and for the benefit of the fund.

---

**Is it possible to conduct lending or investment business through a branch or establishment?**

Yes, provided however, that if the company conducts any authorized activities it must be authorized in another EEA country.
A company can conduct lending or investment business in Finland through a branch but this does not create a separate legal entity. The foreign trader must submit a start-up notification concerning its branch to the Finnish Patent and Registration Office before the branch commences its operations. If the business to be conducted and the services to be provided are regulated activities (i.e. it is a branch to a credit institution, insurance company, investment company or management company) then the Finnish Financial Supervisory Authority (FIN-FSA) must also be notified.

If the trader is from a country outside the EEA, it will also need a permit from the Finnish Patent and Registration Office, as well as the FIN-FSA for the establishment of the branch.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending, given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- consumer loans (Fixura and Lainaaja are examples of providers); and
- small and medium-sized enterprises (SME) lending (e.g. Fellow Finance).

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology, in which data is recorded on computers, by way of a peer-to-peer mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features, such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over
A wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that, once authorized can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced more-complex interactions with the outside world using so called ‘Oracles’. With Oracles the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form, or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture. ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding.

In an ICO the company issues digital tokens or coins that have value inside the company's ecosystem. The tokens or coins can be transferred either to other ecosystems, or for government regulated money.

It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a virtual
currency (as discussed later in detail), a specified investment or form of regulated security, or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

**Artificial intelligence and robo advisory systems**

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally used in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs. In Finland, for example, Taaleri has an authorized robo-advice system.

**Data analysis and cloud computing**

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

**Financial management for businesses**

There are currently several Finnish FinTech companies (Holvi and Zervant are examples) providing online financial management services for SMEs. Such services include, for example, online invoicing, paperless bookkeeping, portfolio management, customer relationship management and reporting.

**Payment technology**

Finnish FinTech companies are also providing different types of online payment services. These include, for example, an application by PayiQ through which a client may acquire tickets for events or public transport.

*Last modified 26 Nov 2019*
Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The Finnish Financial Supervisory Authority (FIN-FSA) is the regulator for firms providing financial products and services in both retail and wholesale markets.

GENERAL

A person must not carry on a regulated activity in Finland unless authorized or exempt. A financial activity requires regulatory authorization when it:

- is identified as a specified activity in relation to a specified investment;
- is carried on by way of business in Finland; and
- does not fall within any of the available exemptions.

Where FinTech products and/or applications involve financial activity which require regulatory authorization, the firms providing such products and/or applications must be authorized by the FIN-FSA.

FIN-FSA INNOVATION HELP DESK

To foster the growth and development of startup companies and other innovators, the FIN-FSA has set up an Innovation Help Desk to advise whether an innovation requires authorization and to advise further on permits, registration and other authorization issues. The FIN-FSA Innovation Help Desk is available to both startup companies in the sector and enterprises that are already established and are planning a new type of product, service or way of operating. More information can be found here.

Virtual currency

The Act on virtual currency providers (572/2019) entered into force 1 May 2019. The Act is part of the national implementation of the EU's Fifth Anti-Money Laundering Directive. According to the definition, a virtual currency means a digital representation that is not issued or guaranteed by a central bank or a public authority, is not necessarily attached to a legally established currency and does not possess a legal status of currency or money, but is accepted by natural or legal persons as a means of exchange and which can be transferred, stored and traded electronically. Further FIN-FSA regulations and guidelines 4/2019 concerning virtual currency providers enter into force on 1 July 2019.

According to the Act on virtual currency providers, virtual currency issuers, operators of virtual currency exchange services (including marketplaces) and providers of virtual currency custodian wallet services are subject to a registration obligation as of 1 May. Virtual currency providers operating in the market prior to the entry into force of the Act must submit an application for registration with the FIN-FSA by 18 August 2019 in order that their qualification for registration can be assessed by 1 November. New providers considering the launch of activities after the entry into force of the Act may only provide services to customers after their applications for registration have been processed and approved.

Virtual currency providers are considered obliged entities under the Anti-Money Laundering Act as of 1 December 2019, which means that they must report suspicious transactions to the Financial Intelligence Unit of the Police. The FIN-FSA supervises the actions and measures of virtual currency providers related to anti-money laundering and counter-terrorist financing.

Crowdfunding services and peer-to-peer lenders

CROWDFUNDING SERVICES

The Crowdfunding Act (Fi. Joukkorahoituslaki 734/2016, as amended) (Crowdfunding Act) entered into force in September 2016. The objective of the Crowdfunding Act was to clarify the responsibilities of various authorities in the supervision of crowdfunding, to improve investor protection, to diversify the financial markets and to ease the regulation on entities offering crowdfunding services.

The Crowdfunding Act covers both loan-based crowdfunding and investment-based crowdfunding (i.e., which involves the issue of
securities or other instruments), but is not applied to either peer-to-peer (P2P) lending or to money collection. Under the Crowdfunding Act, entities offering crowdfunding services (ie crowdfunding intermediaries) must have a permit issued by, and entered in, a register maintained by the FIN-FSA. Depending on the operating model of the crowdfunding intermediary, the operations may also be subject:

- to other regulations, such as the:
  - Money Collection Act (Fi: Rahankeräyslaki 255/2006, as amended);
  - Sale of Goods Act (Fi: Kauppalaki 355/1987, as amended) and;
  - Consumer Protection Act (Fi: Kuluttajansuojalaki 38/1978, as amended) (as is the case with loan-based crowdfunding); or
- to financial markets legislation, such as the:
  - Credit Institutions Act (Fi: Laki luottolaitostoiminnasta 610/2017, as amended);
  - Investment Services Act (Fi: Sijoituspalvelulaki 747/2012, as amended);
  - Act on Alternative Investment Fund Managers (Fi: Laki vaihtoehtorahastojen hoitajista 162/2014, as amended); and
  - Securities Markets Act (Fi: Arvopaperimarkkinalaki 746/2012, as amended) (with investment-based crowdfunding).

Intermediaries providing services under the Crowdfunding Act are within the optional exemption available to European Union member states under article 3 of the Markets in Financial Instruments Directive (MiFID 1). This means that crowdfunding intermediaries operating under the Crowdfunding Act do not require authorization as MiFID investment firms. Consequently, entities permitted by FIN-FSA to offer crowdfunding services are not within the European Union passporting regime and may not offer crowdfunding services in other European Economic Area (EEA) countries and, vice versa, entities authorized in other EEA countries may not offer such services in Finland without FIN-FSA's permission. It should be noted, however, that this position does not apply to entities which have been authorized to carry out a regulated activity which is within the scope of MiFID I. These include inter alia credit institutions operating under the Credit Institutions Act (Fi: Laki luottolaitostoiminnasta 610/2017, as amended) and investment firms operating under the Investment Services Act (Fi: Sijoituspalvelulaki 747/2012, as amended). Such entities may act as crowdfunding intermediaries under their authorization without needing separate permission for crowdfunding services.

PEER-TO-PEER LENDERS

P2P lending so far, requires no authorization; hence, for example, the administrative staff, internal control or risk management systems of a P2P lending intermediary are not subject to official supervision. This also means that there is no supervision of the credit ratings that may be assigned to borrowers by P2P lending companies. However, authorities have decided that certain participating parties in P2P lending must be entered in a register of credit providers maintained by, and must be supervised by, the Regional State Administrative Agency of Southern Finland (Fi: Etelä-Suomen aluehallintovirasto). Under the Act on Registration of Certain Loan Providers and Credit Brokers (Fi: Laki eräiden luotonantajien ja luotonväittäjien rekisteröinnistä 853/2016, as amended) the lending intermediary must be registered in the register maintained by the Regional State Administrative Agency of Southern Finland if they provide consumer credit or are considered to offer consumer credit, as defined in the Consumer Protection Act (Fi: Kuluttajansuojalaki 38/1978, as amended) or if they act as an intermediary in P2P lending.

Regulation of payment services

Payment services include, for example, account transfers, card payments and direct debits (where the service provider acts as intermediary between payer and payee and transfers funds between the parties in accordance with given instructions). In Finland, payment services can only be provided by service providers that meet the requirements laid down in the Payment Institutions Act (Fi: Maksulaitoslaki 297/2010, as amended), either acting as authorized payment institutions or entities that the FIN-FSA has approved for the provision of payment services without actual authorization.

Payment services can be provided without authorization, as long as the total value of completed transactions does not exceed:

- for natural persons, an average of €50,000 a month over a period of 12 months; and
- for legal persons, an average of €3 million a month.

However, those providing payment services without authorization must submit a notification to FIN-FSA prior to the commencement of the service. After receiving such a notification, FIN-FSA investigates whether the service provider meets the statutory requirements.
• A natural person cannot be authorized as a payment institution.

• Legal persons must apply for authorization as a payment institution if the total value of their payment services exceeds the above-mentioned limit.

• A credit institution may provide payment services based on its own authorization.

• A foreign payment institution authorized in EEA may also provide payment services in Finland, provided that proper notification is made to FIN-FSA.

The legal requirements for the provision of payment services, such as the disclosure requirements and contract terms and conditions, are laid down in the Payment Services Act (Fi: Maksupalvelulaki 290/2010), as amended. It regulates, for example, the service provider's obligation to provide information to end users on the terms of the relevant agreement governing the provision of the services and executed payments. It also regulates how payments are executed, what the terms and conditions are, and what responsibilities the parties have.

FIN-FSA supervises terms and conditions, disclosure obligations and the carrying out of such services in respect of payment institutions, credit institutions and their agents.

The European Union's Payment Services Directive II has been transposed into Finnish law through changes to the Payment Institutions Act and the Payment Services Act. It can be noted that the FIN-FSA complies with European Banking Authority's proposed additional time for strong customer authentication in e-commerce card-based payments and such requirements must be implemented by 31 December 2020.

Application of data protection and consumer laws

General principles of processing and disclosing personal data are regulated by the European General Data Protection Regulation (GDPR), supplemented by the Personal Data Act of Finland (Tietosuojalaki 1050/2018, as amended). Criminal liability may ensue if obligations of the Data Protection Act are not followed.

In addition to sector-specific regulations, general consumer protection regulation applies to the provision of payment services to consumers. A consumer is defined in the Consumer Protection Act (Fi: Kuluttajansuojalaki 38/1978, as amended) as a natural person who acquires consumer goods and services primarily for other purposes than to his or her professional purposes. The Finnish consumer ombudsman supervises the terms and conditions and disclosure obligations and the carrying out of such services in respect of payment services providers without authorization, where the users of the service are consumers.

Money laundering regulations

Payment services providers must comply with anti-money laundering requirements as provided in the new Finnish Act on Preventing Money Laundering and Terrorist Financing (Fi: Laki rahanpesun ja terrorismin rahoittamisen estämisestä 444/2017, as amended), which entered into force in July 2017. The new Act implements the European Union's Fourth Money Laundering Directive.

Last modified 26 Nov 2019

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by, for example, the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

THE FINNISH FUNDING AGENCY FOR TECHNOLOGY AND INNOVATION (TEKES)
Tekes is the most important public funding agency for research funding in Finland. Tekes provides funding to transform research-stage ideas into viable businesses, and may combine direct unconditional funding with Tekes-guaranteed loans, conditional on the success of the resulting business.

**ANGEL INVESTORS**

Business angel financing has developed as an important source of early stage capital for startups. A business angel is an individual who provides capital for a startup and usually in exchange for convertible debt or ownership equity. Business angel funding is also provided through cooperative platforms, such as the Finnish Business Angels Network (FiBAN).

**ACCELERATORS**

Accelerators, which are normally set up by business communities, governments or academic centers provide essential mentoring, capital and connections for FinTech companies. Accelerators had an important role in startup financing some years ago but their relevance has, however, since declined.

**CROWDFUNDING**

Crowdfunding is available but is not a common way of funding for a FinTech business, because the business ecosystems around FinTech are typically highly complex and not easily marketable to the public. Crowdfunding involves members of the public investing in a business by pooling their resources through an intermediary platform. The idea of crowdfunding is, that a large number of investors make relatively small investments through an online platform to a certain company, which usually is in its early stages.

**Venture capital and debt**

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

**Peer-to-peer platform funding**

One form of funding is by way of peer-to-peer (P2P) lending platforms, which bring individual borrowers and lenders together without the involvement of traditional banks. P2P lending does not involve equity investments, and instead interest is paid on the money borrowed.

**Senior bank debt and capital markets funding**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis, depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**CAPITAL MARKETS FUNDING**

In Finland both debt and equity capital markets are accessible to businesses (usually of a certain size).

A FinTech company may raise finance by listing on First North, which is a Nordic alternative market designed for small and growing companies. The First North market is maintained by local NASDAQ OMX stock exchange companies (in Finland NASDAQ OMX Helsinki Oy). Using a less extensive rulebook than the main market, the First North market provides companies with more room to focus on their business and development, while still taking advantage of all the positive aspects of being a listed company. The First North market runs in the Nordic stock exchange parallel to the main market, where the shares are traded in a single trading system. For investors, First North
offers an opportunity to invest in companies that are in an interesting stage of their growth. Many large and established companies began their journey on First North, creating growth and gaining experience. Many of these companies went on to listing on the NASDAQ regulated main market.

As an alternative to bank or other types of financing, Nordic companies are increasingly funding themselves via corporate bonds. The benefits of corporate bonds include, for example:

- the possibility for longer maturities;
- fixed interest rates and bullet repayment (ie no amortization);
- reduced dependency of banks;
- less detailed terms compared to bank loans; and
- transparency in secondary market pricing.

The Nasdaq First North Bond Market is an alternative marketplace with an efficient admissions process. On the Nasdaq First North Bond Market, bonds can be admitted to trading without having a prospectus approved by the Finnish Financial Supervisory Authority or without a need to comply with IFRS accounting standards. Due to these reasons, issuing bonds on the Nasdaq First North Bond Market can be seen as a tempting alternative for FinTech companies as it allows them to concentrate on developing their core business.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are:

- **Transfer** – A transfer is a full legal transfer of the loan agreement, including all rights and obligations of the lender as well as the underlying security. It is a tripartite arrangement between the existing parties and the transferee and results in a fresh contract being formed between the continuing party and the transferee and the transferor being released from its obligations.

- **Assignment** – An assignment is a transfer of lender's rights only, not obligations. Subject to any contractual restrictions, assignment can be done without the consent of the debtor. An assignment can be effected as either an equitable assignment or legal assignment depending on whether certain statutory requirements have been satisfied.

- **Sub-participation** – A sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the buyer taking on double credit risk, both on the seller as well as the borrower.

- **Securitization** – In a securitization transaction the creditor/issuer creates a financial instrument by combining and repacking loans and selling the related cash flow to investors in a form of securities.

Loan transfers are commonly documented using standard form contracts made available by the Loan Market Association. For more complex transactions, a more bespoke form of sale and purchase agreement would tend to be used. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

What are the main considerations when transferring a loan and related security?

There are a number of issues to be considered before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller’s legal advisors. Some of the key considerations include:
• **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;

• **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;

• **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;

• **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;

• **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms;

• **consent** – whether a transfer requires the consent or notification of any other parties;

• **lender’s position** – according to Finnish law, the transferee of a loan will not obtain a better position towards the borrower than the original transferor (thus, to the extent the borrower may present claims against the original lender, it may also present such claims against the new lender);

• **security** – whether the loan is covered by guarantee or other security (Finnish law does not recognize an assignment of security. However, under Finnish law, secured loans can be transferred and the general rule is that, as an ancillary obligation, the guarantee/security associated with the loan is transferred together with the debt which is typically expressly permitted under the financing documents.); and

• **syndicated loans** – usually, a security agent is appointed to act for and on behalf of all lenders (no further actions, other than notices in the loan documents, are usually required to transfer the benefit of the security if the composition of the bank syndicate changes).

**Projects**

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

**Generally**

The ownership of energy and infrastructure assets in Finland varies according to the asset class. The main asset class may be divided into:

• **economic infrastructure** (energy, aviation, rail, telecommunications, water, roads and waste); and

• **social infrastructure** (education, health and justice/prisons, housing).

Key sectors are considered below.

**Energy**

Finland’s electricity market was gradually opened to competition after the passing of the Electricity Market Act in 1995. Since late 1998, all electricity users, including private households, have been able to choose their preferred electricity supplier. Monopolistic electricity transmission is regulated and supervised by the national authority, which in Finland is the Finnish Energy Authority.

**Fingrid Oyj** is responsible for the electricity transmission in the high-voltage transmission in Finland. Republic of Finland owns approximately 28% of the shares, National Emerge Supply Agency 25% and Ilmarinen Mutual Pension Insurance Company 20%. There are approximately 76 electricity distribution network operators in Finland. Sale of electricity does not require permit but is regulated and supervise by the authorities. The electricity market also allows electricity consumers (including households) to practice small-scale electricity production and sell the energy on the market.

The electricity market is regulated by the Electricity Market Act and Government Decrees based on the Electricity Market Act. The Energy Authority monitors compliance with the electricity market legislation and promotes the operation of the competitive electricity and natural gas markets.
From the beginning of 2020, the Finnish natural gas transmission network will be operated by state-owned gas transmission operator, Gasgrid Finland. Under the Natural Gas Market Act the wholesale and retail natural gas markets will be opened for competition at the beginning of 2020. Simultaneously the previous TSO, Gasum will be unbundled and Finland is not anymore an isolated market.

**Telecoms infrastructure**

The telecommunication networks in Finland are privately owned by a number of service providers. Elisa, TeliaSonera and DNA, which is a subsidiary of the Norwegian Telenor.

The Finnish Transport and Communications Agency Traficom steers and supervises compliance with the provisions and regulations that apply to its field of activity. Traficom's steering and supervision applies to telecommunications operators, TV and radio operators, users of radio frequencies, postal operators, and several players related to electronic communications networks.

**Transport infrastructure**

**LIGHT RAIL**

Light rail systems (metro and trams) in Helsinki are managed by the Helsinki City Transport (HKL) that is owned by the City of Helsinki. HKL owns the tramways, metro tracks and metro stations of Helsinki, as well as the trams and metro trains themselves. Further, HKL owns the public transport infrastructure in Helsinki and is in charge of developing and maintaining it. Other cities in Finland do not have light rail public transportation.

**HEAVY RAIL**

In Finland the rail passenger market is not yet open to competition and VR is the only train operating company in Finland. The rail freight market was fully opened to competition in 2007, with the first new entrant on the market in 2012.

The Finnish Transport Agency is responsible for the state-owned railways. The transport system is maintained and developed in cooperation with other actors, such as VR Tracks, a subsidiary of the VR Group.

**ROADS, BRIDGES AND TUNNELS**

Together with the regional ELY Centers, the Finnish Transport Agency is responsible for the maintenance and development of the state-owned road network. The Finnish road network comprises highways (owned by the State), municipal street networks (maintained by municipalities) and private roads (owned by private individuals or associations, and are mainly used to enable the passage to private lands and may only be used by those who own the roads). Private roads may only be established by application and in accordance with the Act on Private Roads. The public sector does not currently outsource the construction, maintenance or operation of roads. It does however, use public procurement procedures when planning and contracting and maintaining roads. For example, Public-Private Partnership (PPP) financing models have been used in motorway projects (eg E18 Muurla-Lohja motorway).

**AVIATION**

The basic rules governing aviation in Finland can be found in the Aviation Act and in EU regulations directly applicable in all member states. Some of the market is privatized however, the principal actors on the market are government owned companies. For example the biggest airline is Finnair, of which the state owns almost 60%. However, airports themselves and the aviation infrastructure are not privatized and are all owned by the state of Finland. The maintenance of all airports is the responsibility of Finnavia Oyj, which is a public limited liability company owned by the state.

**PORTS**

In the past, the ports in Finland have been public utilities of municipalities but after the decision of the European Commission, the ports were incorporated and are nowadays limited liability companies. The ports are however, mainly in the ownership of municipalities or a group of municipalities. Also, the industrial sector owns some ports for the purposes of their industry.

**Other infrastructure**
SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES, CENTERS/PRISONS)

Typically, all are owned by the public sector.

_Hospitals/healthcare_

Healthcare in Finland consists of a highly decentralized, publicly funded healthcare system and a relatively small private sector (mainly consisting of occupational health care, provided to employees by their employer as a work benefit and also of few private hospitals and healthcare hubs). Each person residing in Finland has the right to healthcare services.

The Ministry of Social Affairs and Health is the highest decision-making authority regarding healthcare, but the municipalities are responsible for providing healthcare to their residents. The municipal financing of healthcare consists of two sources; municipal taxes and user fees. The municipalities also have the right to receive state subsidies, if their tax levy is not adequate for providing the public services required.

The private sector is relatively small and the barrier to using private healthcare services are high due to the higher service fees. However, the Social Insurance Institution (KELA) reimburses a significant share of the cost.

There is an ongoing social welfare and healthcare reform in Finland, the objective of which is to create financially viable bodies as service organizers (including private sector bodies), and to also to achieve complete horizontal and vertical integration of social welfare and health care services. This reform is expected to offer opportunities to investors.

_Schools_

Schools are generally owned by the public sector (mainly municipalities). However, schools may outsource certain services such as building, maintenance and other projects to private sector entities.

_DEFENSE_

Defense assets are owned by the public sector.

_WASTE_

The municipalities must organize the recovery and treatment of hazardous agricultural waste and domestic waste. In addition to this, municipalities are responsible for the urban waste produced by public administration services and the education sector. Municipalities also distribute information and offer guidance on waste management. Municipal responsibilities are described in more detail in Section 32 of the Waste Act. In practice, many municipalities sub-contract most of their waste management duties to local companies.

_WATER_

The municipalities are responsible for the arranging of water and wastewater services in Finland but water supply establishments usually provide the services. The regional ELY Centers as well as the municipal health authorities regulate and supervise the water sector.

_Last modified 26 Nov 2019_

**Are there special rules for investing in energy and infrastructure?**

_Generally_

There is no specific regime governing or restricting investment in energy or infrastructure projects in Finland over and above existing regulation for investors and funders more generally but a particular proposed investment may be subject to legislative or regulatory control (eg merger control rules). As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made) the legal/regulatory position relevant to that project must be considered. For example, a project involving development on land will require planning permission; and a project may need environmental authorizations and/or sector specific regulatory consents or licenses.

_Energy_

The energy markets in Finland are open to competition (with the exception of Åland) and there are no restrictions on entering into the
market. However, the regulation is fairly complex: while the production and sales of electricity are open to competition, distribution activities are divided into regional monopolies, subject to permits and are under the surveillance of Energy Market Authorities.

Production activities are heavily regulated and supported by legislation and authorities (eg for environmental reasons).

Electricity production facilities are capital-intensive and investments in them are long-term investments. The functioning of the markets, legislation and predictability of such markets and legislation are influential considerations to investments in electricity production facilities on a commercial basis.

The most important legislative development in Finland pertaining to renewable energy took place in June 2018 by the amendment of the Finnish Act on Production Subsidy for Electricity Produced from Renewable Energy Sources (1396/2010, Fi: laki uusiutuvilla energialähteillä tuotetun sähön tuotantotuesta), which implemented a new support scheme for renewable energy based on technology-neutral premium based tender process.

The Act adopts a new tendering system for renewable energy subsidies. Unlike in the previous feed-in tariff system, under the new auction-based tendering system the state will define the annual target amount of renewable energy for each tendering round, and eligible electricity producers will then file their bids with the Finnish Energy Authority.

During each tendering round, the producers must determine the premiums (i.e. the amount of support from the state) they require for producing energy and the predicted annual volume of their energy production. The projects will then be ranked based on the bids, and those with the lowest premium rates will be accepted in ascending order until the annual target amount of renewable energy production is reached. The premium offered would have to fall under the threshold price of the process, which to start with is EUR 53.5 per MWh, i.e. the same as under the current feed-in tariff system. The state will grant premiums for the accepted projects for a maximum period of 12 years.

The first (and so far the only) auction round took place between 15 November and 31 December 2018. The annual electricity production available for auction was 1.4 TWh.

The principal legal framework regarding energy markets consists of the Act on Electricity Markets and the Act on Natural Gas Markets.

Corporate PPAs:

Corporate power purchase agreements (PPAs) for renewable energy have only recently entered the Finnish renewable energy market. This results from the fact that while the installed capacity of wind energy has doubled within two years to roughly 2,000 MW in Finland in 2018, a majority of these wind energy investments were made with the support of state aid from the previous feed-in tariff scheme, which was closed at the end of 2017.

Registration and reporting obligations under REMIT:

Undertakings active in the electricity sector are preparing for registration and reporting obligations under REMIT to enter into force gradually in force in Finland. Registration and reporting obligations, as well as ensuring compliance with several partially overlapping regulatory regimes (REMIT, financial regulation, competition law), increase the administrative burden and costs of numerous undertakings active in the sector.

Currently, it is hard to anticipate the exact effects of the REMIT regime in Finland and on the Nordic electricity markets, and much will also depend on the actual activity of the Energy Authority, Financial Supervisory Authority and their cooperation with other relevant domestic and supranational authorities.

Telecoms infrastructure

The telecoms markets are heavily regulated and certain activities are subject to permits (eg network permits) from the FICORA. However, FICORA actively intervenes in competition problems detected on the broadband and telephone markets, which enables new and innovative service providers to enter the markets.

The principal legal framework consists of the Information Society Code, which regulates most parts of the field.

Transport infrastructure
There is an ongoing legislation project to implement a new Traffic Code, which will also affect the legal framework regarding transportation more generally.

In Finland, the rail passenger market is not yet open to competition and VR is the only train operating company in Finland. The tracks however, are the responsibility of the Finnish Transport Agency who procures the planning, building and maintenance from companies in the field. VR Tracks is the principal actor in the market. The rail freight market is open to competition.

Maintenance of the roads is on the responsibility of the government. The public sector usually procures services for road projects from private sector entities, who carry out the projects. However, these actions are not outsourced.

What is the applicable procurement process?

Finnish public procurement is subject to national procurement legislation (Act on Public Contracts and Concessions). In addition, there are sector-specific regulations, such as the act regarding public contracts and concessions on certain special fields (ie water and energy maintenance, traffic and postal services) and the Act on Defense and Security Public Contracts. These implement the EU directives on public procurement.

Under these regulations, public sector procurement must follow transparent open procedures ensuring fair and non-discriminatory conditions of competition for suppliers.

Investing in energy and infrastructure

Public procurement is relevant where a public unit is seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal, which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset. The relevant procurement legislation applies to certain public bodies including central government departments, local authorities etc.

A regulated procurement is required where certain financial thresholds are met. On most major infrastructure projects, it is likely that those thresholds will be met so a regulated procurement would need to be run.

In most cases, the public sector will need to publish a contract notice in the Office Journal of the European Union (OJEU) and typically run one of the following procedures (please note that in the procurements subject to the act regarding public contracts on certain special fields, ie water and energy maintenance traffic and postal services, the procedure is more flexible than described below in accordance with the Act on Public Contracts):

- **Open procedure** – This is suitable for easy-to-evaluate projects and tenderers simply submit a tender in response to the OJEU notice. Change and negotiations to the tender are not permitted.

- **Restricted procedure** – There is a shortlisting of at least five tenderers following an expression of interest stage and tenderers submit a bid. Again, no negotiation is permitted other than limited clarification and finalization of the contract terms.

- **Competitive dialogue** – This is often the most common procedure for complex infrastructure projects and involves a shortlisting of at least three bidders who are invited to dialogue with the public sector to develop detailed solutions which are capable of being accepted by the public sector. Clarification and further negotiations are allowed following final tender but only on the basis of confirming the financial and other commitments in a tenderer’s bid.

- **Competitive procedure with negotiation** – This is sometimes described as a hybrid procedure as it allows dialogue with bidders but also allows the public sector to award a contract on the basis of an initial tender (or further stages) but clarification and negotiation is not allowed following final tender.

The Competition and Consumer Authority supervises the compliance of the procurement regulations and it may issue reminders to procurement units if it observes unlawful conduct, and, in the case of illegal direct procurement, it may prohibit the implementation of a procurement decision. The authority may also propose that the Market Court impose sanctions. The Market Court is the court which hears public procurement cases (appeals) in the first instance.

Last modified 26 Nov 2019
What are the most common forms of funding / investing in energy and infrastructure?

The principal forms of private sector funding are:

**Funding**

Common forms of funding in energy and infrastructure include:

- loans made on a corporate finance basis (balance sheet debt);
- loans made on a project-finance basis;
- bond finance;
- mezzanine debt (in some sectors, generally not very common in Finland); and
- refinancing of the debt in operational projects.

Funding/funding products can also, sometimes, be provided by the European Investment Bank and export credit agencies.

**Investing**

Common forms of investing in energy and infrastructure include:

- 'equity' investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of 'equity').

Restructuring

**Enforcement and sanctions**

*When can there be regulatory investigations?*

The supervisory powers of the Finnish Financial Supervisory Authority are defined in the Act on the Financial Supervisory Authority. These powers include the right to perform inspections of supervised entities, or, when deemed necessary, other financial market participants and to obtain documents and other records necessary for the conduct of supervision. The powers also include the right to convene meetings of authorized supervised entities with decision-making and administrative powers and to attend these meetings.

*What regulatory penalties may apply?*

The Finnish Financial Supervisory Authority (FIN-FSA) may exercise supervisory powers in respect of financial markets, such as temporary prohibition from holding a managerial position in a supervised entity and curtailment of operations subject to authorization.

In addition, the FIN-FSA may impose administrative sanctions, ie administrative fines, public warnings, and penalty payments. FIN-FSA may also request a police investigation.

*What criminal penalties may apply?*

Criminalized activities include *inter alia*:
• insider dealing, misleading statements and practices and manipulating the markets;
• breaches of money laundering regulations; and
• conducting regulated activities without authorization.

The criminal penalties vary between fines and imprisonment.

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

There are no stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

There are no stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

There are no stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

Secured lenders and secured debt security holders take priority over the Finnish tax authorities on the enforcement of security.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

No, but withholding tax can be levied in a few exceptional cases. These are very rare in practice. These exceptional cases include where interest is paid to a person who is not resident in Finland on:

• additional investments into Finnish funds;
• deposits into staff cash pools;
• deposits into co-operative cash pools;
• debt between private individuals where the creditor ceased to be resident for tax purposes in Finland after the debt arrangement was put in place; and
• debt which is recognized as a capital investment for tax purposes.

If so:

What is the rate of withholding?

In the exceptional cases where withholding tax applies, the rate of withholding tax is 20%, where the interest is paid to a company not resident in Finland, and 30% where the interest is paid to an individual not resident in Finland.

What are the key exemptions?

An exemption from the application of withholding tax in the exceptional cases in which it applies may be available, in whole or in part, under the terms of a double tax treaty entered into by Finland, provided that the requisite conditions are met.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Last modified 26 Nov 2019

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both French and EU law.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in France or to request that they are admitted to trading on a regulated market operating in France unless an approved prospectus has been submitted for approval to the French regulator (Autorité des Marchés Financiers) and made available to the public.

The Autorité des Marchés Financiers has provided guidelines and instructions for the issuance of debts securities and the distribution of marketing materials to the public.

What are common issuing methods and types of debt securities?

The most common methods of issuing debt securities in France are on a standalone basis or under a program. The program method is for an ongoing series of issues governed by a set of legal documentation while standalone issuance is for one particular issuance of debt securities.

Many different types of debt securities are offered in France. Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities;
- guaranteed securities, subordinated securities, perpetual debt securities (ie debt securities that have no specified redemption date);
- asset-backed securities;
- derivative securities such as securities linked to the value of one or more reference asset – including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- hybrid securities (ie securities with both debt and equity features);
- equity-linked securities such as convertible bonds (ie debt securities convertible into the equity of the issuer);
- exchangeable bonds (ie debt securities convertible into the equity of a third party);
- depositary receipts (ie security issued by a depositary conferring on the holders beneficial ownership of certain underlying assets held by the depositary for the holders); and
• warrants (ie securities giving the holders the option to purchase the equity of the issuer or a related company).

What are the differences between offering debt securities to institutional/professional or other investors?

The Prospectus Directive does not make a distinction between professional and other investors for the purposes of its disclosure requirements but does include different disclosure regimes by reference to the minimum denomination of a single security.

If the denomination of the securities is equal to or above €100,000 (or the equivalent in another currency), the 'wholesale' rules apply. If the denomination is under €100,000, the 'retail' rules apply. Additional disclosure requirements apply for retail securities.

When is it necessary to prepare a prospectus?

Under the Prospectus Directive, unless an exemption applies, it is necessary to publish a prospectus where there is an offer of securities to the public or an application for the securities to be admitted to trading on a regulated market.

The obligation to publish a prospectus does not apply to offers made to the public if it is made solely to qualified investors, addressed to fewer than 150 persons (other than qualified investors) per European Economic Area state or where the minimum denomination per unit is at least EUR100,000.

The definition of 'qualified investor', following the implementation under French law of Directive 2010/73/EU has been aligned with the definition provided under the Markets in Financial Instruments Directive. Pursuant to article D. 411-1 of the French Monetary and Financial Code, in order to be a qualified investor, a person needs to be either a professional client or an eligible counterparty.

If the offer is deemed not to be made to the public, a prospectus may still be required if an application is made for the securities to be admitted to trading on a regulated market.

What are the main exchanges available?

Market operator NYSE Euronext manages the Euronext Paris regulated markets in France.

Is there a private placement market?

France has an active private placement market. The documentation is generally standardized (such as the Euro PP standard).

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers are required to provide comprehensive information in relation to their financial situation and activities as well as to provide risk factors to bring the attention of investors. Issuers are accountable and liable for misleading or inaccurate information provided in their prospectus or information memorandum.

Investing in debt securities
Specific risks factors related to the securities and the ability of the issuer to repay the securities are generally provided for under the prospectus or the information memorandum. Typically, an investor may lose all his investment in case of insolvency or inability of the issuer to fulfil his payment obligations.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Depending on the characteristics of the fund (offered to professional or nonprofessional investors), alternative investment funds (AIFs) must be authorized by or notified to the Financial Markets Authority (Autorité des Marchés Financiers) (AMF).

What are common fund structures?

Several fund structures are listed by the Monetary and Financial Code (Code monétaire et financier):

- retail investment funds;
- funds of alternative funds;
- private equity funds;
- employee investment undertakings;
- real estate collective investment undertakings (OPCI);
- real estate investment companies (SCPI);
- forestry investment companies (SEF);
- closed-ended investment companies (SICAF);
- professional investment funds (FPS which take the form of (i) mutual fund (fonds commun de placement) or (ii) société en commandite simple (SLP));
- professional private equity funds;
- professional real estate collective investment undertakings; and
- financing entities, which includes securitisation entities and specialised financing entities (organismes de financement spécialisés).

These funds generally take the form of investment companies with variable capital or mutual fund (fonds commun de placement) with no legal personality.

Others fund structures (Autres FIA) are not listed by the Monetary and Financial Code (Code monétaire et financier) and fall within the scope of AIF by meeting the criteria of the definition referred to in Article 3 of the AIFM Directive.

What are the differences between offering fund securities to professional / institutional or other investors?

Retail funds

Retail funds, including Undertakings for Collective Investment in Transferrable Securities (UCITS), are subject to substantial regulatory oversight and restrictions, including obligations with regard to independent custodian/depository arrangements for assets, investment and borrowing powers specifications, concentration requirements and other matters.
Institutional/professional funds

Professional funds can only be marketed to professional clients as defined in the MiFID.

Professional funds that are offered in France are subject to the Alternative Investment Fund Managers Directive regime in relation to authorization of the manager/fund, marketing arrangements, reporting, depositary arrangements for assets and governance etc.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

Managing investments is a regulated activity under French law and therefore subject to authorization. Certain investment vehicles which do not fall within any of the categories of alternative investment fund (AIF) under the Monetary and Financial Code (Code monétaire et financier) may nevertheless be subject to regulatory obligations if they fall within the definition of AIF as defined in the Alternative Investment Fund Managers Directive.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

French selling restrictions

Generally in France, offering securities or interests in alternative investment funds (AIFs) is covered under the Monetary and Financial Code (Code monétaire et financier) and the General Regulation of the AMF, which implement in French law the Undertakings for Collective Investment in Transferable Securities Directive and the Alternative Investment Fund Managers Directive.

Undertakings for Collective Investments in Transferable Securities (UCITS)

UCITS, including those established in France, have an EU passport which enables fund promoters to create a single product for marketing in all EU member states and on the completion of the appropriate notification procedure, a UCITS established in one member state can be sold in any other.

A UCITS intending to market in another member state must complete and submit to its home regulator a notification including certain specified information, including copies of key investor documents. The home regulator then completes a notification file which is sent in a regulator-to-regulator transmission, following which the UCITS can be sold in the other member state.

Alternative Investment Funds (AIFs)

An alternative investment fund manager (AIFM) may only market an AIF to EU investors if it is authorized by a relevant EU regulator – registration with one EU regulator opens access, subject to certain further limited conditions, to marketing to professional investors across the EU under a EU passport or if it complies with national private placement regimes (where available).

Reverse solicitation and the definition of ‘marketing’

The act of marketing AIFs consists in presenting the products on French territory by different means (advertising, direct marketing, advice, etc) with a view to encouraging an investor to subscribe to or purchase such AIFs. If units or shares of AIFs are marketed as defined above, those units or shares are considered as being marketed in France and the manager of the AIF must comply with the legal and regulatory framework applicable to the marketing of AIFs (eg Financial Markets Authority (Autorité des Marchés Financiers) (AMF) authorization or EU passport).

The AMF expressly considered in its AIF marketing guidelines that the purchase, sale or subscription of units or shares of an AIF in...
response to a client's unsolicited request to purchase a specifically designated AIF, provided that the client is authorized to do so, would not be considered as an act of marketing in France (Reverse Solicitation). Any entity wishing to rely on the Reverse Solicitation exception should document all of its communications with potential investors.

*Last modified 4 Dec 2019*

**Are there any restrictions on managing a fund?**

Managing a fund is a regulated activity. Any entity managing funds must be authorized by the AMF before commencing its activities.

*Last modified 4 Dec 2019*

**Entering into derivatives contracts**

**Are there any restrictions on entering into derivatives contracts?**

The [European Market Infrastructure Regulation](#) applies to all derivative transactions and requires transactions to be reported to trade repositories, for relevant transactions (certain classes of over-the-counter (OTC) derivatives above certain thresholds) between dealers to be cleared, or when derivatives are not centrally cleared, subject to risk mitigation techniques such as initial margin and variation margin requirements.

Local authorities may only enter into derivatives contracts for hedging purposes and subject to the fulfilment of other specific conditions.

In addition, the French regulators have provided instructions to be complied with in respect of the marketing and the transparency obligation applicable to banks and investment services providers offering complex derivatives products. Unless an exemption applies, investment services on financial contracts (i.e. derivatives contracts) require a license in France (or a passport) to provide the relevant investment service.

*Last modified 4 Dec 2019*

**What are common types of derivatives?**

Derivatives may be traded over-the-counter or on an organized exchange.

All of the main types of derivative contracts are widely used in France:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying assets seen in France are:

- equity;
- fixed income instruments;
- commodities;
- emission allowances;
- indexes;
- foreign currency; and
- credit events.
Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007 to 2008, many regulations have been enacted with the intention of monitoring and/or regulating derivatives markets. The European Commission has sought in particular, to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative positions;
- reduce counterparty risk by increasing the use of central counterparty clearing, limiting the scope of title transfer, by generally prohibiting such type of collateral in case the counterparty to the financial counterparty is a non professional client (e.g. retail);
- improve the management of operational risk by increasing the standardization of derivatives contracts;
- provide rules for the collection and posting of initial and variation margins;
- improve banking secrecy (e.g. for redit derivatives); and
- provide rules on miscelling/good conduct.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

If the lending activity is performed on a regular basis, the lender must be authorized.

Borrowing

Borrowing is generally not regulated. However, depending on the circumstances, borrowers should insure that lenders are duly licensed.

What are common lending structures?

There is no mandatory lending structure in France; lending can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, equity bridge facilities or project facilities.

Loan durations

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
• a standby or bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

**Loan security**

A loan can either be secured, unsecured or guaranteed.

**Loan commitment**

A loan can also be:

• committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
• uncommitted, meaning that the lender has discretion whether or not to provide the loan.

**Loan repayment**

A loan can be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or in full on the maturity date.

**What are the differences between lending to institutional/professional or other borrowers?**

The main differences concern lending to consumers. This type of lending is governed by the Consumer Code (Code de la consommation) and lenders are subject to additional obligations regarding in particular:

• advertisement of consumer credit transactions;
• pre-contractual and contractual information obligations are reinforced; and
• evaluation of the consumer's solvency.

**Do the laws recognize the principles of agency and trusts?**

**Agent**

**COMMON AGENCY RULES (MANDAT)**

Security interests have traditionally been granted under French law in favor of a security agent, acting in the name and on behalf of the beneficiaries. Such regime raises, however, several difficulties in practice (eg in case of court proceedings).

**SPECIFIC PROVISIONS OF THE FRENCH CIVIL CODE (CODE CIVIL)**

As a result of the imperfection of the common agency rules (mandat), the French lawmaker created a specific set of rules for the security agent (providing that any security may be constituted, registered, maintained and enforced on behalf of its beneficiaries by an agent appointed in the agreement under which the secured obligations arise) (Art. 2488-6 and seq. of the French Civil Code). Albeit the legal regime of the security agent has been clarified pursuant to the ordonnance n°2017-748 dated 4 May 2017, it is still not widely used in practice since the market and the legal practitioners need to get used to it.

**Trust in a context of security taking/similar mechanism**

**PARALLEL DEBT MECHANISM**

Security interests can be granted under French law in favor of a security agent to the extent only such security agent has been appointed pursuant to 2488-6 and seq. of the French Civil Code (cf. above paragraph).
Otherwise, in practice, and to the extent valid under the law governing the loan agreement, the loan agreement may provide for a ‘parallel debt’ obligation due by the borrower to the security trustee, which can be secured by a French security granted in favor of the security trustee. This ‘parallel debt’ mechanism may, however, not be used in respect of security that is exclusively granted in favor of a lender (e.g. a Daily assignment, pledge over tools and equipment or pledge over inventory).

**FRENCH LAW TRUSTS (FIDUCIE-SÛRETY)**

Under French law, it is possible to transfer the ownership of assets to a trustee (*fiduciaire*) in order to guarantee obligations owed to third parties. The trustee (*fiduciaire*) shall (i) hold such assets segregated from its own assets and (ii) following the occurrence of an enforcement event, transfer the ownership of such assets in accordance with the beneficiaries’ instructions. It is, however, uncommon to use such a security structure in France.

---

**Are there any other notable risks or issues around lending?**

**Generally**

Lenders are required to inform any borrower (professional or consumer) of the percentage rate of charge (taux effectif global) of the loan.

Since the ordonnance n°2019-740 dated 17 July 2019, if a lender fails to provide the percentage rate of charge (taux effectif global), such lender may not be entitled to receive the contractual interest rate of the loan, up to a proportion to be determined by a judge, depending on the damage actually suffered by the borrower.

**Specific types of lending**

Consumer and mortgage credit rules aim to prevent irresponsible lending to consumers and impose a number of requirements on lenders including the need to, among other things:

- conduct affordability tests before lending; and
- provide standard information about the credit to enable borrowers to compare products (e.g., annual percentage rate of charge).

---

**Are there any other notable risks or issues around borrowing?**

Borrowers should be aware of the potential implications of the EU’s Bank Recovery and Resolution Directive (BRRD), which outlines certain measures for dealing with failing financial institutions.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to ‘bail in’ obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. ‘Bail in’ describes a variety of write-down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of French or other EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

In certain circumstances, the agent must be licenced as creditor or payment institution (or duly passported in France for such activities) or as loan broker (“intermédiaire en opérations de banque”) and registered as such with the French dedicated authority (ORIAS).

---

**Giving and taking guarantees and security**

**Are there any restrictions on giving and taking guarantees and security?**
Capacity

It is important to check the constitutional documents of a company giving a guarantee or security and relevant provisions of French law applicable to it in order to check:

- whether such a transaction is within its corporate objects (objet social);
- who are the persons entitled to bind the company towards third parties (ie the legal representatives of the company);
- whether any corporate approval is required prior to the execution of the relevant security document by its legal representatives (In international transactions, even if not expressly requested by the articles of association of the company, it is market practice to request that resolutions be taken by a corporate body of the company so as to confirm that the transaction is useful to the implementation of its corporate object (utile à la réalisation de son objet social) and in its corporate interest. Compliance with corporate interest is a matter of fact and requires a careful review, in particular regarding any upstream or cross-stream guarantee or security provided by a subsidiary to its parent or sister company.); and
- the security document constitutes a regulated convention (conventions réglementées), as defined under French law and, as the case may be, the articles of association of the company. (Depending on the legal form of the company, French law provides for specific procedures to be complied with in the case of agreements entered into between, for example, the company and any of its shareholders holding more than 10% of its share capital. Specific advice should be sought on a case-by-case basis.)

Execution by same authorized representative

Pursuant to article 1161 of the French Civil Code (Code civil), where the same physical person acts as authorized representative of one or several other physical persons party to the same agreement, this may lead to the nullity of the said agreement, unless expressly approved or ratified by the represented physical persons. The scope of this provision has been clarified pursuant to a law n°2018-287 dated 20 April 2018 and no longer encompass the representations of companies.

Insolvency

HARDENING PERIOD (PÉRIODE SUSPECTE)

Under French law, security interests granted to secure previously existing debts are null and void if they are granted during the hardening period (période suspecte) (ie the period from the date the pledgor became insolvent up to the date of the opening judgement, the duration of such period being up to 18 months prior to the date of the opening judgement).

DISPROPORTIONATE SECURITY INTERESTS

In the event of insolvency proceedings being opened against a company, if guarantees and security interests granted in favor of a creditor are disproportionate to the loan granted or credit extended to the company, the security interests of such creditor may be challenged and such guarantees and security interests may be nulled or reduced by a French judge.

Financial assistance

It is unlawful for any société anonyme and société par actions simplifiée to advance funds, grant loans or provide a security or a guarantee for the purpose of enabling a third party to acquire or subscribe its shares. However, the financial assistance rules do not apply to:

- operations carried out by credit institutions and finance companies in the normal course of their business;
- operations carried out for the purpose of the acquisition or subscription by employees of shares of the company, of one of its subsidiaries or of a company coming within the scope of a group savings plan (plan d’épargne de groupe) as provided by article L.3344-1 of the French Employment Code (Code du Travail); and
- any security or guarantee provided for any part of the debt which is not used to acquire or refinance the acquisition or subscription of shares.

What are common types of guarantees and security?
Common forms of guarantees

Guarantees can take a number of forms, the more common ones being:

- a corporate guarantee (cautionnement), which is an undertaking taken by a guarantor towards a beneficiary to pay a debtor’s debt in case of non-payment by the latter (such guarantee is ancillary to the principal obligation – the obligations of the guarantor are closely linked to the obligations of the main debtor);

- an autonomous guarantee (garantie autonome), which is an undertaking taken by a guarantor, in light of a third party’s obligation, to pay a sum of money to a beneficiary on first demand or upon the terms and conditions agreed between the parties (it is a non-ancillary separate and distinct obligation – the guarantor may not raise any exception pertaining to the obligation of the debtor and, unless otherwise agreed between the parties, such guarantee does not follow the guaranteed obligation); and

- a letter of intent (lettre d’intention, lettre de confort or lettre de patronage), which is an undertaking to do or not to do, so as to support a debtor in the performance of its obligation towards the creditor (its purpose is to ensure that the debtor will be in a position to satisfy its obligations – otherwise, the issuer of the letter will have to indemnify the creditor for any damages incurred because of such failure).

Common forms of security

There are three basic types of security interest that can be created under French law and that are suitable for securing different types of assets:

- a pledge over non-tangible property (nantissement) (such as financial securities accounts (nantissement de comptes de titres financiers), receivables, bank account and intellectual property rights);

- a pledge over tangible property (gage) (such as stock or equipment); and

- a mortgage (hypothèque) over real estate, vessels or aircrafts.

Under French law, as a matter of principle, there is no assignment for security purposes, except:

- the so-called ‘Daily assignment’ of receivables; and

- the French trust for security purposes ‘fiducie-sûreté’ (which is only used in practice under exceptional circumstances).

It is not possible to grant security over all of the assets of a company, such as an English law debenture. The closest security would be to grant a pledge over business (nantissement de fonds de commerce), which covers the logo, commercial name, commercial leasehold, customers, some fixed assets (equipment, machinery and tools) and intellectual property rights.

Last modified 4 Dec 2019

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

The main points that should be checked are as follows.

SPECIFIC RULES APPLICABLE TO GUARANTEES GRANTED BY COMPANIES

The French Commercial Code provides for rules applicable to certain guarantees granted by companies. For instance, it is not possible for some companies to guarantee the obligations of managers and shareholders and/or directors. Specific advice should be sought depending on the form of company.

HANDWRITTEN WORDING TO BE INSERTED IN A CORPORATE GUARANTEE (CAUTIONNEMENT)

In a guarantee granted by a private deed, it is required that the guarantor write by hand the amount of the secured obligations in words.
and figures.

SPECIFIC RULES APPLICABLE TO CORPORATE GUARANTEE (CAUTIONNEMENT) GRANTED BY INDIVIDUALS

The French [Consumer Code (Code de la consommation)] provides for specific rules applicable to corporate guarantees granted by individuals. In particular, the guarantors' undertaking shall be proportionate to its revenues and assets at the time when the guarantee is granted, except if the guarantor's assets are sufficient to satisfy its obligations when the guarantee is called.

**Giving or taking security**

**RESTRICTIONS AS TO THE SECURED CREDITORS AND OBLIGATIONS**

Security may only be granted in favor of the person to whom the secured debt is owed.

Certain kind of security interests may only be granted in favor of certain creditors to secure certain claims. For instance, a Daily assignment may only be granted in favor of a credit institution or a financing company to secure a loan that it has granted to the assignor in the course of its business.

**PRIVATE DEED OR NOTARIAL DEED**

There are no notarization requirements for security documents under French law, except for:

- mortgage over real estate – the mortgage deed (acte d'affectation hypothécaire) has to be drawn up by a notary;
- pledge over business (nantissement de fonds de commerce), which can be either drawn up by a notary or entered into as a private deed provided that it is registered (ie stamped and filed at nominal costs) with the tax authorities; and
- pledge over shares issues by a société civile, which has to be notarized and accepted by the company or notified by bailiff (huissier) to the company whose share are being pledged.

**COMPULSORY PROVISIONS**

Some security documents (such as aircraft mortgages, mortgages over ships and Daily assignments) must contain compulsory provisions. In the absence of such provisions, the security shall be declared null and void.

**PERFECTION REQUIREMENTS**

Once granted, some security interests need to be properly perfected in order to be enforceable against third parties. Perfection formalities can range from having the secured asset delivered to the security holder, registration of the security and notice being given to third parties.

In France, there is no general security register in which all security interests granted over assets located in France shall be registered. However, specific security interests have to be registered with the commercial register having territorial jurisdiction or, as the case may be, specific registers.

Depending upon the type of security, there may be applicable time limits for registration. In the case of non-registration within such time limits, the security interest will be unenforceable against third parties. The security interest takes priority according to the date of its registration. The registration shall remain effective for a specific period of time, but may be renewed before expiry of such period of time.

**LANGUAGE**

Security documents can be drafted in foreign languages, except when:

- drawn up by a French notary;
- registered with a French authority; or
- mandatory provisions drafted in French are required (eg a 'Daily' assignment).

_Last modified 4 Dec 2019_
Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Civil Code (Code civil), in particular Book III, Title III (Contracts), IV (Obligations’ regime) & Title X (Loan), and Book IV (Security & Guarantee)

Monetary and Financial Code (Code monétaire et financier)

Regulation of the French authorities (AMF, ACPR, Banque de France)

Consumer credit

Consumer Code (Code de la consommation), in particular Chapter IV (Consumer Credit)

Mortgages

Civil Code (Code civil), in particular article 2393 and seq.

Corporations

Commercial Code (Code de commerce), in particular Book II (Companies and other groups)

Funds and platforms

Monetary and Financial Code (Code monétaire et financier)

AMF General Regulations (Règlement Général de l'AMF)

Other key market legislation

Commercial Code (Code de commerce), in particular Book VI (Insolvency Proceedings)

Regulatory authorization

Who are the regulators?

There are two main regulators:

- the Prudential Supervisory and Resolution Authority (Autorité de contrôle prudentiel et de résolution) (ACPR), which supervises regulated entities acting in the banking, payments, investment and insurance industries (eg credit institutions, payment institutions, electronic money institutions, investment companies, digital assets service providers (DASPs), insurance firms, etc.); and

- the Financial Markets Authority (Autorité des Marchés Financiers) (AMF), which supervises and authorises participants and products in financial markets including, without purporting to be exhaustive:
  - financial markets and market infrastructures;
  - listed companies;
  - financial intermediaries authorized to provide investment services and financial investment advice (credit institutions authorized to
provide investment services, investment firms, alternative investment fund managers (AIFMs), financial investment advisors;

- alternative investment funds (AIFs);
- undertakings for collective investments in transferable securities (UCITS); and
- DASPs.

**What are the authorization requirements and process?**

Depending on the type of regulated entity (credit institution, investment firm, alternative investment fund manager (AIFM), an entity must apply to the Prudential and Resolution Supervisory Authority (Autorité de contrôle prudentiel et de résolution) (ACPR) or the Financial Markets Authority (Autorité des Marchés Financiers) (AMF) for authorization.

The regulators assess whether the application meets the required conditions such as:

- suitability of the legal form for the proposed activity;
- minimum capital requirements;
- program of operations, technical and financial resources, organization;
- identity and status of capital contributors, and where applicable, of their guarantors, and the size of their holding;
- location of the central administration and registered office;
- the activity must be effectively run by at least two people, whose knowledge, experience and fitness must be demonstrated, both individually and collectively, as well as their availability; and
- members of the governing body, persons who are in charge of effective management and persons responsible for governance procedures must meet, without purporting to be exhaustive, availability, worthiness, knowledge, skills and experience requirements, assessed both individually and collectively.

**What are the main ongoing compliance requirements?**

Authorized entities must, without purporting to be exhaustive, comply with all required conditions listed above and also with the legal and regulatory rules applicable to their activities.

**What are the penalties for failure to be authorized?**

A person undertaking a regulated activity without being authorized or exempted, commits a criminal offence and is liable to imprisonment and a fine.

**Regulated activities**

**What finance and investment activities require authorization?**

Save for certain exemptions provided for in the Monetary and Financial Code (Code monétaire et financier), any person who/which provides finance or investment services, on a regular basis, is required to be authorized by either the Prudential and Resolution Supervisory Authority (Autorité de contrôle prudentiel et de résolution) (ACPR) or the Financial Markets Authority (Autorité des Marchés Financiers) (AMF).
In particular, the following financing and investment activities require authorization from the regulators or a registration:

- banking services (including, without purporting to be exhaustive, receipt of repayable funds from the public and credit);
- payments services;
- issuance and management of electronic money;
- investment services;
- crowdfunding; and
- management or marketing of alternative investment funds (AIFs).

Banking services are subject to the banking monopoly, which especially applies to the paragraphs on giving and taking guarantees and securities below. In this respect, when transferring a loan and related security, it should be considered whether the transferor was or is duly licensed to provide a credit and whether the transferee is duly licensed (or passported) to act as a transferee.

**Are there any possible exemptions?**

Certain exemptions are available depending on the entity providing the regulated activities (such as certain public entities, etc.).

Certain exemptions are available depending of the type of activity contemplated (such as intercompany lending, loans granted by non-profit associations, etc.).

**Do any exchange controls or other restrictions on payments apply?**

Manual money changers obtain an authorisation from the Prudential Supervisory and Resolution Authority (Autorité de contrôle prudentiel et de résolution) (ACPR). Pursuant to EU and French regulations, any person which carries to a Member State of the European Union or from a Member State of the European Union more than EUR10,000 of cash shall declare that sum to the custom authorities.

Other restrictions apply related to payments and foreign investments (and divestments).

**What are the rules around financial promotions?**

The main rules regarding financial promotions are as follows.

**Banking and financial solicitation (démarchage bancaire et financier)**

Banking or financial solicitation (démarchage bancaire et financier) is strictly regulated under French law: any unsolicited contact, by whatever means, with an individual or legal entity in order to obtain its agreement to enter into a transaction for financial instruments constitutes banking or financial solicitation (démarchage bancaire et financier) (Solicitation).

The Monetary and Financial Code (Code monétaire et financier) (CMF) provides a list of entities authorized to perform Solicitation, among which are, without purporting to be exhaustive, credit institutions, electronic money institutions, payment institutions, insurance firms, investment firms and their agents, financial investment advisers, etc. Any entity carrying out Solicitation must comply with the specific regime provided in the CMF relating to information obligations, right of withdrawal, registration requirements etc.

Several exemptions to this regime are available. One of them is when the targeted persons are French ‘qualified investors’: a qualified investor is an individual or a legal entity possessing the expertise and resources required to apprehend the risks inherent in transactions in financial instruments (eg banks, financial institutions or large corporates).

Solicitation is prohibited for certain products, such as, without purporting to be exhaustive, products whose maximum risk is not known or that exceed the amount of the initial subscription made by the investor, or products unauthorized for marketing.
Information, advertisements and marketing material addressed to clients

Any information, advertisement or marketing material addressed to investment firms’ clients must be clearly identified as advertising, be accurate, clear and not misleading. In addition, the material must mention the existence of a prospectus and the key investor information document. The Financial Markets Authority (Autorité des Marchés Financiers) (AMF) may request the marketing material contents to be modified or sent to it prior to the publication. In accordance with the Markets in Financial Instruments Directive, investment firms acting in France must also provide their clients or potential clients with information that enables them to have a reasonable understanding of the nature of the investment service and the specific type of financial instrument proposed, as well as the risks associated therewith, thus enabling them to make their investment decisions in full knowledge of the facts.

The rules detailed above are not exhaustive and do not cover for instance certain specific French law provisions that may apply depending on the characteristics of the activities carried out in France (eg consumer protection rules, contract or solicitation made by electronic means, financial instruments distribution rules, rules applicable to the marketing of structured or complex financial instruments, etc.).

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

The most common types of legal entities are used to undertake financial or investment activity, such as public limited company (société anonyme) or simplified joint-stock company (société par actions simplifiées), both of which are body corporates with separate legal personality and limit the liability of their members.

Is it possible to conduct lending or investment business through a branch or establishment?

It is possible to conduct lending or investment business through a branch of an authorised European regulated entity or from an authorised European regulated entity without any physical presence in France through the so-called ‘European passport’.

Overseas companies having a French branch may conduct lending business in France subject to an authorization granted by the Prudential and Resolution Supervisory Authority (Autorité de contrôle prudentiel et de résolution) (ACPR) and compliance with specific prudential and regulatory requirements.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based
Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
- consumer loans;
- student lending products;
- small and medium-sized enterprises (SME) lending; and
- residential property and commercial property mortgage lending.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

**HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?**

Marketplace lending includes peer-to-peer (P2P) type structures often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

**Blockchain, smart contracts and cryptocurrencies**

**WHAT IS BLOCKCHAIN?**

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the block using sophisticated algorithms and add the verified block to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a 'proof of work' process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open ('permissionless' or 'unpermissioned') or structured within a private group ('permissioned').

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an 'address'). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known
within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so-called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced more-complex interactions with the outside world using so-called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Banking Authority definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded electronically. The best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal and may result in criminal sanctions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

• access to the assets or features of a particular project;
• the ability to earn rewards for various forms of participation on the platform; and
• prospective return on the investment.

Key aspects to consider will include the:

• availability and limitations on the total amount of the tokens;
• decision-making process in relation to the rules or ability to change the rules of the scheme;
• nature of the project to which the tokens relate;
• technical milestones applicable to the project;
• basis and security of underlying technology;
• amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
• quality and experience of management; and
• compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

On 22 May 2019, France has adopted an innovative legal framework (law and decree) governing initial coin offerings (ICOs), digital assets and digital assets services providers (DASPs). The entry into force of this legislation is however subject to specific rules to be published by the French financial market authority (AMF). The definition of digital assets is very broad and not limited to ICO Tokens and virtual currencies. DASPs providing the service of digital asset custody or purchase/sale of digital assets in exchange for legal tender are subject to mandatory registration with the AMF. Additionally, all DASPs may apply for an optional license.

Public offering of tokens is subject to specific rules including an optional registration (visa) with the AMF requiring the issue of a white paper made available to investors detailing, without purporting to be exhaustive, the token issuer’s project, the intended use of the funds and digital assets collected, the rights and obligations attached to the tokens, etc. The AMF publishes on its website a white list of ICOs benefiting from its visa as well as a “black list” of ICOs and DASPs not complying with the regulation.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Payment initiation service and account information service

The European Directive on payment services introduced two new types of payment services providers: payment initiation service is a service to initiate a payment order at the request of a bank account holder with respect to this account, held at another payment service provider, and account information service is an online service to provide consolidated information on one or more payment accounts held with either another payment service provider or with more than one payment service provider.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The Prudential and Resolution Supervisory Authority (Autorité de contrôle prudentiel et de résolution or ACPR) and the Financial Markets Authority (Autorité des Marchés Financiers or AMF) are the supervising entities and regulators of firms providing banking and financial products and services.
A person must not carry on a regulated activity in France unless authorized or exempted. A banking or financial activity requires regulatory authorization when it is identified as a regulated activity, carried on by way of business on a regular basis in France and it does not fall within any of the available exemptions. Where FinTech products and/or applications involve banking or financial activity which requires regulatory authorization, the firms providing such products and/or applications must be authorized by the ACPR or the AMF.

**ACPR’S FINTECH INNOVATION UNIT**

The FinTech Innovation Unit is the ACPR team dedicated to FinTech and to innovative project initiators. The unit provides an interface between project initiators and the relevant ACPR departments, as well as the Bank of France (for projects regarding payment services) and the AMF (for projects regarding investment services). The ACPR considers that an innovative financial project consists of the creation of a company (‘startup style’) with a strong level of innovation and acting in one or several financial fields under ACPR’s supervision.

**AMF’S FINTECH, INNOVATION AND COMPETITIVENESS DIVISION**

The AMF’s FinTech, Innovation and Competitiveness Division assists stakeholders in analysing innovations in the investment services industry, identifying competitiveness and regulation challenges and, where applicable, evaluating the need to modify European regulations or the AMF policy. The ambition of the AMF is to develop an ecosystem that promotes FinTechs in order to make the Paris financial centre more attractive to foreign participants and facilitate the development and support of FinTechs.

**Electronic payments platforms and regulation of peer-to-peer lenders**

**ELECTRONIC PAYMENT PLATFORMS**

Electronic payment platforms' activities are generally considered as regulated payment services activities requiring a payment institution authorization with the ACPR. Electronic payments platforms may also be authorized as lightly-supervised payment institutions if they do not exceed the threshold of an average volume of monthly payment transactions of EUR3 million. Depending on their features, such platforms may also trigger other qualifications and regulatory regimes, and notably, enter into the scope of the new “Pacte” law (dated 22 May 2019) – digital assets framework.

**PEER-TO-PEER LENDERS**

A person carries out a regulated banking activity if they provide lending or facilitate lending and borrowing between individuals or between individuals and businesses, in particular through an electronic platform, by way of business on a regular basis. Such regulated activity can be carried out if the person is authorized as a credit institution or financing company, or, if the person is registered as a crowdfunding intermediary.

**CROWDFUNDING INTERMEDIARIES**

Any person or entity proposing, through a website, to fund projects in the form of a loan with or without interest must be registered in the Banking, Insurance and Financial Intermediaries Register (ORIAS), as a crowdfunding intermediary. Crowdfunding intermediaries are subject to organizational and business conduct rules (in particular information obligations).

**Regulation of payment services**

Where a person provides payment services as a regular occupation or business activity in France, it will require authorization by the ACPR to become an authorized payment institution. Failure to obtain the required authorization is a criminal offence.

In order to become authorized by the ACPR, a payment services business will need to meet certain criteria, including in relation to its business plan, initial capital, processes and procedures in place for safeguarding relevant funds, sensitive payment data and money laundering and other financial crime controls.

PSD 2 regulation, as implemented into French law, has broaden the scope of payment service, which now extended to payment initiation and aggregation of payments.

**Money laundering regulations**
The Monetary and Financial Code (CMF), which will implement the European Union’s Fifth Money Laundering Directive by 10 January 2020, contains the legal provisions governing anti-money laundering and terrorism financing. The ACPR and AMF are responsible for supervising the compliance of regulated banking and financial entities with anti-money laundering requirements.

The CMF expressly includes platforms facilitating the trade of virtual currencies under the scope of the anti-money laundering legal and regulatory framework.

Last modified 21 Sep 2017

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**

**SEED INVESTMENT**

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

**CROWDFUNDING**

The crowdfunding sector may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

**Venture capital and debt**

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

**Senior bank debt**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

Last modified 21 Sep 2017

**Portfolio sales**
Loan transfers and portfolio sales

What are common ways of buying and selling loans?

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are as follows.

Transfer of contract (cession de contrat)

A cession de contrat is a full legal transfer of the party’s rights and obligations. It is a tripartite arrangement between the transferor (cédant), the assigned party (céde) and the transferee (cessionnaire). To the extent the assigned party (céde) has given its consent, the transferor (cédant) is released from its obligations for the future.

Assignment of rights (cession de créance)

A cession de créance is available to the extent the facility has been fully drawn. Subject to any contractual restrictions, a cession de créance can be done without the consent of the debtor.

Sub-participation

A sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the buyer taking on double credit risk, both on the seller as well as the borrower.

What are the main considerations when transferring a loan and related security?

The main considerations in connection with a transfer of loan include:

• consent/notification – whether a transfer requires the consent or notification of any other parties;

• lender eligibility – whether there are any restrictions around the type of entity to which the loan can be transferred;

• undrawn commitments – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;

• confidentiality and banking secrecy – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser; and

• data protection – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser.

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

From a general point of view, infrastructure and energy infrastructure assets in France are mostly owned by the state or the relevant public entity.
Energy

The gas and electricity industries in France have been partially privatized (EDF-GDF).

Onshore wind farms, offshore wind farms and photovoltaic plants are owned by the private companies in charge of the projects, not by public entities.

The energy sector is regulated by an independent administrative authority entitled Commission de Régulation de l’Énergie (CRE).

Telecoms infrastructure

The telecommunications networks (fixed and mobile) in France are privately owned by a number of service providers (Orange, Bouygues, SFR and Free).

The telecom sector is regulated by an independent administrative authority entitled Autorité de Régulation des Communications Electroniques et des Postes (ARCEP).

Transport infrastructure

RAIL

Railway infrastructure is owned by SNCF Réseau, a public entity managing the railway infrastructure.

The railway sector is regulated by an independent administrative authority entitled Autorité de Régulation des Activités Ferrovières et Routières (ARAFER).

HIGHWAYS

Highways are owned by the state and concessions have been granted to private companies.

The highways sector is regulated by the ARAFER.

AVIATION

Airports are owned by public entities (State or local public entities), who have generally granted a concession. Concessionnaires were initially state-owned entities, but French law now provides for a progressive opening of the share capital of the concessionnaires to the private sector.

The aviation sector is regulated by the Direction Générale de l’Aviation Civile (DGAC).

Other infrastructure

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS/PRISONS)

These assets are owned by the relevant public entities in France. Generally, a contractor is in charge of the construction or the maintenance of these assets pursuant to a public-private partnership.

Are there special rules for investing in energy and infrastructure?

There is no specific regime governing or restricting investment in energy or infrastructure projects in France, subject to:

- antitrust clearance;
- prior authorization of the Minister of the Economy in case of foreign investments in activities in relation to materials, products or performance of services, including activities in relation to the safety and well-functioning of the installations and equipment, essentials to the guarantee of the country’s interest on public policy, public security or national defense (eg supplying electricity, gas or public health); and
What is the applicable procurement process?

Generally

The key principles of the public procurement are that:

- contracts procured by the public sector are awarded fairly, transparently and without discrimination on the grounds of nationality; and
- all potential bidders are treated equally.

Different forms of public procurement exist, depending on:

- the type of administrative contract (marché public or délégation de service public ou concession);
- the nature of the project (eg PPP or renewable energy project); and
- the procurement threshold.

Legal framework of the public procurement in France

Public procurement for PPP in France is mostly based on the following European directives:

- Directive n°2014/23/UE regarding concession agreements (implemented in France by ordinance n°2016-65 and decree n°2016-86); and

Public procurement for renewable energy in France is mostly based on the following texts:

- Directive n°2009/28; and
- Law n°2015-992 and its implementing decrees issued or to be issued.

Publicity of the public procurement

This legislation is complex and depends on:

- whether it is a public procurement contract or a concession; and
- some thresholds applicable to this type of procurement and contract.

Form of public procurement

For greenfield projects (ie when the asset has not been commissioned yet), the public procurement is complex.

For public procurement contracts:

- below a certain threshold there is an adapted bidding process (marché à procédure adaptée) in which the public entity determines freely the modalities of the procedure; or
- above a certain threshold there is formalised procedure (procédure formalisée) in which the public entity shall run one of the following procedures:
  - tender process (appel d'offres), which may be opened (ie any bidder may apply) or restricted (ie a few bidders may apply);
  - competitive procedure with negotiation (procédure concurrentielle avec négociation) in which the public entity may negotiate the
conditions of the public procurement contracts with one or several bidders, after receipt of the initial offer;

- negotiated procedure with prior call of competition (procédure négociée avec mise en concurrence préalable) in which the public entity may negotiate the conditions of the public procurement contracts with one or several bidders, before receipt of the initial offer; or

- competitive dialogue (dialogue compétitif) in which the public entity cannot set out the technical, financial or legal means for the project.

For concession agreements:

- the public entity freely organizes the procurement procedure;

- the minimal procedural guarantees (garanties procédurales minimales) shall be complied with by the public entity for any concession agreements; and

- in addition to the common rules set out for the concession agreements, sectoral rules (for example in relation to hydroelectric, highway or ski lift concession) and specific rules depending on the amount of the concession agreement or its purposes shall apply.

For renewable energy (for example), in the offshore wind, onshore wind and photovoltaic sectors, a tender process shall be complied with for projects exceeding a certain threshold.

For a brownfield investment (ie when the asset has already been commissioned), contractual mechanisms inserted in the public contract (or in the relevant finance documents) control the shareholding structure of the special purpose vehicle (SPV).

Financing in the context of a public procurement

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. In any case, size and costs of the debt financing play an important role in the decision of the awarding public entity.

What are the most common forms of funding / investing in energy and infrastructure?

The principal forms of private sector funding/investment in energy and infrastructure in France (including in relation to public-private partnerships) are:

Funding

Common forms of funding in energy and infrastructure include:

- loans made on a project-finance basis (to a special purpose project company) without any recourse against the shareholders of the special purpose vehicle (SPV) (these loans are generally a bridge loan for the construction and VAT, and at the commissioning, a refinancing loan in order to reduce the financing costs (as the asset has been delivered));

- projects bonds in the context of a refinancing;

- mezzanine debt provided by funds to the holding company of the SPV; and

- asset financing (which is particularly relevant in the rail, aviation and maritime sector).

The European Investment Bank is very active in telecom and infrastructure from a general point of view, while export credit agencies are more focused on assets (such as aircraft or ships).

Distressed funds may also acquire some debt participation through one of the mechanisms described in Loan transfers and portfolio sales. In addition, French law has recently authorized certain kind of funds to lend directly to borrowers (professional private equity fund (FPCI), private equity funds (FPS and SLP), financing entities, which includes securitisation entities and specialised financing entities (OFS and SFS).

Investing
Common forms of investing in energy and infrastructure include:

- equity participation in the SPV, shares, convertible bonds etc; and
- shareholders loans (subordinated to the rights of the lenders in the context of a project financing).

It is specified that a private entity and a public entity may own some companies operating an asset in certain areas, called sociétés d'économie mixte.

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

When the Prudential and Resolution Supervisory Authority (Autorité de contrôle prudentiel et de résolution) (ACPR) or the Financial Markets Authority (Autorité des Marchés Financiers) (AMF) considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

What regulatory penalties may apply?

When a rule breach has taken place, the Prudential and Resolution Supervisory Authority (Autorité de contrôle prudentiel et de résolution) (ACPR) or the Financial Markets Authority (Autorité des Marchés Financiers) (AMF) may impose a penalty (up to EUR100 million or to 10% of net annual turnover for legal persons, and EUR 5 million or tenfold the amount of the benefit derived from the breach for natural persons for the ACPR, and up to EUR 100 million or to 10 times any profit earned for professional under AMF supervision or up to EUR 300,000 or to 5 times any profit earned for individual acting under the authority or on behalf of a professional, for the AMF) or censure, or withdraw regulated status (on a temporary or definitive basis) against the firm and/or regulated individuals. Regulators may also require inter alia the compulsory resignation of the regulated entities directors. The regulator will publicize these penalties.

The ECB has competence to pronounce sanctions as well against French entities subject to its direct supervision.

What criminal penalties may apply?

Following formal judicial proceedings, French courts have powers to impose criminal penalties in certain cases, including:

- insider dealing and misleading statements and practices;
- breaches of the Money Laundering Regulations;
- conducting regulated activities when not authorized; or
- any other breach of applicable rule such as prudential, good conduct rules, etc.

Tax

Tax issues
**Are stamp, registration, transfer or other similar taxes applicable?**

**Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?**

No stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan, unless the parties voluntarily register the agreement in relation to the loan before the French tax authorities. In this case, the registration fee amounts to €125.

**Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?**

The constitution of a conventional mortgage (hypothèque conventionnelle) over real estate must be entered into by notarial deed and executed in front of a French public notary. It gives rise to (i) notary fees and (ii) land registration tax (taxe de publicité foncière) at a global rate of 0.71498% calculated on the amount guaranteed by the mortgage plus a real estate contribution (contribution de sécurité immobilière) at a rate of 0.05% calculated on the amount guaranteed.

The assignment of the beneficiary right under a conventional mortgage (subrogation d'hypothèque) gives rise to (i) notary fees and (ii) a real estate contribution (contribution de sécurité immobilière) at a rate of 0.05% calculated on the amount of the assigned mortgage.

Under French law, the question as to whether the taking or the transfer of a security interest must be registered is dependent on the type of security. Certain security interests (e.g., a pledge over ongoing business assets or share pledge with respect to shares in civil companies) must be registered in a special registry kept by the clerk of the commercial court (Tribunal de commerce) and are subject to registration fees. In any case, the parties may voluntarily register the agreement in relation to the taking or the transfer/assignment of security before the French tax authorities. In this case, the registration fee amounts to €125.

**Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g., a bond)?**

No stamp, registration, transfer or other similar taxes are payable on the issue, transfer or assignment of a debt security (e.g., a bond), unless the parties voluntarily register the agreement in relation to the debt security before the French tax authorities. In this case, the registration fee amounts to €125.

**Do tax authorities take priority on enforcement?**

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g., secured bond holders)?

The French Public Treasury has a general privilege to ensure the collection of the main taxes (e.g., corporation tax and value added tax).

Determining the ranking between the French Public Treasury and secured lenders or secured debt security holders is a complex issue. Indeed, rules regarding priority on enforcement vary depending on the type of security, the creditor and the situation of the debtor (insolvent or not insolvent).

In insolvency cases, for example, French insolvency law provides for a set waterfall of payments for unsecured assets (sale of assets or business within the frame of safeguard, receivership, or liquidation proceedings) that is as follows:

- the employees’ super priority (wages and paid holidays due to employees for the last 60 days preceding the opening of the insolvency proceedings);
- court expenses and legal professional fees;
- new money facilities granted during conciliation proceedings;
- claims arising after the opening of the insolvency proceedings to the benefit of the proceedings (including taxes arising after the
opening of the proceedings);

- claims secured by real property or by a security interest including a right of retention or pledge on professional machinery and equipment (including any tax claim that have been converted into a security on real estate or machinery);
- other privileged or secured pre-judgment claims; and
- other pre-opening unsecured claims.

The secured lenders take priority over other creditors on any sale of collateral over which their security has been taken (it has to be noted that tax claims can be converted into security before the opening of the proceedings and therefore the tax authorities could be treated as a secured creditor).

In conclusion, the position of the tax authorities compared to secured lenders and secured debt security holders in the context of insolvency proceedings depends on the nature of the tax claim and whether or not the tax claim has been converted into security with collateral before the opening of the insolvency proceedings.

**Is withholding tax on interest payments applicable?**

**Is there withholding tax on interest payments under a loan?**

As a general rule, no withholding tax is levied on French source interest payments, except in cases where:

- interest is paid to a beneficiary or to an account, located in a non-cooperative state or territory (NCST); or
- the interest payment is not deductible for the debtor by virtue of the application of the French rules which in some cases may limit the deduction of interest to the maximum legal interest rate provided for by Article 39.1.3° of the French tax code. In these cases, the non-deductible interest is reclassified as a deemed dividend subject to dividend withholding tax.

If so:

**What is the rate of withholding?**

Interest paid under a loan by a French entity to a beneficiary located in a NCST or to an account located in a NCST may be subject to withholding tax at a rate of 75%, unless the recipient is able to prove that the payments do not have a tax avoidance motive.

The standard withholding tax rate on dividends is currently 30% (to be progressively reduced down to 25% in 2022). This rate applies to deemed dividends (see above). The rate may be reduced or the withholding tax eliminated under an applicable double tax treaty.

**What are the key exemptions?**

There is generally no withholding tax on interest, except for the specific circumstances described above.

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes.

**Are foreign lenders and debt security holders subject to tax on interest payments?**

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.
Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

German debt securities are predominantly bearer bonds. Issuing bearer bonds does not require any permission and, in particular, does not constitute deposit taking. Raising moneys on the basis of German law registered bonds (Namensschuldverschreibungen) may constitute deposit taking and may require a banking license.

What are common issuing methods and types of debt securities?

Debt securities are issued either directly or through underwriters purchasing the securities and distributing them to investors. Debt securities may be issued on a stand-alone basis or under a program.

Types of securities include corporate bonds, hybrid bonds (for rating or regulatory capital purposes), convertibles, exchangeables, high yield bonds and a large variety of structured notes (including warrants).

What are the differences between offering debt securities to institutional / professional or other investors?

The issuance of unlisted notes to professional investors does not trigger a prospectus requirement while public offers of unlisted notes to retail investors requires the publication of a prospectus. Prospectuses for retail offers are typically based on a special format (the German retail format) containing integrated or consolidated German language terms and conditions.

When is it necessary to prepare a prospectus?

It is necessary to prepare a prospectus in the case of non-exempted public offers and listings.

What are the main exchanges available?
The main securities exchange is the Frankfurt Securities Exchange operated by Deutsche Börse AG. The Stuttgart stock exchange is important for structured notes.

Is there a private placement market?

There is a very active private placement market. Debt instruments in this market are primarily German law Schuldscheine (debt certificates) and German law registered notes (Namensschuldverschreibungen).

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

There are no unusual jurisdiction-specific legal risks.

Investing in debt securities

There are no unusual jurisdiction-specific legal risks.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Establishing a fund is regulated under the German Capital Investment Code (Kapitalanlagegesetzbuch – KAGB).

What are common fund structures?

Common form of funds include:

- Undertakings for Collective Investments in Transferrable Securities (UCITS); and
- Alternative Investment Funds (AIFs).

What are the differences between offering fund securities to professional / institutional or other investors?

A different set of rules apply under the German Capital Investment Code (Kapitalanlagegesetzbuch – KAGB) depending on whether you are marketing funds to retail investors or to professional/semi-professional investors. For all types of investors the marketing of a fund must be notified to and approved by the Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht (BaFin)). When marketing to retail investors the fund managers generally need to provide the retail investor with more comprehensive information regarding the fund. There are specific rules as to the protection of retail investors, such as the right of revocation in certain scenarios.
Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

Establishing a fund is regulated under the German Capital Investment Code (Kapitalanlagegesetzbuch – KAGB). Managing investments is a regulated activity under the KAGB and therefore subject to authorization – pursuant to Section 339 KAGB providing the services of a fund manager without being authorized is a criminal offence punishable by imprisonment of up to five years.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Yes. The marketing must comply with the detailed marketing rules set out in the German Capital Investment Code (Kapitalanlagegesetzbuch – KAGB). Generally, there are different rules with regard to the marketing of funds depending in particular on the type of fund, the type of investors and the domicile of the fund/fund manager.

Are there any restrictions on managing a fund?

Yes. Alternative Investment Fund Managers (AIFMs) managers of Undertakings for Collective Investments in Transferable Securities (UCITS) are subject to regulation under the Capital Investment Code and must generally be authorized by the Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht – BaFin).

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

Yes. Derivatives contracts are considered financial instruments under the German Banking Act (Kreditwesengesetz – KWG). Any person dealing in financial instruments can be subject to prior authorization by the Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht (BaFin)) if such activity qualifies as banking business or a financial service.

The European Market Infrastructure Regulation (EMIR) generally applies to 'over-the-counter' derivative transactions (OTC-transactions) and requires that certain transactions are to be reported to the regulators and for transactions between counterparties to be cleared. Please note: The reporting obligation under Article 9 EMIR applies to all derivative transactions, regardless of whether the transaction is an OTC-transaction or a transaction carried out on an exchange venue.

What are common types of derivatives?

Types of derivative contracts that are used in Germany include, among others:

- forwards;
• futures;
• swaps (such as interest rate or currency swaps); and
• options (call options and put options).
borrower’s note (i.e. Schuldschein) as documentary evidence of the loan debt is usually issued. Schuldscheindarlehen are exempt from the obligation to publish a prospectus under European prospectus law. They enable borrowers to gain access to institutional capital markets investors that usually cannot be reached via other bank financings. See the LMA Schuldschein Product Guide published by the Loan Market Association (LMA) for more information.

Loan durations

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Loan security

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

Loan commitment

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

Loan repayment

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

What are the differences between lending to institutional / professional or other borrowers?

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

By contrast, lending to consumers is a regulated activity and subject to special requirements for consumer credit agreements pursuant to section 491 et seq. of the German Civil Code (Bürgerliches Gesetzbuch – BGB), regarding, for example, the written form, minimum content, information obligations of the lender and right of withdrawal of the borrower.

Do the laws recognize the principles of agency and trusts?

The principle of agency is recognized under German law. For instance, it is possible to appoint an agent to act on behalf of other parties.

The English common law concept of trust is not recognized as a matter of German law. However, the same effect of a trust is achieved through the use of a similar German law legal instrument, namely a Treuhand which creates a contractual fiduciary relationship. Hence, in a finance transaction the security can be held by a security agent for the benefit of the secured parties as trustee under German law (Sicherheitentreuhänder) on similar conditions as a English common law trust. Particular provisions are required with respect to accessory security interests. (For more information, see Giving and taking guarantees and security.) Please note that, in order to minimize insolvency
risks, the payment streams have to be checked on a case-by-case basis as the German Sicherungstreuhand does not, in contrast to an English common law trust, create a separate legal estate.

Are there any notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual principles, such as:

- the general civil law principle of good faith (Treu und Glauben);
- the general civil law principle prohibiting violation of good morals (gute Sitten);
- usury (Wucher); and
- the prohibition of compound interest (Zinseszinsverbot) under German law.

Standard form documentation

Most German law syndicated finance transactions are governed by documentation based on the German law versions of the recommended forms published by the Loan Market Association (LMA) in the English language. Bilateral finance transactions are more likely to be documented on bank standard form documentation prepared in-house in German language. Sometimes, the standard documentation developed by the Association of German Banks (Bundesverband der deutschen Banken) is used.

Are there any notable risks or issues around borrowing?

Borrowers should be aware of the potential implications of the EU's Bank Recovery and Resolution Directive (BRRD), which outlines certain measures for dealing with failing financial institutions.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to 'bail in' obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. 'Bail in' describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of English or other EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the giving of guarantees and security are as follows.

Insolvency

Under German insolvency laws the fulfilment of a debt, the granting of collateral or enabling a counterparty to obtain such fulfilment or collateral may be contested by the insolvency administrator if the guarantee or security was granted by a company within certain periods of time (suspect periods) prior to the filing of insolvency proceedings against such company. This would be the case if, for example, the granting of collateral was made during the three months prior to the request to open insolvency proceedings, the company was illiquid on the date of the transaction, or the creditor was aware of his insolvency on this date (section 130 of the German Insolvency Act (}
Awareness of circumstances indicating insolvency or to a request to open insolvency proceedings are deemed equivalent to awareness of insolvency or of the request to open insolvency proceedings. Guarantees and security may also be challenged on other grounds relating to insolvency. Outside of insolvency proceedings, transactions and payments of the company may be contested by creditors under the Avoidance of Transactions Act (Gesetz über die Anfechtung von Rechtshandlungen eines Schuldners außerhalb des Insolvenzverfahrens – AnG) which provides rights to creditors similar to those of an insolvency administrator in insolvency proceedings.

Financial assistance/upstream security

Pursuant to German statutory law on capital maintenance requirements, a limited liability company (Gesellschaft mit beschränkter Haftung – GmbH) may, in general terms, only grant upstream security to its shareholders to the extent it has free reserves in its balance sheet. Free reserves are roughly equal to the total assets minus total liabilities and provisions, minus stated share capital. The principle also applies to the general partner in a partnership in the form of a GmbH and Co. KG. A stock corporation (Aktiengesellschaft – AG) may not grant upstream security at all. Exemptions apply under domination and profit transfer agreements and to payments which are covered by a full claim to counterperformance or restitution against the shareholder. In order to achieve compliance with the relevant statutory law, so called 'limitation language' has to be introduced in the relevant finance documentation.

Accessory security interests

Accessory security interests that depend on the existence of the underlying secured claim, such as guarantees and pledges must be granted to and held by each secured creditor and are automatically terminated and released by operation of mandatory German law upon satisfaction of the underlying secured claim. This can be an issue in certain cases, for example syndicated loans or, in case of the transfer of a lender’s rights and obligations under a loan agreement, by way of novation. For such cases parallel debt structures have been established by the market.

Parallel debt structure

Non-accessory security interests (that exist irrespective of a secured claim, such as security assignment, security transfer or land charge) can be held by a security agent for the benefit of the secured parties as trustee under German law (Sicherheitentreuhänder). For more information, see Lending and borrowing.

With respect to accessory security interests, such as guarantees and pledges, the standard technique used for sharing security between various creditors under syndicated loans is by the use of a parallel debt structure. With this structure, a second claim is created for the benefit of the security agent as an abstract acknowledgment of debt in the amount of the original payment obligations under the loan agreement (Parallel Debt). As the creditor of the Parallel Debt, the security agent can then hold and administer the accessory security. Provisions in an inter-creditor agreement or collateral agency agreement usually stipulate that the security agent acts on the instructions of the other secured parties. Please note that, although the Parallel Debt structure is commonly used in the market and generally accepted in German legal doctrine, its validity has never been tested by the German courts.

Floating charges

The concept of a floating charge is not recognized as a matter of German law.

What are common types of guarantees and security?

Common forms of guarantees

Guarantees may take the form of a performance guarantee or a payment guarantee. The most common form in finance transactions is the payment guarantee.

German law further distinguishes between an accessory guarantee and an independent (non-accessory) guarantee, such as payment guarantees upon first demand. German courts held that, to be valid, a guarantee upon first demand needs to be granted by a guarantor experienced in international transactions and familiar with guarantees upon first demand. This is due to the fact that a guarantor giving a guarantee upon first demand has only limited defenses, for example the objection of abuse of law. In contrast, a guarantor who gives an accessory guarantee may rely on the defenses to which the principal debtor is entitled.
Common forms of security

The security package which is granted for financings mainly depends on the financed asset and the specific transaction. Typically, the following security interests are requested by the lenders:

SHARE/INTEREST PLEDGE

A pledge of shares in a German limited liability company (Gesellschaft mit beschränkter Haftung – GmbH) requires notarization whereas a pledge over interests in a limited partnership (Kommanditgesellschaft – KG) can be entered into in simple written form. A pledge over shares in a stock corporation (Aktiengesellschaft – AG) may also be completed without observing specific formalities; only the share certificates issued for the relevant shares need to be transferred to the pledgee. The notification of the relevant company/partnership is not required for the perfection of the security. However, the articles of association of a company may provide for the requirement of the company's approval. As an accessory security interest, the share/interest pledge must be granted to and held by each secured creditor. Therefore, a parallel debt structure is usually implemented in syndicated financings. For more information, see Lending and borrowing.

BANK ACCOUNT PLEDGE

The notification of the account bank is required for the perfection of the security. The account bank usually has a first ranking pledge pursuant to its general business terms; if the lending bank wishes to obtain a first ranking security, the account bank then may be asked to waive/subordinate its rights pursuant to its general business terms. Security must be granted to and held by each secured creditor. Therefore, a parallel debt structure is usually introduced in syndicated financings. For more information, see Lending and borrowing.

SECURITY ASSIGNMENT OF RECEIVABLES AND CLAIMS

Unless disclosed to the debtors of the assigned receivables (third party debtors), the debtor may continue to pay with discharging effect to the assignor. The notification of the assignment is no perfection requirement, but common where there are only a small number of third party debtors (eg with respect to claims under insurance agreements).

SECURITY TRANSFER OF MOVEABLE ASSETS (SUCH AS INVENTORY AND EQUIPMENT)

It is very important to describe the assets precisely, for example by using maps or serial numbers, in order to ensure their determinability when acquired (particularly in relation to future assets) or enforced. Typically, the specification of transferred assets is done by a combination of describing the area where the assets are located and by delivery of a list of the relevant assets. If the assets are fixtures (ie they relate to the relevant premises in such a way that they cannot be legally separated from the premises) then land security should be obtained.

MORTGAGE OR LAND CHARGE OVER LAND AND BUILDINGS

A mortgage or land charge must be created by notarized deed. In addition, the registration of the mortgage or land charge in the relevant land register (Grundbuch) is required for its effectiveness. The notary and registration fees depend on the nominal amount and may be significant.

Last modified 20 Oct 2017

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

In order to be valid, a guarantee upon first demand must be granted by a guarantor experienced in international transactions and familiar with guarantees upon first demand. This is because the guarantor of a guarantee upon first demand has only limited defenses. For more information, see Giving and taking guarantees and security – common types.

Giving or taking security

NOTARIZATION REQUIREMENTS
The following security interests require notarization under German law:

- a pledge over shares in a German limited liability company; and
- the creation of a mortgage or land charge.

REGISTRATION REQUIREMENTS

A mortgage or land charge must be registered in the relevant land register (Grundbuch) to become valid.

INITIAL AND SUBSEQUENT OVER-COLLATERALIZATION

In case of an initial disproportionate relationship between the value of the granted security and the secured claims (initial over-collateralization), the agreement creating such security may be invalid. If, after the conclusion of the agreement (subsequent over-collateralization), the value of the security exceeds 110% of the secured claims, the grantor may have a claim for release of the excess security.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

- German Banking Act (Kreditwesengesetz – KWG)
- Securities Trading Act (Wertpapierhandelsgesetz – WpHG)
- Payment Services Supervision Act (Zahlungsdienstaufsichtsgesetz – ZAG)

Consumer credit

- German Civil Code (Bürgerliches Gesetzbuch – BGB)
- Introductory Act to the Civil Code (Einführungsgesetz zum Bürgerlichen Gesetzbuche – EGBGB)

Mortgages

- German Civil Code (Bürgerliches Gesetzbuch – BGB)

Corporations

- Stock Corporation Act (Aktiengesetz – AktG)
- Limited Liability Companies Act (Gesetz betreffend die Gesellschaften mit beschränkter Haftung – GmbHG)
- Commercial Code (Handelsgesetzbuch – HGB)

Funds and platforms

- German Capital Investment Code (Kapitalanlagegesetzbuch – KAGB)

Other key market legislation

- Bank Recovery and Resolution Directive (2014/59/EU) (recovery and resolution)
- Capital Requirements Regulation (Regulation (EU) 575/2013) (capital requirements)
- European Market Infrastructure Regulation (Regulation (EU) 648/2012) (derivatives)
Regulatory authorization

Who are the regulators?

The Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht – (BaFin)) and the Deutsche Bundesbank share banking supervision in Germany.

Pursuant to Section 6 para 1 of the German Banking Act (Kreditwesengesetz (KWG)), BaFin is the administrative authority responsible for the supervision of institutions under the Banking Act. The cooperation between BaFin and the Deutsche Bundesbank is governed by Section 7 of the German Banking Act (Kreditwesengesetz (KWG)), which stipulates that, among other things, the Deutsche Bundesbank shall, as part of the ongoing supervision process, analyze the reports and returns that institutions have to submit on a regular basis and assess whether their capital and risk management procedures are adequate.

What are the authorization requirements and process?

A firm must apply for authorization to the Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht – (BaFin)). The BaFin will assess whether a firm meets the requirements set out in the German Banking Act (Kreditwesengesetz – KWG) including, for example capital requirements and organizational requirements.

The BaFin must assess the application within a period of six months from the submission of the complete application for authorization.

What are the main ongoing compliance requirements?

Threshold conditions, such as having adequate financial resources and compliance arrangements in place, are an ongoing compliance requirement for authorized firms.

Failure to comply with the threshold conditions and more detailed regulatory rules may result in sanctions for firms and regulated individuals, and loss of regulated status.

What are the penalties for failure to be authorized?

A person undertaking a regulated activity without being authorized or exempt, commits a criminal offence and is liable to imprisonment of up to five years.

Regulated activities

What finance and investment activities require authorization?

Generally

A person must not carry on a regulated activity in Germany unless authorized or exempt.
A financial activity generally requires regulatory authorization when it either qualifies as banking business (e.g., deposit-taking business) or the provision of financial services (e.g., the provision of investment advice).

**Consumer credit**

Credit business generally qualifies as licensable banking business and requires prior authorization by the Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht – BaFin).

*Last modified 20 Oct 2017*

**Are there any possible exemptions?**

Activities that are otherwise regulated may be undertaken without authorization if general or specific exemptions are available.

**General exclusions**

Certain persons may carry on a regulated activity without being authorized if they are granted an exemption granted by the Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht (BaFin)).

**Specific exclusions**

For certain types of regulated activities specific exemptions can apply, for example:

- for undertakings whose sole financial service within the meaning of section 1 para 1a sentence 2 of the German Banking Act (Kreditwesengesetz – KWG) comprises carrying out financial leasing activities, if they act only as an asset-leasing vehicle for a single leased asset, do not make their own business policy decisions and are managed by an institution domiciled in an EEA state which is authorized to conduct financial leasing operations under the laws of the home member state; and

- for undertakings whose sole financial service within the meaning of section 1 (1a) sentence 2 of the German Banking Act (Kreditwesengesetz – KWG) is dealing in foreign notes and coins, unless their principal activity is foreign currency dealing.

*Last modified 20 Oct 2017*

**Do any exchange controls or other restrictions on payments apply?**

Compliance with the Foreign Trade and Payments Ordinance (Außenwirtschaftsverordnung – AWV) must be ensured.

Where money is being transferred from non-EU member states, imports of foreign currency may need to be declared in customs declarations.

*Last modified 20 Oct 2017*

**What are the rules around financial promotions?**

Financial promotions of banks or investment firms must comply with the rules set out in the German Banking Act (Kreditwesengesetz KWG) and the Securities Trading Act (Wertpapierhandelsgesetz – WpHG).

*Last modified 20 Oct 2017*

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

Banks and financial services providers are usually established as German entities in the form of a private company limited by shares (Gesellschaft mit beschränkter Haftung – GmbH) or a public company limited by shares (Aktiengesellschaft – AG) and, in some cases, as a...
limited liability partnership (GmbH and Co KG).

To the extent Special Purpose Vehicles are set up for a certain transaction, they are usually established as a GmbH or a GmbH and Co KG.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

Firms authorized by the Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht (BaFin)) in Germany can establish branches in Germany.

Certain firms that are authorized in other EEA-member states may rely on the European passport regime when establishing a branch in Germany.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Blockchain

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a peer-to-peer mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the block using sophisticated algorithms and add the verified block to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a 'proof of work' process.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open ('permissionless' or 'unpermissioned') or structured within a private group ('permissioned').

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an 'address'). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

Smart contracts

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called 'smart contracts'. These contracts have been converted into code and are then executed and enforced by the blockchain.
network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called 'Oracles'. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

**Artificial intelligence and robo advisory systems**

Automated financial advice tools, also known as 'robo advisers', are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters.

**Cloud computing**

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection.

**Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?**

**General financial regulatory regime**

The Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht or BaFin), and the Deutsche Bundesbank are the regulatory authorities in Germany with respect to firms providing banking or financial products and services.

A person must not carry out a regulated activity in Germany unless authorized or exempt under the German Banking Act or the Payment Services Supervision Act. Where FinTech products or applications involve any financial activity which requires regulatory authorization, the firms providing such products or applications must obtain such authorization prior to commencing their regulated business activity. Carrying out regulated activities without the necessary authorization is a criminal offence.

The BaFin has published guidance for FinTech companies, in particular as to the question of whether certain business activities (eg crowdlending, crowdinvesting or robo advice) require a license in Germany.

**Banks and financial services providers**

Any FinTech provider that either conducts banking business or provides financial services must obtain a prior written authorization under the German Banking Act.

**Regulation of payment services**

Payment services providers are regulated under the Payment Services Supervision Act and require a prior written authorization by the BaFin for carrying out payment services.

**Application of data protection and consumer laws**

FinTechs dealing with consumers must comply with all relevant consumer protection laws (eg in relation to information obligations). FinTechs must also comply with the applicable data protection legislation, in particular if they come in contact with any personal data.

**Money laundering regulations**
Generally, where a firm is authorized as either a financial institution or a payment services provider it will need to comply with the regulations on money laundering, in particular with the requirements set out in the German Money Laundering Act.

*Last modified 20 Oct 2017*

**What type of funding arrangements and incentives are available to FinTech businesses?**

There are numerous options available to FinTechs with respect to funding their businesses, including the following.

**Crowdfunding**

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

**Venture capital**

Venture capital (VC) funding is a type of equity investment usually targeted at early stage FinTech companies. VC provides an alternative to traditional lending in particular in scenarios where the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

**Bank debt**

Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**Capital markets funding**

An Initial Public Offering (IPO) can be a viable option for FinTech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange.

FinTech companies can also issue bonds to investors as a way of raising more competitive funding.

*Last modified 20 Oct 2017*

**Portfolio sales**

**Loan transfers and portfolio sales**

**What are common ways of buying and selling loans?**

Buying and selling loans is very common.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling and transferring loans are:

- **Assignment and Assumption of Contract (Vertragsübernahme)** – A Vertragsübernahme is a full legal transfer of a party's rights and obligations. It is a tripartite arrangement between the existing parties and the transferee and results in a continuation of the existing contract between the continuing party and the transferee and the transferor being released from its obligations.

- **Assignment** – An assignment is a transfer of rights only, not obligations. Subject to any contractual restrictions, assignment can be done without the consent of the debtor. Assignments may be done on a silent basis or on a disclosed basis. If disclosed, payments by the debtor to the assignee have releasing effect.
Sub-participation – A sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the buyer taking on double credit risk, both on the seller as well as the borrower.

Loan transfers are commonly documented using standard form contracts in Germany based on the Federal Association of Loan Purchase and Servicing (Bundesvereinigung Kreditankauf und Servicing e.V. – BKS) standards. For more complex transactions, a more bespoke form of sale and purchase agreement would tend to be used.

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller’s legal advisors. Some of the key considerations include:

- **Assignability** – whether the loans and security can be transferred or are subject to contractual or legal restrictions;
- **Registration of land charges** – whether land charges (if this type of security is part of the security package) are duly registered and serve the correct security purpose;
- **Parallel debt** – if the loan and security can be independently demanded by a security trustee, whether a valid parallel debt structure is in place that secures accessory security against extinguishment if transfers of the loan have to be made under a different jurisdiction’s law, for example novation under English law;
- **Confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **Data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **Lender eligibility** – whether there are any restrictions regarding the type of entity to which the loan can be transferred;
- **Undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- **Transfer mechanics** – whether there are any steps required to be taken in order to transfer the loan in accordance with its terms; and
- **Consent** – whether a transfer requires the consent or notification of any other parties.

Projects

Financing / investing in energy / infrastructure

**To what extent are energy and infrastructure assets publicly or privately owned?**

The gas and electricity industries in Germany are privatized, with the generation/production, transmission, distribution and supply provided by various private sector companies. Accordingly, relevant infrastructure assets used for generation/production, transmission and distribution are owned by private sector companies. However, at a regional level, municipal utilities (such as public law companies or private law entities in majority held by municipalities) may provide utility services under a public service mission and therefore may also own energy infrastructure assets.

Motorways and roads are almost exclusively owned by the state, either by the Federal Republic of Germany (eg the motorways), or the relevant Bundesländer, municipal entities etc. Very few roads are privately owned. The same is true for other traffic assets (tunnels etc).

The major German rail company, Deutsche Bahn, is organized as a stock exchange company, but all stock is held by the Federal Republic of Germany. Other smaller rail companies exist which are, however, private entities.
Are there special rules for investing in energy and infrastructure?

Energy and infrastructure markets in Germany are highly regulated by European and national legislation and also by decisions of the German regulatory authority, the German Federal Network Agency (Bundesnetzagentur). This especially holds true for the operation of electricity or gas networks. In particular, network operators are not entitled to freely determine tariffs for the transportation of energy but need to comply with regulatory requirements relating to tariffs (which will, however, still provide for considerable incentives for investments). Accordingly, investors will need to have a good understanding of the applicable regulatory framework and, due to regularly changes to the regulatory framework, will also need to take into account potential directions in which the market may move.

Investors will also need to be aware that energy markets are subject to a complex system of contractual arrangements between generators/producers/importers, suppliers, purchasers, network and storage operators and also the relevant person conducting balancing services for the injection of energy in the network and the withdrawal from the network. The contractual agreements in relation to network access are highly regulated and therefore will generally not leave much room for negotiation between market participants.

Furthermore, under European and national unbundling provisions effective separations of networks from activities of generation/production and supply of energy are required in order to avoid discriminatory effects. Accordingly, where an investor is already active in the area of generation/production or supply, he will only be able to invest in network facilities in compliance with strict unbundling provisions and vice versa.

Various other regulatory provisions and limitations exist for other infrastructure assets, such as telecom assets or roads.

Where essential security interests of the Federal Republic of Germany would be affected by the acquisition of the shares of a German entity or infrastructure assets, a foreign investor would also need to take into account statutory requirements under the German Federal Act on Foreign Trade (Außenwirtschaftsgesetz – AWG). In particular, such acquisition may be subject to notification requirements and the objection of German authorities.

What is the applicable procurement process?

Public procurement in Germany is governed by a variety of federal acts based on a triad of EU Directives which were modernized in 2014. On 18 April 2016, the modernized European procurement law was enacted into German law and has, in some respects, brought material changes. In relation to energy and infrastructure, the Regulation on the Award of Public Contracts (Vergabeverordnung – VgV) and the Regulation on the Award of Contracts in the field of Sectors (Sektorenverordnung – SektVO) apply. Whereas the VgV is more general in nature and therefore contains provisions for procurements not being addressed by the SektVO, the SektVO provides specific regulations for contracts in the water, electricity, energy and transportation sectors. Furthermore, there are special statutes on procurement of concessions, construction services and defense and security-related contracts.

The key principles of German procurement law are that all contracts procured by the public sector or other so-called contracting authorities are awarded fairly, transparently and without discrimination on the grounds of nationality and that all potential bidders are treated equally.

Investing in energy and infrastructure

Public procurement is relevant where a German contracting authority, such as the government or a sector entity, is seeking to outsource the delivery of a new project. For infrastructure projects, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal, which could include: design; building; operation; maintenance and financing of the relevant energy or infrastructure asset. The relevant procurement legislation applies not only to certain public bodies including central government departments and local authorities but also to various non-governmental bodies, such as private entities in the various sectors. A regulated procurement is required where certain financial thresholds are met and in most major infrastructure projects (where limited exclusions do not apply), it is likely that those thresholds will be met and therefore a regulated procurement would be necessary.

In most cases, the public sector will need to publish a contract notice in the Office Journal of the European Union (OJEU) and typically run one of the following procedures:

- Open procedure – This is suitable for easy-to-evaluate projects. Tenderers simply submit a tender in response to the OJEU notice. Change and negotiations to the tender are not permitted.
• **Restricted procedure** – There is a shortlisting of at least five tenderers following an expression of interest stage. Tenderers submit a bid. Again, no negotiation is permitted other than clarification and finalization of the contract terms.

• **Negotiated procedure with prior call for competition** – In negotiated procedures with prior call for competition, any economic operator may submit a request to participate in response to a call for competition. Only those economic operators invited by the contracting entity following its assessment of the information provided may participate in the negotiations. This is a hybrid procedure as it allows dialogue with bidders but also allows the public sector to award a contract on the basis of an initial tender (or further stages) but clarification and negotiation are not allowed following final tender.

• **Competitive dialogue** – The competitive dialogue involves a shortlisting of at least three bidders who are invited to enter into dialogue with the public sector to develop detailed solutions which are capable of being accepted by the public sector. Clarification and further negotiations are allowed following final tender but only on the basis of confirming the financial and other commitments in a tenderer’s bid.

An investor may choose, however, to seek to invest in a project (by acquiring an interest in a private sector partner) that has already been procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the originally awarded contract rather than procurement regulations themselves.

Depending on the structure of the deal, any acquisition of an interest in or variation to the existing project may have procurement-related considerations that need to be borne in mind since they might cause a new procurement procedure.

**Financing energy and infrastructure**

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, in project finance deals, a refinancing of the senior debt will require the consent of the public sector.

Last modified 20 Oct 2017

**What are the most common forms of funding / investing in energy and infrastructure?**

As various regulatory restrictions exist, investing into the equity of an energy or infrastructure project may require in depth legal regulatory advice. Beyond these particularities, funding and investing in energy and infrastructure in Germany follows the European standard:

**Funding**

Common forms of funding in energy and infrastructure include:

• loans made on a corporate finance basis (balance sheet debt);

• loans made on a project-finance basis (to a special purpose project company) on medium- to long-term bases – such loans may later be syndicated to other funders;

• bond finance (less common in Germany than in the UK, but could become more popular in the future);

• mezzanine debt (rarely seen since the financial crisis, but in theory an alternative);

• refinancing of the debt in operational projects; and

• asset financing (this is particularly relevant in the rail sector).

Following the global financial crisis, the German government has tried to expand the funding base and increase liquidity in the market by increasing the KfW funding program for renewable energy projects with a German element to them.

Funding provided by the European Investment Bank and export credit agencies is also very popular in the German market.

**Investing**

Common forms of investing in energy and infrastructure include:
• ‘equity’ investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans; and

• secondary market investment in operational projects (acquisition of ‘equity’).

Restructuring

Enforcement and sanctions

**When can there be regulatory investigations?**

The Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht – BaFin) can – without any particular reason – perform statutory audits.

**What regulatory penalties may apply?**

Failure to comply with the requirements of the German Banking Act (Kreditwesengesetz – KWG) and other regulatory rules may result in sanctions for firms and certain individuals (eg directors). The Federal Financial Supervisory Authority (Bundesanstalt für Finanzdienstleistungsaufsicht – BaFin) can also revoke a firm’s authorization.

**What criminal penalties may apply?**

A person undertaking a regulated activity without being authorized or exempt, commits a criminal offence and is liable to imprisonment of up to five years.

There are further criminal penalties, eg for market abuse and for money laundering.

Tax

Tax issues

**Are stamp, registration, transfer or other similar taxes applicable?**

**Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?**

There are no stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan.

**Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?**

There are no stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security.

**Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or...**
assignment of a debt security (eg a bond)?

There are no stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security.

Last modified 20 Oct 2017

**Do tax authorities take priority on enforcement?**

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

The German tax authorities do not take priority over secured lenders or secured debt security holders on enforcement of security.

Last modified 20 Oct 2017

**Is withholding tax on interest payments applicable?**

Is there withholding tax on interest payments under a loan?

Provided that the borrower is not a bank or financial services provider, generally no withholding tax will be levied. Withholding tax may, however, apply in the case of a loan that qualifies as profit participating. Generally, a loan qualifies as profit participating if either the claim for interest generally, or its amount, depends on the profitability of the borrower's business or specific parts thereof.

If so:

What is the rate of withholding?

Where applicable, the rate of withholding is 25%.

What are the key exemptions?

Most German double tax treaties allocate the taxing rights on interest to the contracting state in which the lender resides, which means that, in most cases, there is a full exemption from German withholding tax. Otherwise, most German double tax treaties limit Germany's taxing rights to a withholding tax rate of 10%.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Last modified 20 Oct 2017

**Are foreign lenders and debt security holders subject to tax on interest payments?**

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding tax (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

A lender which is not resident in Germany would only be subject to tax in Germany to the extent it receives German source income. German source income in this regard only includes interest paid on a:

- loan secured by real estate located in Germany or ships registered in a German register; and
- profit-participating loan.

Therefore, a lender which is not resident in Germany, would not be taxed on 'plain vanilla' interest income in Germany.
It should also be noted in this regard that most German double tax treaties exclude a German taxing right on interest payable or paid to a lender resident in the other contracting state (meaning that there is full exemption), and otherwise, most German double tax treaties limit Germany’s taxing right to 10% withholding tax.

**Would the same analysis apply to interest payments under a debt security (e.g. a bond)?**

Interest paid on a bond is generally not included in German source income. It is, however, included in German source income if:

- the bond is not held in a securities deposit account at the financial services provider paying out the interest; and
- the interest is paid on presentation of the respective interest coupon either in cash or by crediting such amount to an account of a person or entity that is not a bank or a financial services provider.

It should also be noted in this regard that most German double tax treaties exclude a German taxing right on interest paid or payable to a person resident in the other contracting state (meaning there is full exemption). Otherwise, most German double tax treaties limit Germany's taxing right to a withholding tax rate of 10%.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

Under the Companies Act, 2019 (Act 992), companies may issue shares or debentures. Debentures may be in the form of individual loans or debenture stock representing units of debt issued to separate holders. Debentures are transferable without restrictions unless express provision is made to the contrary.

The business of arranging or underwriting the issuance of debt securities is carried out by licensed market operators such as issuing houses and broker-dealers.

Only public companies as defined in the Companies Act are permitted to make an invitation to the public to acquire shares or debentures. Such an invitation requires the issuance of a prospectus. It is usual, though not mandatory, for debt securities issued through invitations to the public to be listed on the Ghana Fixed Income Market which is part of the Ghana Stock Exchange.

More than 90% of listed debt securities are issued by government (i.e. central government or the central bank).

Government borrowing is subject to constitutional provisions and the provisions of the Public Finance Management Act, 2016 (Act 921). Pursuant to the Act, government debt securities are issued within the framework of a published medium-term debt management strategy and annual borrowing program.

External Issuance

Beyond the domestic markets, the government issues Eurobonds from time to time. In the last few years there has tended to be one Eurobond issue each year. Private companies may also issue debt securities externally.

What are common issuing methods and types of debt securities?

Issuing methods

Private: broker-dealers may underwrite debt securities for an issuer; issuing houses are in the business of arranging or underwriting the issue of securities.

Public: auctions, book-building; auctions are conducted by central bank – weekly for treasury bills and less frequently for other government securities.
Publicly issued debt may be listed on the stock exchange. There is also provision for listing of debt on the stock exchange without a public issue. A trust deed approved by the Securities Exchange Commission is required for listing non-government debt securities.

**Types**

Government securities include treasury bills, treasury notes, and bonds.

Short-term instruments include two-week, 91-day, 182-day, and 364-day bills. Two- to three-year notes are also issued periodically. There is currently an effort to shift towards three- to seven-year maturities. A small number of 10-year and 15-year bonds have been issued.

Listed corporate bonds have often been issued under medium-term note programs. Most listings have been by financial institutions or real estate companies. State-owned entities such as the Ghana Cocoa Board and Produce Buying Limited, and most recently a state-owned special purpose vehicle E.S.L.A. plc have issued in the corporate bond market.

Commercial paper is defined in the SEC Guidelines as having a fixed maturity ranging from 15 to 270 days.

Supra nationals and statutory bodies including local governments have been identified as potential issuers of listed debt securities but so far, they have issued none in the Ghanaian markets.

---

**What are the differences between offering debt securities to institutional / professional or other investors?**

Only primary dealers are eligible to participate in Bank of Ghana auctions.

Trading on the GFIM is limited to authorized dealers. Investors must therefore buy and sell listed securities through brokers.

---

**When is it necessary to prepare a prospectus?**

Every invitation to the public by a private (i.e. non-government) issuer or by a statutory body (e.g. a local government entity) requires a prospectus. There are circumstances where a statement in lieu of prospectus is acceptable and in the case of a restricted invitation, a short form prospectus may be sufficient.

---

**What are the main exchanges available?**

---

**Is there a private placement market?**

Yes, licensed broker-dealers, issuing houses etc. can enter into underwriting agreements and offer securities to their clients.

---

**Are there any other notable risks or issues around issuing or investing in debt securities?**

Currency risk – domestic debt issues open to non-resident investors are denominated in GHS and therefore subject to exchange rate risk.
Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

The Securities Industry Act, 2016 (Act 929) sets out rules for the establishment of funds under the regulatory authority of the Securities and Exchange Commission.

These include requirements for a license to operate, appointment of trustee, manager and custodian, minimum capital and approval of prospectus by the Securities and Exchange Commission.

Hedge funds, private equity funds, venture capital funds, and collective investment schemes (mutual funds and unit trusts) all require a license from the Securities Exchange Commission as is also the case for fund managers, trustees, and custodians.

Specific provisions of the Securities Industry Act together with the Unit Trusts and Mutual Funds Regulations, 2001 (LI 1695) establish the regime governing the establishment and operation of mutual funds and units trusts.

Pension fund trustees require a license from the National Pensions Regulatory Authority established under the National Pensions Act, 2008 (Act 766). Trustees must be trust companies set up solely for that purpose; pension fund managers must be registered with the National Pensions Regulatory Authority.

What are common fund structures?

Collective investment schemes make up a substantial proportion of funds.

There has been a significant growth of pension funds since the enactment of the National Pensions Act, 2008 mandating that a part of pension contributions be paid into privately managed pension funds.

What are the differences between offering fund securities to professional / institutional or other investors?

The identified sources of funds for management include individuals, institutions, provident funds and welfare funds, collective investment schemes, endowments and foundations and pension funds.

Collective investment schemes designed to be offered to the general public including the retail investor are subject to elaborate and detailed regulation.

Pension funds are subject to an elaborate regulatory regime under the pension legislation.

Funds marketed to private high-net-worth clients or to professional or institutional investors are not subject to the elaborate regime for collective investment schemes under LI 1695.

Are there any other notable risks or issues around establishing and investing in funds?

The Securities and Exchange Commission has published a circular indicating permissible investments for fund managers.

Permissible capital markets instruments include local equity (listed and unlisted); foreign equity (listed); local bonds (listed and unlisted); foreign bonds (listed); preference shares; venture funds; mutual funds and unit trusts; notes (more than one year); others (as may be permitted by law).

Permitted money market instruments include fixed deposits issued by financial institutions regulated under the banking legislation; commercial paper issued pursuant to the Securities Exchange Commission’s Guidelines and treasury bills.
There are also provisions under the pensions legislation and guidelines issued by the National Pensions Regulatory Authority which prescribe the classes of assets permitted for pension fund investments as well as limits for different classes of assets and prohibitions on certain types of investments and transactions by pension funds.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

An advertisement for the marketing of a fund generally may only be made by a person licensed or authorized by the Securities and Exchange Commission. It must not be unclear, false or misleading and must comply with the Security and Exchange Commission Regulations, 2003 (LI 1728).

In relation to mutual funds and unit trusts, an invitation to the public to acquire shares or units is prohibited without a license from the Securities and Exchange Commission. The advertisement must be approved in writing by the trustee of the unit trust or board of directors of the mutual fund by a duly passed resolution and reproduce the approved scheme particulars or, where applicable, indicate where the scheme particulars may be obtained and the most recently published issue, sale, and repurchase or redemption price of an interest. An advertisement must also include a statement that an investor's right to redeem the investor's interests in certain circumstances may be suspended by the Securities and Exchange Commission. LI 1695 sets out additional details to be provided with regards to any investment plan advertised.

Are there any restrictions on managing a fund?

The Securities Industry Act, 2016 (Act 929) together with the Unit Trust and Mutual Funds Regulations, 2001 (LI 1695) prescribe the rules for the management of funds, and in particular, unit trusts and mutual funds.

Under Act 929 generally, a fund manager must:

- be licensed by the Securities and Exchange Commission;
- maintain a register of securities in respect of which it has an interests and notify the Securities and Exchange Commission where that register is kept;
- in any written communication in which it recommends any securities, disclose any interest it may have in any of the securities recommended;
- not give unsecured credit to anyone to purchase securities or in the knowledge that the unsecured credit will be used to purchase securities;
- operate in a manner that would ensure compliance with the Anti-Money Laundering Act, 2008 (Act 749) and Anti-Terrorism Act; and
- comply with the rules on trading in securities, including insider dealing and fraudulent practices in the sale and purchase of securities.

Additionally, for unit trusts and mutual funds, the manager must be a company incorporated in Ghana and have at least three directors. They must:

- have the minimum issued and paid up capital mandated by the Securities and Exchange Commission;
- not participate in prohibited transactions involving the lending or borrowing of money on behalf of the fund under Act 929;
- comply with the prescribed investment regime provided in Act 929, including the limitation on investments in securities in which the officers of the fund have an interest;
- submit half yearly and yearly investors' reports to holders of interests on the performance of their schemes; and
- obtain the prior approval of the Securities and Exchange Activities to engage in manager's own account transactions or investments in other collective investment schemes not licensed under Act 929.
Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

There are no generally applicable restrictions on derivatives. There is little in Ghanaian finance legislation specifically addressing derivatives contracts.

Authorization to enter into derivatives transactions is therefore entity-specific to be determined from the entity's corporate powers, and any mandatory regulatory provisions to which an entity may be subject.

With regard to the government, the Public Financial Management Act, 2016 (Act 921) provides that the government can engage in derivatives transactions as part of its debt management strategy.

The central bank uses derivative financial instruments such as forward currency contracts to hedge its foreign currency risks, interest rate risks and commodity price risks.

Statutory corporations may be authorized to enter into derivatives contracts to the extent that their enabling statutes give them such authority.

Local authorities appear to be restricted to “safe securities,” which is yet to be authoritatively interpreted but could be interpreted to exclude derivatives.

The central bank says that there are no restrictions as such on banks undertaking derivatives transactions but requires that they report these transactions.

There is currently no exchange that trades derivatives.

What are common types of derivatives?

Forward contracts, interest rate swaps, currency swaps and options.

Are there any other notable risks or issues around entering into derivatives contracts?

Legal risk

Legislative provisions on netting remain untested. There is no case law interpreting these provisions. There is as yet no ISDA legal opinion on netting or on collateral. There are elements in the corporate insolvency law regime which leave room for some uncertainty.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Requirement for license
Banks and specialized deposit-taking institutions and non-bank financial institutions require a license from the Bank of Ghana to carry on the business of lending.

**Banks and specialized deposit-taking institutions**

Certain restrictions apply to banks and specialized deposit-taking institutions regarding lending. They are prohibited from:

- granting an advance, loan or credit facility including a guarantee against the security of (i) their shares; (ii) shares of the financial holding company; or (iii) shares of a subsidiary of the financial holding company;
- taking financial exposure in respect of a person or a group of connected persons which constitutes in the aggregate, a liability amounting to more than 25% of their net own funds or a lower percentage that the Bank of Ghana may prescribe;
- taking an unsecured financial exposure in respect of a person or a group of connected persons in excess of 10% of their net own funds;
- granting or permitting to be outstanding, a financial exposure in respect of an affiliate or an insider which are preferential in any respect including creditworthiness, term, interest rate and value of the collateral;
- taking a financial exposure in respect of an affiliate if the aggregate of financial exposure to the affiliate exceeds 25% of the net own assets;
- taking a financial exposure in respect of related parties and their related interests if the aggregate of the financial exposure exceeds 20% of the net own funds;
- taking an unsecured financial exposure in excess of 10% of their net own funds;
- taking a financial exposure in respect of an insider and the related interest of the insider if the aggregate of the financial exposure exceeds 10% of its net own funds;
- taking an unsecured financial exposure in respect of an insider and the related interests of that insider in excess of 5% of their net own funds;
- lending on preferential terms to an employee unless the lending is part of a formally approved employment package or employment benefit plan;
- providing an unsecured advance on or credit facility to an employee the aggregate amount of which exceeds two years' total emoluments of the employee; and
- granting an aggregate amount of loans on preferential terms both secured or unsecured, in excess of 20% of their net own funds.

**Non-bank financial institutions**

Non-bank financial institutions are also prohibited from:

- granting an advance or credit or issuing financial guarantee or indemnity to or in respect of any person or group of persons which constitutes in the aggregate a liability to the institution amounting to more than the proportion of the net worth of the institution;
- granting an unsecured advance, credit, or issuing any guarantee or indemnity amounting in aggregate to more than the proportion of the net worth of the institution;
- granting to any of its officers or employees an unsecured advance or credit facility, the aggregate amount of which exceeds two years' salary of the officer or employee;
- assuming unsecured financial exposure in respect of (i) any of its directors or significant shareholders, (ii) a firm or company in which a director or a significant shareholder of that institution is interested as director, (iii) a controlling shareholder, partner, proprietor, employee or guarantor of that institution, (iv) a holding or subsidiary company of that institution in which a director is interested, or (v) a director's relative or a significant shareholder's relative, unless the prior written approval of the Bank of Ghana is obtained in respect of that unsecured exposure;
- assuming a financial exposure in respect of a director or a significant shareholder or other related party in excess of (i) 15% of the institution's net own funds where the financial exposure is on a secured basis, or (ii) 10% of the institution's net own funds where the financial exposure is on an unsecured basis; and
• writing off or waiving fully or partially, the financial exposure of the institution to a director, a significant shareholder and other related party without the approval of the institution's board and the approval in writing of the Bank of Ghana.

Protection against discrimination

The Borrowers and Lenders Act, 2008 (Act 773) prohibits a lender from discriminating against a person on the grounds of race, gender, ethnicity, political affiliation or religion in: (a) assessing the ability of the person to meet the obligations of a proposed credit agreement; (b) deciding whether to refuse an application to enter into a credit agreement, or to offer or enter into a credit agreement; (c) determining an aspect of the cost of a credit agreement to the borrower; (d) proposing or agreeing on the terms and conditions of a credit agreement; (e) assessing or requiring compliance by the person with the terms of a credit agreement; (f) exercising any right of the lender under a credit agreement, Act 773 or any legislation relating to credit; or (g) determining whether to continue, enforce, seek judgment as regard a credit agreement or terminate a credit agreement.

Protection of borrower credit rights

Where a borrower exercises a right under the Borrowers and Lenders Act, 2008 (Act 773) the lender is prohibited from responding by: (a) penalizing the borrower; (b) altering, or proposing to alter the terms or conditions of a credit agreement with the borrower to the detriment of the borrower; or (c) taking an action to accelerate, enforce, suspend or terminate a credit agreement with the borrower. A dissatisfied borrower may have recourse to the complaint procedures and redress mechanisms provided under the central bank’s Consumer Recourse Mechanism Guidelines for Financial Service Providers, 2017.

Borrowing

The following restrictions apply to the entities indicated below:

BANKS, SPECIALIZED DEPOSIT-TAKING INSTITUTION OR FINANCIAL HOLDING COMPANY

A bank, specialized deposit-taking institution or financial holding company which has a capital adequacy ratio of less than the ratio prescribed by the Bank of Ghana is prohibited from receiving a loan from another bank, specialized deposit-taking institution or financial holding company without written approval from the Bank of Ghana.

STATUTORY CORPORATIONS AND STATE-OWNED ENTERPRISES

The written approval of the Minister responsible for Finance is required for a public corporation or state-owned enterprise to borrow from a foreign market or to borrow an amount above the limit determined by the minister.

LOCAL GOVERNMENT AUTHORITIES

A local government authority may borrow funds only from within Ghana and up to the limit determined by the minister responsible for finance in consultation with the minister responsible for local government. The prior written approval of the minister responsible for finance is required for the borrowing above the determined limit.

GOVERNMENT OF GHANA

The terms and conditions of all government borrowings require parliamentary approval. The minister for finance may subject to parliamentary approval, enter into and execute an agreement on behalf of the government in relation to matters of a financial nature.

Government borrowing from banks and financial institutions under a loan agreement must be based on the annual borrowing plan.

What are common lending structures?

Various lending structures are used depending on the financing needs of the borrower and requirements of the parties. Loans may be provided by a single lender providing the entire facility or multiple lenders each providing parts of the total facility.

Duration of loan
A loan may be structured as a term loan, revolving loan, overdraft or bridge loan.

Security

Loans may be secured, unsecured or guaranteed.

Loan repayment

A loan may also be structured to be repayable in installments of both principal and interest over the life of the loan, by paying interest-only during the term of the loan with only the outstanding principal due at the end or repayable in full at maturity.

What are the differences between lending to institutional / professional or other borrowers?

There are specific rules such as the restrictions indicated above that apply to banks, specialized deposit-taking institutions, statutory corporations and local government authorities, but do not apply to individual borrowers.

Do the laws recognize the principles of agency and trusts?

Ghanaian law recognizes the principles of agency and trusts.

Are there any other notable risks or issues around lending?

Default on interest

A Ghana Court may refuse to order the recovery of default interest on the ground that such interest amounts to a penalty.

Insolvency issues

On the commencement of official liquidation, remuneration up to a prescribed limit owed to employees in respect of the whole or a part of the four months preceding the commencement of the winding-up and rates, taxes, or similar payments owed to the state or a local authority have priority over payments to floating charge creditors and general unsecured creditors of the company.

Are there any other notable risks or issues around borrowing?

Credit reporting

Where a borrower's loan is 90 days past the due dates for repayment, the details are required to be disclosed by the creditor (financial institution) to a licensed credit bureau.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?
There are no statutory restrictions on the giving or taking of security. There may, however, be contractual restrictions such as negative pledges or requirements to obtain consent from counterparties to certain agreements.

Last modified 15 Jan 2020 | Authored by Reindorf Chambers

What are common types of guarantees and security?

Guarantees

The types of guarantees commonly used are corporate guarantees and personal guarantees.

Security

Security arrangements can take various forms depending on the agreement of the parties. In Ghana, parties usually use fixed or floating charges, pledges or mortgages.

Where the borrower is a company, the ideal form of security is a full debenture containing fixed and floating charges over all assets of the company.

Last modified 15 Jan 2020 | Authored by Reindorf Chambers

Are there any other notable risks or issues around giving and taking guarantees and security?

Registration of security

A borrower or a person interested in a charge is required to register it with the Collateral Registry within 28 days after the date of its creation. An unregistered charge "is of no effect as security for a borrower's obligations for repayment of the money secured."

Charges created by a company over its property must additionally be registered with the Companies Registrar within 45 days of its creation, failing which the charge is void as security over the property. Pledges of goods, documents of title and negotiable instruments are excluded from the requirement for registration.

Interests in land are subject to registration under the Land Title Registration Act, 1986 (PNDCL 152) and the Land Registry Act, 1962 (Act 122). An instrument conveying an interest in land is ineffective until it has been registered.

Ascertainment of ownership

Lenders face the risk of creating an ineffective security where they fail to ascertain or verify the ownership of the assets, especially landed property, before taking security over them.

Insolvency issues

If a company is wound up under the provisions of the Bodies Corporate (Official Liquidations) Act, 1963 (Act 180), the following provisions apply:

FLOATING CHARGES

A floating charge created during the 12 months before the winding up of the company may – except to the extent of any cash paid in consideration for it – be rendered invalid on the commencement of the winding-up of the company, unless it is established that the company was solvent immediately after the creation of the charge.

Floating charges may also be affected by the operation of the preference provisions of the insolvency laws as outlined below.

The liquidator may call for a restoration of money paid or transfer of property or its value if:

• the underlying transaction is entered into by the company before the winding up of the company commences with the "dominant intent" that the particular creditor should benefit at the expense of others; or
• a payment was received during the relevant period (beginning 21 days before the presentation of the petition on which a winding-up order is made) other than payments made in respect of secured debts and debts incurred during the relevant period.

The liquidator is also entitled to call upon a person to restore any excess benefit accrued to him from the disposition of property otherwise than for full value or in settlement of any due debt either during the two years ending with the making of a winding-up order, or more than two years, but less than ten years before the making of the order and at a time when the company was insolvent.

ASSIGNMENTS

In relation to two or more assignments in respect of the same debt, later assignees take priority over earlier assignees if the debtor or other person against whom the right is enforceable did not have notice of the earlier assignment at the time of the later assignment.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Banking and Securities

Bank of Ghana Act, 2002 (Act 612)
Banks and Specialised Deposit-Taking Institutions Act, 2016 (Act 930)
Non-Bank Financial Institutions Act, 2008 (Act 774)
Bank of Ghana notices, directives and circulars
Securities Industry Act, 2016 (Act 929)
Securities and Exchange Commission Guidelines, Directives, Codes and Circulars
Ghana Stock Exchange Listing Rules 2006
Ghana Stock Exchange Listing Regulations, 1990 (LI 1509)
Ghana Stock Exchange Membership Regulations, 1990 (LI1510)

Bodies Corporate

Companies Act, 2019 (Act 992)\(^1\)
Incorporated Private Partnerships Act, 1962 (Act 152)
Bodies Corporate Official Liquidations Act, 1963 (Act 180)

Mortgages

Mortgages Act, 1972 (NRCD 96)
Home Mortgage Finance Act, 2008 (Act 770)

Insurance and Pensions

Insurance Act, 2006 (Act 724)

Other relevant legislation

Anti-Money Laundering Act, 2008 (Act 749)
Anti-Terrorism Act, 2008 (Act 762)
Bills of Exchange Act, 1961 (Act 55)

---

1. \(^1\) Companies Act, 2019 (Act 992)
Borrowers and Lenders Act, 2008 (Act 773)
Central Securities Depository Act, 2007 (Act 733)
Contracts Act, 1960 (Act 25)
Credit Reporting Act, 2007 (Act 726)
Data Protection Act, 2012 (Act 843)
Electronic Transactions Act, 2008 (Act 772)
Finance Lease Act, 1993 (PNDCL 331)
Foreign Exchange Act, 2006, (Act 723)
Ghana Deposit Protection Act, 2016 (Act 931)
Ghana Investment Promotion Centre Act, 2013 (Act 865)
Income Tax Act, 2015 (Act 896)
Payment Systems and Services Act, 2019 (Act 987)
Public Financial Management Act, 2016 (Act 921)
Stamp Duty Act, 2005 (Act 689)
Venture Capital Trust Fund Act, 2004 (Act 680)

Reference to an Act includes its amendments and regulations.

1The Companies Act, 2019 (Act 992) came into effect on 2 August 2019.

Regulatory authorization

Who are the regulators?

The central bank (Bank of Ghana) is the supervisory and regulatory authority for all banks, specialized deposit-taking institutions and non-bank financial institutions.

The securities industry is regulated by the Securities Exchange Commission under the Securities Industry Act, 2016 (Act 929).

The Ghana Stock Exchange is recognized by the Securities and Exchange Commission as a self-regulatory organization authorized to prescribe rules for its members as market participants.

The National Insurance Commission supervises and regulates institutions within the insurance industry under the Insurance Act, 2006 (Act 724).

The National Pensions Regulatory Authority establishes standards, rules and guidelines for the management of pension funds, including guidelines for pension fund investments. It approves, regulates and monitors trustees, pension fund managers, custodians and other institutions that deal with pensions and supervises the administration by trustees of registered schemes.

What are the authorization requirements and process?

Depending on the type of activity to be conducted, an application must be made to the Bank of Ghana, Securities and Exchange Commission, National Pensions Regulatory Authority or National Insurance Commission for a license.

Bank of Ghana

The Bank of Ghana is responsible for:

- issuing licenses to banks and specialized deposit-taking institutions;
- approving the establishment of representative offices by foreign banks; and
- registration of financial holding companies.
The application for a license to carry on a deposit-taking business must be in writing accompanied by the required information and processing fee. The application must show that the applicant meets the threshold conditions for eligibility.

The Bank of Ghana must inform the applicant of its decision within six months of the submission of the application. If it requires further information or investigation, it must inform the applicant and make its decision within a reasonable additional time period.

**Securities and Exchange Commission**

An application must be made in a prescribed form. There is a prescribed fee payable which ranges from GHS400 to GHS1,000 depending on the type of license applied for, as well as an annual renewal fee ranging from GHS200 to GHS500. There is a minimum capital requirement to be met for a license may be granted.

**National Insurance Commission**

Only a limited liability company may apply for a license. The application for the license must be made in the prescribed form accompanied by the required information and fee.

**National Pensions Regulatory Authority**

An application may be made in the prescribed form accompanied by the required information and fee.

**Trustees**

Both individuals and trust companies may apply for a license to serve as trustees for occupational pension schemes, provident fund schemes, personal pension schemes and other privately managed pension schemes. They must meet the eligibility requirements set out in the National Pensions Act, 2008 (Act 766).

**Pension fund managers**

Only a body corporate licensed by the Security and Exchange Commission as an investment advisor may apply to be registered as a pension fund manager.

**Pension fund custodians**

Only a bank, an insurance company or a non-bank financial institution or wholly owned subsidiary of any of these institutions licensed by the Securities and Exchange Commission as a custodian may apply to be registered as a pension fund custodian.

*Last modified 15 Jan 2020 | Authored by Reindorf Chambers*

**What are the main ongoing compliance requirements?**

**Bank of Ghana**

Banks and specialized deposit-taking institutions are required to maintain the prescribed minimum unimpaired paid up capital and minimum capital adequacy ratios, become members of the Ghana Deposit Protection Scheme, pay an annual license fee and comply with any conditions imposed by the Bank of Ghana or statutory provision. Failure to meet these requirements may result in the revocation of the license.

**Securities and Exchange Commission**

The Securities Exchange Commission must be notified by an institution to which it has granted a license of any change of particulars from those submitted in the application form within 14 days of the change. Other compliance requirements include notifying the Securities and Exchange Commission of the appointment, removal and resignation of auditors within 30 days of the occurrence (except for banks and insurance companies), maintaining the prescribed minimum liquid funds and appointing a designated compliance officer. The failure to comply with these requirements may result in a penalty of GHS500 for each infringement and the suspension, revocation or restriction of a license.
National Insurance Commission

A company must maintain the prescribed solvency margin and minimum capital (or higher amount where one is imposed by the National Insurance Commission), prescribed level of reserves and also deposit 10% of the minimum capital with the Bank of Ghana when required to do so.

The insurance company must notify the National Insurance Commission within 14 days of the termination of the appointment of a director, auditor or senior member of staff. The prior written approval of the National Insurance Commission is required for:

- the appointment of a director or a principal officer.

National Pensions Regulatory Authority

A trustee, pension fund manager or custodian must report fraud, forgery, theft or other acts of dishonesty that occur in its establishment and a staff member whose appointment is terminated on any of these grounds to the Board of the National Pensions Regulatory Authority. A trustee, pension fund manager or custodian is prohibited from employing a person whose name is on the list maintained by the National Pensions Regulatory Authority of employees dismissed on those grounds without its prior approval.

Failure to report any of the above-mentioned incidents is an offense punishable by a fine of GHS24,000 or a term of imprisonment of not more than two years or, where applicable, both.

A trustee, pension fund manager or custodian who employs a person named in the above dismissed employees list is liable to a penalty of an amount of not less than GHS3,000 or, in the case of persistent contravention, revocation of license or registration.

What are the penalties for failure to be authorized?

Bank of Ghana

A person who undertakes a regulated activity without a license commits an offense and upon summary conviction may be liable in the case of a body corporate, to a fine ranging from GHS18,000 to GHS60,000 or in the case of an individual, either the above fine and/or a term of imprisonment ranging between two to four years.

Securities and Exchange Commission

A person who undertakes a regulated activity within the securities industry without a license is liable to pay a penalty of GHS48,000.

National Insurance Commission

A person who undertakes an insurance activity without a license commits an offense and is liable on summary conviction to a fine not exceeding:

- in the case of a body corporate, to a fine of GHS30,000; or
- in the case of an individual, either a fine of GHS30,000 or a term of imprisonment of five years or to both.

A director, partner or officer of a corporate body or partnership convicted of undertaking an insurance activity without a license shall be considered to have committed an offense and is liable to the fine and/or term of imprisonment stated above.

National Pensions Regulatory Authority

Anyone who acts as a trustee without a license commits an offense and is liable on summary conviction to a fine of GHS24,000 in the case of a body corporate or, to a term of imprisonment not exceeding two years or to both in the case of an individual.

A body corporate which acts as a pension fund manager or custodian without registration is liable on summary conviction to a fine of not more than GHS12,000.
Regulated activities

What finance and investment activities require authorization?

A person shall not carry on a deposit-taking business in Ghana without a license issued by the Bank of Ghana. In addition to taking money on deposit, deposit-taking businesses are permitted to engage in financial activities such as lending, financial leasing, investment in financial securities, participation in securities issues and provision of services related to those issues, electronic banking, money transmission services and issuing and administering means of payment including credit cards, travelers checks, bankers’ drafts and electronic money.

A person cannot establish or maintain a securities exchange, unit trust or mutual fund, or carry on business as a market maker or market operator in the securities market without a license issued by the Securities and Exchange Commission. Market operators include broker-dealers, investment advisors, trustees, custodians, fund managers or underwriters.

Banks and financial institutions which do business in the capital market other than as custodian, trustee, primary dealer, nominee, registrar, issuing house and underwriter, must incorporate a subsidiary company and obtain a license for that subsidiary.

A person cannot act as a representative of a market maker or market operator without a license.

Are there any possible exemptions?

A representative of a market maker or operator who does not deal directly with clients may be exempted from holding a representative's license.

A foreign bank or company may be exempt from registration as a financial holding company where the Bank of Ghana is satisfied that it is subject to satisfactory supervision and regulation in its home jurisdiction.

Do any exchange controls or other restrictions on payments apply?

There are no foreign exchange controls in relation to the remittance of the principal amount invested, or any capital gains, dividends, interest payment or any related earnings.

However, foreign currency payments to and from Ghana between a Ghana resident and non-resident, or non-residents, must be made through a bank. Transfers of foreign currency to or from Ghana must also be made through a licensed person.

There are two types of accounts involving non-Ghanaian currency that Ghana residents may operate, to which different terms and conditions apply with regard to the source of funds and the making of external transfers. Only one of the two categories of account is available to non-residents.

A licensed specialized deposit-taking institution cannot trade in foreign exchange or offer services denominated in a foreign currency.

The Bank of Ghana has powers to restrict the importation and exportation of foreign currency and securities denominated in such currency.

A declaration must be made at the point of entry or exit into the country where foreign currency beyond a prescribed amount is being conveyed.

A bank or specialized deposit-taking institution must report any currency transaction greater than the prescribed threshold amount to the Financial Intelligence Centre.

What are the rules around financial promotions?
An invitation to the public to buy or sell shares or debentures of a company or to deposit money with any company for a fixed period or payable at call can only be made in relation to a public company.

No advertisement in connection with any activity or service which must be licensed or authorized by the Securities and Exchange Commission may be made by a person other than a licensed or authorized person.

An advertisement by a licensed or authorized person in connection with any activity or service which must be licensed or authorized by the Securities and Exchange Commission must not be unclear, false or misleading in any material particular.

The Securities and Exchange Commission may direct a person who publishes an advertisement in contravention of these provisions to cease the publication or modify the advertisement.

A false or misleading statement in a material particular that is likely to induce the sale or purchase of securities by any other person, whether or not made knowingly, recklessly or dishonestly, is an offense for which, upon summary conviction, a person may be liable for the payment of a fine ranging from GHS12,000 to GHS30,000, or a term of imprisonment of four to five years and or, where applicable, both.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

The most common types are companies limited by shares which may be private or public. Private companies can have up to 50 shareholders or members while public companies have unlimited shareholders or members. Incorporated partnerships may also be used to provide some services.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes. A company can conduct lending or investment business through a branch, or in the case of a company incorporated outside Ghana (external company), through an established place of business registered under the Companies Act, 2019 (Act 992).

An external company is subject to the licensing requirements of the banking and securities industry laws and has tax liability under Ghana law.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

The fintech space has been described as vibrant and burgeoning. In 2018, the central bank counted 71 fintech operators providing services to the banking sector. Payment services and mobile money are the most widely used technology products. Banks are increasingly collaborating with telecommunications companies (Telcos) to offer products and services to holders of mobile money accounts. The Ghana Interbank Payment and Settlement System operated by a subsidiary company of the central bank has enabled inter-operability across the financial institutions and the Telcos. A number of licensed financial institutions have deployed various online technologies to offer savings and loan products. Fintech enterprises have been active in online remittances, lending and insurance. Some have used
peer-to-peer funding platforms and engaged in marketplace lending. A small number are beginning to offer services based on artificial intelligence and robo advisory systems and some are developing the use of blockchain technology. A few have been involved in initial coin offerings. There are several cryptocurrency trading platforms operating. Data analysis and cloud computing capabilities are also being developed by some fintech companies.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

Other than as specified in this section, there are as yet no fintech-specific laws or regulations. Where fintech businesses engage in regulated activity such as deposit-taking, lending, insurance or investment, they are subject to the rules generally applicable to those activities.

The Payment Systems and Services Act, 2019 (Act 987) which entered into force on 14 May 2019 establishes a regime of licensing and regulation by the central bank of payment service providers, operators of payment systems, and electronic money issuers. Existing operators have been given nine months to comply with the new regime. It is not yet clear if all electronic payment platforms will be regulated as payment systems under the Act.

A payment service provider or electronic money issuer must have at least 30% Ghanaian ownership. The Bank of Ghana may prescribe minimum capital requirements.

Regulations under the Payment Systems and Services Act are to be issued by the Minister of Finance on the advice of the central bank.

Application of data protection

A registration certificate from the Data Protection Commission is required in an application for a license by a payment service provider or electronic money issuer. The data protection principles enacted in the data protection legislation apply to entities providing these services.

Consumer laws

Consumer protection principles, including transparency, disclosure of sufficient information, fair treatment and client access to redress are laid down in Act 987. The central bank has the authority to make final determination of complaints by clients against payment services providers and electronic money issuers.

Money laundering regulations

Fintech businesses are likely to belong to the extensive list of entities identified as “accountable institutions” under the anti-money laundering legislation e.g. as businesses which provide financial services that involve the remittance or exchange of funds; they are therefore subject to record-keeping, due diligence, client identification and verification, reporting and disclosure obligations and liable to sanctions prescribed for breach of these obligations.

Cryptocurrency

The Securities and Exchange Commission and the Bank of Ghana have both issued directives on cryptocurrency indicating that they do not license or regulate cryptocurrency. Act 987 does not appear to have changed that position.

What type of funding arrangements and incentives are available to FinTech businesses?

Startups in fintech face the constraint that there is little available by way of venture capital and debt for startups in general. Banks and investors typically prefer growth companies with a three- to five-year track record. However, a good business case with credible promoters with a track record can attract funding.
Established companies entering the fintech space such as the Telcos have access to capital markets and senior debt financing.

Tax breaks have recently been introduced for young entrepreneurs. The income of a person who is 35 years old or under from an information and communications technology business is exempt from tax for the first five years of the business and a concessional tax rate may be applicable for the next five years.

The capital allowances regime is designed to enable investors recoup their investment expenditure.

Portfolio sales

Loan transfers and portfolio sales

*What are common ways of buying and selling loans?*

The most common ways of selling loans in Ghana are by way of:

- assignment; and
- novation.

*What are the main considerations when transferring a loan and related security?*

The main considerations for transferring a loan and related security are whether:

- the underlying contract allows for such transfer;
- the consent of the borrower or any other party is required for such transfer;
- there are limitations on the financial institution(s) to whom the loan and related security may be transferred;
- there are any stamp duty implications;
- the transfer will prejudice the borrower; and
- there are any formalities that need to be adhered to for the transfer of a loan and related security.

Projects

Financing / investing in energy / infrastructure

*To what extent are energy and infrastructure assets publicly or privately owned?*

Energy

Energy assets are publicly or privately owned or by way of joint venture.

Electricity

There are currently three hydro-electric dams in Ghana, all of which are state-owned.
The Volta River Authority (VRA), a statutory authority responsible for generating electricity, owns a number of thermal plants located in Aboadze near Takoradi, and within the Tema enclave, with a combined generation capacity of 1,292MW. The 340MW Takoradi Thermal 2 (T2) Power Plant is a joint venture between VRA and a private company from Abu Dhabi. There are also other independent power producers who are contributing to the energy generation capacity.

VRA owns a 2.5MW Solar Power Plant located in Navrongo, in the Upper East Region. Two other solar plants located at Gomoa Onyandze near Winneba in the Central Region were developed by private entities.

Power Distribution Services Ghana Limited, which comprises Ghanaian investors (51%) and foreign technical partners (49%), recently took over operations of the Electricity Company of Ghana (ECG). It is currently the electricity service provider in all of ECG's operational areas in the southern distribution zone of Ghana. The Northern Electricity Distribution Company (NEDCo) is responsible for distribution of electricity in the northern sector of the country. Ghana Grid Company (GRIDCo), a wholly owned government entity which has responsibility for the transmission functions of the electricity sector owns a majority of the transmission facilities.

Oil and Gas

There are three major oil fields in Ghana: Jubilee, SGN and TEN. They are operated by two international oil companies on behalf of the joint venture partners including the Ghana National Petroleum Corporation (GNPC) a statutory corporation responsible for undertaking the exploration, development, production and disposal of petroleum.

Bulk Distribution Companies, Oil Trading Companies and Oil Marketing Companies licensed by the National Petroleum Authority to import, export, distribute and market crude and petroleum products, are largely privately owned.

Ghana has a gas processing plant located at Atuabo in the Western Region operated by the Ghana National Gas Company which is mandated to build, own and operate infrastructure required for the gathering, processing, transporting and marketing of natural gas resources in the country.

Telecommunications infrastructure

The National Communications Authority (NCA) is responsible for regulating the provision of communications services in Ghana. Telecommunications infrastructure is largely privately owned.

There are four mobile network operators in Ghana, three of which are wholly privately owned. They are AirtelTigo, Glo, MTN and Vodafone, in which the government of Ghana has about 30% shareholding. Vodafone and AirtelTigo also provide fixed line services to the public.

The mobile telecommunications sector has about 5,000 communication towers, the majority of which are owned by three privately owned tower companies.

Transport infrastructure

ROAD

Road transport is the primary land transport system in Ghana. Ownership of the road network is held by the government. The Ghana Highway Authority is responsible for the administration, control, development and maintenance of trunk roads and related facilities.

RAIL

Rail infrastructure in Ghana is currently largely government-owned. The Ghana Railway Company Limited operates the railways and is responsible for managing the national rail system.

Government has been seeking private sector participation in the development and rehabilitation of railway infrastructure. The Ministry of Railways Development has for example recently entered into a concession agreement with the Ghana European Railway Consortium (GERC) (which consists of 16 investment companies from Ghana, Germany, Austria, France and Italy) for the construction of the Eastern Railway line.

AVIATION

Cargo and passenger aviation is privately owned. The Ghana Civil Aviation Authority is responsible for the regulation of the aviation sector.
The only international airport, Kotoka International Airport, is owned by the government and managed by the Ghana Airports Company Limited. There are domestic airports in Kumasi, Sunyani, Tamale and Takoradi. An airport is being constructed in Ho and the government plans to convert the Kumasi airport into an international airport.

Two private passenger airlines currently operate domestic flights. Three others have suspended operations.

PORTS

The government dominates infrastructure ownership in this sector. The two main ports are located in Tema and Takoradi. The Ghana Ports and Habours Authority is the statutory body responsible for planning, building, developing, managing, maintaining and operating ports in Ghana. The government has indicated that there are plans to develop a port in Keta and an inland port in Boankra near Kumasi to facilitate trade with neighboring landlocked countries.

Other infrastructure

EDUCATION INFRASTRUCTURE

Ownership of education infrastructure is a combination of public and private ownership. A majority of these are public schools. It is reported in the Ghana Education Service's Education Management Information System data that in the 2017-2018 academic year, there were 21,730 public basic schools and 10,056 private basic schools in Ghana. Regarding Senior High Schools, 630 were publicly owned and 286 of them were privately owned.

HOSPITAL INFRASTRUCTURE

Health facilities in Ghana are both publicly and privately owned.

The Ghana Health Service in its 2017 facts and figures report indicates that in 2016 about 78.7% of hospital beds in the country were publicly owned and 16.9% privately owned.

Are there special rules for investing in energy and infrastructure?

Minimum equity capital contribution

Generally, under the Ghana Investment Promotion Centre Act, in a joint venture between a Ghanaian and a foreign shareholder, the foreign shareholder is required to make a minimum equity capital contribution of USD200,000. A wholly foreign owned venture requires a minimum equity capital contribution of USD500,000.

Energy

ELECTRICITY OWNERSHIP

The Energy Commission (Local Content and Local Participation) (Electricity Supply Industry) Regulations, 2017 (L.I. 2354) prescribes local content and local participation levels applicable to persons engaged or intending to engage in the electricity supply industry. LI 2354 is aimed at achieving a long-term goal of minimum local content of 60% and local participation of 51% in the electricity supply industry.

LICENSING

A public utility requires a license from the Energy Commission for the transmission, wholesale supply, distribution or sale of electricity.

Oil and Gas

OWNERSHIP

The right to develop oil and natural gas reserves is granted through a petroleum agreement between the Minister responsible for Petroleum acting on behalf of Ghana, the Ghana National Petroleum Corporation (GNPC) and the investor who should be a body corporate. The GNPC is entitled to a 15% initial participating carried interest in all petroleum exploration and development operations and
may acquire an additional participating interest which may be for a specified period and shall be a paying interest in respect of costs incurred in the conduct of petroleum activities other than exploration costs.

To qualify to enter into a petroleum agreement or be granted a petroleum license, there must be at least 5% equity participation of an indigenous Ghanaian company other than the GNPC. Again, a non-indigenous company which intends to provide goods or services to a contractor, a subcontractor, or a licensee in Ghana is required to establish a joint venture company with an indigenous Ghanaian company and afford it an equity participation of at least 10%.

Prior written consent of the Minister for Energy is required for the assignment of interests in a petroleum agreement.

In relation to downstream petroleum activities, a license holder is required to have at least 50% Ghanaian ownership.

**Licensing**

A permit is required from the Petroleum Commission to install and operate any facility for the purpose of transporting, treating and storing petroleum.

In the midstream sector, the prior written approval of the Energy Commission must be obtained in order to commence the construction, installation, operation or modification of a pipeline.

A license is required from the Energy Commission for the transmission, wholesale supply or distribution of natural gas.

A license is required from the National Petroleum Authority to engage in a business or commercial activity in the downstream industry including importation, exportation, re-exportation and shipment of crude oil, gasoline, diesel, liquefied petroleum gas, kerosene and other designated petroleum products.

**Telecommunications**

A person who operates a public electronic communications service or network or provides a voice telephony service requires a license from the NCA.

A person who has a significant interest in a network operator, service provider or the holder of a frequency authorization is prohibited from selling, transferring, charging or otherwise disposing of that interest or any part of that interest, unless notice is given to the NCA 30 days before the proposed transaction.

Holders of frequency authorizations, network operators or service providers are required to give prior notice to the NCA of the (a) sale, transfer, charge or other disposition of a significant interest, (b) issuance or allotment of any shares or any other reorganization of their share capital that would result in: (i) a person acquiring a significant interest or (ii) a person who already owns or holds a significant interest, increasing or decreasing the size of that person’s interest.

A person who acquires a significant interest in a network operator or service provider is required to notify the NCA within 14 days of the acquisition except where the sale is as a result of an internal reorganization of a network operator or service provider.

The prior written approval of the NCA is required for the assignment of the license of a network operator or network provider or a frequency authorization.

**What is the applicable procurement process?**

Procurement of works and services with public funds must be in accordance with the Public Procurement Act, 2003 (Act 663) as amended which sets various thresholds, procurement procedures and approvals required to embark on such projects. Procurement entities are required to have tender committees to which they must submit not later than one month prior to the end of each financial year, their procurement plan for the following year.

There are procedures prescribed under the Act for the procurement of goods, services, and works and the engagement of consultants. Generally, competitive selection procedures are preferred, with single source procurement as a possible exception.
What are the most common forms of funding / investing in energy and infrastructure?

Funding

Common forms of funding in energy and infrastructure include:

- direct government budgetary expenditure;
- government borrowing from development finance institutions;
- government guarantees and commitments to concessionaires; and
- debt and equity raised on a project-finance basis.

There is a growing interest in pursuing infrastructure development through public-private partnership arrangements.

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

In addition to the regulatory investigations specified in this section, there are a number of provisions in the Companies Act, Anti-Money-laundering Act and Data Protection Act which vest authorities named in the legislation with powers to investigate breaches of those laws together with accompanying sanctions which may affect persons regulated in the financial sector.

Bank of Ghana

The Banks and Specialised Deposit-Taking Institutions Act, 2016 (Act 930) authorizes the Bank of Ghana to carry out an investigation where there is sufficient reason to believe that a person is taking deposits or carrying out a deposit taking business without a license.

In addition to its general powers of routine inspection, the Bank of Ghana may also carry out unannounced examinations of specific activities or matters relating to the affairs of a bank, specialized deposit-taking institution, financial holding company, electronic money issuer or payment service provider.

Securities and Exchange Commission

The Securities Industry Act, 2016 (Act 929) authorizes the Securities and Exchange Commission to carry out an investigation where there is sufficient reason to suspect that a person has committed an offense under that Act or the Companies Act, or has been guilty of fraud or dishonesty in relation to securities dealings and the issue of securities. It may also carry out an investigation in circumstances where a person is assisting other domestic and foreign regulatory authorities in an investigation.

National Insurance Commission

Where the National Insurance Commission is of the opinion that it may take enforcement action against an insurer on any of the grounds set out in the Insurance Act, 2006 (Act 724), it may appoint a competent person to carry out an investigation into the nature, conduct or state of the insurer's business or any particular aspect of it, or the ownership and control of the insurer.

The National Insurance Commission may also at any time authorize an actuary to investigate the financial condition of an insurer.

National Pensions Regulatory Authority

The Board of the National Pensions Regulatory Authority may examine the activities of a trustee, pension fund manager or custodian at least once in a year to determine whether or not the provisions of the National Pensions Act or any regulations made under it are being complied with. It may also order a special examination of the books and affairs of a trustee, pension fund manager or custodian where it
What regulatory penalties may apply?

Bank of Ghana

After the Bank of Ghana provides the entity investigated with its investigation report, it may require the entity to submit an explanation for the findings in the report. An entity which fails to submit an explanation upon request is liable to an administrative penalty of not more than GHS12,000.

After the Bank of Ghana receives an explanation for its findings from the entity investigated, it may direct the entity to take remedial action within a stated period of time. An entity which fails to comply with the directives given by the Bank of Ghana is liable to an administrative penalty of not more than GHS24,000.

Other regulatory penalties which may be imposed by the Bank of Ghana after an examination into the operations of an entity include the appointment of an advisor or official administrator and remedial measures set out in sections 102 and 103 of the Banks and Specialised Deposit-Taking Institutions Act, 2016 (Act 930) against both the entity and its directors and key management personnel such as an order to the bank or specialized deposit-taking institution to cease the violation or unsafe practice.

Securities and Exchange Commission

For a breach of the Securities Industry Act, 2016 (Act 929) which does not constitute a criminal offense, the Securities and Exchange Commission may impose an administrative fine of an amount specified in relation to the particular breach, or if no amount is specified, GHS36,000. For example, a person who carries out the business of a market operator without a license may be fined GHS54,000. It may also nullify the purchase of shares following a takeover, consolidation or merger involving a public company if it determines that the Code has been violated.

National Insurance Commission

The National Insurance Commission may suspend or revoke an insurance license upon notice to the license holder stating the reasons for the suspension or revocation. It may also give directives to the license holder, including a directive to cease to engage in any class of insurance business or not to enter into any new contracts for any class of insurance business.

National Pensions Regulatory Authority

Regulatory penalties which may apply include the removal from office of a director or officer of a trustee, pension fund manager or custodian who fails to submit reports of any fraud, forgery, theft or other acts of dishonesty which occurs in the establishment. Other penalties are the payment of an amount not less than GHS3,000 for employing a person whose name is on the list kept by the Board of the National Pensions Regulatory Authority of persons dismissed for fraud or other dishonesty and, for persistent offenders, revocation of license.

What criminal penalties may apply?

Bank of Ghana

Breaches of Act 930 as well as any conditions imposed by the Bank of Ghana on any of the entities it regulates may result in criminal prosecution.

A person convicted of an offense under Act 930 may be liable to a fine of the amount or a term of imprisonment for the number of years provided for that offense.

Securities and Exchange Commission
Breaches of the Securities Industry Act, 2016 (Act 929) as well as any conditions imposed by the Securities and Exchange Commission on any of the entities it regulates may result in criminal prosecution.

For a breach of Act 929 which constitutes a criminal offense, a person may be liable on summary conviction to a fine for an amount or to a term of imprisonment specified in relation to the particular breach, or to both. If no penalty is specified, a fine of between GHS1,800 and GHS6,000 or term of imprisonment of between one year and three years or both may be imposed. For example, a person who fraudulently induces another person to deal in securities is liable on summary conviction to a fine between GHS12,000 and GHS30,000 or to a term of imprisonment of between four to five years or to both.

National Insurance Commission

The First Schedule of the Insurance Act, 2006 (Act 724) sets out a list of offenses created by the Insurance Act, 2006 (Act 724) and applicable penalties. A person summarily convicted of an offense under the Insurance Act or who contravenes any of its provisions is liable to a fine (including where applicable, a daily default fine for each day that the default continues) or, in the case of an individual, a fine or term of imprisonment or to both. If a penalty is not provided for an offense, a maximum fine of GHS12,000 may be imposed. Directors and officers of corporate bodies as well as partners of a partnership convicted of an offense may be liable for the offense unless they can prove that it was committed without their knowledge after they had exercised due care and diligence to prevent the offense from being committed.

National Pensions Regulatory Authority

For a breach of the Pensions Act, 2008 (Act 766) which constitutes a criminal offense, a person may be liable on summary conviction to a fine for an amount or to a term of imprisonment specified in relation to the particular breach, or to both. If no penalty is specified, a fine of GHS12,000 or term of imprisonment of not less than one year or both may be imposed.

For example, a trustee, pension fund manager, custodian or director who misappropriates pension funds is liable on summary conviction to a fine of an amount equal to three times the amount misappropriated or to a term of imprisonment not less than ten years or to both. Directors and officers of corporate bodies convicted of an offense may be liable for the offense unless they can prove that it was committed without their knowledge after they had exercised due care and diligence to prevent the offense from being committed.

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

Nominal stamp duty is payable on the advance of a loan exceeding GHS50. No stamp, registration or transfer tax is payable on the transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

Stamp duty and registration fees are payable on the taking, transfer or assignment of a mortgage, debenture or other security. Unless a mortgage or other charge is registered at the Collateral Registry and, if created by a company over its property, at the Companies Registry, it is void and ineffective as security.

Mortgages created in respect of land must similarly be registered at the Land Title Registry to be effective.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?
Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?

Secured lenders and secured debt security holders take priority over the Ghana Revenue Authority on the enforcement of security. However, in the event of a windup of a corporate body, taxes owed to the government or any local authority which became due and payable within the year preceding the date of the commencement of the winding-up will have priority over claims of debentures holders under any floating charge created by the company.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Yes, withholding tax is payable on interest payments under a loan where the payment has a source in Ghana.

If so:

What is the rate of withholding?

The rate of withholding is 1% in the case of interest paid to an individual, or 8% in every other case.

What are the key exemptions?

Key exemptions are:

• interest payments made by an individual, unless made in the course of business;
• interest paid to a resident financial institution; and
• where the payment is an exempt amount under the Income Tax Act, 2015 (Act 896), such as capital gains from the realization of securities traded on the stock exchange up to December 2021.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

The following are exempt from the payment of tax:

• interest paid to individuals:
  • by resident financial institutions; and
  • on government bonds;
• interest paid to a holder of an investment in a unit trust; and
• interest paid to a non-resident on government bonds.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not
otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both Hungarian and EU law.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Hungary or to request that they are admitted to trading on a regulated market operating in Hungary unless an approved prospectus has been made available to the public.

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Hungary are bonds issued on a stand-alone basis or under a program.

The private offering of debt securities must take place through an investment firm or credit institution which is authorized to provide those services, with the exception of:

- a credit institution or investment firm offering its own securities;
- a non-resident credit institution or a non-resident investment firm offering its own securities through a branch; or
- an investment fund manager offering the investment units of the investment fund it manages.

Similar rules apply to public offerings. The issuer or the offeror shall procure the services of an investment service provider for organizing and conducting the procedure for the public offering of securities, unless:

- the provisions of the Act CXX of 2001 on the Capital Market (Capital Markets Act) pertaining to public offering applies (in the case of admission to trading on a regulated market);
- the government securities are offered by the issuer itself;
- an investment fund manager offers the investment units of an investment fund it manages;
- a credit institution or investment firm offers to issue its own securities;
- a non-resident credit institution or a non-resident investment firm offers its own securities through a branch;
- the provisions of the Capital Markets Act pertaining to public offering apply (only in the case of registration in a multilateral trading facility), and shares of the same class and type have already been registered previously in the same multilateral trading facility; or
- the provisions of the Capital Markets Act pertaining to public offering apply (only in the case of registration in a multilateral trading facility), and shares of the same class and type have already been registered previously in the same multilateral trading facility; or
facility), and the securities to be registered, issued as part of a series have already been admitted to trading on a regulated market or on a stock exchange established in an OECD member state.

The different types of debt securities offered in Hungary include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities and high-yield bonds;
- guaranteed securities, subordinated securities, perpetual debt securities (ie debt securities that have no specified redemption date);
- asset-backed securities;
- derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- hybrid securities (securities with both debt and equity features);
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer);
- exchangeable bonds (debt securities convertible into the equity of a third party);
- depositary receipts (a security issued by a depositary conferring on the holders beneficial ownership of certain underlying assets held by the depositary for the holders); and
- warrants (securities giving the holders the option to purchase the equity of the issuer or a related company).

**What are the differences between offering debt securities to institutional / professional or other investors?**

The Prospectus Directive does not make a distinction between professional and other investors for the purposes of its disclosure requirements but does include different disclosure regimes by reference to the minimum denomination of a single security.

If the denomination of the securities is equal to or above €100,000 (or the equivalent in another currency), the 'wholesale' rules apply. If the denomination is under €100,000, the 'retail' rules apply. Additional disclosure requirements apply for retail securities.

**When is it necessary to prepare a prospectus?**

Under the Prospectus Directive, unless an exemption applies, it is necessary to publish a prospectus where there is an offer of securities to the public or an application for the securities to be admitted to trading on a regulated market.

An offer is deemed not to have been made to the public if:

- securities are offered only to qualified investors;
- securities are offered to less than 150 persons in each EU member state who are not considered to be qualified investors;
- securities are offered to investors who each purchase securities for a total consideration of at least €100,000, or its equivalent in any other currency;
- the face value of the securities offered is at least €100,000, or its equivalent in any other currency;
- the total consideration for all securities in the EU included in the offer shall not exceed €100,000, or its equivalent in any other currency, within twelve months from the date of announcement of the offer; and/or
- a limited company is created by the transformation of a cooperative society and its shares are offered only to the members and shareholders of the predecessor.

Even if the offer is deemed not to be made to the public, a Prospectus Directive compliant prospectus may still be required if an application is made for the securities to be admitted to trading on a regulated market. An exemption from both the offer to the public and
the admission to trading on a regulated market is required in order to avoid having to publish a prospectus.

**What are the main exchanges available?**

The Budapest Stock Exchange has two principal sections on which debt securities are traded:

- debt securities section (cash market); and
- futures and options section (derivatives market).

**Debt securities section**

Debt securities represented in the debt securities section of the Budapest Stock Exchange include government debt securities (treasury bills and government bonds), corporate bonds and mortgage bonds.

**Derivatives section**

The derivatives section of the Budapest Stock Exchange consists of futures and options contracts based on single stocks, equity indices, FX and interest rate.

**Is there a private placement market?**

Hungary has a relatively active private placement market but there is no dominant standard for documentation.

**Are there any other notable risks or issues around issuing or investing in debt securities?**

**Issuing debt securities**

Issuers, offerors and distributors are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to (joint and several) civil liability under Hungarian law.

**Investing in debt securities**

If the prospectus has been supplemented during the public offering of securities any investor who has subscribed for securities or entered into an agreement to purchase securities before the supplement was made available to the public shall be entitled to cancel his declaration of subscription or withdraw from the agreement. The investor may exercise the right of withdrawal within two working days from the date when the supplement was published.

**Establishing and investing in debt / hedge funds**

**Are there any restrictions on establishing a fund?**

**Generally**

Establishing a fund, offering fund securities and operating a fund, among other things, are regulated activities under the Act XVI of 2014 on Collective Investment Trusts and Their Managers, and on the Amendment of Financial Regulations and is therefore subject to
regulation by the National Bank of Hungary.

**Collective Investment Trusts**

The regulations apply to activities undertaken in relation to 'Collective Investment Trusts' which means any form of collective investment which raises capital from a number of investors with a view to investing it in accordance with a defined investment policy for the benefit of those investors.

*Last modified 20 Oct 2017*

**What are common fund structures?**

An investment fund may be established:

- in the form of private or public investment funds, depending on the mode of placing investment units on the market (form of operation);
- based on the sphere of potential investors, in the form of an investment fund offered to professional or retail investors (mode of marketing);
- in the form of open-ended or closed-ended investment funds, according to the type of redemption of their investment units (type of investment fund);
- for a fixed or unfixed term (maturity of the investment fund);
- in the form of securities fund, real estate fund, venture capital fund or private equity fund, based on the primary assets in which the investment fund may invest (type of primary category of assets); and
- on the basis of harmonization as Undertakings for Collective Investment in Transferable Securities (UCITS) or Alternative Investment Fund (AIF) (type of harmonization).

*Last modified 20 Oct 2017*

**What are the differences between offering fund securities to professional / institutional or other investors?**

**Retail funds**

The investment units of securities funds and real estate funds may be offered to professional and retail investors alike.

**Institutional/professional funds**

Venture capital funds and private equity funds may be established for fixed periods by the private offering of non-redeemable investment units to professional investors exclusively.

*Last modified 20 Oct 2017*

**Are there any other notable risks or issues around establishing and investing in funds?**

**Establishing funds**

There are no other specific issues to mention here for the purposes of this site.

**Investing in funds**

There are no other specific issues to mention here for the purposes of this site.

*Last modified 20 Oct 2017*
Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Undertakings for Collective Investments in Transferable Securities (UCITS)

UCITS, including those established in Hungary, have an EU passport which enables fund promoters to create a single product for marketing in all EU member states and on the completion of the appropriate notification procedure, a UCITS established in one member state can be sold in any other.

A UCITS intending to market in another member state must complete and submit to its home regulator a notification including certain specified information, including copies of key investor documents. The home regulator then completes a notification file which is sent in a regulator-to-regulator transmission, following which the UCITS can be sold in the other member state.

Alternative Investment Funds (AIFs)

Under the Alternative Investment Fund Managers Directive, marketing is defined as: a direct or indirect offering or placement at the initiative of the Alternative Investment Fund Manager (AIFM) or on behalf of the AIFM of units or shares in an AIF it manages to or with investors domiciled or with a registered office in the EU.

An AIFM may only market an AIF to EU investors if it is authorized by a relevant EU regulator – registration with one EU regulator opens access, subject to certain further limited conditions, to marketing to professional investors across the EU under an EU passport or if it complies with national private placement regimes (where available).

Reverse solicitation and the definition of ‘marketing’

The Alternative Investment Fund Managers Directive generally continues to permit professional investors who wish to invest in AIFs based on their own initiative (reverse solicitation); however, the EU is currently reviewing this area during 2017 and may impose more stringent requirements.

Specifically in Hungary, Act XVI of 2014 on Collective Investment Trusts and Their Managers, and on the Amendment of Financial Regulations defines marketing as a direct or indirect offering or placement at the initiative of the investment fund manager or on behalf of the investment fund manager of collective investment instruments of a collective investment trust it manages for investors domiciled, or with a registered office, in the EU.

Are there any restrictions on managing a fund?

Fund management in Hungary is regulated under Act XVI of 2014 on Collective Investment Trusts and Their Managers, and on the Amendment of Financial Regulations. The National Bank of Hungary is responsible for regulating funds, fund managers and those marketing funds and any legal or natural person is prohibited from carrying on regulated activities, such as fund management, without authorization.

Alternative Investment Fund Managers (AIFMs) are also subject to regulation under the Alternative Investment Fund Managers Directive (as implemented in Hungary) and managers of Undertakings for Collective Investments in Transferable Securities (UCITS) are subject to certain requirements under the Undertakings for Collective Investment in Transferable Securities Directive. Full National Bank of Hungary registration involves a significant authorization process which among others must include information on senior personnel (must be suitable persons etc), organizational structure, policies and procedures and remuneration practices.

However, AIFMs based in Hungary can be exempted from full regulation on certain grounds, including managing assets under €500 million where assets are not leveraged and investors have no redemption rights for five years, and managing assets under €100 million including assets acquired through leverage. Exempted managers must still register with the regulator.
Entering into derivatives contracts

*Are there any restrictions on entering into derivatives contracts?*

Unless an exemption or exclusion applies, a person entering into a derivatives contract by way of business in Hungary (such as a dealer) will ordinarily have to be authorized by the National Bank of Hungary if the transaction is one of the specified activities set out in the applicable legislation such as:

- options;
- futures;
- contracts for difference; or
- rights to or interests in investments.

The [European Market Infrastructure Regulation](#) applies to all derivative transactions and requires transactions to be reported to regulators and for transactions between dealers to be cleared or subject to other risk mitigation techniques such as initial margin and variation margin requirements.

Last modified 20 Oct 2017

*What are common types of derivatives?*

Derivative contracts are entered into in Hungary for a range of reasons including hedging, trading and speculation.

Derivatives may be traded over-the-counter or on an organized exchange.

All of the main types of derivative contract are widely used in Hungary:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying asset seen in Hungary are:

- foreign currency;
- equity;
- fixed income instruments; and
- commodities.

Last modified 20 Oct 2017

*Are there any other notable risks or issues around entering into derivatives contracts?*

Since the global financial crisis in 2007 and 2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. The European Commission has sought, in particular, to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative position;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.
As a result, the derivatives market has seen and continues to see the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

**Debt finance**

**Lending and borrowing**

*Are there any restrictions on lending and borrowing?*

**Lending**

Lending in a business-like manner is a regulated activity in Hungary, therefore a lender will need to be authorized by the National Bank of Hungary to conduct such business.

Mortgage and consumer loans are subject to a range of regulatory requirements that do not apply to unregulated loans. For example, for regulated mortgage contracts, there are particular restrictions around how:

- the loans are marketed, originated and sold;
- lenders administer the loans on an ongoing basis; and
- to deal with borrowers who fall behind with their payments.

Regulated credit agreements on the other hand have specific requirements regarding how the agreement is drafted and formatted and what information must be included.

There are no additional restrictions that apply to foreign lenders making loans to Hungarian borrowers.

**Borrowing**

While borrowers are generally not regulated, it is advisable for borrowers to consider whether either the mortgage or consumer lending regimes apply to their activities, in which case they will benefit from the protections mentioned above.

**What are common lending structures?**

Lending in Hungary can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents which fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate members taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, e.g., term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities.

**Loan durations**

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
• a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
• an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
• a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Loan security

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

Loan commitment

A loan can also be:
• committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
• uncommitted, meaning that the lender has discretion whether or not to provide the loan.

Loan repayment

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

What are the differences between lending to institutional / professional or other borrowers?

Lending to institutional/professional borrowers (as opposed to consumer borrowers) is subject to less regulatory oversight and is therefore less burdensome from a compliance perspective.

By contrast, stricter rules shall apply in case of lending in the context of mortgages and to consumers. For more information, see Lending and borrowing – restrictions.

Do the laws recognize the principles of agency and trusts?

Yes, as of 2013 both principles are recognized as a matter of Hungarian law, however, no significant court practice has been established yet regarding these legal instruments.

For instance, it is possible to appoint an agent to act on behalf of other parties and a trustee to hold rights and other assets on trust for the lenders or secured parties.

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual principles. For example, Hungarian courts will not enforce an excessive penalty and so lenders have to be careful about the rate of default interest charged on a loan. Lenders therefore tend to opt for a modest uplift of around 2% above the usual rate.

Specific types of lending
Specific to the area of mortgage lending is the issue of whether a lender falls within the Hungarian mortgage regime. The Mortgage Credit Directive, as implemented in Hungary, aims to prevent the irresponsible lending and borrowing practices that were exposed during the global financial crisis. It imposes a number of requirements on lenders including the need to:

- conduct affordability tests before lending;
- provide standard information about the mortgage to enable borrowers to compare products; and
- ensure that staff are suitably trained.

**Standard form documentation**

Major syndicated finance transactions under the laws of Hungary are governed by documentation based on recommended forms published by the [Loan Market Association (LMA)](https://www.lma.net). Bilateral finance transactions are more likely to be documented on bank standard form documentation prepared in-house.

*Last modified 20 Oct 2017*

**Are there any other notable risks or issues around borrowing?**

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to 'bail in' obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. 'Bail in' describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of Hungarian or other EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

*Last modified 20 Oct 2017*

**Giving and taking guarantees and security**

**Are there any restrictions on giving and taking guarantees and security?**

Some of the key areas affecting the giving of guarantees and security are as follows.

**Capacity**

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and that there are no restrictions on the directors’ powers that would be preventative.

**Insolvency**

Guarantees and security may be at risk of being set aside under the insolvency laws of Hungary if the guarantee or security was granted by a company within a certain period of time prior to the onset of insolvency.

Under Hungarian law, the creditor, and on behalf of the debtor, the liquidator may file for legal action before the court within 90 days from the time of gaining knowledge or within a one-year limitation period from the date of publication of the notice of liquidation to contest certain contracts entered into by the debtor prior to the onset of insolvency.

**Financial assistance**

Public companies limited by shares may provide financial assistance to third parties for the acquisition of shares issued by the public
company limited by shares only under market conditions, from the assets available for the payment of dividends and provided that the
general meeting has approved such decision by at least a three-quarters majority upon recommendation by the management board. No
financial assistance restrictions apply for other corporate forms.

Last modified 20 Oct 2017

What are common types of guarantees and security?

Common forms of guarantees

Unless the parties agree otherwise, under the general rules of the Hungarian Civil Code the guarantee contract, and the statement of
guarantee means a guarantor's commitment under which payment is to be made to the creditor subject to the conditions laid down in the
statement. The obligation of the guarantor set out in the statement of guarantee is independent of the underlying obligation of the
debtor. The guarantor may not raise the same objections that can be made by the debtor against the creditor. The guarantor is liable to
make payment under the guarantee if the creditor requested payment in writing, strictly abiding by the requirements specified in the
statement of guarantee.

Common forms of security

There are three basic types of security interest that can be created under the laws of Hungary:

- a pledge;
- a charge; and
- a mortgage.

Different types of security are suitable for securing different types of assets.

Under Hungarian law it is possible to grant security over all of the assets of a Hungarian company or over individual assets. Granting
security over all of a company's assets will tend to be achieved by way of a pledge agreement which will include:

- a mortgage over real estate;
- a pledge over assets which are identifiable and can be controlled by the creditors (such as equipment);
- a pledge over assets identified by detailed description (such as stock); and
- an assignment or pledge over receivables and rights.

Last modified 20 Oct 2017

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

To be valid, a guarantee needs to be in writing and signed by the guarantor.

Consideration for a guarantee is subject to general contractual principles. In the case of a guarantee, the underlying obligations will
usually be the consideration for the guarantee and so it is advisable to execute the guarantee at the same time as executing the
underlying obligations to avoid any suggestion of past consideration. Often the guarantee is included in the loan agreement and so this
should not be an issue. It can also be difficult to establish consideration for a guarantee as the primary obligations are between the
underlying obligor and beneficiary, for example between the borrower and lender.

Giving or taking security

Once granted, certain forms of security need to be properly perfected before they are valid against third parties. Perfection formalities can
range from having the secured asset delivered to the security holder, registration of the security and notice being given to third parties.
Most charges created by a Hungarian company must be registered at the public registry within 15 days of its creation.

Like guarantees, for a period after a new security interest has been granted (known as the hardening period), it is at risk of being set aside in certain circumstances under Hungarian insolvency laws. Reviewable transactions include those conducted at an undervalue or preferences.

Last modified 20 Oct 2017

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Act CXXXIX of 2013 on the National Bank of Hungary (2013. évi CXXXIX. törvény a Magyar Nemzeti Bankról) (regulates the primary objectives, basic tasks and responsibilities of the National Bank of Hungary)

Act CCXXXVII of 2013 on Credit Institutions and Financial Enterprises (2013. évi CCXXXVII. törvény a hitelintézetekről és a pénzügyi vállalkozásokról) (regulates the obligations of credit institutions and financial enterprises regarding their establishment and operation)

Act CXXXVIII of 2007 on Investment Firms and Commodity Dealers, and on the Regulations Governing their Activities (2007. évi CXXXVIII. törvény a befektetési vállalkozásokról és az arutzsai szolgáltatókról, valamint az általuk végezhet tevékenységek szabályairól) (regulates the obligations of investment firms and commodity dealers regarding their establishment and operation)

Act CXX of 2001 on the Capital Market (2001. évi CXX. törvény a tőkepiacról) (regulates the capital markets and the obligations of the market participants thereof)

Act XXX of 2014 on the further development of the system of institutions strengthening the security of the individual players of the financial intermediary system (2014. évi XXX. törvény a pénzügyi közvetítrendszer egyes szereplőinek biztonságát erősíti intézményrendszer továbbfejlesztéséről) (stipulates provisions regarding the financial stability of the financial sector and establishes the framework for the administrative restructuring of financial institutions)

Consumer credit

Act CLXII of 2009 on Consumer Credit (2009. évi CLXII. törvény a fogyasztónak nyújtott hitelről) (consumer lending and the rights and obligations of the lenders and consumers)

Mortgages

Mortgage Credit Directive (2014/17/EU) (mortgage credit)

Act XXX of 1997 on Mortgage Loan Companies and on Mortgage Bonds (1997. évi XXX. törvény a jelzálog-hitelintézetekről és a jelzáloglevélről) (regulates the establishment and operation of mortgage loan companies and the use of mortgage bonds)

Corporations

Act V of 2013 on Civil Code (2013. évi V. törvény a Polgári Törvénykönyvről) (body of rules regulating the core areas of private law)

Act V of 2006 on Public Company Information, Company Registration and Winding-up Proceedings (2006. évi V. törvény a cégnilvánosságról, a bírósági cégeljárásról és a végelszámolásról) (establishes the legal framework regarding the foundation and
registration of companies and for providing full public access to information from registers of official company records)

Act CXXXII of 1997 on Hungarian Branch Offices and Commercial Representative Offices of Foreign Companies (1997. évi CXXXII. törvény a külföldi székhely vállalkozások magyarországi fióktelepeiről és kereskedelmi képviseleteiről) (business establishment for foreign companies)

**Funds and platforms**

**Other key market legislation**

Bank Recovery and Resolution Directive (2014/59/EU) (recovery and resolution)

Capital Requirements Regulation (Regulation (EU) 575/2013) (capital requirements)

European Market Infrastructure Regulation (Regulation (EU) 648/2012) (derivatives)

Market Abuse Regulation (Regulation (EU) 596/2014) (market abuse)

**Regulatory authorization**

**Who are the regulators?**

The National Bank of Hungary is the conduct regulator for firms providing financial products and services in both retail and wholesale markets, and also the prudential regulator for many firms. It is also responsible for enforcing the market abuse and listing regimes.

The National Bank of Hungary is also responsible for the prudential regulation of systemically important financial institutions, including banks, building societies, insurers and major investment firms.

**What are the authorization requirements and process?**

All financial institutions/investors must apply to the National Bank of Hungary for authorization.

According to the general rule, the regulators must assess whether the application meets the required threshold conditions within three months of the submission of the completed application, however, in certain circumstances the three-month period might be extended on one occasion by up to a further three months.

The regulator will also approve key individuals (eg senior management) in their roles.

Authorized firms and individuals are listed on the Registry of the National Bank of Hungary.

**What are the main ongoing compliance requirements?**

Threshold conditions (such as having adequate financial resources and compliance arrangements in place) are an ongoing compliance requirement for authorized firms.
Failure to comply with the threshold conditions and more detailed regulatory rules can result in sanctions for firms and regulated individuals, and a loss of regulated status.

Last modified 20 Oct 2017

**What are the penalties for failure to be authorized?**

A person undertaking a regulated activity without being authorized or exempt, commits a criminal offence and is liable to imprisonment.

Last modified 20 Oct 2017

**Regulated activities**

**What finance and investment activities require authorization?**

**Generally**

Under Hungarian law, carrying on finance and investment activities by way of business is subject to government authorization. By way of business shall mean gainful (for-profit) economic activities performed on a regular basis for compensation, involving the conclusion of deals which have not been individually negotiated.

The following financial and investment activities are subject to authorization:

- financial services and financial auxiliary services (such as taking deposits and receiving other repayable funds from the public, credit and loan operations, financial leasing, money transmission services or the issuance of electronic money);
- investment services, investment ancillary services and commodity exchange services (such as dealing on own account, portfolio management, granting credits and loans to investors or investment research and financial analysis); and
- services provided under the Act CXX of 2001 on the Capital Market (such as the activities of any stock exchange, central securities depository, central counterparty established in Hungary)

**Consumer credit**

Consumer credit activities, including credit broking, operating an electronic system in relation to lending and entering into a regulated credit agreement as lender are regulated activities.

Last modified 20 Oct 2017

**Are there any possible exemptions?**

As a general rule, every person carrying out finance and/or investment activities must apply for authorization, however, certain entities, such as the European Investment Fund or European Investment Bank are exempt from this obligation.

Last modified 20 Oct 2017

**Do any exchange controls or other restrictions on payments apply?**

Hungary does not operate any foreign currency controls.

For cases of money transferring from non-EU member states, imports of foreign currency may need to be declared in the custom declarations, but there is no legal restriction on moving money in and out of the country.

Compliance with the EU rules on payments (EU Payments Regulation and the Transfer of Funds Regulations) must be ensured.

There may also be anti-money laundering and tax considerations to take into account.
What are the rules around financial promotions?

Under Hungarian law, the communications by financial institutions are subject to special consumer protection provisions governing the form and content of financial promotions. These provisions stipulate that financial promotions shall be clear about the key conditions, shall not be misleading and shall not create unrealistic expectations.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common types of legal entities are companies limited by shares and limited-liability companies, both of which are body corporates with separate legal personality that limit the liability of their members.

Companies limited by shares can either be private (denoted by the suffix 'Zrt.') or public (denoted by the suffix 'Nyrt.') depending on whether their shares are offered to the public. Some activities require a particular type of legal entity to be used, for example banks and specialized credit institutions may only operate in the form of companies limited by shares or as branches.

The liability of a company's shareholder is limited by shares, in which case they are only liable to pay for their shares and not the company's debts.

Limited-liability companies (or 'Kft.') are similar to companies limited by shares in many ways. The main difference is that they require a lower minimum initial capital contribution.

Funds

Investment funds are recognized as legal entities, and shall be deemed established when registered by the National Bank of Hungary, and shall be deemed terminated when removed from the register. In its capacity as the investment fund's lawful representative, an investment fund manager may act in the name of the investment fund.

Investment fund managers (with certain exceptions) typically operate in the form of companies limited by shares.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

A company can conduct lending or investment business in Hungary through an establishment (also known as a 'branch') but this does not create a separate legal entity.

Overseas companies having an establishment in Hungary need to comply with the Act CXXXII of 1997 on Hungarian Branch Offices and Commercial Representative Offices of Foreign Companies.

Overseas companies carrying on a trade in Hungary through a 'permanent establishment' will be subject to Hungarian corporation tax.
FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
- consumer loans;
- student lending products;
- small and medium-sized enterprises (SME) lending; and
- residential property and commercial property mortgage lending.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P) type structures often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

ISSUES FOR STARTUP MARKETPLACE LENDERS

Following the initial incorporation and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform. As the startup lender will not have an established track record, deposit base or asset pools, the funding structure will often follow the format of a warehouse securitization structure.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus.
that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a 'proof of work' process.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open ('permissionless' or 'unpermissioned') or structured within a private group ('permissioned'). Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an 'address'). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example the most widely-known alternatives to bitcoin being ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of
access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The National Bank of Hungary (National Bank) is the conduct regulator for firms providing financial products and services in both retail and wholesale markets, and also the prudential regulator for many firms. It is also responsible for enforcing the market abuse and listing
regimes.

GENERAL

Under Hungarian law, carrying on finance and investment activities by way of business is subject to government authorization. All financial institutions/investors must apply to the National Bank for authorization. The National Bank will also approve key individuals (e.g. senior management) in their roles. Authorized firms and individuals are listed on the Registry of the National Bank. Where FinTech products and/or applications involve financial activity which requires regulatory authorization, the firms providing such products and/or applications must be authorized by the National Bank.

REGULATORY DEVELOPMENTS ON INVESTMENT PLATFORMS

The Hungarian regulatory framework on investment platforms follows the direction of European Union developments.

Electronic payments platforms and regulation of peer-to-peer lenders

ELECTRONIC PAYMENT PLATFORMS

Act CCXXXV of 2013 on Payment Service Providers (Payment Service Act) regulates the establishment and the operation of electronic payment platforms. A number of FinTech businesses are offering electronic payment platforms to rival the traditional payment systems. The Payment Service Act and Act CCXXXVII of 2013 on Credit Institutions and Financial Enterprises (Financial Institutions Act) contain a number of electronic money (e-money)-related rules, aimed at businesses that are issuing or considering the issuance of e-money. E-money is defined by the Financial Institutions Act as electronically, including magnetically, stored monetary value as represented by a claim on the issuer of the e-money which is issued on receipt of funds for the purpose of making payment transactions, and which is accepted by a natural or legal person, unincorporated business association or private entrepreneur other than the e-money issuer. Generally, firms issuing e-money must be authorized or registered with the National Bank.

PEER-TO-PEER LENDERS

A person carries out a regulated activity (requiring authorization by the National Bank) if they facilitate lending and borrowing on a commercial scale.

Regulation of payment services

Under Hungarian law, carrying on finance and investment activities by way of business is subject to authorization. By way of business means gainful (for-profit) economic activities performed on a regular basis for compensation, involving the conclusion of deals which have not been individually negotiated. In order to become authorized by the National Bank, a payment services business needs to meet certain criteria, including in relation to its business plan, initial capital, processes and procedures in place for safeguarding relevant funds, sensitive payment data and money laundering and other financial crime controls.

Application of data protection and consumer laws

The Act CXII of 2011 on the Right of Informational Self-Determination and on Freedom of Information (Data Protection Act) regulates the processing of personal data within Hungary. The Data Protection Act implements the European Data Protection Directive. Where a business determines the purposes and manner in which any personal data is processed, it will be regulated by the Data Protection Act and have certain notification and compliance obligations. In addition, Act CVIII of 2001 on Electronic Commerce and on Information Society Services stipulates further data protection provision related to transactions made through electronic commerce.

The European General Data Protection Regulation (GDPR) is set to come into effect on 25 May 2018. The GDPR is more prescriptive and restrictive compared to the Data Protection Act, including mandatory notifications where a breach occurs and provides for severe monetary sanctions for breach.

Money laundering regulations

Act LIII of 2017 on the Prevention and Combating of Money Laundering and Terrorist Financing gives the National Bank responsibility for supervising the anti-money laundering controls of businesses that offer certain services, such as lending, providing payment services and issuing and administering other means of payment. These regulations implement the European Union's Fourth Money Laundering Directive.
Generally, where a firm is authorized and supervised by the National Bank it will also be authorized and supervised by the National Bank for complying with anti-money laundering requirements. Electronic currencies such as bitcoin and cryptocurrencies tend to represent a higher money-laundering risk.

Last modified 20 Oct 2017

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**

**SEED INVESTMENT**

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

**CROWDFUNDING**

The crowdfunding sector may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

**ACCELERATORS**

There are various incubators or accelerators in the Hungarian market which offer support, facilities and funding for startups, often in return for an equity stake.

**Venture capital and debt**

Venture capital (VC) funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. VC provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of VC and involves an equity investment by a corporate fund. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a loan (or series of loans) secured against a company’s assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

**Warehouse and platform funding**

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.
Another alternative form of funding is by way of peer-to-peer (P2P) lending platforms, which bring individual borrowers and lenders together without the involvement of traditional banks.

**Senior bank debt and capital markets funding**

**Senior Bank Debt**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**Capital Markets Funding**

Raising finance by way of an Initial Public Offering (IPO) is a possible funding arrangement for FinTech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange, such as the Budapest Stock Exchange.

**Convertible Bonds/Loan Notes**

A popular funding tool for fast-growing FinTech businesses is to issue convertible bonds or loan notes which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

**Incentives and reliefs**

As of 1 January 2017, the Act LXXXI of 1996 on Corporate Tax and Dividend Tax offers a corporate tax relief for businesses who invest in the shares of qualifying startups, up to a maximum amount of HUF 20 million per year for three years, following the acquisition of the shares.

**Portfolio sales**

**Loan transfers and portfolio sales**

*What are common ways of buying and selling loans?*

Buying and selling loans is not very common in Hungary.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are:

- **Transfer of contract** – The transfer of the contract is a full legal transfer of the party's rights and obligations. It is a tripartite arrangement between the existing parties and the transferee and results in the transfer of the contract between the continuing party and the transferee and the transferor being released from its obligations. The debtor can grant a prior approval to such transfer.

- **Sub-participation** – A sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the buyer taking on double credit risk, both on the seller as well as the borrower.

For more complex transactions, a more bespoke form of sale and purchase agreement would tend to be used. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

*What are the main considerations when transferring a loan and related security?*
There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller’s legal advisors. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and
- **consent** – whether a transfer requires the consent or notification of any other parties.

Projects

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

**Generally**

The ownership of energy and infrastructure assets in Hungary varies according to the asset class. The main asset classes are usually considered to be:

- economic infrastructure (energy, aviation, rail, telecommunications, roads and waste); and
- social infrastructure (education, health and justice/prisons and housing).

Key sectors are considered below.

**Energy**

The liberalization of the Hungarian electricity and natural gas market was completed in 2008, with generation, transmission, distribution and supply services provided by a number of private sector companies. Private sector companies own such generation assets, however, transmission and distribution assets are owned by the state owned MAVIR Hungarian Independent Transmission Operator Company Ltd.

The public sector finances and delivers most of the required infrastructure but there are a number of private sector investments, mainly in connection with the renewable and smaller scale co-generation energy generation technologies.

The Hungarian Energy and Public Utility Regulatory Authority (MEKH) is the principal body with responsibility for regulation of the energy sector in Hungary.

**Telecoms infrastructure**

The telecommunications networks (fixed and mobile) in Hungary are privately owned by a number of incumbent service providers. A good example is Telekom Hungary which is responsible for most of Hungary's broadband infrastructure but whose work is heavily regulated by government.

The National Media and Infocommunications Authority (NMHH) is the regulator of Hungary's telecommunications sector. It also has responsibilities for television broadcast services and wireless communications services.

**Transport infrastructure**
LIGHT RAIL

Typically, light rail assets (such as trams and associated track) are owned by local public sector promoting bodies.

HEAVY RAIL

The rail market in Hungary is dominated by the state owned Hungarian State Railways Ltd. (MÁV). The principal elements to the rail sector in Hungary are:

- Hungarian State Railways Ltd. (MÁV), a private limited company, is on the public sector balance sheet and owns or operates and maintains rail tracks, signaling and station infrastructure. It is responsible for operating most of the regulated national rail infrastructure.

- Freight Operating Companies (FOCs) and Rolling Stock Companies (ROSCOs) are mostly owned by the Hungarian State Railways Ltd.

The rail sector is regulated by the National Transport Authority.

ROADS, BRIDGES AND TUNNELS

A government entity, Hungarian Public Road Non-Profit Ltd, operates, maintains and improves the motorways and major roads in Hungary, and receives funding from the government for investment in the strategic road network (including additional road capacity). Local roads in Hungary are the responsibility of local authorities. Construction contracts are generally procured by the National Infrastructure Developing company NIF Zrt. In the case of toll roads, the private sector has taken on roads/crossings on a full concession basis and is therefore responsible for the design, build, financing, operation, maintenance and collection of tolls for a number of years with the main revenue stream being the collection of toll revenues from users (rather than any service payments from the public sector). However, these types of projects are no longer considered viable as the private sector is not willing to take ‘demand risk’ in order to service the upfront capital costs and associated bank debt.

AVIATION

Aviation in Hungary is (for the most part) privatized. As regards airport infrastructure, there are a number of ownership structures in the Hungarian market, including private ownership and local government ownership. All models are heavily regulated by government and the National Transport Authority is the aviation regulator in Hungary.

Other infrastructure

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS/PRISONS)

Typically, these are owned by the public sector (eg ownership of hospitals is vested in various public sector bodies). The majority of social infrastructure assets in Hungary are directly financed by the government.

DEFENSE

Typically, defense assets are owned by the public sector.

WASTE

In Hungary waste related services are provided by the public sector, which is responsible for designing, building, operating and maintaining the facilities and the infrastructure.

WATER

In Hungary water and wastewater services are provided by state owned companies.

Last modified 20 Oct 2017

Are there special rules for investing in energy and infrastructure?

Generally
There is no specific regime governing or restricting investment in energy or infrastructure projects in Hungary over and above existing regulation for investors and funders more generally however, a particular proposed investment may be subject to legislative or regulatory control (eg merger control rules). As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory position relevant to that project must be considered. For example, a project involving development on land will require planning permission or a development consent order; and a project may require environmental authorizations/permits and/or sector specific regulatory consents or licenses. Key sector-specific issues are flagged in the sections below.

Whether an investor can invest will depend on the terms of the procurement of that project if it is a public sector project and whether there are any contractual restrictions on change of control, in respect of an existing/operational project. This is less of a concern for private sector infrastructure although investors would need to consider whether any licenses/consents/permits would be affected by their acquisition of an interest.

**Energy**

The energy markets in Hungary have a complex system of arrangements between suppliers, generators, transmission and distribution which are heavily regulated. In particular, there are complex arrangements in respect of licensing, subsidies and demand/charging mechanism with suppliers, customers and the MAVIR Magyar Villamosenergia-ipari Átviteli Rendszerirányító Zrt. (the Hungarian transmission system operator) which are subject to change/regular updates meaning that investors will need to have a good understanding of the current framework and the potential directions in which the market may move. Investors need to understand how developments in technology may impact on the overarching regulatory framework and vice versa.

Investors should also consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with any license conditions or the granting of specific subsidies. In particular, if a breach of those conditions could lead to the revocation of a license/subsidy that might make the potential target less attractive or viable.

**Telecoms infrastructure**

There is a complex regulatory environment for this sector including how access and interconnectors (between networks) are regulated under Act C of 2003 on Electronic Communications and other applicable legislation and how The National Media and Infocommunications Authority (NMHH) grants rights to access private or public land in order to install and maintain essential equipment in, over or under that land. This equipment might be cables sunk beneath the ground or a mobile mast sited on the ground.

The industry is largely privatized, therefore investors should consider if any permits/consents/licenses will be affected by their interest.

**Transport infrastructure**

**RAIL**

There is an extensive and complex regulatory framework to consider in respect of a practical and operational involvement in this sector. Key areas include understanding the regulatory regime for certification for train use and acceptance and user fare regulation. Depending on how an investor wishes to invest in a project (specifically what type of entity or asset), there is a varying degree of difficulty for investors to enter into an existing project.

**ROADS**

In order for a private sector partner to carry out its duties on certain types of roads projects, the procuring public sector authority may delegate certain of its statutory duties to the private sector partner. This will be dependent on the project and the specific contractual requirements. Any investor will, therefore, need to understand those duties and whether it is able to subcontract those duties to an appropriate person.

Last modified 20 Oct 2017

**What is the applicable procurement process?**

Public procurement in Hungary is, in most instances governed by Act CXLIII of 2015 on Public Procurement which is based on EU Directives. There are some sector-specific regulations such as Act XXX of 2016 the Defense and Security Public Procurements, but these are also based on EU Directives.
The key principles are that contracts procured by the public sector are awarded fairly, transparently and without discrimination on the grounds of nationality and that all potential bidders are treated equally.

**Investing in energy and infrastructure**

Public procurement is relevant where the Hungarian government, or any branch of it as a state-owned company, is seeking to outsource the delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset. Design, Build, Finance and Operate public-private partnership (DBFO PPP) schemes were popular in Hungary in road, prison, education and sports projects before 2010. Currently, no new DBFO PPP projects are launched and existing DBFO PPP projects are being actively terminated by the state. The relevant procurement legislation applies to certain public bodies including central government departments, local authorities, police and fire authorities and various non-governmental bodies. A regulated procurement is required where certain financial thresholds are met and on most major infrastructure projects (where limited exclusions do not apply), it is likely that those thresholds will be met so a regulated procurement would need to be run.

In most cases, the public sector will need to publish a contract notice in the Office Journal of the European Union (OJEU) and typically run one of the following procedures.

**OPEN PROCEDURE**

This is suitable for easy-to-evaluate projects and tenderers simply submit a tender in response to the OJEU notice. Change and negotiations to the tender are not permitted.

**RESTRICTED PROCEDURE**

There is a shortlisting of at least five tenderers following an expression of interest stage and tenderers submit a bid. Again, no negotiation is permitted other than clarification and finalization of the contract terms.

**COMPETITIVE DIALOGUE**

This is often the most common procedure for complex infrastructure projects and involves a shortlisting of at least three bidders who are invited to discuss with the public sector to develop detailed solutions which are capable of being accepted by the public sector. Clarification and further negotiations are allowed following final tender but only on the basis of confirming the financial and other commitments in a tenderer’s bid.

**COMPETITIVE PROCEDURE WITH NEGOTIATION**

This is sometimes described as a hybrid procedure as it allows dialogue with bidders but also allows the public sector to award a contract on the basis of an initial tender (or further stages) but clarification and negotiation is not allowed following final tender.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement-related considerations that need to be borne in mind.

**Financing energy and infrastructure**

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector.

_Last modified 20 Oct 2017_

**What are the most common forms of funding / investing in energy and infrastructure?**

**Funding**

Common forms of funding in energy and infrastructure include:
loans made on a corporate finance basis (balance sheet debt);

- loans made on a project-finance basis (to a special purpose project company) on medium- to long-term bases – such loans may later be syndicated to other funders;
- bond finance;
- refinancing of the debt in operational projects; and
- asset financing (particularly relevant in the rail sector).

Funding/funding products can also, sometimes, provided by the European Investment Bank and export credit agencies.

Investing

Common forms of investing in energy and infrastructure include:

- 'equity' investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of 'equity').

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

When the National Bank of Hungary considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

What regulatory penalties may apply?

When a rule breach has taken place, the National Bank of Hungary may impose a financial penalty or censure, or withdraw regulated status against the firm and/or regulated individuals. The regulator will publicize these penalties.

What criminal penalties may apply?

Following formal investigation, the criminal courts have the power to impose criminal penalties in certain cases, including:

- insider dealing;
- unlawful disclosure of inside information;
- unlawful market manipulation;
- organization of pyramid schemes;
- money laundering; and
- unauthorized financial activities.
Tax

Tax issues

*Are stamp, registration, transfer or other similar taxes applicable?*

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

No stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

Most security interests must be registered with the competent authority to ensure that they are valid against third parties.

The grant of a security interest over Hungarian real estate should be registered at the Land Registry as the competent authority.

Other forms of registration may also be required, depending on the nature of the asset over which the security is taken. In the case of security over shares or business quotas the Court of Registration is the competent authority for registration purposes. Security over certain movable property, rights and claims must be registered on the Collateral Register of which the Hungarian Chamber of Notaries is the competent authority.

Such registration procedures are subject to notional administrative service charges (eg the registration of a mortgage over Hungarian real estate at the Land Registry is subject to a procedural fee of HUF 12,600 (approximately €30) per plot number). Such registrations may also require the payment of notional registration fees.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

No stamp, registration, transfer or other similar taxes are payable on the issue, transfer or assignment of a debt security. However, the introduction of securities (issued in a series) to the regulated market or the registration in a multilateral trading system may be subject to administrative service charges.

*Do tax authorities take priority on enforcement?*

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

In the case of an enforcement procedure, a mortgage concerning movable or immovable property takes priority over the claims of the tax authority.

In the case of a liquidation procedure, taxes and social security contributions related to employment and termination of employment take priority over debts secured with a mortgage. Other claims of the tax authority related to taxes and social security contributions are subordinated to a debt secured with a mortgage.

*Is withholding tax on interest payments applicable?*

Is there withholding tax on interest payments under a loan?
No withholding tax applies on outbound interest payments made to a corporate entity which is not resident for tax purposes in Hungary, provided that the recipient does not have a permanent establishment in Hungary.

Interest payments made to an individual who is not resident for tax purposes in Hungary are, in general, subject to withholding tax in Hungary.

**If so:**

**What is the rate of withholding?**

Withholding tax is not applicable in the case of interest payments made to a corporate entity which is not resident for tax purposes in Hungary, provided that the recipient does not have a permanent establishment in Hungary.

In general, interest paid to an individual who is not resident for tax purposes in Hungary is subject to 15% withholding tax in Hungary.

**What are the key exemptions?**

Withholding tax is not applicable in the case of interest payments made to a corporate entity which is not resident for tax purposes in Hungary, provided that the recipient does not have a permanent establishment in Hungary.

Relevant double tax treaty provisions may mitigate or provide protection against taxation of outbound interest payments in Hungary in the case of payments made to an individual who is not resident for tax purposes in Hungary.

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes, the analysis described above is applicable to both interest payments under a loan or other form of debt security.

*Last modified 20 Oct 2017*

**Are foreign lenders and debt security holders subject to tax on interest payments?**

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No, provided that the lender does not have a permanent establishment in the jurisdiction of the borrower (ie in Hungary).

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both Irish and EU law.

Unless certain exemptions apply, it is unlawful to offer debt securities to the public in Ireland. Where an issuer of debt securities is able to avail of one of the exemptions (outlined below), a prospectus will still be required if the Issuer intends to have the securities admitted to trading on a regulated market in Ireland.

Under the Companies Act, 2014 (as amended), a private company limited by shares (LTD) and a designated activity company (DAC) cannot offer securities to the public. However, section 68 (3) of the Companies Act 2014 provides that the offer of certain types of securities by a private limited company will not constitute an offer to the public. They include an offer:

- addressed to qualified investors only;
- addressed to fewer than 150 persons (other than qualified investors);
- addressed to investors who acquire securities for a total consideration of at least EUR100,000 per investor, for each separate offer;
- with a denomination per unit of at least EUR100,000; and
- with a total consideration in the EU of less than EUR100,000, calculated over a 12-month period.

A DAC can, pursuant to section 981 of the Companies Act 2014, apply to have the above securities admitted to trading or listed on any market, regulated or otherwise. An LTD is prohibited from applying to have, and from having securities admitted to trading or listed on any market.

A public limited company can offer debt securities to the public and can apply to have those debt securities admitted to trading and listing, whether on a regulated market or otherwise.

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Ireland are bonds or notes issued on a standalone basis or under a program.

Many different types of debt securities are offered in Ireland. Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities and high-yield bonds;
• asset-backed securities;
• derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
• hybrid securities (securities with both debt and equity features);
• equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer);
• Capital Contingent Convertibles (CoCos), which can qualify as either Additional Tier 1 (AT 1) or Tier 2 (T2) bonds (all subordinated debt instruments issued by banks to fulfil regulatory capital requirements);
• Restricted Tier 1 (RT1) and Tier 2 (T2) bonds (junior bonds issued by insurance companies to fulfil regulatory capital requirements);
• Sovereign green bonds and corporate public green bonds which comply with the International Capital Market Association’s Green Bond Principles; and
• warrants (securities giving the holders the option to purchase the equity of the issuer or of a related company).

What are the differences between offering debt securities to institutional / professional or other investors?

The Prospectus Regulation (EU) 2017/1129 (the Prospectus Regulation) became directly effective in Ireland from July 21, 2019. Two Delegated Regulations (Commission Delegated Regulations (EU) 2019/980 and Commission Delegated Regulation (EU)2019/979) have also been implemented. The European legislation puts in place a harmonized framework which is intended to ensure investor protection and to drive supervisory convergence at the EU level where securities are offered to the public or admitted to trading on a regulated market in an EU Member State.

Domestic legislation in the form of EU (Prospectus) Regulations 2019 (S.I. No. 380/2019) (the Irish Regulations) was enacted in July 2019. The Central Bank of Ireland also published new rules to replace its existing market abuse, transparency and prospectus requirements and consolidate them into a single statutory instrument. The Central Bank (Investment Market Conduct) Rules 2019 (S.I. No. 366/2019) came into force in July 2019 and are supplemented by guidance documents which are published on the Central Bank of Ireland’s website.

The EU (Prospectus)(Amendment) Regulations 2019 (S.I. No 670 of 2019) increased the threshold of total consideration to EUR8 million for a public offer of securities below which a prospectus would not be required for offers to the public.

The Finance (Tax Appeals and Prospectus Regulation) Act 2019 commenced on December 18, 2019, and amended the prospectus law provisions in Part 23 of the Companies Act 2014 to reflect the transposition of the Prospectus Regulation.

Under the Prospectus Regulation, one of the circumstances in which a prospectus must be produced is where an offer of securities is made to the public within the EU. An exemption from this requirement to publish a prospectus applies where offers are made solely to qualified investors (which are defined as persons or entities under the professional investor classification in the MiFID II Directive (2014/65/EU) (professional clients, persons treated as professional clients, and persons recognized as eligible counterparties)). However, if the debt securities are to be admitted to trading on an EU-regulated market, a prospectus would still be required.

The nature of the information that has to be disclosed in a prospectus for the issue of debt securities under the Prospectus Regulation depends on whether the issue falls within the retail regime or the wholesale regime.

If the denomination of the securities is equal to or above EUR100,000 (or the equivalent in another currency), the wholesale rules apply. If the denomination is under EUR100,000, the retail rules apply. Additional disclosure requirements apply for retail securities.

When is it necessary to prepare a prospectus?

Securities can only be offered to the public in the EU after prior publication of a prospectus in accordance with the Prospectus Regulation. Securities shall only be admitted to trading on a regulated market situated or operating within the EU after prior publication of a prospectus in accordance with the Prospectus Regulation.
An offer would not be deemed to have been made to the public if, among other things, it is made solely to qualified investors, addressed to fewer than 150 persons (other than qualified investors) per Member State or where the minimum denomination per unit is at least EUR100,000.

Pursuant to the Irish Regulations there is an additional exemption from the obligation to publish a prospectus where the total consideration of the offer does not exceed EUR8 million.

Even if the offer is deemed not to be made to the public, a Prospectus Regulation compliant prospectus may still be required if an application is made for the securities to be admitted to trading on a regulated market. An exemption from both the offer to the public and the admission to trading on a regulated market is needed to avoid having to publish a prospectus.

What are the main exchanges available?

The Irish Stock Exchange joined Euronext in March 2018 and now operates under the trading name Euronext Dublin. Issuers of debt securities can list on either the Euronext Dublin Regulated Market (Regulated Market) or the Global Exchange Market (GEM).

The Regulated Market is a regulated market (as defined under MiFID II) and Euronext Dublin is the authority for the approval of the securities for admission to listing and trading on the Regulated Market.

The GEM is an exchange-regulated market and Multilateral Trading Facility as defined under MiFID II which is aimed at professional investors.

Issuers and debt securities listed on the Regulated Market are subject to the prospectus regime, the transparency regime and the market abuse regime, whereas issuers of debt securities listed on the GEM are subject to the market abuse regime only.

Euronext Dublin has published a comprehensive set of rules for listing a variety of debt securities on the Regulated Market (Euronext Dublin Rule Book – Book II: Listing Rules) and GEM (Global Exchange Market – Listing and Admission to Trading Rules for Debt Securities – Release 6). These rules impose obligations on issuers of debt securities at the time of application for admission to trading and listing, and on an ongoing basis.

Is there a private placement market?

Ireland has an active private placement market. “Private placement” is not a defined term under Irish securities market legislation; however, it is generally described as an offer where securities are made available to a relatively small number of selected investors as a way of raising capital. Essentially, a private placement is one that does not qualify as a public offer and therefore, where any of the exceptions set out in section 68 (3) of the Companies Act 2014 (discussed above) are applicable, the obligation to publish a prospectus would not arise (unless the securities, the subject of the offer, are to be listed on a regulated market).

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Pursuant to Regulation 35 of and the schedule to the Irish Regulations, each of the following persons (i.e. more than one person may be required to take responsibility for the whole of the prospectus) is responsible for the prospectus, where the securities are not equity securities:

- if the case involves an offer of securities to the public, the offeror of the securities;
- if the case involves the admission to trading of securities, the person seeking admission;
• if there is a guarantor in respect of the issue, the guarantor in respect of statements included in, or information omitted from, the prospectus that relate to the guarantor or the guarantee given by the guarantor.

Certain persons can take responsibility for specified parts. This is in addition to the responsibility attaching to the person(s) in (a) to (c) above.

Civil and criminal liability may attach to an issuer for breaches of the prospectus regime, the transparency regime, market abuse regime, including civil and criminal liability under the Companies Act 2014. In addition, the Central Bank of Ireland and/or Euronext Dublin can impose administrative sanctions for breach of the prospectus regime or of the listing rules, as appropriate.

Civil liability for certain claims, including mis-statements or omissions in a prospectus, may also arise under common law.

Civil liability in respect of misstatements under the Companies Act 2014 does not extend to the directors of the issuer or an expert who consented to the inclusion of their statement in the debt securities prospectus, unless the prospectus expressly provides otherwise or unless such person is convicted on indictment of an offence created by the Irish Regulations or an offence under s1357 of the Companies Act in respect of the issue of that prospectus.

Under the Transparency (Directive 2004/109/EC) Regulations 2007 (S.I. 277/2007) (as amended), any person (including a director or secretary) who knowingly or recklessly provides false or misleading information in an attempt to comply with those regulations shall be guilty of an offence. The Irish Regulations also permit the Central Bank of Ireland to impose administrative sanctions for prescribed contraventions as set out therein.

The Market Abuse Regulation (EU596/2014), the Market Abuse Directive on criminal sanctions for market abuse (Directive 2014/57/EU) (transposed into Irish law by the Irish Market Abuse Regulations) (S.I. No 349/2016) together with the Companies Act 2014 provide that civil and criminal liability may attach to the issuer and potentially a director or officer of the issuer who consented to or approved a breach of market abuse law.

Investing in debt securities

The terms and conditions relating to debt securities typically contain provisions permitting minor amendments to be made to transaction documentation without the need to obtain the consent of all investors. The trustee acting on behalf of the investors is usually given the discretion to do this. The terms and conditions also provide for meetings of investors in order to consider matters that could potentially affect an investor's interests. The transaction documents will provide for defined majorities to bind all investors, including those who did not attend and vote and those who voted against the majority.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Ireland is regarded as a key strategic location by the world's leading investment funds players; attracting significant levels of foreign investment. It is Europe's top hedge fund domicile and is the largest hedge fund administration centre in the world.

The Central Bank of Ireland is responsible for the authorization and supervision of collective investment schemes established in Ireland, including regulated investment funds and investment managers. Regulated funds and fund service providers must also comply with the Central Bank of Ireland's fitness and probity requirements for persons performing certain prescribed roles within those entities.

What are common fund structures?

Ireland as a domicile provides a number of potential structuring options for funds, which can be broadly categorized as regulated by the Central Bank of Ireland or unregulated.

Regulated Fund Structures
Broadly speaking, each of the regulated fund structures below may be established as either an Undertaking for Collective Investment in Transferable Securities (UCITS), pursuant to the European Communities (Undertakings for Collective Investment in Transferable Securities) Regulations, 2011, as amended (the UCITS Regulations) or as an Alternative Investment Fund (AIF), pursuant to the EU (Alternative Investment Fund Managers) Regulations 2013, as amended (the AIFM Regulations), which transposed the Alternative Investment Fund Managers Directive (AIFMD) into Irish law. AIFs are authorized by the Central Bank of Ireland in one of two categories – either as a Retail Investor AIF (RIAIF), which may be marketed to retail investors, or as a Qualifying Investor AIF (QIAIF), which may be marketed to qualifying investors.

An application for authorization of a UCITS or an AIF must be submitted for review and approval to the Central Bank of Ireland. It needs to be accompanied by certain information (including the relevant Central Bank of Ireland application forms, the draft fund documentation and any draft letters relevant to the application).

The main types of regulated fund structures in Ireland are set out below. Other than the ILP, which can only be used for AIFs, each of these fund structures are suitable for UCITS and AIFs.

(I) THE ICAV

The ICAV, established in 2015, is quickly becoming the vehicle of choice for Irish funds. It is an Irish corporate investment fund which was introduced pursuant to the Irish Collective Asset Management Act 2015 to meet the needs of the global funds industry. Since its creation, the ICAV has replaced the Investment Company as the most commonly used structure for newly established funds. The ICAV is a tailored corporate structure that is specifically designed to give more administrative flexibility than an Investment Company.

An ICAV may be established as an umbrella structure with a number of sub-funds and share classes. In an important innovation, it is possible to prepare accounts per sub-fund. It is not subject to those aspects of company law which are irrelevant to, or inappropriate for, collective investment schemes (thereby helping to reduce administrative burden and costs). Establishing an ICAV involves a two-stage process. The ICAV must first be registered with the Central Bank of Ireland and then authorized as either a UCITS fund pursuant to the UCITS Regulations or an AIF pursuant to the AIFM Regulations. In addition, and unlike Investment Companies, the ICAV can elect to be treated as a tax transparent entity for US federal income tax purposes. UCITS and AIFs that are established in Ireland as Investment Companies can convert into ICAVs, in accordance with a conversion process provided for by the Central Bank of Ireland. The ICAV legislation also provides for ICAV mergers and for the migration of funds domiciled outside Ireland into Ireland as ICAVs by continuation.

(II) THE INVESTMENT COMPANY

An Investment Company is established as a public limited company under the Companies Acts 2014. This entity has a separate legal identity and there is no recourse to its shareholders. However, there is a statutory requirement for an investment company to spread risk, under Part 24 of the Companies Act 2014.

(III) THE UNIT TRUST

A Unit Trust is not a separate legal entity but rather a contractual fund structure constituted by a trust deed between a trustee and a management company. With this structure, the trustee or its appointed nominee acts as legal owner of the fund’s assets. As the Unit Trust does not have a separate legal personality, it cannot contract for itself.

This is a common form of fund vehicle, available for both UCITS and AIFs. While this vehicle is often used by fund managers who are marketing a fund to Irish, UK, US or Japanese investors (as many civil law jurisdictions do not recognize the trust structure), it is not typically used by promoters who wish to sell their funds to continental European investors (who have traditionally preferred the investment company structure).

(IV) INVESTMENT LIMITED PARTNERSHIPS (ILPS)

An ILP is established pursuant to the Investment Limited Partnership Act 1994. This structure has not proven popular in Ireland and has been used infrequently. It is available only for AIFs. An ILP is a partnership and as with a Unit Trust, an ILP does not have an independent legal existence. It has one or more limited partners (similar to shareholders in an Investment Company or ICAV, or a unitholder in a Unit Trust), and a general partner that can enter into contracts on behalf of the ILP. The ILP is recognized under the laws of a number of countries, including the US, as a tax-transparent entity. In June 2019, the Irish government published the Investment Limited Partnership (Amendment) Bill 2019, which proposes to reform and modernize the legislation in relation to ILPs, bringing the regime in line with those
in other leading jurisdictions and making Ireland an attractive domicile for the establishment of ILPs. The changes proposed include the establishment of umbrella ILPs and clarifying and expanding safe harbors to allow limited partners to undertake certain actions without being deemed to take part in the management of ILPs.

(V) COMMON CONTRACTUAL FUNDS (CCFS)

A CCF, similar to a Unit Trust and investment limited partnership, does not have a separate legal existence. It is a contractual arrangement established under a deed of constitution, giving investors the rights of co-owners of the assets of the CCF. As co-owners, each investor in a CCF is deemed to hold an undivided co-ownership interest in the assets of the CCF, as a tenant in common with other investors.

A CCF is essentially a facility whereby investors may pool their resources to enable them to be commonly managed for investment purposes provided certain investor criterion are met. Importantly, the CCF is treated as being transparent for Irish tax purposes as long as all of its investors are institutional investors.

Unregulated Fund Structures

(I) LIMITED PARTNERSHIPS (LPS)

A limited partnership established pursuant to the Limited Partnership Act 1907 is a popular structure for unregulated investment funds in Ireland. An LP is a partnership between one or more general partners and one or more limited partners, which is constituted by a partnership agreement. To have the benefit of limited liability, only the general partner is permitted to engage in the management of the business of the partnership, or to contractually bind the partnership. LPs are tax transparent and do not have separate legal personality.

There is a general limit of 20 partners in a limited partnership or 50 where the partnership is formed "for the purpose of, and whose main business consists of, the provision of investment and loan finance and ancillary facilities and services to persons engaged in industrial or commercial activities." Limited partnerships are commonly used on financing transactions. They often sit under regulated fund structures (please see discussion on ICAVs above). They are frequently used by promoters of Irish regulated funds as they are treated as "look through" entities from a tax perspective. The partners of the limited partnership are instead subject to tax on their profit share, as provided for in the partnership deed.

Another reason limited partnerships are used in these structures is that they help create a separate security package in a sub-fund structure where limited recourse financing is being provided. Multiple limited partnerships can be used under one sub-fund, thus creating a separate security package for lenders and reducing the set-up and ongoing costs of multiple sub-funds.

(II) SECTION 110 COMPANIES

A section 110 company is an Irish resident special purpose vehicle that holds and/or manages what are known as "qualifying assets" (as defined in the Taxes Consolidation Act 1997). Qualifying assets include a wide range of financial assets, commodities and plant and machinery.

The main benefit of a Section 110 company is that it is generally entitled to claim a tax deduction for all of its financing expenses, including (subject to some conditions) its profit-linked financing expenses. Therefore, it is in general possible to ensure that a section 110 company can acquire assets using debt financing on a tax neutral basis by ensuring that the section 110 company pays out all of its return in respect of those assets as tax deductible interest payments to lenders and investors.

Section 110 companies are widely used by international lenders, asset managers and investment funds for a variety of transactions, including, securitizations, CLOs, CDOs, bond issuances in the capital markets and as onshore investment platforms. They are also frequently used to hold and lease qualifying plant and machinery, such as aviation and shipping assets. Ireland is regarded as a center of excellence for aircraft financing and leasing and Section 110 companies are frequently used for structuring on such transactions.

In addition, a Section 110 company qualifies for the benefits of Ireland's double tax treaty network which should reduce or eliminate withholding taxes on income flows and capital gains in treaty jurisdictions.

What are the differences between offering fund securities to professional / institutional or other investors?
There are various differences which arise depending on whether securities are being offered to professional/institutional or other investors. These differences, and the various fund structures that are typically used, are explored further below.

**Retail**

**UCITS**

Open-end retail funds must be either authorized or recognized (if domiciled in another jurisdiction) by the Central Bank of Ireland. Funds that are recognized in this context are usually UCITS, which are collective investment schemes established and authorized under a harmonized EU legal framework. Under this framework, a UCITS established and authorized in one EU Member State holds what is termed the "European passport," allowing it to be sold cross-border into other EU Member States without further authorization. This enables fund promoters to create a single product for the entire EU rather than having to establish an investment fund product on a jurisdiction by jurisdiction basis. Ireland is one of the world's leading domiciles for cross-border UCITS.

UCITS are aimed at the retail market. They are a regulated retail investment product, subject to various liquidity constraints, investment/asset class restrictions (both in terms of permitted investments and required diversification) and borrowing and leverage limits. UCITS are structured as open-ended, diversified and liquid products. Although designed principally for the inexperienced investor, they are often sold across the full spectrum of investor types, including institutional investors.

UCITS are subject to a simple registration process and the EU framework mentioned above means they do not need to comply with local securities laws in each Member State. They can also be sold globally and can be restricted to institutional investors if the promoter wishes.

**RIAIF**

A RIAIF is an AIF authorized by the Central Bank of Ireland aimed at non-professional/institutional investors. It does not have a regulatory minimum subscription. The Central Bank of Ireland has set out the general investment and borrowing restrictions applicable to RIAIFs in its AIF Rulebook. As a retail fund, a RIAIF does not have the automatic right to any marketing passport and access to individual markets is granted on a case-by-case basis only. RIAIFs must appoint a fully authorized AIFM and non-EU managers or registered AIFMs are prevented from managing RIAIFs.

A RIAIF is subject to fewer investment and eligible asset restrictions than UCITS, but a more restrictive regime than the QIAIF (discussed below). There is a restriction on a RIAIF borrowing more than 25% of its net assets.

**Institutional/professional funds**

**QIAIFS**

Non-retail funds that are offered in Ireland are usually authorized as QIAIFS and subject to the AIF regime in relation to authorization of the manager/fund, marketing arrangements, reporting and governance.

QIAIFS are authorized by the Central Bank of Ireland to be marketed only to what are termed qualifying investors (i.e. sophisticated and institutional investors). A QIAIF is subject to a minimum initial subscription requirement of EUR100,000 (or equivalent in other currencies) per investor and investors must meet certain appropriate expertise/understanding tests in order to invest. A QIAIF is the most frequently used non-UCITS vehicle due to its greater flexibility in terms of investment, leverage and borrowing limits (though it is obliged to spread risk if established as an Investment Company). Ireland's tax regime provides that Irish QIAIFs are not subject to Irish tax on their income, gains or dividend payments to non-Irish investors.

A QIAIF must appoint a depositary and also an alternative investment fund manager (AIFM). In addition, the status of its AIFM determines how the QIAIF can be managed and where and how it can be marketed. A QIAIF can avail of the right to market across the EU, using an AIFMD passport, and can either be managed by an EU or non-EU AIFM and/or internally managed (discussed further below). A QIAIF can also be marketed freely to professional investors throughout the EU Member States (and the three additional European Economic Area Members States) by an authorized AIFM using an AIFMD marketing passport.

A QIAIF is suitable for hedge funds, less liquid and illiquid alternatives, private equity, venture capital, development capital and real estate funds (as well as most other types of investment fund exposure).

Real Estate Investment Trusts (REITs) were introduced in Ireland in 2013, with a view to stabilizing the local property market at a time when it was stagnating due to the fiscal crisis. Although REITs are not collective investment undertakings, the Central Bank of Ireland has indicated that they will generally be regarded as AIFs for the purposes of AIFMD (and therefore require an AIFM) unless the REIT can
demonstrate that this should not be the case.

In broad terms, a REIT must reside in Ireland for tax purposes, be incorporated under the Companies Act 2014 and list its shares on the main market of a recognized stock exchange in a Member State of the EU. As REITs are intended to provide risk diversification and after tax returns to investors, they must hold at least three properties and no one property may account for more than 40% of the total value of the property in the relevant REIT. Once incorporated, the trust can gain classification as a REIT from the Irish Revenue Commissioners when certain conditions are satisfied. In order to classify as a REIT, the trust must (among other things) derive at least 75% of its profits from property rental and distribute at least 85% of its rental profits to shareholders. Once classification is obtained, the REIT is exempt from corporation tax on qualifying income and gains from rental property.

UCITS structures are not appropriate for REITs, as UCITS may not invest directly in real estate, must focus on liquid assets and are required to provide at least twice monthly redemption facilities. Accordingly, the appropriate structures for real estate funds are non-UCITS structures.

Are there any other notable risks or issues around establishing and investing in funds?

Irish investment funds may be open-ended, open-ended with limited liquidity or closed-ended. Accordingly, the risks/issues that arise around establishing or investing in a fund will largely depend on the structure of the fund and its underlying fund documents. Certain notable risks/issues are considered below.

Making investments

The agreement between the fund and the investor in relation to subscription is typically enshrined in a subscription or capital call agreement. This tends to be a relatively short document, which needs to be read in conjunction with the constitutional documents underpinning the fund structure and the documents governing the service provider arrangements.

In many cases, it is the fund, acting through its directors, that will be authorized to make the calls on investors. Alternatively this role can be delegated to either the relevant investment manager or the administrator. For funds that are structured as Unit Trusts or CCFs, which are constituted by deed between the manager and the trustee/depository, it is usually the manager who is authorized to make the calls.

It is important to consider the full scope of fund documentation and the impact this may have on, for example, redemptions. In the context of a capital call facility (in the case of closed-ended funds or limited liquidity funds with a capital commitment structure), for example, it would also be important to understand: (i) the subscription process, including who can make calls on investors and when capital calls can be made; (ii) who determines the price at which units or shares are issued and by what means; (iii) what an investor can be asked to fund; (iv) the implications of an investor not meeting a capital call; and (v) the relevant account into which subscription funds must be paid. Any of these matters could result in risks for an investor, particularly if the obligations to fund are more onerous than expected or don’t align with any back-to-back funding arrangements an investor might have in place to meet such calls.

Managing investments

For Irish domiciled funds, the general rule is that any entity with discretionary asset management capacity, whether an investment manager or a delegate thereof such as a portfolio manager, must be approved in advance by the Central Bank of Ireland. Accordingly, issues may arise with regards to this approval process for any new entrants. There will also be ongoing compliance aspects to comply with once authorized. For example, an investment manager cleared to act for an Irish authorized fund should inform the Central Bank of Ireland in advance of any upcoming changes to its regulatory status, its name or registered address.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Irish selling restrictions
Generally, in Ireland, offering securities is either covered under the Central Bank's marketing regime, the UCITS regime or the AIF regime.

**Undertakings for Collective Investments in Transferable Securities (UCITS)**

UCITS, including those established in Ireland, have an EU passport which enables fund promoters to create a single product for marketing in all EU Member States and on the completion of the appropriate notification procedure, a UCITS established in one member state can be sold in any other.

A UCITS intending to market in another Member State must complete and submit to its home regulator a notification, including certain specified information, as well as copies of key investor documents. The notification procedure between competent authorities is transmitted on an electronic basis and contains information in relation to the marketing requirements of the host Member State, as well as the latest versions of the UCITS documents. The home regulator then completes a notification file which is sent in a regulator-to-regulator transmission, following which the UCITS can be sold in the other Member State.

With the exception of certain classes of AIFs established in Guernsey, Jersey and the Isle of Man, a non-Irish AIF proposing to market their units in Ireland to retail investors (a RIAIF) must make an application to the Central Bank of Ireland for authorization, enclosing certain prescribed information, in order to ensure the protection of unitholders and (in the opinion of the Central Bank of Ireland) provide an equivalent level of investor protection to that provided under Irish laws, regulations and conditions governing RIAIFs.

**Alternative Investment Funds (AIFs)**

Under the AIFMD, marketing is defined as “a direct or indirect offering or placement at the initiative of the Alternative Investment Fund Manager (AIFM) or on behalf of the AIFM of units or shares in an AIF it manages to or with investors domiciled or with a registered office in the EU.”

The passporting procedure under the AIFMD is similar to that which exists for UCITS funds in the EEA. An AIFM may only market an AIF to EU investors if it is authorized by a relevant EU regulator – registration with one EU regulator opens access (subject to certain limited conditions) to marketing to professional investors across the EU under an EU passport or if it complies with national private placement regimes (where available). There is no need for additional authorization but there must be a notification letter for each EEA Member State in which the AIFM wishes to market its shares or units to professional investors.

For passporting purposes, an investor must meet the definition of professional client set out in the Markets in Financial Instruments Directive (2014/65/EU) (MiFID). According to MiFID, a professional client is a client who possesses the expertise, knowledge and experience to make its own investment decisions and properly assess the risks that it incurs. Furthermore, in the case of an AIF structured as a master/feeder, the master must be domiciled in the EEA in order to avail of the passport.

**Reverse solicitation and the definition of marketing**

Reverse solicitation or “passive marketing” is marketing that is not at the direct or indirect initiative of the fund manager. Applicable in the context of professional investors, it is a sensitive area in Ireland and across Europe generally. AIFMD generally continues to permit professional investors who approach an AIF based on their own initiative (i.e. a reverse solicitation). However, many commentators argue that reverse solicitation may constitute marketing under AIFMD and caution should be exercised if seeking to rely on the reverse solicitation argument.

Notwithstanding that the definition of marketing is very broad for the purposes of the AIFMD, no additional guidance on the concept is provided by the Central Bank of Ireland, leaving the definition open to interpretation. Most Member States have chosen not to provide guidance, but the UK Financial Conduct Authority (FCA) has done so, stating that marketing will occur when: “a person seeks to raise capital by making a unit or share of an AIF available for purchase by a potential investor. This includes situations which constitute a contractual offer that can be accepted by a potential investor in order to make the investment and form a binding contract, and situations which constitute an invitation to the investor to make an offer to subscribe for the investment” (FCA Handbook).

The AIFM would be well advised to consider at a minimum whether it had, for example, followed up with prospective investors following a marketing event or whether it had been in correspondence with prospective investors in a manner which could be construed as an “indirect” offering. Any AIFM seeking to rely on the reverse solicitation argument would also need to take care in preparing offering materials and marketing documentation, to include web-based platforms, to ensure that appropriate selling restrictions are specifically set out. Individual legal advice on a case-by-case and jurisdiction-by-jurisdiction basis should be sought, and it would be necessary to ensure that procedures and policies are put in place to clearly demonstrate that a particular EU investor invested in the fund on the basis of reverse solicitation.
If a manager is unwilling to rely on reverse solicitation, then the only alternative at present for such managers is to market in accordance with existing private placement regimes.

**Packaged Retail and Insurance-based Investment Products (PRIIPs)**

Packaged Retail and Insurance-based Investment Products are also common in the Irish market. Regulation (EU) No 1286/2014 on PRIIPS (the PRIIPS Regulation) introduced an obligation on all persons who manufacture, advise on or sell PRIIPs to retail investors (i.e. any person who does not fall within the definition of "professional client" under MiFID), to produce a pre-sale disclosure document known as a Key Information Document (the PRIIPS KID) to the retail investor in advance of them making their investment decision. Packaged investment products that are within the scope of the PRIIPS Regulation include life insurance investment products, investment funds, structured deposits and derivative instruments. Accordingly, RIAIFs, QIAIFs and UCITS are all capable of falling within the definition of a PRIIP for the purposes of the PRIIPS Regulation.

Similar to the UCITS KIID (Key Investor Information Document), the PRIIPs KID aims to explain the main features of risk, reward and costs to the retail investor in a concise document. Any PRIIPs KID must be updated annually, but may also need to be revised more frequently if changes are made to the produce which impact the information disclosed in the PRIIPs KID.

At present, UCITS can continue to provide a UCITS KIID to investors and will not have to provide a PRIIP KID until January 1, 2022.

**Are there any restrictions on managing a fund?**

A UCITS or AIF can appoint an external manager or be managed through its Board of Directors (where the legal form of the vehicle permits) and, in this case, the fund is referred to as an internally managed or self-managed fund. In contrast, those structured as a unit trust or as a CCF must always appoint a management company.

Where a fund does not appoint a management company, it is referred to as a self-managed investment company (SMIC). Where a UCITS is a SMIC, it is required to submit a detailed corporate governance and oversight document (known as a business plan) to the Central Bank of Ireland for review and comment before the UCITS can be authorized. In light of the additional corporate governance, oversight and time commitment obligations involved, the externally managed UCITS is a more popular model in Ireland. This structure has the advantage that the UCITS can relinquish compliance with certain obligations so that they rest with a management company instead.

Management of a fund is a regulated service. Both UCITS management companies and AIFMs incorporated in Ireland are authorized by the Central Bank. Irish authorized UCITS Management Companies and AIFMs can manage funds in other EU Member States on a cross-border passporting basis, subject to necessary notification requirements.

A fund manager may wish to establish its own management company or use a management company platform in cases where a management company is a requirement and the fund manager will be a signatory to the trust deed constituting the fund. A fund management company can also act as the central coordinator of service providers for the fund – i.e. the fund would delegate all management activities to the management company, which can then appoint, for example, a sub-investment manager, a fund administrator and/or different service providers.

Various restrictions arise on manager structuring/compensation and profit-sharing arrangements as a result of EU and Irish regulations and any manager that is subject to the remuneration rules must apply those rules proportionate to its size, internal organization and the scope and complexity of its activities. The rules affect, among other things, reporting, equity remuneration, deferred compensation arrangements and clawback.

AIFMs are also subject to regulation under the AIFMD and managers of UCITS are subject to certain requirements under the UCITS Regulations. Registration with the Central Bank of Ireland involves a significant authorization process. It is normal practice for the Central Bank of Ireland to engage with new applicants before the beginning of the process. An effective authorization process depends on the timeliness and quality of responses received from the applicant to the Central Bank of Ireland's comments. The completion of the application must be accompanied by (among other things) a detailed business plan, individual questionnaires, code of conduct and anti-money laundering protocols.

Funds established in Ireland as a UCITS or an AIF enjoy the benefit of the EU-wide passporting regime. A single management company (a so-called Super ManCo) can be authorized to manage both UCITS and AIFs and this can be used to obtain access to the passporting regimes for both UCITS and AIF products without the need to establish two separately regulated entities. The rules in relation to
establishment of Super ManCos has been updated by the Central Bank of Ireland, making this a favorable option.

### Entering into derivatives contracts

**Are there any restrictions on entering into derivatives contracts?**

Regulation (EU) No 648/2012 on OTC (over-the-counter) derivatives, central counterparties and trade repositories, as amended by Regulation 2019/834, (EMIR) establishes certain regulatory requirements for counterparties to OTC derivatives contracts, including:

- a mandatory clearing obligation for certain classes of OTC derivatives;
- a margin posting obligation for OTC derivatives contracts not subject to clearing;
- daily valuation and other risk-mitigation techniques for OTC derivatives contracts not subject to clearing by an authorized or recognized central counterparty; and
- certain reporting and record-keeping requirements.

EMIR applies not only to Financial Counterparties (FCs) as regulated entities, but it also extends the supervisory remit of the Central Bank of Ireland to Non-Financial Counterparties (NFCs), the vast majority of which may not have not had any previous interaction with the Central Bank of Ireland.

Last modified 16 Jul 2020

**What are common types of derivatives?**

In Ireland, derivative contracts are entered for a number of reasons, including hedging, arbitrage and speculation.

Derivatives may be traded OTC or on an organized exchange.

All of the main types of derivative contract are widely used in Ireland:

- futures;
- options (call options and put options); and
- contracts for difference (including swaps (such as interest rate or currency swaps) and forwards).

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying asset seen in Ireland are:

- equities;
- fixed income instruments;
- commodities;
- foreign currency; and
- credit events.

Last modified 16 Jul 2020

**Are there any other notable risks or issues around entering into derivatives contracts?**

Since the 2007-2008 global financial crisis, derivatives and over-the-counter derivatives have attracted significant regulatory attention.

The European Commission has sought in particular, to:
enhance transparency by requiring the provision of comprehensive information on OTC derivative position;
reduce counterparty risk by increasing the use of central counterparty clearing; and
improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen and continues to see the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

EMIR has recently been amended and the changes, known as EMIR Refit, entered into force in June 2019. The EMIR Refit aims to simplify the EMIR regime and reduce regulatory and administrative burdens and cost for smaller counterparties. For example, under the EMIR Refit Regulation, those categorized as small non-financial counterparties do not need to comply with reporting and clearing requirements from specified dates.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Lending to natural persons (other than in very limited circumstances; for example, if they are a professional client for the purposes of the Markets in Financial Instruments Directive (2014/65/EU)) is a regulated activity in Ireland. Lending to corporates is not regulated on a standalone basis; however, if the lending is accompanied by deposit taking or carrying on other banking business, this triggers a requirement to be regulated. If a loan to a corporate is originated by a regulated entity, the borrower may have the benefit of certain legislation such as the Lending to Small and Medium-Sized Enterprises Regulations 2015.

The Consumer Protection (Regulation of Credit Servicing) Act 2015 (as amended) provides that unregulated entities that hold loans or control the overall strategy or key decisions relating to such loans where those loans were advanced: (i) to natural persons; or (ii) to SMEs and were originated by regulated entities, must be regulated as credit servicing firms by the Central Bank of Ireland. These requirements apply, for example, if such loans are acquired by way of secondary purchase.

Lending to natural persons is (with limited exceptions) a regulated activity in Ireland. Consumer loans, including mortgage loans are subject to a range of regulatory requirements, including around how those loans are marketed, originated and sold, how the lender administers the loans on an ongoing basis and how borrowers who fall behind on their repayments are dealt with by the relevant lender. The Central Bank of Ireland, in recent years, has also imposed certain rules providing for financial limitations and other conditionality relating to mortgage lending in Ireland.

Borrowing

Borrowing is not a regulated activity in Ireland. However, it is advisable for borrowers to consider whether either the mortgage or consumer lending regimes apply to their activities in which case they will benefit from certain regulatory protections.

What are common lending structures?

Lending in Ireland can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or on a syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents and trustees which fulfil certain roles for the finance parties), are
more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loan Market Association documents are widely used in Ireland and are adopted for Irish law.

Loans will be structured to achieve specific objectives, e.g. term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities.

**LOAN SECURITY**

A loan can be either secured, unsecured or guaranteed. For more information, see *Giving and Taking of Guarantees and Security*.

**LOAN TERM**

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Loan term is important as a longer term loan might incur more interest. Ensure that a guaranteed loan has an end date; for example, an overdraft account.

**LOAN COMMITMENT**

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

**LOAN REPAYMENT**

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

*What are the differences between lending to institutional / professional or other borrowers?*

Please see above in relation to the differences in lending to corporates and to natural persons.

*Do the laws recognize the principles of agency and trusts?*

Yes, both principles are recognized as a matter of Irish law. For example, it is possible to appoint an agent to act on behalf of other parties and a trustee to hold rights and other assets on trust for the lender or secured parties.
Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual principles. For example, a contractual provision that has the effect of placing an increased obligation on a party as a result of a breach of contract needs to be carefully examined to establish if it amounts to a genuine pre-estimate of probable loss. If not, it is likely to be considered to be an unenforceable penalty.

Examinership

Examinership is a corporate rescue procedure provided for under the Companies Act 2014. The appointment of an examiner will restrain any enforcement action (including the appointment of a receiver) against a company for the duration of the examinership (typically 70 days, but extendable to 100 days) during which the examiner will attempt to put in place a scheme of arrangement with the company's creditors. During the period of examinership, a lender cannot enforce its security or seek to appoint a receiver over the company's assets without the examiner's consent.

Specific types of lending

Depending on the borrower in question – and particularly where consumers and SMEs are involved, lenders may have enhanced obligations towards borrowers; for example, when advertising products, communicating with borrowers and undertaking arrears handling and enforcement procedures.

Are there any other notable risks or issues around borrowing?

Borrowers should be aware of the potential implications of the EU's Bank Recovery and Resolution Directive (BRRD), which outlines certain measures for dealing with failing financial institutions.

The BRRD is an EU framework which came into effect on 15 July 2015. It acts as the central resolution authority with the EU Banking Union and outlines certain measures for dealing with failing financial institutions.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities. Article 55 of the BRRD gives authorities the power to bail in obligations of failed EEA financial institutions and also to postpone the enforcement of early termination rights against the affected institution. Bail in describes a variety of write-down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of Irish or other EEA law contracts, such powers override contractual terms. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Capacity

The constitutional documents of a corporate borrower should be examined to ensure that it has the power into the guarantee or security.

It should be noted that the constitution of an LTD company does not contain an objects clause and, subject to other applicable laws, LTDs have the same capacity as a natural person.

Corporate benefit

Under Irish law, directors have a general duty to promote the success of the company for the benefit of its members as whole; as such,
they will need to be able to show that adequate corporate benefit is derived from the company giving a guarantee or security. This is often more difficult in the case of upstream or cross-stream guarantees or security provided by a subsidiary to its parent or sister company. The prudent approach is often to have the members of the company approve the giving of the guarantee or security by resolution.

Financial Assistance

Under Irish law (Section 82 of the Companies Act 2014), it is not lawful for a company to provide financial assistance (this definition is broadly drafted and can be by way of a loan, security, guarantee or otherwise) for the purposes of the acquisition made or to be made by any person of shares in that company, or where the company is a subsidiary, in its holding company, unless one of the statutory exemptions apply or the company has availed of the “summary approval procedure” (a statutory procedure provided for in the Companies Act 2014) The rationale for the prohibition is the preservation of the company's capital and shareholder and creditor protection.

Where the financial assistance is being given by a company that is a private company, it can avail of the ‘summary approval procedure’, which validates the giving of financial assistance by the company. This requires (amongst other things) that the directors of the company make a declaration that in their opinion the company will be able to pay its debts and liabilities in full as they fall due in the 12 months following the giving of the financial assistance. If a company enters into a transaction in contravention of Section 82, the transaction will be voidable at the instance of the company against any person (whether a party to the transaction or not) who “had notice of the facts” that constitute such contravention. If a company contravenes Section 82, the company and any officer (e.g. directors, company secretary, etc.) of the company who is in default shall be guilty of an offence under the Companies Act 2014.

Unfair Preference

Any payment or other transfer of property (including security) by a company within six months of its insolvent winding up in favor of any creditor with a view to giving such a creditor a preference over other creditors, shall be deemed an unfair preference. The six-month period extends to two years where such creditor is a “connected person.” If a transaction is held to be an unfair preference, a liquidator or receiver of the company may recover the money paid or property transferred to the creditor, or may have the security set aside.

Improper Transfer

Where a company is being wound up, a liquidator or creditor of or contributory to such company can apply to court to have a disposition (which includes security) set aside, and for the return of the assets the subject of the disposal, where the disposition had the effect of perpetrating a fraud on the company, its creditors or its members. There is no time limit within which an improper transfer can be challenged.

Invalid floating charge

A floating charge created within the period of 12 months before the commencement of the winding-up of a company will be invalid except to the extent of monies actually advanced or paid, or the actual price or value of goods or services sold or supplied, to the company at the time of or subsequent to the creation of, and in consideration for the charge, or to interest on that amount at the appropriate rate or unless the company was solvent immediately after the creation of the charge. The 12 month period is extended to 2 years where the floating charge is created in favour of a ‘connected person’.

Recharacterization of fixed charges

Fixed charges (e.g. on bank accounts) can be re-characterized as floating charges if the requisite prohibition on dealing with the account and the monies therein is not adequately provided for in the relevant security document notice to the account bank.

What are common types of guarantees and security?

Guarantees

Contracts of suretyship may be divided into two broad categories: guarantees and indemnities. The key distinction between a guarantee and an indemnity is that under a contract of guarantee, the guarantor assumes an obligation to answer for the debt of another (i.e. a
secondary obligation contingent on the obligation of the principal to the beneficiary of the guarantee). Accordingly, a guarantor will only be liable if the principal debtor is liable. However, in the case of an indemnity, the party providing the indemnity has a primary obligation to make good the loss suffered by the beneficiary. The obligation of the party providing the indemnity does not depend on the existence of an underlying obligation. Whether a surety is liable where the main contract is void because of, for example, the principal's incapacity, depends on whether the contract is a guarantee or an indemnity. Guarantees incorporating indemnities are common on Irish financing transactions.

It should be noted that while an Irish regulated fund can provide guarantees or security in respect of any 100% owned subsidiary, it is however restricted from acting as a guarantor on behalf of third parties. The term "guarantor" for this purpose is not defined and so it potentially extends to all forms of credit support. In addition, this prohibition extends to one sub-fund providing security for the obligations of another sub-fund of the same ICAV.

Common forms of security

There are a number of different types of security interest that can be created under Irish law, including charges, mortgages and pledges.

Different types of security are used to secure different types of assets.

Under Irish law it is possible to grant security over all of the assets of an Irish company or over individual assets. Granting security over all of a company's assets will tend to be achieved by way of an "all assets" debenture which will typically include:

- a charge over real estate;
- a fixed charge over assets which are identifiable and can be controlled by the creditors (such as equipment);
- a floating charge over fluctuating and less identifiable assets (such as stock); and
- an assignment by way of charge over receivables and contracts.

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

To be valid, a guarantee needs to be in writing, signed by the guarantor and be provided for good consideration.

Consideration for a guarantee is subject to general contractual principles. The relevant underlying obligations will usually be the consideration for the guarantee and so it is advisable to execute the guarantee at the same time as executing the underlying obligations to avoid any suggestion of past consideration. Also, it can be difficult to establish consideration for a guarantee as the primary obligations are between the underlying obligor and beneficiary (e.g. between a borrower and a lender). As a result, guarantees are usually executed as deeds to avoid any argument that there was a lack of consideration. Deeds have particular execution requirements under Irish law which need to be observed.

A guarantee is a secondary obligation dependent on the existence of the borrower's liability to the lender. As a result, as mentioned above, guarantees will often also include an indemnity, imposing a primary obligation on the guarantor to repay the relevant debt, as well as also guaranteeing repayment of the debt to the lender.

Irish law takes a protective approach towards guarantors given that the nature of a guarantee involves assuming the obligations of a third party. This means that there are various factors that lead to a guarantee being deemed as discharged, such as a material variation of the underlying agreement or a misrepresentation by the borrower. A guarantee may also be set aside on the basis that it was procured by duress or undue influence (by either a borrower or a lender). A party being provided with a guarantee should be alert to this issue and take steps to avoid such claims by, for example, requiring the guarantor to take independent legal advice.

In terms of regulatory compliance, lenders should note that prescribed warnings must be included in guarantees to which the Central Bank of Ireland's Consumer Protection Code 2012 and the Central Bank (Supervision and Enforcement) Act 2013 (Section 48) (Lending to Small and Medium-Sized Enterprises) Regulations 2015 (the SME Regulations) apply.
In addition, the SME Regulations, where applicable, impose certain obligations on lenders in their dealings with guarantors. A guarantee may also be limited or vitiated on certain statutory grounds, including under the Consumer Credit Act 1995 and the European Communities (Unfair Terms in Consumer Contracts) Regulations 1995.

**Giving or taking security**

Although only a limited number of assets require a security document to be executed as a deed (e.g. real estate), it is standard practice in Ireland for security documents to be executed as deeds. The formalities for the execution of deeds are set out in legislation (and in the relevant entity's constitutional documents).

Once granted, security needs to be properly perfected before it is valid against third parties. Perfection formalities can range from having the secured asset delivered to the security holder, registration of the security and notice being given to third parties. Details of mortgages or charges created by a company or an ICAV must be delivered to the Companies Registration Office or the Central Bank of Ireland (as applicable) within 21 days either of the creation of the charge. Failure to register the charge within 21 days has the effect of rendering the charge void against a liquidator of the company/ICAV and any creditor of the company/ICAV. Priority will be determined by the date and time of receipt by the Companies Registration Office or the Central Bank of Ireland of a fully filed charge submission. The date of creation of the deed of charge does not determine its priority. Certain categories of assets, including cash and shares, are carved out from the foregoing registration requirements.

**Notarization**

There are no notarization requirements for security documents or guarantees under Irish law.

Regulatory authorization

Who are the regulators?

The Central Bank of Ireland is the body responsible for prudential regulation and conduct of business of financial services firms operating in Ireland. It is also responsible for enforcing Ireland’s market abuse and listing regimes.

Since November 2014, following the implementation of the EU single supervisory mechanism, credit institutions have been subject to EU-wide regulation. This grants the European Central Bank (the ECB) powers in relation to the prudential supervision of credit institutions. There are two categories of “credit institution” in Ireland – those which are designated by the ECB as “significant” and those designated as “less significant”. Where a credit institution is designated as “significant”, it is supervised directly by the ECB, whereas credit institutions designated as “less significant” are subject to direct supervision by the Central Bank of Ireland, and to indirect supervision by the ECB.

Financial institutions may also be subject to the supervision of other regulatory bodies or agencies, such as the Data Protection Commission. In addition, certain agencies have statutory responsibility for investigating and/or enforcing financial services law.
example, the Financial Services and Pensions Ombudsman is empowered to investigate and resolve disputes between consumers and financial institutions. The Competition and Consumer Protection Commission has statutory responsibility for enforcing competition and consumer protection law.

**What are the authorization requirements and process?**

Depending on the nature of its activities or the relevant sector within which it intends to operate, a firm may need to apply to the Central Bank of Ireland for authorization before commencing activities. The form and content of the application will vary depending upon the nature of the authorization being sought; however, it will usually involve the submission of an application form, along with supporting documentation, to the Central Bank of Ireland.

Upon receipt of the required documentation, the Central Bank of Ireland will complete an assessment of the application and may issue detailed comments and/or seek additional information, in which case the applicant will be provided with the opportunity to address the comments and requests issued by the Central Bank of Ireland in a revised application submission(s). The Central Bank of Ireland will then notify the applicant of its decision in respect of the application submission.

The time taken to assess the applicant's submission depends on the nature of the application and/or authorization sought.

There are no fees for applications; however, the Central Bank of Ireland imposes levies after authorization.

Authorized firms are listed on the CBI Register.

The Central Bank of Ireland will also approve key individuals (e.g. senior management in their roles).

**What are the main ongoing compliance requirements?**

The ongoing compliance obligations imposed on a regulated entity will vary depending on the industry within which it operates and the type of authorization obtained.

The Central Bank of Ireland monitors ongoing compliance with prudential standards, primarily through examining returns (weekly, monthly and annual), financial statements and annual reports, conducting regular review meetings and on-site inspections.

The Central Bank of Ireland has published fitness and probity standards for persons performing particular functions within a regulated entity. These standards in general require that such a person is: (i) competent and capable; (ii) honest, ethical and acts with integrity; and (iii) financially sound. In the case of credit institutions considered to be “significant” for the purposes of the EU single supervisory mechanism and credit institutions applying for authorizations, fitness and probity assessments are carried out by the European Central Bank.

Failure to comply with these regulatory requirements can result in sanctions for regulated firms and individuals performing prescribed functions within those firms, and loss of regulated status.

**What are the penalties for failure to be authorized?**

Any person who undertakes a regulated activity without being authorized or exempt commits a criminal offence and is liable to financial sanctions. Depending on the nature of the offence, the Central Bank of Ireland can issue a caution or reprimand, a disqualification of an individual from managing a regulated firm, a prohibition of an individual from working in a regulated firm and fines ranging from up to EUR1 million (for individuals) and up to EUR10 million or 10% of the firm's turnover (for corporations).

**Regulated activities**
What finance and investment activities require authorization?

A person must not carry on a regulated activity in Ireland unless authorized or exempt.

Generally speaking, the Central Bank of Ireland regulates the activities of:

- credit institutions, credit servicing firms, investment firms, funds, fund service providers;
- insurance and reinsurance companies;
- moneylenders, mortgage and credit brokers and intermediaries;
- bureaux de change, electronic money institutions, money transmission businesses, payment institutions; and
- credit unions, among others.

One point of note is that commercial lending is not of itself a regulated activity in Ireland (unless the lender is engaged in deposit-taking or carrying on other banking business); however, certain regulatory reporting requirements may apply to such lenders.

Are there any possible exemptions?

There are certain exceptions and exemptions to the general requirements to be regulated. Therefore, the relevant legislation, rules and guidance should be examined to ascertain whether any exception/exemption applies.

In addition, a firm that is authorized to provide certain services by the regulatory authority of another country in the European Economic Area may also be permitted to provide financial products and services into Ireland without the need to apply to the Central Bank of Ireland for authorization through the free provision of services on a cross-border basis, i.e. by "passporting" into Ireland, from its home Member State.

Do any exchange controls or other restrictions on payments apply?

Ireland does not operate any exchange controls.

The Minister of Finance has the power to restrict financial transfers between Ireland and other countries provided such restrictions comply with EU laws. Ireland is subject to, and complies with, EU Council Regulations relating to financial sanctions, also known as "restrictive measures." Once a person or entity has been sanctioned under EU financial sanctions, there is a legal obligation not to transfer funds or make funds or economic resources available, directly or indirectly, to that person or entity.

Payments services, e-money services and money transmission services are all regulated activities in Ireland and must only be undertaken by an authorized payment service provider, e-money institution or money transmission business, as the case may be.

Anti-money laundering and tax considerations may also need to be taken into account.

What are the rules around financial promotions?

There is no cross-sectoral financial promotions regime in effect in Ireland.

There are, however, certain sector-specific rules (both domestic and EU) in respect to the promotion of specific services and products, including requirements in relation to advertisements and incentives. These arise, for example, under the Prospectus Regulation, the MiFID Regulations, the Insurance Distribution Regulations and the Consumer Protection Code.
**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

The most common types of legal entities/structures used to undertake financial or investment activity in Ireland are companies, limited partnerships and regulated funds.

**COMPANIES**

The most common types of company used to undertake financial or investment activity in Ireland are private limited companies (either private companies limited by shares (LTD) or designated activity companies limited by shares (DACs)), companies limited by guarantee, unlimited companies and public companies. These each have separate legal personality and apart from unlimited companies, limit the liability of their members.

**LIMITED PARTNERSHIPS**

Limited partnerships (established in Ireland under the Limited Partnerships Act 1907) are also frequently used; these are unregulated, tax transparent and unlike companies, do not have separate legal personality.

**FUNDS**

Ireland is regarded as a key location by the world's investment funds industry and Ireland as a domicile provides for a number of different regulated fund vehicles. These include Irish collective asset management vehicles (ICAVs), investment limited partnerships, unit trusts, investment companies and common contractual funds. The ICAV is a relatively new corporate vehicle, governed by the Irish Collective Asset-Management Vehicles Act 2015, which has proven very popular as an investment vehicle. It is a suitable fund vehicle for both UCITS and AIFs and it is not affected by amendments to the company law that are more generally targeted at trading companies.

Please see further at Topic 7 below in relation to **Establishing and Investing in Debt and Hedge Funds**.

Some activities require a particular type of legal entity to be used. For example, offering debt securities to the public cannot be done by a private company limited by shares.

**Is it possible to conduct lending or investment business through a branch or establishment?**

Yes. A foreign company seeking to conduct lending or investment business in Ireland can do so through a branch or establishment. Any company which is incorporated outside Ireland and establishes a branch in Ireland must be registered within one month of its establishment with the Companies Registration Office under the Companies Act 2014 and must comply with certain ongoing disclosure and other requirements prescribed by that Act. There are some differences between the requirements imposed on a company from a Member State of the European Economic Area and companies from third countries.

Whether or not a foreign company can be deemed to have established a branch in Ireland is dependent on a number of factors, including whether that company has an independent Irish management structure, a reasonable degree of financial independence and the appearance of permanency.

**FinTech**

**FinTech products and uses**

**What are the most common technology products and FinTech applications used or being**
developed in the finance and investment marketplace?

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
- consumer loans;
- student lending products;
- small and medium-sized enterprises (SME) lending; and
- residential property and commercial property mortgage lending.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P)-type structures, often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds, as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

ISSUES FOR STARTUP MARKETPLACE LENDERS

Following the initial incorporation and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform. As the startup lender will not have an established track record, deposit base or asset pools, the funding structure will often follow the format of a warehouse securitization structure. Origination of new assets will be funded through drawings on a note issuance facility backed by security over the new assets. Each of the new assets will be subject to eligibility criteria determined by reference to the nature of the underlying asset. In order to provide an efficient financing structure, the assets will typically be held through a SPV with origination and servicing provided by the marketplace lender. In order to cover expected losses on the asset pool, the senior facility will be subject to the lending platform maintaining sufficient subordinated capital in the form of equity, or a combination of equity and subordinated debt.

While the funding may be structured through a revolving loan or note program, if there is tranching of the debt, this will typically result in the platform being treated as a securitization for the purposes of the EU Securitization Regulation, with the attendant requirements to hold risk retention and provide appropriate reporting and disclosures.

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a peer-to-peer mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features, such as; its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever
transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (e.g. in the case of cryptocurrencies such as bitcoin) or providing an indisputable record; for example, relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third-party intermediary. It may be public and open (permissionless or unpermissioned) or structured within a private group (permissioned).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that, once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an address). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so-called smart contracts. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another, or advanced, more-complex interactions with the outside world using so-called Oracles. With Oracles the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of the transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is
illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

**ARTIFICIAL INTELLIGENCE AND ROBO ADVISORY SYSTEMS**

Automated financial advice tools, also known as robo advisors are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms, which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

**DATA ANALYSIS AND CLOUD COMPUTING**

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running fintech businesses and the technology has had a significant impact in recent years.

Last modified 16 Jul 2020

*Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?*

The Central Bank of Ireland is the conduct regulator providing financial products in both retail and wholesale markets.

**GENERAL**

A person must not carry on a regulated activity in Ireland unless authorized or exempt. A financial activity requires regulatory authorization when it involves the provision of services or undertaking of activities constituting a regulated activity (as defined in legislation). Where fintech businesses do provide a regulated activity and which cannot avail of an exemption – they will fall within the
existing body of financial regulation and so require prior authorization from the Central Bank of Ireland to conduct business.

Where a fintech business is authorized the firms will be subject to Irish legislation and various ongoing Central Bank of Ireland requirements, but fintech companies authorized by the Central Bank of Ireland can benefit from regulatory passporting across the EU. Payment institutions, electronic money institutions (EMIs), investment companies, money transmission businesses and payment initiation and account information service providers are examples of business models which may require authorization, as will certain crowdfunding platforms when the EU Crowdfunding Regulation comes into force.

INNOVATION HUB

The Central Bank of Ireland launched its Innovation Hub in April 2018 to enable open and active engagement with all firms innovating in financial services. The Innovation Hub provides firms with a direct and dedicated point of contact at the Central Bank of Ireland as a means to pose questions on the authorizations process, the regulatory framework or engage in a discussion on their product or service outside of more formal regulatory process.

CROWDFUNDING AND PEER-TO PEER LENDERS

Crowdfunding is a relatively new and growing industry and is working for businesses in Ireland by providing peer-to-peer lending. The speed at which funds can be raised through platforms such as LinkedFinance, Flender, Fund:it and Kickstarter makes this a particularly attractive option for small businesses. Currently, the lending model is more prevalent in Ireland (as opposed to equity investment) but Spark Crowd Funding launched Ireland's first equity crowdfunding platform and the company seeking to raise new money to finance its growth plans offers a fixed number of shares to subscribers i.e. crowd in return for finance.

Ireland does not currently have a bespoke regulatory regime for crowdfunding. However, the EU Commission has published a proposal for an EU Crowdfunding Regulation which would include a comprehensive authorization and passporting regime for crowdfunding platforms across Europe. The Central Bank of Ireland also issued a Feedback Paper on the Regulation of Crowdfunding in Ireland, which indicated that "proportionate" regulation was favored generally.

Plans by the Department of Finance to regulate crowdfunding could further develop the debt funding options for fintech businesses.

CRYPTOCURRENCIES

Cryptocurrencies and cryptoassets are not subject to specific regulation in Ireland, and the Central Bank of Ireland confirmed that such virtual currencies do not have legal tender status in Ireland. While there is no specific regulation, it should be noted that cryptocurrencies or cryptoassets may be subject to the existing regulatory frameworks that are in place.

The regulation of cryptoassets is currently being considered at an EU level and Ireland would likely follow any proposed approach to ensure the implementation of a uniform regulatory regime.

ELECTRONIC MONEY

Electronic money (E-Money) is a relatively recent kind of payment instrument. Instead of using a debit card (which requires a bank account) or a credit card (which requires a contract agreement) the customer has purchased a non-cash means of payment. This may be in the form of value stored on a technical device such as a chip card or a computer and can be best described as a digital form of cash since it has many of the characteristics of cash. E-money can therefore be defined as monetary value as represented by a claim on the issuer, which is electronically stored, issued on receipt of funds for the purposes of making payment transactions and accepted as means of payment by a natural or legal person other than the issuer.

An E-Money institution is an undertaking that has been authorized to issue E-Money in accordance with the European Communities (Electronic Money) Regulations 2011, as amended (the EMR). An applicant seeking authorization must satisfy the Central Bank of Ireland that it can meet the authorization standards set out in the EMR. In complying with these standards, the Central Bank of Ireland, as gatekeeper, adopts a robust and structured process and so only applicants that can demonstrate compliance with these authorization requirements are authorized. The Central Bank of Ireland provides guidance on its website for to firms considering applying for authorization as an electronic money institution to provide clarity with regard to the process, its requirements and timelines.

REGULATION OF PAYMENT SERVICES

The Payment Services Regulations 2018 enhance regulation in the area of fintech by: (i) increasing reporting obligations applicable to providers offering payment services; (ii) applying new authorization requirements for providers offering payment services (payment
initiation and account information service providers now require authorization); and (iii) requiring that all remote and online payment transactions meet strong customer authentication requirements.

The issue of strong customer authentication is subject to regulatory technical standards published by the European Banking Authority.

**APPLICATION OF DATA PROTECTION AND CONSUMER LAWS**

The Data Protection Acts 1988-2018 (the DPA) regulate the processing of personal data within Ireland. The DPA gives further effect to the European General Data Protection Regulation (EU) 2016/679 (the GDPR), which came into effect on May 25, 2018. As a European Regulation, GDPR has direct effect in Irish law and automatically applies in Ireland. Where a business determines the purposes and manner in which any personal data is processed, it will be regulated by the DPA and have certain notification and compliance obligations.

The GDPR is more prescriptive and restrictive compared to the principles-based DPA, including mandatory notifications where a breach occurs and provide for severe monetary sanctions for breach. GDPR sets the key principles, rights and obligations for most processing of personal data.

The ePrivacy Regulations (SI 336/2011) regulate direct marketing by electronic means. The general rule is that the affirmative consent of the recipient is required (such as by specifically opting-in). Even where the direct marketer has the consent of the data subject to use their personal data for marketing, that consent may be withdrawn by the data subject. Article 21 of GDPR provides that a data subject has the right to object at any time to the use of their data for such marketing.

**MONEY LAUNDERING REGULATIONS**

The Irish legislation in this area is the Criminal Justice (Money Laundering and Terrorist Financing) Act 2010 as amended by Part 2 of the Criminal Justice Act 2013 and the Criminal Justice (Money Laundering and Terrorist Financing) (Amendment) Act 2018 (the MLA). The MLA give the Central Bank of Ireland responsibility for supervising the anti-money laundering controls of businesses that offer certain services, such as lending, providing payment services and issuing and administering other means of payment. Generally, where a firm is authorized and supervised by the Central Bank of Ireland it will also be authorized and supervised by the Central Bank of Ireland for complying with anti-money laundering requirements. The Central Bank of Ireland has published guidelines setting out its expectations for credit and financial institutions in relation to compliance with their obligations with regards to anti-money laundering and countering the financing of terrorism.

In addition, the General Scheme of the Criminal Justice (Money Laundering and Terrorist Financing) (Amendment) Bill 2019 will transpose the Fifth EU Anti Money Laundering Directive (EU) 2018/843 into Irish law and will impose obligations on (certain types of) exchanges and wallet providers and will bring the following firms within the scope of the MLA:

- cryptoasset exchange providers (including Cryptoasset Automated Teller Machine (ATM), Peer to Peer Providers, Issuing new cryptoassets, e.g. Initial Coin Offering (ICO) or Initial Exchange Offerings); and
- custodian wallet providers.

**What type of funding arrangements and incentives are available to FinTech businesses?**

Most Irish fintech businesses are raising funding through traditional funding mechanisms such as seed investment, venture funding, debt and government-supported funding.

DLA Piper Ireland has excellent relationships with all stakeholders involved in these funding arrangements and is happy to make introductions for clients as required.

**EARLY STAGE**

**FINTECH IN IRELAND**

A number of key organizations, incubators and other support mechanisms have emerged in Ireland to further develop the growing fintech sector.

1. Industry Organizations
Fintech industry organizations in Ireland include:

- The FinTech and Payments Association of Ireland – the main trade association representing fintech and payments businesses in Ireland.
- FinTech Ireland – an independent, nonprofit organization which regularly collaborates with other organizations internationally to run events in Ireland.
- Blockchain Ireland – a combined effort of the Irish government and Irish-based companies, led by the Industrial Development Authority Blockchain Expert Group to promote and share information on blockchain in Ireland.

  a. Incubators and accelerators

  • Incubators

  Incubators cater to new companies specifically, nurturing the growth of a new business, as the name suggests. An incubator typically offers shared office spaces, networking and mentoring opportunities and perhaps some seed capital. Examples of such incubators include Dogpatch Labs (which operates a co-working space for scaling technology start-ups) and the Digital Hub, where hundreds of companies have progressed through its enterprise cluster and gone on to create thousands of jobs in Ireland’s digital economy.

  • Accelerators

  There are various accelerators in the Irish market which offer support, facilities and funding for fintech startups, often in return for an equity stake. For example, the Citi Accelerator Hub is a co-working space for fintech startups located in Citi’s offices in the IFSC in Dublin and offers participating startups access to Citi’s mentoring network for advice and support, as well as industry meet-ups and networking events. Another example is the MasterCard Labs StartPath program which provides a four-month program and office space in MasterCard’s Dublin office, which is its global technology HQ.

SEED INVESTMENT

Initial investment in fintech businesses may be provided by family and friends of the founders and other investors, in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The Irish Venture Capital Association (IVCA) reported that there was a 55% year-on-year increase in seed funding in Ireland in 2019, from EUR49 million in 2018 to EUR76 million in 2019.

VENTURE CAPITAL

Venture capital is a type of equity investment provided by full-time, professional firms (venture capitalists) who invest with management in ambitious, fast-growing companies with the potential to develop into significant businesses. Venture capital firms and private equity investors continue to focus on high potential fintech businesses. According to the IVCA, fintech companies raised 9% of the total venture capital investment in Irish small and medium-sized businesses in 2019.

VENTURE DEBT

An additional funding option is venture debt, which is offered by banks such as the European Investment Bank and offers long-term venture debt products for fast growing companies. The financing structure of venture debt includes bullet repayments and remuneration linked to equity risk, and compliments existing venture capital financing. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

SENIOR BANK DEBT

Once a fintech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. Bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

CONVERTIBLE LOAN NOTES

A popular funding tool for fast-growing fintech businesses is to issue convertible loan notes, which are essentially a hybrid between debt
and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

ONLINE FINANCING

In addition to traditional lending from financial institutions for small and medium-sized businesses, there are also online financing platforms available for fintech businesses in Ireland.

CROWDFUNDING

Crowdfunding is the financing of a new project by raising many small amounts of money from a large number of people and often involves the financing being provided in exchange for an equity investment in the relevant company. As discussed above, Ireland does not currently have a bespoke regulatory regime for crowdfunding. The Irish government's Ireland for Finance 2025 Strategy Paper in March 2019 included a proposal to regulate crowdfunding in Ireland and enact a domestic regulatory regime, in parallel with European regulation, to ensure sufficient consumer protection for unsophisticated investors and to facilitate the growth of crowdfunding as an alternative source of finance for Irish small and medium-sized enterprises.

PEER-TO-PEER (P2P) LENDING

Another alternative form of funding is by way of P2P lending platforms such as Flendr and Linked Finance. P2P lending involves a person or party lending money to a business rather than going through a traditional bank. Typically, P2P lenders earn interest in addition to capital repayments in exchange for their funding as opposed to any equity investment in the relevant company. Ireland does not currently have a bespoke regulatory regime for P2P lending.

GOVERNMENT-SUPPORTED FUNDING

The Irish government, through its various arms, offers funding arrangements and incentives to fintech businesses doing business in Ireland. We have outlined some of these arrangements and incentives below.

ENTERPRISE IRELAND (EI)

EI is a state agency responsible for the development and growth of Irish companies in world markets. EI offers a number of supports to fintech businesses including:

(a) Competitive Start Fund – this fund is open to early stage companies in fintech and offers EUR50,000 equity investment designed to accelerate the development of high potential startup companies by supporting them to achieve commercial and technical milestones such as evaluating international market opportunities or building a prototype; and

• Innovative High Potential Start-up Fund (HPSU) – this fund allows EI to offer equity investment to HPSU clients, on a co-funded basis to support the implementation of a company's business plans.

INDUSTRIAL DEVELOPMENT AUTHORITY (IDA)

The IDA is responsible for attracting multinational investment into Ireland, its primary goal being to create new employment. The IDA provides logistical support and granting assistance to its client companies. Grants are negotiated on a project-by-project basis (and are usually subject to job creation in Ireland) and are subject to limits and EU state aid rates. IDA fintech clients include Stripe, First Data, Rubicoin and Future Finance.

• Ireland Strategic Investment Fund (ISIF)

The ISIF, managed and controlled by the National Treasury Management Agency, is an EUR8 billion sovereign development fund with a statutory mandate to invest on a commercial basis in a manner designed to support economic activity and employment in Ireland. The ISIF offers companies “permanent” capital that can work to a longer-term horizon than most participants in the market. The ISIF has invested in fintech companies such as Silicon Valley Bank and Polaris Partners.

Other government-led initiatives worth mentioning include:

• Disruptive Technologies Innovation Fund – this fund provides EUR500 million for projects which include the use of disruptive technologies that will significantly alter the way we work and live, involve collaboration, innovation and/or be disruptive in its impact on
one of the sectors in the competitively-funded Research Priority Areas designated by the Irish government (one of which includes Business Services and Processes).

- Startup refunds for Entrepreneurs – offers individuals the ability to obtain up to a 41% refund for capital they invest in their own startup business.

- Employment and Investment Incentive (EII) – offers individuals the ability to claim up to 40% tax relief on investments they make in other companies.

**CAPITAL MARKETS FUNDING**

Raising finance by way of an Initial Public Offering (IPO) is a popular funding arrangement for fintech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange, such as EuroNext Dublin.

**TAX INCENTIVES AND RELIEFS**

Ireland has for many years used tax incentives as a tool to attract foreign direct investment. In addition to the 12.5% rate of corporation tax on trading profits, the other key tax benefits available to fintech businesses investing in Ireland include:

- tax relief on the acquisition costs of IP and other intangibles;
- a generous R&D tax credit system giving an effective tax deduction of 37.5% for qualifying expenditure;
- stamp duty exemption available on the transfer of a wide range of IP;
- no Capital Gains Tax on gains from the sale of certain shares and reduced tax on foreign dividends;
- key employee reward mechanism;
- Ireland's Extensive Double Taxation Treaty Network;
- the first OECD compliant patent box regime (the Knowledge Development Box) with 6.25% effective tax rate on profits arising from certain types of IP; and
- extensive domestic exemptions from withholding tax on interest and dividend payments.

*Last modified 16 Jul 2020*

**Portfolio sales**

**Loan transfers and portfolio sales**

**What are common ways of buying and selling loans?**

Buying and selling loans is quite common in Ireland. A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

There are a number of legal methods to transfer loans and any associated underlying security. The most common ways of selling loans are:

- **Assignment** – An assignment is only effective to transfer rights under a contract and not the obligations and liabilities (see further discussion on novation below). Subject to any contractual restrictions, assignment can be done without the consent of the underlying debtor. An assignment can be effected as either an equitable assignment or a legal assignment depending on whether certain statutory requirements have been satisfied, namely that the assignment must be: (i) in writing under the hand of the assignor; (ii) of the whole of the debt; and (iii) absolute (that is, unconditional) and not by way of charge.

If the assignment does not fulfil all these requirements, it will likely take effect as an equitable assignment so that any subsequent assignment effected by the seller which is fully compliant with the Supreme Court of Judicature Act 1877 requirements will take priority, if notified to the debtor before the date on which the original assignment is notified to the debtor.
Novation – A novation is a full legal transfer of the party’s rights and obligations. It is a tripartite arrangement between the existing parties and the transferee and results in a fresh contract being formed between the continuing party and the transferee and the transferor being released from its obligations.

Novation is often not practical when seeking to transfer a large pool of loans and associated security, given the need for obligor consent. The form and content of the transfer documentation will depend on the nature of the underlying assets being sold.

Other methods which are less frequently used to buy and sell interests in loans include a declaration of trust over the proceeds of the receivables or a sub-participation (this being a transfer of the economic interest in a loan without changing the legal relationship between the existing parties).

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller’s/buyer’s legal advisors.

Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms;
- **consent** – whether a transfer requires the consent or notification of any other parties. Under the Central Bank’s Code of Conduct on the Transfer of Mortgages, a loan secured by a mortgage of residential property may not be transferred without the written consent of the underlying debtor. However, the relevant consent is often obtained under the mortgage origination documentation (which should be checked to confirm on a case-by-case basis);
- **notice of assignment** – in order for a legal assignment to be effective, a notice of assignment must be given under the Supreme Court of Judicature Act 1877 to the underlying debtor, notifying them that the loan has been assigned. The notice serves to inform the debtor to whom he must repay the loan;
- **perfection formalities** – whether the underlying security is preserved in favor of the new lender and whether any perfection formality is needed for the transfer to be enforceable (in addition to the service of a notice of assignment under the Supreme Court of Judicature Act 1877);
- **regulatory requirements** – whether the assignee is required to be registered as a credit servicing firm pursuant to the Consumer Protection (Regulation of Credit Servicing Firms) Act 2015 (as amended); and
- **tax** – whether taxes apply. A transfer of a loan by way of novation should not give rise to stamp duty. However, in limited circumstances, stamp duty might arise on the acquisition of a loan by way of assignment.

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?
Ownership

The ownership of energy and infrastructure assets in Ireland varies according to the asset class. These asset classes can be broken down into the following key areas:

- economic infrastructure (energy, rail, telecommunications, water, roads and waste); and
- social infrastructure (education, health, justice/prisons and social housing).

Many of Ireland's infrastructure assets are publicly owned, but the provision of energy and telecommunication services that were once provided by state-owned monopolies now operate in a regulated competitive market that provides customers with a wide array of advanced services.

Ireland 2040 is the Irish state's infrastructure investment plan which guides public and private investment and has as its aim to accomplish ten strategic outcomes. An accompanying National Development Plan sets out EUR116 billion worth of planned projects over the next ten years, including investment in transport, housing, hospitals and schools. It anticipates EUR91 billion in funding directly from the exchequer, as well as nearly EUR25 billion in investment from state-owned commercial companies.

Key sectors are considered below.

ELECTRICITY SUPPLY

The Irish electricity market has been going through a process of liberalization since 1998. Before this, the Electricity Supply Board (the ESB) operated as a state-owned monopoly. The liberalization has happened in phases with sectors of the market being progressively opened for competition, with the market wholly open to competition since 2004.

The Commission for Regulation of Utilities (the CRU) is the principal body with responsibility for regulation of the energy sector in the Republic of Ireland. The functions and duties of the CRU have been altered and expanded by legislation transposing EU directives into Irish law.

There are now several electricity suppliers licensed by the CRU to supply electricity to residential and business customers.

The ESB owns the transmission and distribution networks in the Republic of Ireland and EirGrid plc (as transmission system operator) is an independent state-owned body with responsibility for the transportation of energy, operating these systems and ensuring the economic operation of the high voltage electricity grid in a competitive market.

GAS SUPPLY

Responsibility for the natural gas pipeline infrastructure lies with Ervia (formerly Bord Gáis Éireann), which is wholly owned by the state. The gas supply market has, however, been opened to competition in recent years for both residential and business customers. Most of the energy supply companies providing electricity (listed above) also operate in the market to supply natural gas to customers.

TELECOMS INFRASTRUCTURE

Following the privatization of Ireland's telecoms network in 1999, telecommunications networks (landline and mobile) in Ireland are privately owned by a number of service providers in a regulated competitive market providing customers with a wide range of advanced digital services. The Commission for Communications Regulation is the regulator of Ireland's telecommunications sector with responsibility for television broadcast services and wireless communications services.

TRANSPORT

Most of the transport system in Ireland is in public hands. The Irish road network has evolved separately in the two jurisdictions into which Ireland is divided, while the Irish rail network was mostly created before the partition of Ireland. In the Republic of Ireland, the Minister for Transport, acting through the Department of Transport, is responsible for the state's road network, rail network, public transport, airports and several other areas.

ROADS, BRIDGES AND TUNNELS

The primary and secondary roads in Ireland are owned by the state, with a significant section of the road network having been built using
private or public-private funds (mostly as part of projects structured by way of Public-Private Partnership (PPP)), and are operated as toll roads. Approximately one-third of the motorway network is operated by PPPs, with the other sections managed by motorway maintenance and renewal contract operators.

HEAVY RAIL AND BUS SERVICES

Public transport is mainly in the hands of Córas Iompair Éireann (CIÉ), which is a statutory corporation, and its subsidiaries – Bus Átha Cliath (Dublin Bus), Bus Éireann (Irish Bus), and Iarnród Éireann (Irish Rail).

These three subsidiaries are largest internal operators of public transport in Ireland:

- **Bus Átha Cliath/Dublin Bus** provides bus services in the Greater Dublin area, including most bus services within Dublin city and County Dublin;

- **Bus Éireann/Irish Bus** provides intercity and regional bus services outside Dublin city and county and from Dublin to the rest of the country, as well as operating the city buses in Cork, Limerick, Waterford, and Galway and a number of other small urban bus systems; and

- **Iarnród Éireann/Irish Rail** operates InterCity, Commuter and DART trains, and – together with Northern Ireland Railways – the Dublin–Belfast Enterprise train

(collectively the CIÉ Companies and each a CIÉ company)

CIÉ does not enjoy a monopoly in the provision of public transport services but rather it is granted a direct award contract for particular routes and private operators may not compete directly on any route for which a CIÉ Company has been granted an exclusive license. Each year, funding is provided to CIÉ Companies for the provision of socially necessary public transport services in Ireland, in order to fund the difference between income from fares and the cost of operating such non-profit making (or loss-making) services. The Public Service Obligation scheme for public transport is the scheme through which the operating costs of providing financially unviable transport services in Ireland are subsidized by the state.

LIGHT RAIL

The Dublin Area Rapid Transit system (stylized as the DART) is an electrified commuter rail railway network serving the coastline and city center of Dublin which is operated by the state through Iarnród Éireann.

The Luas is Dublin city's Light Rail Transit System (tram), carrying over 90,000 passengers per day. The French public transport operator Transdev operates and manages the Luas rail system under a contract with Transport Infrastructure Ireland (TII), which is the state body responsible for the Luas. The current contract will run until 2025.

AVIATION AND AIRPORTS

Aviation in Ireland is privatized but the government currently owns the main airport infrastructure, consisting of three state-owned airports – Dublin, Cork and Shannon Airports, which are the three largest airports in the country. DAA plc is a public limited company responsible for the management, operation and development of Dublin and Cork airports. Shannon Group plc is also a public limited company responsible for the same roles in respect of Shannon Airport. Both companies are state-owned.

Ireland has a number of regional airports. However, improvements made to surface transport infrastructure such as motorways, has reduced the role of these regional airports in the provision of domestic connectivity. The Irish government provides support for these airports through Ireland's Regional Airports Programme, with airports located in Donegal, Kerry, Knock and Waterford receiving funding.

PORTS

Ireland's ports are publicly controlled with a high level of private-sector involvement in the provision of infrastructure and services. The Irish government's stated objective is to facilitate a competitive and effective market for maritime transport services.

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES, HUBS AND PRISONS)

These are owned for the most part by the public sector, with the exception of social housing (please see below). The private sector is often involved in the design, build, financing, operation and maintenance of the structure. The majority of social infrastructure assets in Ireland are directly financed by the state.
EDUCATION

Primary schools – a large majority of primary schools (approximately 96%) are owned by and under the patronage of religious denominations with approximately 90% owned by the Catholic Church and other private owners.

Secondary schools – the land and buildings are for the most part, owned by the state or Minister for Education (in many cases where ownership is vested in the religious order and Educational Trustee Boards). In all cases, the capital costs associated with secondary schools are borne by the state.

PRISONS

All prisons in Ireland form part of the Irish Prison Service and are owned by the state, with political responsibility vested in the Minister for Justice and Equality.

HOSPITALS

Ownership of public hospitals is vested in public sector entities and religious orders operating within the Health Service Executive (HSE). There are a number of private hospitals owned by various individuals and entities.

SOCIAL HOUSING

The Housing Agency is a government body that works with the Department of Housing, Planning and Local Government, Local Authorities and approved housing bodies (being voluntary housing organizations approved under the Housing (Miscellaneous Provisions) Act 1992 for the purpose of accessing assistance from local authorities for housing provision) in the delivery of housing and housing services. Approved housing bodies receive both public and private investment. There are several purchase schemes which have been developed to enable tenants to buy their own homes.

DEFENSE

Defense assets are owned by the public sector.

WASTE

Waste disposal and recovery activities require an authorization in accordance with the Waste Management Act 1996 (as amended), subject to certain limited exceptions. These services are provided by private companies, once granted with the requisite license/permit or certificate from the Environmental Protection Agency or relevant local authority, depending on the authorization required.

WATER

The Irish government established Irish Water in 2013. This is the state's water utilities company, which is now a subsidiary of the state-owned Ervia (formerly Bord Gáis Éireann), with responsibility for the delivery of public water and waste water services, taking over the role that was previously held by local authorities.

Irish Water is regulated by the CRU from an economic perspective, with responsibility to protect the interests of water consumers, ensuring the services are delivered in a sustainable manner and to oversee that the company operates in an efficient manner.

The Environmental Protection Agency is responsible for supervising Irish Water’s supply of drinking water and the authorization of discharges from waste water treatment plants.

Last modified 16 Jul 2020

Are there special rules for investing in energy and infrastructure?

There are no special rules nor any specific regime governing or restricting investment in energy or infrastructure projects in Ireland, over and above existing regulation for investors and funders more generally. However, depending on the sector involved, investment may be subject to legislative or regulatory control (e.g. merger control and state aid rules).

With regard to the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be
made), the legal/regulatory position relevant to that project must be considered. For example, a project involving development on land may require planning permission and a project may require environmental permits and/or other sector specific regulatory consents or licenses.

If a public body (e.g. a government department or local authority) is procuring a project and the public body is to benefit from central government funding towards the cost, the project will be subject to governmental approval. Key sector-specific issues are flagged in the sections below.

**ENERGY INFRASTRUCTURE**

The CRU has responsibility to grant, revoke and enforce licenses for the purposes of supplying electricity. Application forms can be downloaded and submitted directly to the CRU. Prospective suppliers must fulfill a number of industry requirements as set down by ESB Networks (responsible for market design) and the Single Electricity Market Operator (SEMO), as facilitator of the continuous operation and administration of the SEM.

Following the grant of a license, licensees may request consent from the CRU for subsequent actions such as an assignment and transfer, change of control, extensions and revocation.

Investors should also consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with any license conditions or the granting of specific subsidies. In particular, it should be considered if a breach of those conditions could lead to the revocation of a license/subsidy that might make the potential target less attractive or viable.

**TELECOMS INFRASTRUCTURE**

ComReg is the independent regulatory authority that regulates the telecoms sector and it is the designated national regulatory authority under the European common regulatory framework for electronic communications networks and services. It has extensive powers, which include to:

- issue licenses to provide telephony services;
- conduct market reviews and impose obligations on operators found to have significant market power; and
- enforce compliance and resolve disputes between operators and between operators and their customers (including commercial disputes).

Following a review by the European Commission of the regulatory framework for electronic communications, the European Electronic Communications Code (the EECC) entered into force in December 2018. Ireland has until December 21, 2020, to implement the directive into national law. The adoption of the EECC marks a significant revision of the EU framework for telecoms regulation. It operates to consolidate and update the existing EU legislation regulating electronic communications services and networks. The core objectives of the EECC are to promote connectivity to high capacity networks across the EU, develop an internal market for telecoms, and provide greater protection for consumers.

The broad inclusion of interpersonal communication services within the scope of an electronic communication service will mean that telecom companies outside the scope of the regulatory regime at present will have to consider, among other things, their obligations under the EECC and adapt as needed.

No foreign ownership restrictions apply to communications services.

**TRANSPORT INFRASTRUCTURE**

The National Transport Authority (the NTA) is responsible for issuing licenses for public passenger services. The application can be downloaded from and submitted through the NTA’s website and a completed map of the proposed route is required (among other things) to be submitted with the application.

Any attempt to provide a transport service without having obtained a license is a contravention of the Public Transport Regulation Act, 2009.

**PLANNING AND BUILDING CONTROL**

When buying or leasing a property in Ireland, it is important to obtain satisfactory evidence of compliance with planning permission and
building regulations regarding the construction of the property and any significant post-construction works.

With the exception of certain specified changes of use and limited forms of development which are exempted, permission must be obtained from the relevant local authority and/or An Bord Pleanála in order to make any material change of use of property or to construct buildings.

Unlike in the UK, there is no statutory planning register which can be checked to verify that a building has been constructed in accordance with the relevant planning permission(s).

Building control regulations regulate the design and construction of buildings, extensions or certain material change of use, their services, fittings and equipment. They deal with, among other things, accessibility, health, safety and welfare of users, and energy efficiency.

Fire Safety Certificates and Disability Access Certificates must be obtained from the Building Control Authority in respect of the design of works before commencement. Once the relevant works have been completed the developer must obtain a Certificate of Compliance on Completion from an Assigned Certifier in order to verify that the works comply with building regulations. This certificate must then be registered with the national Building Control Management System.

What is the applicable procurement process?

Public procurement in Ireland is based on the EU regime, which has as its objective the free movement of goods, services and works within the EU. There are some sector-specific regulations as set out below.

The legislation around public procurement is applicable where any public sector bodies outsource the delivery of these goods and services, this includes all government departments/offices, local and regional authorities, health authorities, commercial and non-commercial state bodies. If the relevant procurement is in relation to a major infrastructure project or the contract exceeds EU thresholds, the procurement is regulated.

Contracts below the EU thresholds which are funded or part-funded from public funds or awarded by private sector entities, should, as far as possible, be awarded in accordance with the national guidelines.

The basic principle of public procurement is that there should be a competitive process, affording an equal opportunity for all suppliers to compete. The type of process will depend on the value and nature of the requirement. There is a legal obligation to engage in a competitive process for contracts above EU thresholds and award them in accordance with procedures set out in EU public procurement directives.

In most cases, the public sector body will need to publish a contract notice in the Office Journal of the EU (OJEU) and typically run one of the following procedures:

- **Open Procedure** - The open procedure is the most commonly used procedure in Ireland for public sector bodies. It allows an unlimited amount of offers and, therefore, unlimited competition.

- **Restricted Procedure** - The restricted procedure is a two-stage procedure that takes longer to run than the Open Procedure and is more complicated to run. It is used where there is a need to pre-qualify suppliers or where there is evidence that the number of potential suppliers is very large or possibly where a contracting authority wants to limit the number of people who will have access to confidential and/or sensitive information.

- **Competitive Dialogue Procedure** - This procedure provides for some clarification and optimization after the final call for tenders making it better for highly complex outcome-based procurement. It is a more structured procedure than the Competitive Procedure with Negotiation and could be said to offer more safeguards for contracting authorities.

- **Competitive Procedure with Negotiation** - This is a two-stage procedure that generally starts with a call for competition. The contract notice must make it clear that this procedure is being used. There is an obligation on the contracting authority to provide a description of its needs, to specify the award criteria and to define the minimum requirements that must be met by all tenderers.

When fixing the deadline for receipt of tenders or requests to participate, contracting authorities must take account of the complexity of the contract and allow sufficient time for submitting the necessary information and preparing tenders.

An investor may also choose to invest in a project (for example, by way of acquiring equity in a private sector partner) that has already
been procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the original awarded contract rather than the procurement regulations themselves.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement related considerations that need to be borne in mind.

OTHER APPLICABLE LAW

The Freedom of Information Act 2014 (the FOI Act) applies to public bodies. Any person may request “records”, including records relating to tendering procedures. There are exemptions under the FOI Act regime which apply where records are confidential or commercially sensitive. Tender-related records are not exempt as a class. Tenderers are normally requested to indicate in their tenders, with supporting reasons, any information which should be regarded as confidential.

CODE OF PRACTICE ON THE GOVERNANCE OF STATE BODIES

Commercial and non-commercial state bodies in Ireland are subject to the Code of Practice on the Governance of State Bodies (2016) (Code). The Code provides that it is the responsibility of the relevant body to satisfy itself that the requirements for public procurement are adhered to. Transparency is a key theme of the Code and competitive tendering is advocated as the standard procedure in the procurement process of state bodies.

FINANCING ENERGY AND INFRASTRUCTURE

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector and may require that any refinancing gains to be shared with the public sector.

Last modified 16 Jul 2020

What are the most common forms of funding / investing in energy and infrastructure?

Funding

Sources of financing are mostly provided by leading foreign financial institutions and private investors but also by investment funds offering structured solutions for public projects established within a public-private partnership.

Many public infrastructure projects have been delivered by way of a public-private partnership, which is an arrangement between a public authority and a private partner under a long-term contract.

The funding structure has been used most often in the building of economic infrastructure such as roads.

Other common forms of funding in energy and infrastructure include:

- loans made on a corporate finance basis (balance sheet debt);
- loans made on a project-finance basis (to a special purpose project company) on medium- to long-term bases – such loans may later be syndicated to other funders;
- bond finance; and mezzanine debt.

Ireland's location has provided it with an abundance of renewable energy potential, and this potential is being realized with the development of a highly active onshore wind energy industry. Ireland's progress towards its renewable energy targets has proven attractive to foreign investors and there is significant investor demand for opportunities in this area.

Restructuring

Enforcement and sanctions
When can there be regulatory investigations?

The Central Bank of Ireland may carry out an investigation where it is concerned that a prescribed contravention under the Central Bank Act 1942 (as amended) has occurred.

Last modified 16 Jul 2020

What regulatory penalties may apply?

The Central Bank of Ireland has a wide range of enforcement tools, including, but not limited to, administrative sanctions, investigations (leading to a public inquiry), directions to refund or withhold money charged, fitness and probity investigations, refusal/cancellation/revocation of registrations, supervisory warnings, and repayment of the Central Bank of Ireland's costs.

The fines that can be imposed as administrative sanctions are capped at EUR10 million or 10% of turnover for a corporate entity and EUR1 million (and/or disqualification) for an individual. Fines made following an inquiry will be determined having regard to the financial circumstances of the entity/individual.

Last modified 16 Jul 2020

What criminal penalties may apply?

Following judicial proceedings, Irish courts have powers to impose criminal penalties in certain cases, including:

• financial crime, including money laundering and terrorist financing (or their equivalents);
• fraud, misrepresentation, dishonesty or breach of trust;
• offences under legislation relating to companies or financial services providers;
• market manipulation, insider dealing, revenue law; and
• conducting regulated activities when not authorized.

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Advance of loan

No stamp, registration, transfer or other similar taxes are payable on the advance of a loan.

Transfer or Assignment of a Debt Under a Loan

A written instrument transferring or assigning a debt under a loan is, in principle, subject to Irish stamp duty, chargeable at 7.5%. However, provided the debt constitutes loan capital and does not have certain offensive features (such as a rights of the same kind as shares in the capital of a company or rights to conversion into shares or other securities), the written instrument assigning or transferring such debt should be exempt from stamp duty (loan capital exemption). Alternatively, an exemption applies where the instrument is an agreement for the sale, or a transfer on sale, of a debt or part of a debt where such sale occurs in the ordinary course of the business of the vendor or the purchaser (debt factoring exemption).

Transfer or assignment of a mortgage, debenture or other security
Generally speaking, there should be no stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security. However, most security interests created by Irish companies must be registered with the Companies Registration Office to perfect the security and ensure it is valid against third parties. The grant of most security interests over Irish real estate should also be registered at the Land Registry to ensure that the security interest takes effect as a legal charge. It would be unusual for the fees payable for such registrations to be a material amount. Other forms of registration may also be required (or be advisable), depending on the nature of the asset over which security is taken. Such registrations may also require the payment of fees.

**Transfer or Assignment of a Debt Security (e.g. a Bond)**

There is no charge to stamp duty on the issue of a debt security in Ireland whether in bearer or registered form.

**BEARER BONDS**

No charge to stamp duty should arise on the transfer of a bearer bond as the title to bearer bonds can pass by delivery, (i.e. no stampable written document needs to be executed in order to transfer a bearer bond).

**REGISTERED BONDS**

The transfer of a debt security is in principle subject to stamp duty at the rate of 7.5% if the instrument is executed in Ireland or wherever executed, if it relates to any property situated in Ireland or any matter or thing done or to be done in Ireland. However, there are a number of exemptions (subject to certain conditions being satisfied) from this including the loan capital exemption and debt factoring agreement exemption, as referenced above. In addition, the transfer of bonds issued by an Irish securitization vehicle are exempt from stamp duty.

**Depositary and Clearing Systems**

**BEARER BONDS AND REGISTERED BONDS**

Stamp duty does not arise on the transfer of securities to and from a central counterparty (CCP) subject to certain conditions being satisfied. This facilitates a system for the clearing and settlement of transactions where the member firms of the exchange or market will submit orders for securities to the central counterparty and the trades will be settled against the central counterparty as the member firms who submitted the order will be unaware of the counterparty on the other side.

*Last modified 16 Jul 2020*

**Do tax authorities take priority on enforcement?**

Generally speaking, secured lenders and secured debt holders (excluding holders of floating charges) take priority over Revenue claims on enforcement of security.

*Last modified 16 Jul 2020*

**Is withholding tax on interest payments applicable?**

Unless an exemption applies, where a payment of interest with an Irish source is paid under a loan which is intended or expected to have a duration of a year or more, an amount equal to the basic rate of the interest payment is required to be withheld and paid to the Irish Revenue Commissioners. The current rate of Irish interest withholding tax is 20%.

The most commonly relied on exemptions to ensure that interest payments made by Irish companies can be made free of Irish interest withholding tax include:

- the exemption for interest paid on an advance from a bona fide Irish tax resident bank (as defined in the legislation and including interest paid in respect of syndicated debt held by a bona fide Irish bank);

- where the interest is paid in the ordinary course of a trade or business carried on by an Irish corporate borrower to a company (1) which is regarded as being a resident of a relevant territory (i.e. a Member State of the European Union (other than Ireland) or a country (a) with which Ireland has a double taxation agreement in force or (b) with which Ireland has signed such a double taxation agreement which will come into force once all the ratification procedures have been completed) under local law and such territory...
imposes a tax that generally applies to interest receivable or (2) where the interest is exempt from tax under the double tax treaty or would be exempted from the charge to income tax under the relevant treaty which has been signed but not yet have the force of law on or before the date of payment on the interest, if such relevant Treaty had the force of law when the interest was paid tax (provided in both cases the interest is not paid to the recipient company in connection with a trade or business carried on by the recipient company in Ireland through a branch or agency);

• the exemption applicable to quoted Eurobonds (applicable to interest paid on a security which is quoted on a recognized stock exchange);

• payments to another company which advances money in the ordinary course of a trade and has made the required notifications to the Irish Revenue Commissioners;

• reliance on a double tax treaty; and

• reliance on the EU Interest and Royalties Directive (Council Directive 2003/49/EC of 3 June 2003 on a common system of taxation applicable to interest and royalty payments made between associated companies of different Member States) as implemented by Irish law (the key requirement being that the lender and the borrower meet the association requirement).

The analysis described above is applicable to both interest payments under a loan or other form of debt security. The quoted Eurobond exemption is particularly relevant to debt securities.

Are foreign lenders and debt security holders subject to tax on interest payments?

The lender should not (in practice) be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch). The same analysis would apply to interest payments made in respect of debt securities.

Issuing and investing in debt securities

*Are there any restrictions on issuing debt securities?*

Pursuant to the Italian Civil Code, a company may issue debt securities for an amount not exceeding twice its share capital, the legal reserve and the available reserves of that company, as set out under its last approved balance sheet. These constraints do not apply in the following cases:

- debt securities issued in excess of the limit set out above which are underwritten by institutional investors subject to prudential supervision;
- debt securities secured by a first-ranking mortgage;
- debt securities to be listed on a regulated market or negotiated on a multilateral trading facility (As a general remark, it is not possible to state a precise timeframe for listing which will be valid for all the issuers. Timeframes for the admission to trading may vary depending on the market (ie whether Borsa Italiana or EuroTLX), the type of issuer and/or the type of security. As a rule of thumb, the admission procedure can take from one week to a couple of months (or even longer if the relevant market requires more information from the issuer));
- convertible bonds which grant the right to purchase or underwrite shares;
- special authorization given by governmental authorities on national economic interest grounds; and
- application of special laws relating to particular categories of companies (eg in relation to banks by virtue of the provisions set out under the Consolidated Banking Act).

Furthermore, pursuant to the Prospectus Regulation, and relevant implementing measures in Italy, an issuer shall draft and file with CONSOB a prospectus in order to offer the debt securities to the public and/or list such debt securities on a regulated market. Such provision is valid and effective to the extent that an exemption does not apply.

*What are common issuing methods and types of debt securities?*

Debt securities are most commonly issued by means of either a standalone prospectus or a base prospectus.

Several different types of debt securities are offered and/or listed in Italy. Among the others, some common forms include:

- plain vanilla notes (including, *inter alia*, fixed-rate notes, floating-rate notes, zero-coupon notes fixed to floating rate notes, step-up notes, step-down notes);
What are the differences between offering debt securities to institutional / professional or other investors?

A different disclosure regime exists in the case of offers addressed to retail investors or institutional/professional investors (named ‘qualified investors’). In the latter case, the Prospectus regulation clarifies that a prospectus is not necessary (unless the securities are subsequently traded on a regulated market).

The disclosure regime also depends on the denomination of the debt securities offered. To this extent, debt securities having a denomination amount that is lower than €100,000 are usually directed to retail investors and offered for subscription by means of a prospectus approved by CONSOB, whereby debt securities having a denomination that is equal to or higher than €100,000 shall be considered as a wholesale issue and a less rigid disclosure regime is applicable.

When is it necessary to prepare a prospectus?

Under the Prospectus Regulation, unless an exemption applies, it is necessary to publish a prospectus where there is an offer of securities to the public or an application for the securities to be admitted to trading on a regulated market.

An offer would not be deemed to have been made to the public if it is made solely to qualified investors, addressed to fewer than 150 persons (other than qualified investors) per European Economic Area state or where the minimum denomination per unit is at least €100,000.

If the offer is deemed not to be made to the public, a Prospectus Directive compliant prospectus may still be required if an application is made for the securities to be admitted to trading on a regulated market. An exemption from both the offer to the public and the admission to trading on a regulated market is needed to avoid publishing a prospectus.

What are the main exchanges available?

Borsa Italiana S.p.A. provides different markets where debt securities may be traded. In this respect, the primary market in Italy is the MOT (Mercato Telematico delle obbligazioni e dei titoli di Stato). Pursuant to the Rules of the Markets organized and managed by Borsa Italiana S.p.A., the financial instruments that may be traded on the MOT are bonds (excluding convertible bonds), sovereign debt, Eurobonds, asset-backed securities, structured bonds, covered bonds and other debt securities and instruments tradable in the monetary market.

The MOT consists of two segments:

- DomesticMOT, for debt securities that are settled through Monte Titoli S.p.A., according to the Instructions accompanying the Rules of the Markets organized and managed by Borsa Italiana S.p.A.; and
- EuroMOT, for debt securities that are settled through Euroclear/Clearstream, according to the Instructions accompanying the Rules of the Markets organized and managed by Borsa Italiana S.p.A.
Furthermore, there are other trading venues – in particular Multilateral Trading Facilities – where debt securities may be traded:

**ExtraMOT**

The ExtraMOT is a multilateral trading facility, regulated by Borsa Italiana S.p.A., for trading corporate bonds issued by Italian and foreign companies which are already listed on other regulated EU markets, as well as non-listed bonds and debt instruments issued by Italian small and medium-sized enterprises (SMEs).

**ExtraMOT Pro**

The ExtraMOT Pro is the professional segment of the ExtraMOT dedicated to trading, *inter alia*, bonds (including convertible bonds), commercial papers and project bonds, generally issued by Italian SMEs. Trading is only open to professional investors on the ExtraMOT Pro.

**EuroTLX**

EuroTLX is the multilateral trading facility organized and managed by Borsa Italiana S.p.A., targeted to non-professional and professional investors trading in retail size and mainly focused on fixed income securities.

*Last modified 22 Jan 2020*

**Is there a private placement market?**

The private placement market in Italy is underdeveloped compared to, for instance, the UK or the US. According to a paper published by the Bank of Italy, there were 235 issuances of debt securities in the period 2012–2014.

Having said that, the private placement market in Italy is growing due to the introduction of so-called minibonds, ie debt securities issued by Italian non-listed companies (generally small and medium-sized enterprises (SMEs)) and usually negotiated on the ExtraMOT Pro.

Efforts have been made by the Loan Market Association and International Capital Markets Association to standardize private placement documentation.

*Last modified 22 Jan 2020*

**Are there any other notable risks or issues around issuing or investing in debt securities?**

**Issuing debt securities**

Under Italian law, the issuer, offeror, guarantor, or the persons responsible for the information contained in the prospectus, shall be liable, each in relation to the extent of their own duties, for damages caused to the investor placing reasonable faith in the truth and accuracy of information contained in the prospectus, unless it is proved that all due diligence was adopted for the purpose of guaranteeing that the information in question complied with the facts and that no information was omitted that could have altered the sense thereof. Investors suffering loss are entitled to bring a civil action for negligent misstatement or misrepresentation, and also criminal law sanctions may be imposed in such cases.

**Investing in debt securities**

Under Italian law, a noteholders' meeting may amend the terms and conditions of the debt securities provided that certain conditions regarding the constitutive/deliberative *quorum* are fulfilled. To this extent, an extraordinary resolution passed by a qualified majority of noteholders binds all the noteholders.

In addition, in the case that the issuer is an institution falling within the scope of the BRRD the potential investor should be aware that such institution may be subject, upon certain conditions, to resolution measures. In particular, the relevant resolution authority could apply certain resolution tools including, among others, the bail-in tool. Consequently, the potential investor may be subject to the risk that the resolution authority will exercise the write-down or conversion power in respect of the relevant institution's liabilities (including the securities purchased by the investor).
Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally

In general terms, the establishment, marketing and management of Italian investment funds (having either contractual or corporate form) are regulated activities, exclusively reserved to duly licensed entities, subject to authorization requirements and ongoing supervision and to be performed in compliance with the relevant rules and regulations.

Collective Investment Schemes

Under the Italian regulatory framework, the overall operation and activities of Collective Investment Schemes shall comply with a set of rules and provisions, involving, inter alia:

- disclosure and authorization procedures vis-à-vis the competent supervisory authorities in relation to:
  - the funds, especially when qualifying as retail funds (in this context the applicable provisions set forth different requirements regarding, inter alia, minimum content of the fund documents, disclosure obligations of such fund documents vis-à-vis the supervisory authorities, investment limits, risks fractioning and diversification requirements etc); and
  - the management companies (in this context, the applicable provisions require, inter alia, the obtainment of an authorization to perform collective asset management activities, the compliance with sound and prudent management safeguards, as well as with minimum capital requirements and ongoing prudential thresholds, transparency provisions towards the investors and rules of conduct); and
- procedures to be followed for the promotion, offer and marketing of the funds, differently modulated based on the cross-border operation, if any, the target investors (retail or professional), the type of vehicles etc.

Generally, the rules set forth for retail funds are more stringent than those relating to reserved funds exclusively for professional investors. Fewer and less stringent investment limits, for example, are imposed on reserved funds, as well as less onerous disclosure and reporting requirements.

What are common fund structures?

Different categories of funds may be identified, based, inter alia, on the:

- subscription and redemption modalities adopted (open-ended or closed-ended funds);
- types of subscribers addressed (retail or reserved);
- risk level involved (recourse to leverage on a substantial basis or not); and
- relevant investments to be made (real estate funds, private equity funds, master-feeder structures, fund of funds etc).

In this context, the most common investment structures, as anticipated, can be divided between:

- investment vehicles having a contractual form (ie investment funds, either qualifying as Undertakings for Collective Investment in Transferable Securities (UCITS) or alternative investment funds (AIFs)), established and managed by a manager as a segregated pool of assets divided into units and collected, through one or more issues of units, among a plurality of investors, managed as a whole in the interest of (and independently from) the unit holders; and
- corporate vehicles (ie Società di Investimento a Capitale Variabile (SICAV) and Società di Investimento a Capitale Fisso (SICAF), depending on the open-ended or closed-ended nature, either qualifying as UCITS or AIFs) which may be both self-managed or externally
What are the differences between offering fund securities to professional/institutional or other investors?

Retail funds

Italian retail funds are subject to stringent regulatory requirements, comprising, *inter alia*, minimum contents of the fund rules, authorization procedure vis-à-vis the Bank of Italy, approval of the management rules and of its subsequent amendments, investments' limits and risk mitigation, fractioning and diversification criteria.

Institutional/professional funds

Italian reserved funds, as expected, are subject to fewer and less stringent investment limits, as well as less disclosure and reporting requirements towards the relevant supervisory authorities. No authorization is required for the establishment of reserved funds and generally the fund rules are not subject to approval by the Bank of Italy.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

As anticipated, the establishment, marketing and management of Italian investment funds (having either contractual or corporate form) represent activities exclusively reserved to duly licensed entities and subject to authorization requirements and ongoing supervision. Such activities, as a consequence, are to be performed in compliance with all the relevant applicable rules and regulations. Every potential breach or evasion (e.g., ‘ghost companies’) of the aforesaid rules and regulations may trigger the application of administrative and criminal sanctions associated to an unlawful exercise of financial activity or to the violations of the applicable regulatory provisions.

Investing in funds

No specific issue arises. Any specific risk and the overall risk profile connected with any investment in a fund is mandatorily disclosed in the fund's offering and subscription documentation.

Managing and marketing debt/hedge funds

Are there any restrictions on marketing a fund?

Italy selling restrictions

The offer of securities in Italy is covered under the CONSOB financial promotion regime provisions, respectively implementing *Undertakings for Collective Investment in Transferable Securities Directive* regime and *Alternative Investment Fund Managers Directive* regime.

*Undertakings for Collective Investments in Transferable Securities (UCITS)*
UCITS, including those established in Italy, have an EU passport which enables fund promoters to create a single product for marketing in all EU member states and, on the completion of the appropriate notification procedure, a UCITS established in one member state can be sold in any other.

A UCITS intending to market in another member state must complete and submit to its home regulator a notification including certain specified information, including copies of key investor documents. The home regulator then completes a notification file which is sent in a regulator-to-regulator transmission, following which the UCITS can be sold in the other member state.

**Alternative Investment Funds (AIFs)**

Under the Alternative Investment Fund Managers Directive, marketing is defined as: a direct or indirect offering or placement at the initiative of the Alternative Investment Fund Manager (AIFM) or on behalf of the AIFM of units or shares in an AIF it manages to or with investors domiciled or with a registered office in the EU.

An AIFM may only market an AIF to EU investors if it is authorized by a relevant EU regulator – registration with one EU regulator opens access, subject to certain further limited conditions, to marketing to professional investors across the EU under a EU passport or if it complies with national private placement regimes (please note that NPPR has not been yet implemented in Italy).

**Reverse solicitation and the definition of ‘marketing’**

In general terms, reverse enquiry mechanisms refer to situations in which clients contact managers, on their own initiative, in order to subscribe for units or shares of a fund, and no placement or marketing activity are performed by the managers towards such clients.

Italian law and regulation does not contain specific provisions on the reverse solicitation scheme. The qualification of the operation as a ‘genuine’ reverse solicitation, in this sense, will derive from an assessment, made by the competent Italian supervisory authorities, of the procedural and documentary evidences underlying the transaction. More precisely, the Italian supervisory authorities, in order to prove the legal construction of the reverse inquiry, adopt a stringent ‘substance over form’ approach.

In relation to the definition of ‘marketing’, the Consolidated Financial Act defines this as ‘the offer, also indirect, on the initiative or on behalf of the manager, of the AIF units and shares managed, addressed to resident investors or those with a registered head office in the EU’.

**Are there any restrictions on managing a fund?**

Fund management in Italy is regulated under the Consolidated Financial Act, various statutory instruments and the supervisory authorities’ rules and regulations. The Bank of Italy is mainly responsible for regulating funds and fund managers, as well as the criteria for the obtainment of the relevant authorizations.

The various restrictions imposed by the aforesaid provisions (including, inter alia, structuring, management autonomy and independence, conflict of interest and remuneration issues) shall be proportionate to the managers’ size, internal organization, scope and complexity of activities.

Alternative Investment Fund Managers (AIFMs) are also subject to regulation under the Alternative Investment Fund Managers Directive (as implemented in Italy) and managers of Undertakings for Collective Investments in Transferable Securities (UCITS) are subject to certain requirements under the Undertakings for Collective Investment in Transferable Securities Directive.

More precisely, the authorization procedure with the Bank of Italy to perform collective asset management activities, is granted upon positive evaluation of, inter alia, the business plan, activities plan and organizational structure of the manager, integrity, professionalism and independence of its directors and controllers' integrity, and professional competence of its shareholders and their representatives.

The entity willing to exercise the collective portfolio management activity must submit to Bank of Italy certain documentation confirming the above prerequisites, and the Bank of Italy will have 90 days from the filing to grant or deny authorization (this term may be suspended in case the Bank of Italy requires clarifications or additional information).

In terms of incorporation costs, the Bank of Italy usually requires the Società di Gestione del Risparmio (SGR) to be provided with excess cash in order to cover incorporation costs without reducing the minimum corporate capital.
Special provisions are set forth for SGR managing assets below predefined thresholds (so called SGR sotto soglia), which are subject, inter alia, to simplified capital and authorization requirements, assets evaluation criteria, control functions, outsourcing, conflict of interest and portfolio and management regimes, as well as to simplified guidelines on remuneration.

**Entering into derivatives contracts**

*Are there any restrictions on entering into derivatives contracts?*

An Italian client entering into derivative contracts in Italy might be a private or corporate client or a public client (such as central and local authorities).

**Italian private and corporate clients**

There are no restrictions on private or corporate clients entering into derivatives contracts.

Nevertheless, when entering into a derivative contract with a corporate client it is advisable to check whether the relevant constituting documents and by-laws of such client:

- Encompass any provision evidencing the authority of the party entering into this type of agreement and the performance of its obligations under such agreement; or
- Encompass any limit in relation to entering into derivatives contracts (in particular, it may be possible that only derivatives contracts with hedging – and not speculative – purposes may be permitted).

**Italian public clients**

As of June 2008, all Italian public authorities (including local entities, regions, metropolitan cities etc) are prohibited from entering into any type of new derivative contract.

**Banks authorized in Italy and/or authorized to carry out in Italy financial services on a cross-border basis**

Entering into derivative contracts entail the provision of financial services. Therefore, in order to provide such service, banks and/or financial intermediaries selling a derivative product must be duly authorized to carry out this service (on its own account) in Italy, whether on a cross-border basis or by establishing a branch.

In the event that the bank/financial intermediary is at the same time advisor and counterparty to the client of the derivative contract, Italian law provides a wide range of further information to be disclosed to the client (in order to comply with both appropriateness and suitability rules in favour of the client).

**What are common types of derivatives?**

In Italy, derivative contracts are entered into for the following purposes:

- hedging; and
- trading (including trading for speculation purposes).

Derivatives may be traded over-the-counter (OTC) or on an organized exchange (ETD, Exchange Traded Derivatives).

The most common types of derivative contract in Italy entered into for hedging purposes are:

- swaps (in particular interest rate swap or currency swap), as OTC derivative; and
Derivative contracts (in particular OTC derivative contracts) are also regulated by the European Market Infrastructure Regulation (EMIR) and the implementing regulation of Regulatory Technical Standards (RTS) which attempts to ensure the same degree of protection to clients within all EU countries by providing comprehensive information and transparency on over-the-counter derivative position, and reduce counterparty risk by increasing the use of central counterparty clearing.

It is worth noting that the derivatives market has significantly changed in light of the implementation of the MiFID II starting from January 2018, as summarised above.

Due to a recent increase in disputes over OTC derivatives in Italy, a specific focus is attributed to the following items:

- complete disclosure of all costs related to the initial mark-to-market of the OTC derivative contract (distinguishing each line item such as hedging cost and bank remuneration); and
- comprehensive information to be provided to the client before the entering into the derivative contract with particular reference to the appropriateness and suitability of the derivative.

The risk related to the non-disclosure of the above information to the client is that the derivative contract might be declared null and void by an Italian court. Pursuant to current case law in Italy a client (professional or retail) shall explicitly receive detailed information and give its consent on the value of the hedging costs and any further charge applied to the derivative transaction to be concluded by it.

According to the provisions of EMIR the counterparties to derivatives transactions must verify the need to enter into specific arrangements for risk reducing. More particularly, for those transactions entered into between clients classified as FC (Financial Counterparties) or as NFC+ (Non-Financial Counterparties above a certain threshold) it will be necessary to establish security arrangements for the calculation and exchange, on a daily basis, of the “variation margin” to be exchanged between the parties to cover the relevant exposure under the master agreement governing the entire set of derivatives transactions.
Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

In general terms, under Article 106 of the Consolidated Banking Act the granting of loans in any form is reserved to duly authorized financial intermediaries enrolled with a Register kept by the Bank of Italy.

Specific exclusions are set forth in Ministerial Decree No. 53 of 2015, as well as cases in which the granting of loans is not considered as performed vis-à-vis the public.

In addition, loans can be granted also by Italian special purpose vehicles incorporated pursuant to the Italian Securitization Law. Such SPVs can carry out lending activity in the context of securitisation transactions, both in performing and non-performing scenario, in accordance with the specific requirements and limits set out under the Italian Securitization Law.

Borrowing

While borrowers are generally not regulated, it is advisable for borrowers to consider whether the consumer-lending regime applies to their activities, in which case they will benefit from some additional protections and benefits (such as, for example, in terms of limitations to unilateral amendments by the finance party and transparency rules).

What are common lending structures?

Lending in Italy can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as the agent which fulfils certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific purposes, eg mortgage loans (including credito fondiario in relation to the financing of real estate assets), working capital loans, equity bridge facilities, bridge to cash facilities, project facilities and, letter of credit facilities and export facilities.

Finally, loans can be ‘in cash’ (finanziamenti per cassa), when the lender makes available to the borrower cash, or through the issue of documentary guarantees in favour of third parties in the interest of the borrower (finanziamenti per firma).

Loan durations

The duration of a loan can vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn on a roll over basis;
- an overdraft, provided on a short-term basis to support short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.
Loan security

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

Loan commitment

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain contractual conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

Loan repayment

A loan can be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or bullet (usually meaning the loan is repayable in full at maturity).

What are the differences between lending to institutional / professional or other borrowers?

Lending to institutional/professional borrowers entails a reduced set of protections and limitations in favour of the borrower.

Lending activities towards retail clients and consumers in particular are subject to stricter provisions and limitations.

Do the laws recognize the principles of agency and trusts?

In theory both principles are recognized as a matter of Italian law, although the trust concept is not yet commonplace in the Italian market and is seldom present in common lending structures.

From a practical perspective, in finance transactions with more than one finance party an agent is always appointed to act on behalf of the finance parties. It is extremely rare to have trustees appointed in connection with secured assets as generally trustees may encounter legitimacy issues in enforcing security interests. Parallel debt structure is not recognized/applicable in Italy.

Moreover, the agent usually is granted with reduced representation powers when such powers are granted by hedging banks which, for example, often have more flexibility in the management of the security interests assisting their claims (although subject to the restrictions of any intercreditor agreement).

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual principles.

However, certain principles of law cannot be contractually derogated and any contrary provisions contained in the finance documents would be null and void. As an example, finance documents may not provide for the exclusion of liability in case of gross negligence (colpa grave) or willful misconduct (dolo), and there are limitations to accrual and liquidation of interest (the Italian Usury Legislation applies in this case) and compound interest.

Furthermore, the enforcement of obligations of a party or the binding effect of such obligations may be limited by laws regarding bankruptcy, receivership, insolvency, liquidation, reorganization and any laws generally affecting the rights of creditors. In particular any payment made in advance in respect of its due date as originally agreed between the parties, including as a consequence of the
acceleration of such payment obligation or as a result of the operation of any mandatory prepayment provision contained in the finance documents, may, at certain conditions, be deemed ineffective vis-à-vis the bankruptcy administration of the payer, pursuant to Article 65 of the Bankruptcy Law, and accordingly the bankruptcy administration of such payer may request the restitution of such payment.

In addition, it is worth noting that:

- In banking transactions, a loan facility (from an accounting perspective) constitutes an asset of the lending bank rather than a liability but Directive 2014/59/EU (Bank Recovery and Resolution Directive or BRRD) and the relevant powers of the competent resolution authority may still be relevant eg in relation to a bank's potential liabilities to other syndicate members in a loan or an inter-creditor arrangement.

- If a financial institution happens to be a borrower, then its liabilities to repay debt may be subject to bail-in.

Specific types of lending

Specific to the area of mortgage lending is the issue of whether a lender falls within the recently formed Italian mortgage regime. The Directive 2014/17/EU on credit agreements for consumers relating to residential immovable property, implemented in Italy through the Consolidated Banking Act and the Transparency Provisions, aims to prevent the irresponsible lending and borrowing practices that were exposed during the global financial crisis. The implementing regulations impose a number of requirements on lenders including the need to:

- conduct affordability tests before lending;
- provide standard information about the mortgage to enable borrowers to compare products; and
- ensure that staff are suitably trained.

Standard form documentation

It is quite common to see Italian law syndicated finance transactions governed by documentation based on forms published by the Loan Market Association (LMA), duly amended and integrated to be compatible with Italian law and Italian market standards. It is, however, also very common to see syndicated and bilateral finance transactions documented on bank standard form documentation prepared in-house or other simplified standard forms prepared by external legal advisors but diverging from the LMA.

Are there any other notable risks or issues around borrowing?

Borrowers should be aware of the potential implications of the BRRD, which outlines certain measures for dealing with failing financial institutions.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to 'bail in' obligations of failed EEA financial institutions and also postpones the enforcement of early termination rights against the affected institution. 'Bail in' describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the granting of guarantees and security are as follows.
Capacity/Corporate Benefit

It is important to check the constitutional documents of a company granting a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors' powers that would be preventative. Under Italian law, directors have a general duty to promote the success of the company for the benefit of its members as whole; as such, they will need to be able to show that adequate corporate benefit is derived from the company giving the guarantee or security. This is often more difficult in the case of upstream or cross-stream guarantees or security provided by a subsidiary to its parent or sister company.

Provided that the assessment of a corporate benefit is a matter of fact depending on a number of commercial and financial factors to be evaluated by the management body of the grantor of the guarantee and/or security, the market approach is often to have the members of the company approving the granting of the guarantee or security by written resolution and, if possible, to limit the guaranteed/secured amount to the direct monetary benefit arising to the issuer/grantor of the upstream or cross-stream guarantees or security (for example, the maximum guaranteed/secured amount would not exceed the amount of the intra-group/shareholders' loans made available to the issuer/grantor by the entity in the interest of which the upstream or cross-stream guarantees or security is issued/granted).

Insolvency

Guarantees and security may be at risk of being set aside under Italian insolvency laws if the guarantee or security was granted by a company within a certain period of time prior to the declaration of bankruptcy (dichiarazione di fallimento). For such a transaction to be set aside, certain statutory criteria would have to be met, including that the guarantee or security was given within six months (or one year in the event that the underlying guaranteed obligation was not undertaken prior to (and not at the same time as) the issue/granting of the guarantee/security) of the declaration of bankruptcy (dichiarazione di fallimento) of the affected party.

In case of mortgage lending transactions governed by Section 38 of the Consolidated Banking Act (the so called 'Credito Fondiario' providing for certain requirements and limitations for the lenders in the selection of the remedies against the borrower in case of default), the period within which the mortgage assisting the financing may be set aside is reduced to 10 days.

Financial assistance

Financial assistance is subject to stringent regulation and limitations and it is therefore quite rare in the market to encounter a company providing financial assistance for the purchase of its own shares as a complex “whitewash” procedure is required in order to legally carry out such a transaction. Financial assistance in this context would include giving a guarantee or security in connection with the share purchase.

What are common types of guarantees and security?

Common forms of guarantees

Guarantees can take a number of forms.

A particular distinction worth remembering is between a personal guarantee (fideiussione) and an autonomous first demand guarantee.

- A personal guarantee (fideiussione) is a strictly regulated form of guarantee. Some of its main features are that:
  - it remains valid only if the underlying guaranteed obligation is valid;
  - the guarantor is entitled to object to a payment request by invoking the exceptions and objections which pertain to the debtor in the interest of which the guarantee was issued (the relevant debtor);
  - the guarantor may, before paying and under certain conditions, act against the relevant debtor to be released from the guarantee or to obtain due counter guarantees or counter security for the satisfaction of its claims after the payment; and
  - the guarantor is released if the guaranteed creditor has further financed the relevant debtor although it was aware of its difficult financial conditions.

- An autonomous first demand guarantee is intended as an instrument ensuring payment to the relevant creditor irrespective of the circumstances affecting the relevant debtor or the underlying guaranteed obligation if the contractual conditions/steps and
procedures provided by the relevant agreement are met.

Both of the above described guarantees shall expressly provide for the maximum guaranteed amount should the guaranteed obligation be a future/conditional obligation.

**Common forms of security**

There are four basic types of security interest that can be created under Italian law:

- a mortgage;
- a pledge;
- an assignment by way of security; and
- a privilegio (general or special lien).

Different types of security are suitable for securing different types of assets.

Under Italian law it is not possible for a single security to cover all of the assets of an Italian company, but only individual assets or classes of assets. Granting security over all of a company’s assets will tend to be achieved through the granting of the following multiple security interests:

- a pledge over movable assets (including shares/quotas of a company) or receivables;
- a mortgage over real estate assets or vehicles or ships;
- a privilegio (general or special lien) over movable assets different from vehicles and ships; and
- an assignment by way of security of receivables.

With respect to financial transactions it is customary to establish securities in the form of “financial collateral guarantees” according to Legislative Decree 170/2004 implementing in Italy Directive EC 2002/47. Financial collateral guarantees relating to financial transactions are documented as transfer-title pledge over assets granted by a transferor in favour of a transferee covering the exposure of one party to another under the relevant financial transactions.

In addition to the above, the following securities have been recently introduced in Italy:

- Security transfer of immovable asset; and
- Non-possessory pledge (not implemented).

**SECURITY TRANSFER OF IMMOVABLE ASSET**

A loan granted to an entrepreneur by a bank or another financial entity authorized to grant loans to the public in Italy can be secured by transferring to the creditor (or to a company in the creditor’s group authorized to purchase, hold, manage and transfer rights in rem in immovable properties) the ownership of an immovable asset of the entrepreneur or of a third party. Such transfer is subject to the condition precedent of the debtor defaulting. In such a case, the creditor is entitled to notify the pledgor its intention to enforce such security pointing out the amount of its credit; following such notification an independent valuer is appointed by the relevant Court in order to determine the value of the relevant immovable asset and consequently the sale process is carried out. The creditor shall pay to the pledgor the difference (if any) between the transfer price and the amount of its credit towards the pledgor.

**NON-POSSESSORY PLEDGE**

A non-possessory pledge allows the pledgor (who shall be engaged in entrepreneurial activities) to continue to use, transfer or otherwise dispose of the pledged assets for business purposes, provided that in such a case, the pledge would extend to any asset resulting therefrom. A non-possessory pledge agreement requires a written form and shall indicate a maximum secured amount. However, the pledge is enforceable vis-à-vis third parties only upon registration on an electronic register of non-possessory pledges to be set up. In this respect, since such electronic register has not been implemented, such security is not currently effective.

_Last modified 22 Jan 2020_

*Are there any other notable risks or issues around giving and taking guarantees and*
Giving or taking guarantees

To be valid, a guarantee needs to be in writing and signed by the guarantor. It can be provided also in case the Relevant Debtor is unaware of its issue.

The issue of a guarantee by a company does have some limitations regarding, *inter alia* the:

- preservation of the assets of the guarantor and the preservation of the rights of the creditors and stakeholders;
- misuse of corporate assets;
- exclusion of liability in case of gross negligence (*colpa grave*) or willful misconduct (*dolo*); and
- accrual and liquidation of compound interest.

Giving or taking security

A security document may need to be executed through notarial deed should it:

- contain a mortgage;
- contain a pledge over quotas over a limited liability company;
- contain a *privilegio speciale* (special lien); or
- contain an assignment of receivables *vis-à-vis* public entities.

In all other cases, it may be entered into either in notarial form or via exchange of commercial letters. In particular, this latter form is mainly utilized when the registration of the relevant instrument is not required by law.

Once granted, security needs to be properly perfected before it is valid against third parties. Perfection formalities can range from having the secured asset delivered to the security holder or a custodian, registration of the security in a company's books (as per the pledge of a company's shares) public registries and/or notice being given to (or, alternatively, acceptance being obtained from) third parties. Mortgages must be registered at the Land Registry, the pledges over a company's quotas must be registered in the Companies Registry, while the *privilegio speciale* (special lien) must be registered in the relevant book held at the competent courts. Failure to register means that the charge will be ineffective (*non opponibile*) against the liquidator, administrator or any creditor of the company and the money secured by the charge becomes immediately payable.

As for guarantees, for a period after a new security interest has been granted (known as the hardening period), there is a risk that such security is set aside in certain circumstances under insolvency laws.

Regulatory authorization

Who are the regulators?

The Bank of Italy is the central bank of Italy and is entrusted with the supervision of banks and financial intermediaries, which are the entities entitled to carry out banking and financial activities vis-à-vis the public. In particular, the Bank of Italy pursues the objective of ensuring the stability and the efficiency of the banking and financial system and compliance with Italian rules and regulations. To this end, the Bank of Italy issues secondary legislation and monitors the activities carried out by banking and financial institutions, also in relation to the payments system and the overall regulatory supervision.

The Bank of Italy has also powers of inspection and sanctioning powers vis-à-vis the banks and the financial intermediaries.

In addition to the above, Italian banks qualifying as significant institutions are also directly subject to the prudential supervision of the European Central Bank (ECB), which is also entrusted with both hard and soft regulatory powers, in accordance with the overall European framework.

The Commissione Nazionale per le Società e la Borsa (CONSOB) is the Italian government authority responsible for regulating the Italian securities market. More precisely, CONSOB is entrusted with supervision on transparency and correctness of regulated entities, including banks and financial intermediaries providing investment services and other financial activities. This authority also regulates, inter alia, the solicitation of investment (ie public offers) and the marketing of financial instruments, including units of collective investment funds. For the purposes of its supervisory competence, CONSOB also has powers of inspection and sanctioning powers vis-à-vis the banks and the financial intermediaries.

What are the authorization requirements and process?

The authorization requirements and processes applicable in Italy depend on the type of intermediary which is involved (i.e. mainly a bank, an institution, an asset management company or a financial intermediary).

Generally speaking, in order to be entitled to perform banking or financial activities in Italy, each type of intermediary shall submit to the Bank of Italy a set of documents describing, inter alia, the activity to be performed and confirming compliance with each of the requisite legal requirements in order to perform such activities. The main documents to be prepared are an organizational structure report aimed at describing the internal organization and main procedures that the applicant is setting up in view of the authorization, and a business plan. The applicant institution shall also be able to demonstrate the possession of the relevant minimum own capital requirements, which differ depending on the type of intermediary.

The application includes, inter alia, documents confirming compliance with certain integrity, professionalism and independency requirements by the stakeholders and their senior management.

In this context, the supervisory authorities shall assess within a certain timeframe whether the applicant meets the required conditions. This term may be suspended if the authority requires clarifications. With respect to some significant banks the authorisation is formally granted by the ECB on the basis of the assessment made by the Bank of Italy.

At the end of the authorization processes, if successful, the banks/financial intermediaries/other supervised companies or institutions are enrolled in the relevant sections of the Bank of Italy Registers.
In relation to the fees associated with the incorporation and authorization of banks and financial intermediaries, there are no fees for the enrolment on any register of the Bank of Italy, however, certain fees are requested by CONSOB (by way of supervisory contribution).

Last modified 22 Jan 2020

**What are the main ongoing compliance requirements?**

Certain conditions, requirements and thresholds (eg financial resources, compliance measures and adequate internal organization, policies and procedures, integrity, professionalism and independency requirements of the senior management) must be met in order to preserve the authorized status of the bank or financial intermediary. Failure to comply with such requirements can result in sanctions for intermediaries or banks and/or regulated entities, and in the revocation of the authorization granted.

Last modified 22 Jan 2020

**What are the penalties for failure to be authorized?**

The provision of banking and/or financial activities in Italy vis-à-vis the public, without being authorized, triggers criminal sanctions (in the form of a financial penalty and/or imprisonment).

In addition (based on a number of Italian court judgements) loans granted by an entity which is not duly authorized will be null and void.

Last modified 22 Jan 2020

**Regulated activities**

**What finance and investment activities require authorization?**

**Generally**

In general terms, the performance in Italy of one or more of the following financial activities requires an authorization:

- savings collection;
- payment and e-money services;
- the provision of investment services;
- granting financing in any form vis-à-vis the public (ie to third parties on a professional basis) (this activity includes the granting of loans, including the issue of guarantees replacing the credit and guarantee commitments, financial leasing, the purchase of receivables for valuable consideration, consumer credit, mortgage credit, loans backed by pledges, the issue of guarantees, the opening of a documentary credit facility, the acceptance, endorsement or commitment to grant a facility, as well as any other form of issuing guarantees and credit commitments); and
- collective asset management activities.

**Consumer credit**

The Consolidated Banking Act defines a consumer credit agreement as a contract by which the lender grants or undertakes to grant credit to a consumer in the form of a deferred payment, loan or other similar financing, also in relation to real estate consumer credit. In this context, pursuant to the Consolidated Banking Act, 'consumer' shall mean a natural person acting for purposes unrelated to a business or professional activity (if any) carried out by the same. Such definition includes all financings granted by professionals (banks or authorized intermediaries) vis-à-vis consumers. Specific transparency and disclosure obligations vis-à-vis consumers are provided for by the Consolidated Banking Act and by the Transparency Provisions. The Transparency Provisions have been amended in order to, inter alia, introduce product oversight and governance requirements for retail banking products, including consumer credit. As a consequence credit institutions shall now make sure to design and bring to the market products with features, charges and risks, that are appropriate for the interests, objectives and characteristics of a pre identified target clientele (so called "target market"). The Consolidated Banking Act also lists a set of exclusions, in relation to which the consumer credit regime shall not apply.
Are there any possible exemptions?

In relation to the possible authorization exemptions, in general terms, the above-mentioned activities do not trigger authorization requirements and can be freely exercisable if they are not performed vis-à-vis the public.

For instance, activities carried out exclusively vis-à-vis the group to which the intermediary belongs, upon certain conditions, do not fall within the scope of activity requiring authorization.

Moreover, activities carried out on an occasional basis, without any stable organization and continuity, do not fall within the definition of activities performed on a ‘professional basis’ and, therefore, are not required to be authorized.

However, according to Italian case law, the granting of one loan can fall within the scope of authorized activity if the lender has a framework in place which presumes the potential continuation of the relevant activity.

Without prejudice to the above, certain specific exemptions are provided for with regard to consumer credit activities.

Also in relation to other type of intermediaries, upon certain conditions, some regulatory exemptions could be invoked, provided that such exemptions widely reflect those already provided at the European level.

As regards the provision of payment services, it has to be considered that, after the implementation of Directive 2015/2366/EU (PSD2), operators willing to invoke the so called “limited network exemption” or the so called “electronic communication exclusion” shall submit a notification to the Bank of Italy – should some volumes and thresholds be exceeded – are enrolled in a separate section of the register as “exempted entities” and are subject to an annual assessment.

Do any exchange controls or other restrictions on payments apply?

In Italy there are no exchange controls. Italian residents may hold, within and outside Italy, foreign currency and foreign securities of any kind and non-residents may export cash and/or securities, in both foreign currency and euro and are entitled to invest in Italian securities provided that when the total amount of the value to be transferred is more than €10,000, reporting and record-keeping requirements are complied with. Entering or leaving the EU with €10,000 or more in cash must also be declared to customs.

Certain additional procedural requirements are also imposed for tax reasons.

In Italy, payments in cash, or made with bank or postal deposit savings passbooks, or by way of debt securities in bearer form both in euro or in a foreign currency must not exceed €2,000. Starting from 1 January 2022 such limit will be reduced to €1,000.

The limit fixed for money transfers as well as bank or postal check books without the identification of the beneficiary is €1,000.

What are the rules around financial promotions?

The rules around financial promotion differ depending on the object of the promotional/offering activity.

As regards the promotion of banking activities/financial services and products in places other than the registered office or the branches of the bank (ie ‘door-to-door offer’), banks may make use of their employees and financial salesmen (agenti), other banks and investment firms and the relevant salesmen, insurance companies and the relevant agents, and financial intermediaries. Certain particular transparency requirements apply in case of door-to-door promotion and placement of banking services/financial activities and products.

Certain other specific transparency rules apply to promotion of banking activities/financial services and products by means of distance marketing techniques.

The relevant rules – both relating to door-to-door promotion of banking activities/financial services and products and to promotion of banking activities/financial services and products by means of distance marketing techniques – are provided for by the Consolidated Banking Act, the Consolidated Financial Act and the relevant implementing provisions.
With reference to promotion/offer of financial instruments/investment services, for ‘door-to-door offers’ – meaning the promotion and the placement with the public of financial instruments and/or investment services and activities in a place other than the registered office of the issuer, the offeror, the seller of the services or the provider, as the case may be, the person in charge of carrying out the promotion and the placement of such financial instrument(s) or service(s) will be subject to specific rules. The intermediaries may also make use of financial salesmen (consulente finanziario abilitato all’offerta fuori sede), ie individuals who, acting as tied agents under the MiFID II, carry out the door-to-door sales of financial instruments/investment services. Financial salesmen must be registered in a specific register kept in accordance with Italian financial law.

Intermediaries, including banks, may engage in door-to-door selling of their own investment services and activities. Where such selling involves services and activities provided by other intermediaries, the offering intermediary must be authorized to perform the services of:

- subscription and/or placement with firm commitment underwriting or standby commitments to issuers; or
- placement without firm or standby commitment to issuers.

In case of door-to-door offers of financial instruments or investment services, any recipient of such instrument or service will have a right of withdrawal within a specific term.

For door-to-door selling of their own investment services and activities by means of distance marketing techniques, the use of financial salesmen is not required. Moreover, the right of withdrawal will be governed by the general provisions set forth by the applicable rules and regulations, as applicable (Consumers’ Code etc).

The above-mentioned requirements relating to door-to-door offer of financial instruments/investment services and the door-to-door offer of financial instruments/investment services by means of distance marketing techniques do not apply in the case that the offering activity is carried out vis-à-vis professional customers nor in case the offering consists only of own financial instruments and is targeted to executives, employees and other affiliates of the relevant issuer.

In addition, certain specific rules will apply to ‘public offering of securities’.

‘Public offering of securities’ means every communication to persons in any form and by any means, presenting sufficient information on the terms of the offer and the securities to be offered, so as to enable an investor to decide to purchase or subscribe for those securities. This definition also applies to the placing of securities through financial intermediaries.

The legislation provides for specific requirements applicable to ‘public offerings of securities’; in particular, any public offering is subject to the publication of a prospectus by the person making the offer, such publication being subject, in turn, to the prior authorization of CONSOB (which, inter alia, is the authority in charge of the supervision of public offerings of securities in Italy). The prospectus shall be drafted in compliance with the provision of the Prospectus Regulation and of its relevant implementing provisions.

Certain exceptions to the obligations relating to ‘public offering of securities’ are provided for by the law.

Entity establishment

**What types of legal entity are generally used to undertake financial or investment activity?**

**Generally**

In general terms, the performance of banking/financial activities in Italy is mainly reserved to duly licensed entities, subject both to initial authorization requirements and to ongoing controls and supervision. In this context, some of the authorization procedures set forth under the Italian regulatory framework expressly require certain types of legal entities or corporate forms, modulated on the basis of the activities to be performed and on the related legal and regulatory safeguards to be adopted (eg with reference to sound and prudent management requirements, the relevant capital requirements and liability issues).
The most common type of legal entities involved are limited companies, especially companies limited by shares (società per azioni) or limited liability companies (società a responsabilità limitata), which are generally characterized by separate legal personality and limited liability of the members.

Please note that, in any case, special organizational and governance rules are usually imposed on supervised intermediaries, regardless of the specific legal regime commonly applicable to the adopted corporation. Particular provisions are also set forth in relation to qualifying holdings which:

- an intermediary is entitled to acquire in other entities; and
- other entities are entitled to acquire in an intermediary.

Notwithstanding the above, upon certain conditions, intermediaries' shares can be offered to the public or admitted to trading on a regulated market.

**Funds**

Italian investment funds can be established by contract or as a corporate entity.

In the case of a fund established by contract, a management company is needed and such entity, usually a Società di Gestione del Risparmio (SGR), shall be a company limited by shares. In the case of corporate funds (Società di Investimento a Capitale Variabile (SICAV) or Società di Investimento a Capitale Fisso (SICAF), based on the open-ended or closed-ended nature of the fund), the vehicle could be both self-managed or externally managed by a management company, qualifying as a company limited by shares.

Last modified 22 Jan 2020

**Is it possible to conduct lending or investment business through a branch or establishment?**

Yes.

A company can conduct lending business in Italy through an establishment (also known as a ‘branch’).

Companies having an Italian establishment need to follow a notification procedure before starting their operations in Italy.

As regards funds, following the Undertakings for Collective Investment in Transferable Securities (UCITS) directives and Alternative Investment Fund Managers (AIFM) directive implementation, EU asset management companies can carry out their activity in Italy on the basis of ‘passports’. In particular, the EU asset management companies can set up and manage Italian alternative investment funds both under an establishment regime and under freedom to provide service regime and can offer in Italy their funds on a cross-border basis.

**FinTech**

**FinTech products and uses**

*What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?*

**Peer-to-peer funding platforms and marketplace lending**

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved, provided that CONSOB has recently conducted a set of studies on the matter, trying to outline a more precise framework for this phenomenon. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based
structure;

• applying technology to leverage and optimize the lending platform and user experience; and
• connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P)-type structures often operated through an electronic platform provider as well as crowdfunding and also direct to retail financing mechanisms.

ISSUES FOR STARTUP MARKETPLACE LENDERS

Italian marketplace lending is at an early stage of development but the number of participants and transactions is increasing at a rapid rate. Issues for such lenders may relate to funding structures and the regulatory aspects of marketplace lending. For more information, see FinTech products and uses – particular rules.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record, for example, relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced,
more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

Recent regulatory changes introduced the possibility for the execution of smart contracts to have the same evidentiary value of written contracts under specific conditions and technical standards that needs still to be approved. Once approved, such a change might represent a significant improvement since smart contracts might be more easily used in the financial services sector.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether, based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Furthermore, because of these different features, it is not only the Italian banks and financial institutions that are interested in this new technology, but also the insurance, digital payments, Industry 4.0, the Internet of Things (IoT), health, retail and public sectors.

As a general remark, it is not quite clear which Italian regulatory reference framework can be (and is) used for managing impacts connected to the crypto-currencies sector; moreover, important proposals for action, such as the adoption of decrees implementing EU provisions, are on the table of the Italian Parliament and are expected to be adopted and implemented in the next future.

Having this said, at the current state of affairs, a first step towards the regulation of the aforesaid sector has been made with reference to the anti-money laundering regulations. With the implementation of the Fourth and Fifth AML Directive providers engaged in exchange services between virtual currencies and fiat currencies and custodian wallet providers have been expressly included within the scope of the obliged entities subject to the requirements and obligations of the AML and CTF regulations.

**Initial coin offerings and token-based products**

**WHAT IS AN INITIAL COIN OFFERING (ICO)?**

ICOs are a form of digital currency or token using blockchain technology. The expression 'Initial Coin Offering' was initially used in the relevant market with reference to the issue of crypto-currencies (e.g., Bitcoin, Ethereum); as of today, such expression is used to identify any offering of tokens which do not necessarily represent a crypto-currency but, however, embed various rights and can be purchased against payment either in fiat currency or crypto-currency. ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. In general terms, most ICOs are issued for an activity/project. Tokens may be issued by companies, natural persons or networks of product developers. The company's business activity is often merely in the phase of being planned (more or less organised start-ups), and the production of goods/services is scheduled to start after the end of funding.

It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

ICOs are substantially similar to an Initial Public Offering as long as both the offerings aim at raising capital from the public made up of a potentially undetermined number of investors, involving a set of activities aimed at promoting/advertising the offering itself. Compared to conventional offerings of financial instruments, ICOs are characterised by the following elements:

- use of blockchain technology, which allows to disintermediate the typical capital markets infrastructure (e.g., custodian banks,
underwriters, secondary markets);

- the means of payment used for the transaction settlement, as payments for purchasing tokens are made in crypto-currencies (e.g., Ethereum, Bitcoin) instead of fiat currency;

- they are advertised and promoted via the World Wide Web, which allows promotion and funding at a cross-border level, with no territorial constraints either for the issuer or the promoter;

- the publication of a so-called ‘white paper’ in place of a prospectus, describing the main characteristics of the investment scheme and the object of the offering.

Due to their characteristics, some types of token may qualify as financial instruments or, as financial products (investment tokens or security-like tokens). Other tokens present a variable mix of characteristics and are therefore called ‘hybrid tokens’; these are the most difficult to discuss and qualify in the light of the current regulatory framework. In particular, this last set of tokens may have a remarkable financial content, in addition to being placed to retail investors via public offerings.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

Artificial intelligence and robo advisory systems

The system known as ‘robo advisors’, or automated financial advice tools, are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services from portfolio selection to personal finance planning. In general, robo advisors or automated financial advice (and optimization) tools are digital/mobile asset management and financial advice platforms, which process data around specified parameters for a variety of financial assets and activities and/or (personal) finances.

Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

In terms of different market sectors, AI brings significant value to financial operations, where both the risk mitigation as well as customer service could be supported. Italian AI is a rapidly growing sector. With reference to the Italian market, it is estimated that in 2019 the assets managed by ‘robo advisors’ exceeded $400 million (with an average assets approximately equal to $12,000 per client), while the average growth rate forecast between the 2019 and 2023 stands at a total of around 51%.

Data analysis and cloud computing

WHAT IS CLOUD COMPUTING?

Cloud computing is a method for delivering scalable and flexible information technology (IT) services in which users can retrieve resources from the internet/intranet through private or public web-based tools and applications, rather than hosting software locally within their
own organization. Within the broad ‘cloud’ concept three main service models can be identified:

- Software as a service (SaaS) involves providing access to and use of, an end user software application, such as e-mail or a word processor, through a pay-as-you-go or on-demand model.
- Platform as a service (PaaS) involves providing access to and use of tools for the development and deployment of custom applications, for example, certain mobile applications.
- Infrastructure as a service (IaaS) involves providing access to and use of computing resources including servers, networking, storage, and data center space on a pay-per-use basis.

Depending on the degree of privacy of the resources and service delivery mechanisms, businesses can employ cloud computing in different ways. Some users maintain all apps and data on the cloud, while others use a hybrid model, keeping certain apps and data on private servers and others on the cloud.

**WHAT ARE THE ADVANTAGES OF CLOUD COMPUTING FOR FINTECH FIRMS?**

The rise of cloud-based solutions offers FinTech companies a number of potential benefits allowing them to speed-up business processes while reducing costs. As an example, cloud computing could:

- assist in automating audit and verification processes thereby allowing FinTech engineers to work on product enhancement;
- allow maintenance of performance levels even during peak hours or end of month queues, by giving access to high-performance servers and data storage;
- help make the production cycle continuous by providing access to data 24/7, thereby reducing time-to-market of a product/solution; and
- help create an enhanced setup for disaster recovery.

In exploring the potential benefits of cloud computing, attention should be paid to ensure full compliance of each solution with the applicable law, even at local level.

*Last modified 22 Jan 2020*

**Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?**

**General financial regulatory regime**

In relation to the performance of banking, financial or payment services, the main Italian supervisory authorities are:

- the Bank of Italy, which is the central bank of Italy and is entrusted with the overall regulatory supervision of banks and other financial intermediaries, including payment services providers and e-money issuers; and
- the CONSOB, which is the Italian government authority responsible for regulating the Italian securities market as well as the provision and marketing of investment services.

CONSOB is entrusted with supervision on transparency and correctness of regulated entities, including banks and financial intermediaries providing investment services and monitoring compliance with the rules of conduct generally imposed on such intermediaries.

Additional authorities also operate, in relation to specific sectors (eg insurance) or in connection with specific issues (eg competition and data protection).

**GENERAL**

The provision of banking, financial and payment services in Italy is reserved to authorized intermediaries. A person must not carry on a regulated activity in Italy unless authorized or exempt.

Consequently, where FinTech products and applications involve financial activities falling within the scope of the required regulatory authorizations, the firms providing such products and applications, if not otherwise exempt, must be authorized/passported, as the case
Following a public debate involving market operators and based on a document for discussion CONSOB recently published a report on the initial offers and exchanges of crypto-activities. Pending the establishment of a shared European regulatory framework on crypto-assets and, in particular, on their possible qualification as securities, CONSOB's intention was to start a debate at national level on initial coin offerings (ICOs) and crypto-assets exchanges, in connection with the recent spread of ICOs and therefore, of crypto-assets invested in by Italian investors.

**Electronic payments platforms and regulation of peer-to-peer lenders**

**ELECTRONIC MONEY (E-MONEY)**

Reference shall be made to the provisions of the e-money directive No. 2009/110/EC (EMD) and to its national implementing measures, which include the Consolidated Banking Act and Legislative Decree No. 45, 16 April 2012, containing the EMD's implementing decree, both as amended from time to time. Moreover, for a complete understanding of the applicable legal and regulatory framework, also the rules regulating the provision of payment services shall be considered, as well as the Bank of Italy secondary level provisions.

E-money is defined as the electronically (including magnetically) stored monetary value, represented by a claim on the issuer, which is issued on receipt of funds for the purpose of making payment transactions. E-money must be accepted by a person other than the e-money issuer and include pre-paid cards and electronic pre-paid accounts for use online.

All providers performing payment services or e-money related activities must be authorized by, or passported with, the Bank of Italy, although, based on the specific functioning mechanism, the management of electronic payment platforms could qualify as a reserved activity, subject to regulations governing payment service providers and e-money issuers, or fall within one of the possible exemptions (eg if the firm qualifies as a mere technical service provider supporting the provision of the relevant services without any involvement in their offering or performance).

**PEER-TO-PEER LENDING**

Peer-to-peer lending activities (also 'social lending' or 'lending based crowdfunding') are defined, under the Italian regulatory framework, as 'the mechanism through which a plurality of borrowers could demand to a plurality of potential lenders, by means of online platforms, refundable funds for personal use or to fund a project'.

Based on the similarity of such activities with those relating to the public savings collection and considering that the latter, in accordance with the Consolidated Banking Act, are exclusively reserved to duly authorized credit institutions, since November 2016, the Bank of Italy has regulated social lending by a regulation governing the performance of collection activities carried out by subjects other than banks. The relevant provisions mainly clarify the conditions to be complied with in order to avoid a qualification of social lending services as reserved savings collection activities.

Bank of Italy's regulation refers both to the managers of social lending platforms and to the subjects who collect or lend funds through such platforms and is generally aimed at preventing non-banking entities from raising significant amounts of funds vis-à-vis an indefinite number of borrowers. In this sense, managers and collectors are, in any case, precluded from collecting demand deposits and from carrying out other forms of collection whatsoever involving the issuance or management of payment instruments having generalized usability. No limits are imposed on banks in carrying out social lending activities through online portals.

The Bank of Italy does not have investigation or sanctioning powers on non-banks entities providing collection activities. Any infringement of the aforesaid provisions is governed by criminal law.

A special regime for the collection of risk capital via online portals (equity crowdfunding) is regulated by the Italian securities law (in particular by the Crowdfunding Regulation (as amended by CONSOB resolution No. 21110 dated 10 October 2019), adopted by CONSOB pursuant to articles 50- quinquies and 100- ter of the Consolidated Financial Act). In equity crowdfunding, the securities respectively sold are issued by Italian innovative startups and small-to-medium-size companies or by certain undertakings for collective investments investing in those kind of companies. The managers of such portals shall comply with a set of requirements, and in order to be entitled to operate are then enrolled in a specific register kept by CONSOB.

Following recent amendments to the Consolidated Financial Act and the Crowdfunding Regulation, the Italian regulation also introduced the possibility, within certain limits, for the aforesaid entities to collect of bonds and other debt financial instruments through such online portals (debt crowdfunding).
The other possible forms of crowdfunding are not formally regulated and may be included – depending on the specific features and structures adopted – in other forms of financial activity, such as those relating to the granting of loans (whose performance is reserved to duly authorized financial intermediaries).

**Regulation of payment services**

Reference shall be made to the provisions of the PSD2 and to its national implementing measures, which include the Consolidated Banking Act, and Legislative Decree No. 11, 27 January 2010, containing the PSD2's implementing decree (PS Decree), both as amended from time to time, as well as Bank of Italy secondary level provisions.

All providers performing payments services related activities shall be authorized by (or passported with) by the Bank of Italy.

In providing and marketing their services, payment services providers must also comply with the transparency and disclosure requirements set forth in the Transparency Provisions.

**Application of data protection and consumer laws**

The Italian Data Protection Code (Legislative Decree No. 193/2003) applies to the processing of personal data, including data held abroad, if the processing is performed by:

- an Italian or European Union company with a branch/stable organization in Italy;
- an entity established in the territory of a country outside the European Union, where said entity makes use in connection with the processing of equipment, whether electronic or otherwise, situated in the Italian territory, unless such equipment is used only for purposes of transit through the territory of the European Union; and
- a non-European Union controller processing data through a branch/stable organization in Italy.

Data processing under the Italian legislation may imply certain notification and compliance obligations and can give rise to privacy issues such as:

- whether the data is used appropriately;
- whether the collection of data is carried out in an appropriate manner;
- whether the data is disclosed only where disclosure is appropriate;
- whether the data is stored and transmitted safely;
- how long the data will be retained for;
- the circumstances under which the data subject can access and correct the data; and
- whether the data subject is sufficiently and appropriately informed about these matters.

The European General Data Protection Regulation (GDPR) will officially replace some of the provisions of the Italian Data Protection Code from 25 May 2018, but its principles are already being enacted in the Measures issued by the Italian Data Protection Authority. The GDPR is more prescriptive and restrictive and includes mandatory notifications where a breach occurs and provide for severe monetary sanctions in case of breach.

The Italian Consumer Code (Legislative Decree No. 206/2005) applies to any service offered to natural persons acting for purposes outside their trade, craft, business or profession. It includes rules relating to matters such as unfair commercial practices and unfair terms. In order to ensure compliance with the Italian Consumer Code, Fintech companies may consider the implementation of solutions aimed at monitoring and analyzing customer services, mitigating fraud and abuse, and implementing fair lending systems.

**Money laundering regulations**

The Italian rules governing the prevention of the use of the financial system for money laundering (AML) and/or terrorist financing (CTF) purposes are mainly contained in Legislative Decrees No. 231 of 21 November 2007 (AML Decree), and No. 109 of 22 June 2007, which implement the Fourth AML Directive) and Fifth AML Directives. Additional secondary level provisions which complete the new regulatory
framework introduced by the Fourth and Fifth AML Directives have been issued by the Bank of Italy.

In general terms, the Central Information Unit (Unità di Informazione Finanziaria), established within the Bank of Italy, is empowered with supervision and monitoring powers on AML and CTF issues. The overall prevention system:

- is based on the collaboration and coordination between each of the operators and the administrative and investigation authorities;
- is regulated according to the risks involved; and
- requires the operators to comply with a series informative and record-keeping obligations.

FinTech services and activities, where relevant in light of the above, are subject to AML and CTF provisions, especially when involving activities considered as high money-laundering risks. Furthermore, with the implementation of the Fourth and Fifth AML Directives, the Italian legislator has expressly included “crypto currency operators” and “custodian wallet providers” within the category of the “other non-financial operators” subject to the provisions of the AML Decree. Crypto currency operators are defined as “any natural or legal person which provides third parties, in a professional capacity, with services that are functional to the use, the exchange, the custody and storage of virtual currencies and their conversion from, or into, currency of legal tender”, or in digital representations of value, including those convertible in other virtual currencies as well as issuing, offering, transfer and clearing any other service instrumental to the acquisition, negotiation or intermediation in the exchange of the virtual currencies”. Custodian wallet providers are, in turn, defined as “any natural person or entity that provides services to safeguard private cryptographic keys on behalf of its customers, to hold, store and transfer virtual currencies”.

It should be noted that, according to the aforesaid AML regulations, crypto-currencies operators and custodian wallet providers are, as of today, subject to the AML obligations to the extent that their operations include the performance of the activity of cryptographic storage or of conversion of virtual currencies from, or into, currency of legal tender.

In addition to the above, FinTech providers qualifying as banking or financial institutions or payment services providers shall also comply with the customer due diligence and on organisational requirements set forth in the secondary level regulations of the Bank of Italy.

Last modified 22 Jan 2020

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**

**SEED INVESTMENT**

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development.

**CROWDFUNDING**

The crowdfunding sector is well established, and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform.

Below are the most common models of crowdfunding:

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.
- Donation crowdfunding involves NGO and non-profit associations in relation to the funding of humanitarian projects and nonprofit projects.
- Hybrid crowdfunding is a combination of the above.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.
ACCELERATORS

There are a growing number of incubators or accelerators in the Italian market which offer support, facilities and funding for startups, often in return for an equity stake, such as iSTARTER.

Venture capital and debt

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions. Research suggest that there are more than 15 asset managers active in venture capital in Italy with more than 60 funds under management.

Warehouse and platform funding

Warehouse financing and platform financing may be suitable for FinTech companies depending on the type of business and assets.

Senior bank debt and capital markets funding

Senior bank debt

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

Capital markets funding

In Italy both debt and equity capital markets are accessible to FinTech businesses (usually of a certain size).

Raising finance by way of an Initial Public Offering (IPO) is a possible funding arrangement for FinTech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange, such as the Milan Stock Exchange. The Milan Stock Exchange’s Alternative Investment Market (AIM) in particular caters for small, growth-orientated companies.

Issuance of bonds is an alternative funding structure for FinTech businesses.

Convertible bonds/loan notes

Convertible bonds or loan notes may also represent a funding tool for FinTech businesses, being essentially a hybrid between debt and equity. Convertible instruments begin as a bond accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

Securitisation transactions

An additional funding tool for the FinTech companies may be the realization of a securitisation transaction. In particular, it is possible to securitize the loans granted by FinTech platforms and have access to the funds of the investors on the debt capital markets.

Incentives and reliefs

Innovative startups

Italian tax law establishes a set of tax incentives to Italian companies qualifying as so-called 'innovative' startups. The favourable regime is available to Italian and European Union/European Employment Strategy companies having a branch in Italy, provided they meet a set of requirements. Among others these are as follows:

- The company’s core business should consist of the development, production and commercialization of innovative goods or services of high technological value.
- The company should have been set up for no longer than 60 months.
The company's turnover should not exceed €5 million.

The company shall not distribute profits.

Companies and individuals investing directly or indirectly in qualified innovative startups may benefit from significant tax reliefs up to 30% of the invested amount, subject to a minimum holding period of three years.

ALLOWANCE FOR CORPORATE EQUITY

Italian companies and Italian permanent establishments (PEs) of foreign enterprises may benefit from Italian notional interest deduction (NID) (so-called Allowance for Corporate Equity or ACE). The ACE benefit entails a notional deduction from the corporate income taxable base corresponding to the net increase in the 'new equity' injected in the entity after 2010, multiplied by a rate annually determined (1.3% for financial year 2019 and thereafter as set by the Budget Law for 2020). The qualifying equity increases may include equity contributions, retained earnings (with the exception of profits allocated to a non-disposable reserve) and the waiver of shareholder credit.

RESEARCH, DEVELOPMENT AND INNOVATION TAX CREDIT ("RDI")

From financial year 2020, Italian companies and Italian PEs of non-resident companies carrying out qualifying RDI activities (i.e. R&D expenses and technological innovation costs, together RDI) can benefit from a tax credit computed as a percentage of each specific RDI expenditures (e.g. 12% of the costs falling in the base of R&D computation, net of external contributions, up to the amount of Euro 3 Mio per 12 months; 6% of the costs qualified as technological innovation expenses, net of external contributions, up to Euro 1.5 per 12 months; 10% of the costs qualified as technological innovation expenses for new products/processes, net of external contributions, up to Euro 1.5 per 12 months; 6% of the design costs, net of external contributions, up to Euro 1.5 per 12 months). The tax credit can be used to offset other taxes due, in three equal instalments. Other fulfilments (e.g. formal communication to the Ministry of Economic Development) are mandatory required before the tax credit is used.

PATENT BOX

The patent box regime is a tax bonus introduced in order to improve the development of intellectual property, granting tax benefits to resident and non-resident taxpayers carrying out R&D activities, consisting of partial tax deduction (50%) from corporate income tax for income arising from direct use or licensing of qualified intangible assets (not including commercial trademarks).

WITHHOLDING TAX EXEMPTION ON INTEREST PAYMENTS

Italian tax law provides for an exemption from withholding tax on interest payments on medium-long term loans granted to Italian-resident borrowers by European Union foreign institutional investors (e.g. banks, insurance companies) and certain approved institutional investors. In order to benefit from the exemption, foreign lenders should comply with Italian law on the exercise of lending activity (to the extent that they operate vis-à-vis the public). The withholding tax exemption would apply to the extent the borrower performs business activities, expressly including holding companies.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio.

The most common ways of selling loans are:

- **Assignment of contract** – An assignment of contract is a full legal transfer of the party’s contractual rights and obligations. It is a tripartite arrangement between the existing parties and the transferee and results the transferee becomes party to the loan agreement, with the transferee assuming all the rights and obligations arising under the agreement and the transferee and the transferor being released from its obligations.
Assignment of receivables – An assignment is a transfer of rights only, not obligations. Subject to any contractual restrictions, assignment can be done without the consent of the debtor but notice to the debtor is generally required in order to make such transfer opposable to vis-à-vis the relevant debtor. The assignment will result in the assignee becoming the legal owner of the receivables and being entitled to receive the relevant payments.

In the case of transfer of contracts/receivables as a pool and provided that the transferee/assignee meets certain requirements, the assignment may be made under Article 58 of the Consolidated Banking Act, so that the notice of the assignment can be performed with a publication on the Official Gazette and in the competent register of the companies registry.

Depending on the specific needs of the transaction and taking into account the requirements of the relevant investors, the receivables can be assigned to a securitization vehicle in accordance with the Italian Securitization Law, so that the purchase price of the receivables is paid by the securitization vehicle which is funded through the issuance of asset-backed securities notes. The assignment of the receivables to the securitization vehicle is made as a true sale.

Loan transfers (including in bonis or non-performing loans) are commonly documented as a bespoke sale and purchase agreement. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercised. Some of the key considerations include:

- **authorization requirements** – lending activity (including the purchase of receivables) is a reserved activity and the transferee/assignee must be duly authorized (in case the investor is not authorized to carry out such activities in Italy, a securitization structure can be used); in relation to the assignment/sub-participation schemes, it is noteworthy to highlight the strict approach very recently locally adopted by the Italian Supreme Cassation Court (criminal law division); in the context of a proceeding against a foreign bank accused of providing lending activity in Italy without authorization, the Court has in fact identified a set of symptomatic elements based on which it could be concluded that a fictitious structure has been put in place with the exclusive aim of concealing the lending activity carried out by a non-authorized entity. These symptomatic elements include, inter alia: (i) allocation of the default risk also on the unauthorized entity and not only on the authorized entity; (ii) independent credit risk assessment formulated by the foreign non-authorized entity; (iii) awareness of disclosure to the borrower of the agreements concluded between the authorized and the unauthorized entities; (iv) possibility, for the foreign non-authorized entity, to interfere in the implementation of the relationship with the borrower; (v) greater commitment of the foreign unauthorized entity in terms of exposure with the borrower;

- **tax aspects** – the tax implication of the assignment/transfer must be evaluated on a case by case basis;

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;

- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;

- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;

- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;

- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms;

- **consent and notification** – whether a transfer requires the consent or notification of any other parties (as indicated above, notice of the assignment (or, in the event of an assignment as a pool and provided that Article 58 of the Consolidated Banking Act applies, publication on the Official Gazette and in the competent register of the companies house) is generally required); and

- **acknowledgment of security** – an acknowledgment of the security is generally needed (depending on the kind of security, notarization and registration of the acknowledgement deed(s) may be needed).
Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

ENERGY

The energy sector has a fundamental role to play in the growth of Italy's economy, both as a facilitating factor (providing a competitive supply environment whilst limiting environmental impact) and also as a growth factor itself. This is why the government has drawn up a National Energy Strategy that sets out clearly the main goals to be pursued in the coming years whilst remaining aware that we are acting in a free market context and with driving forces that cannot be controlled centrally. Sustainable growth, the main priority for both the government and the country, can be achieved only if the competitiveness of the Italian economy improves substantially, not least within the energy sector and the national electricity market. To achieve this goal, it will be essential to act on all structural factors which may enhance Italy's competitive position internationally.

INFRASTRUCTURE

The infrastructure sector in Italy is expected to have an increasingly important role in the national economy in the following years due to the effort of the Italian government to promote economic growth and modernization of the country through infrastructural investments, both public and private. In general, infrastructure is publicly owned, apart from some minor projects (touristic marinas, stadiums, management of airports, management of ports etc). Most infrastructures are now developed under public-private partnership (PPP) schemes financed through project financing investments (metro, motorways, hospitals, light rail, public offices etc).

Energy

The ownership of energy and infrastructure assets in Italy can be private or public. From the grid perspective, the National Electric Transmission Grid (RTN), with over 72,000 km of HV lines, is publicly owned but its management has been assigned to a specific private operator (TERNA). From the 'operator's' point of view, the generation, distribution and supply services has been privatized by the Bersani Decree in 1999 – which has liberalized the energy market by the creation of free competition. The distribution of energy is granted under a concession regime to certain operators while the supply activity of energy is freely carried out by other companies in a competitive regime. All the activities are carried out under the vigilance of the energy authorities. The main public bodies having responsibility for the regulation of the energy sector in Italy are the GSE (Gestore Servizi Energetici) and ARERA (Autorità di Regolazione per Reti e Ambiente).

Transport infrastructure

HEAVY RAIL

The rail market in Italy is dominated by the national railway company Gruppo Ferrovie dello Stato Italiane, a publicly owned company which includes the national network owner RFI Rete Ferroviaria Italiana. With regard to high speed trains, a new operator, Nuovo Trasporto Viaggiatori S.p.A., has entered the market offering high speed train transportation. There are no signs of the market opening up to more competitors on high speed transportation.

LIGHT RAIL, PUBLIC BUSES

Light rail assets (such as trams and associated track) are generally owned by local public sector promoting bodies. As for metro lines, two important projects (Milan Line M 4 and Milan Line M5) have been developed under a PPP scheme. Similarly to light rail, certain regional authorities have tendered concession agreements for the renewal, maintenance and operation of public buses for regional public transportation.

ROADS, BRIDGES AND TUNNELS

A government entity (ANAS) operates, maintains and improves the motorways and major state roads in Italy. ANAS is regulated by the Ministry of Infrastructures and Transport and receives funding from the government for investment in the strategic road network.
(including additional road capacity). Local roads in Italy are the responsibility of local authorities. The public sector may outsource the construction, operation and maintenance (sometimes on a project financed basis) of such assets to the private sector. In certain cases, the private sector is awarded the design, build, financing, operation and maintenance of motorway sections (in particular the BreBeMi motorway where traffic risk is mainly with the private sector).

AVIATION

Aviation in Italy is (for the most part) privatized. In relation to airport infrastructure, there are a number of ownership structures in the Italian market, including private ownership, local government ownership and various forms of public-private ownership. All models are heavily regulated by government and ENAC, the Italian Civil Aviation Authority.

PORTS

The Italian ports sector comprises a variety of company and municipal ports, all operating on commercial principles, independently of government and largely without public subsidy. The private sector operates the vast majority of the Italian major ports.

Other infrastructure

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, NURSING HOMES ETC)

Typically, these are owned by the public sector. Social infrastructure assets in Italy have often been directly financed by the government, save for hospitals and nursing homes where in the recent years the PPP model has been at the base of the most successful projects in the sector or where (especially for nursing homes) investment funds are investing using private capital.

Education

The ownership of a school's infrastructure depends upon the categorization of the school itself. For example, in the case of a local authority maintained school, the school and playing fields will be owned by the local authority, whereas an academy school (which receives funding directly from the government) may lease land from a local authority. In the case of private schools, these are owned and financed by private institutions although it is not uncommon that such private schools receive at least some funding from the government.

Hospitals and nursing homes

Ownership of hospitals and nursing homes in Italy is often vested in various public sector bodies managed and financed at regional level and operating within the National Health Service. There are also several private structures which can also provide health services under specific arrangements with the National Health Service. In recent years, most of the new hospitals especially in the northern regions have been developed under PPP schemes and investment funds are investing in public and private healthcare facilities. It is important to point out that the construction of health and social care facilities and the carrying out of the relevant activities are heavily regulated both at national and regional level.

DEFENSE

Typically, defense assets are owned by the public sector.

WASTE

Waste management in Italy is managed at a municipal level in accordance with national legislation, and differs widely from area to area. Companies in the waste management sector provide services on a continuing basis, with prices set through service contracts. By law such prices are required to cover the full cost of operations and investments, based on the principle of full cost recovery. To date, most players in the waste management sector are public-private partnerships or private companies.

WATER

Water and wastewater (sewage) services in Italy are delivered by public sector companies (water companies) which use the relevant public infrastructure assets. In certain cases, such companies are grouped together to form an ATO (Optimized Territorial Area) so as to manage the relevant services in a more efficient manner by way of outsourcing to private companies.

Last modified 22 Jan 2020
Are there special rules for investing in energy and infrastructure?

**Energy**

There are no particular limitations to the investment by foreign entities in Italian energy assets. However, the supply, generation, transmission and distribution of energy are heavily regulated sectors. Permitting, concessions and subsidies regimes evolve quickly and any investors will need to have a good understanding of both the current framework and the potential directions in which the legal framework and the market may move.

It is also to be considered whether the acquisition of any interests in the energy sector would cause any issues with any concessions, licenses, permits or agreements with public authorities.

**Infrastructure**

There are no particular limitations to the investments by European entities in Italian infrastructure assets. Potential investors coming from outside the EU may face more difficulties and barriers to entry due to less harmonized legislative systems.

**What is the applicable procurement process?**

**Energy**

The procurement process for the achievement of the energy efficiency targets requires, as a prerequisite, collaboration and coordinated action between the State and local governments. This has resulted distribution of the 2020 targets on renewable energy and energy efficiency (known as ‘Burden Sharing’) which assigns to the State and each local government a corresponding objective in terms of sharing energy consumption through renewable sources. Each region can, based on the characteristics of its territory and the general nature of its consumption, operate at the most appropriate levels of renewable energy consumption. Potential savings are very broad but will require the careful action of local government, for example in the fields of local transport and mobility, public lighting, buildings and district heating. The role of regional and local authorities is also crucial for the effective simplification and harmonization of the authorization procedures.

**Infrastructure**

In general, the Code of Public Contracts provides for different public procurement procedures (eg the open procedure, the restricted procedure, the negotiated procedure and the competitive dialogue).

It must be highlighted that the open procedure consists in the following steps:

- publication of a call for tender;
- submission of offers by the bidders;
- evaluation of the offers by the Awarding Entity;
- awarding of the tender; and
- submission of the contract.

Each individual step is structured as follows.

**PUBLICATION OF THE CALL FOR TENDER**

The publication of the call for tender aims to select the subjects who meet the necessary requirements in order to enter into the agreement with the awarding entity.

**THE SUBMISSION OF THE OFFERS**
Pursuant to the Code of Public Contracts, in order to take part to the public tender procedure, the bidder has to meet the requirements stated by the call for bids.

If the bidder does not meet these requirements, it will be excluded from the tender.

As a general rule, two requirements must be met:

- **The general requirements** – These requirements are aimed at assuring that the administration will enter into the agreement with a trustworthy and reliable subject. Such requirements are defined by Article 80 of the Code of Public Contracts, which provides a list of mandatory requirements to be met by all entities taking part in a public procedure. In particular, Article 80 provides, *inter alia*, that the awarding entity cannot award the procedure to companies that have incurred breaches concerning tax payment obligations. This violation represents a cause of exclusion from the tender when the breach is considered serious (i.e., if it exceeds an amount of €10,000). Moreover, there is also the requirement that the bidder and the subcontractor should not have committed any serious professional crime.

- **The special requirements** – Such requirements relate to the experience and technical and financial capability of the bidders. Such requirements are provided by the awarding entity in the tender documentation, on the basis of the value and the nature of works, services or supplies which are subject to tender.

Moreover, in order to take part in the procedure, the bidder shall submit an offer including all the required documents by the deadline indicated in the call for tender. In order to fulfil the above-mentioned requirements, the bidder must declare, through a self-declaration (the so-called DGUE), that the business operator and its management meet all the general requirements. Any sub-contractor will also have to declare through the DGUE. If the business operator or its subcontractor do not fulfil the above-mentioned requirements they will be excluded from the tender.

In case of false self-declaration, penal and civil consequences shall be applied (e.g., exclusion from the tender; enforcement of the bid bond; warning to the Anticorruption Authority (ANAC); prosecution for the offence of false declaration of a public deed). If the ANAC believes that such declarations have been given fraudulently or with sufficiently serious negligence (considering the facts of the false declaration or false documentation), it may exclude the bidder from public tenders for a maximum of two years.

**EVALUATION OF THE OFFERS BY THE AWARDING ENTITY**

After the expiry of the deadline for the submission of the offers, the awarding entity shall proceed with the examination and evaluation of the offers received. This activity is carried out in several private sessions and it depends on the awarding criteria.

The awarding entity will be required to independently make such verifications, in relation to the accessible data, through the consultation of several databases. However, they may ask bidders to provide appropriate evidence or to carry out verifications on a sample basis.

The awarding entity may also require, *inter alia*, the criminal records and a court certificate concerning pending trials (a *Certificato del Casellario giudiziale* and *Certificato dei carichi pendenti*) and a tax certificate released by the ‘Agenzia delle Entrate’.

The awarding entity will also consult the Digital Registry held by the ANAC. This will reveal if the bidder has been excluded from public tenders (within the previous two years, starting from the registration of the fact in the Registry) as a result of false declarations, as mentioned above.

**AWARDING OF THE TENDER AND SUBMISSION OF THE CONTRACT**

If the evaluation of the requirements has a positive outcome, the awarding entity will enter into the agreement with the awardee and ask for the issuance of the performance bond.

Please note that any bidder must satisfy each general and special requirement for the entire duration of the tender procedure. Please also consider that the awarding entity should periodically verify the fulfilment of each requirement and if during the execution of the contract any such requirement is not fulfilled, the awarding entity is entitled to terminate the contract.

Last modified 22 Jan 2020

**What are the most common forms of funding / investing in energy and infrastructure?**

**Funding**
The Italian energy industrial sector has been financed by various structures. Renewable energy sources have been historically financed through project financing and cash-flow based leasing agreements based on business plans reflecting the long-term life span of public subsidies. However, in the recent years the public subsidies for new energy plants have been reduced or, in certain cases, have not been renewed; the result is that the market, at least for the more technologically advanced sources such as photovoltaic, is now shifting to subsidy-free investments supported by long-term private power purchase agreements.

More recently, securitization has been used (including through synthetic transactions) to consolidate large debt portfolios both in the renewable energy sector (eg portfolios deriving from project financing transactions) and in the energy efficiency sector, where operator-owned portfolios of credit receivables and energy efficiency certificates are payable over the lifespan of the underlying agreements.

Bonds and minibonds are also commonly used in the sector.

A current market trend is the offer of mezzanine financing by financial entities or funds eager for high interest rate of return, particularly in the renewable energy sector. An operator may in fact demand mezzanine financing to release equity trapped in generation assets with stable returns and long maturity.

Also, the Italian infrastructure sector has been funded through project financing. In certain cases, traditional project financing has been subject to refinancing which has also contemplated a portion of bond financing.

**Investing**

The most commonly used forms of investments in the energy sector are funds and commercial companies (limited liability companies per shares, SPA, or simplified limited liability companies, SRL). There are significant differences between asset deals and share deals in terms of liabilities transferring to the purchaser, required consents by the authorities to the change of owner of the plant or the energy infrastructure and tax treatment of the transaction. Where possible, share deals are preferred in the energy generation sector, due to various legal and tax considerations.

In the infrastructure sector, investors mainly use special purpose vehicles in the form of commercial companies (either SPAs or SRLs) created specifically for the purposes of appropriate project management.

**Restructuring**

**Enforcement and sanctions**

*When can there be regulatory investigations?*

To safeguard the integrity of the financial system and to combat illegal practices, both the Bank of Italy and the CONSOB carry out specific controls, aimed at preventing unauthorized activities, as well as any activity involving mis-selling, money-laundering, usury, market abuse.

The investigations are carried out through the evaluation of documents and on-site inspections at intermediaries' premises aimed at checking the quality and accuracy of the data submitted and at gaining a better understanding of their organization and operations.

Moreover, regulators may require the drafting or transmission of documents, records and any other useful information.

*What regulatory penalties may apply?*

In the event that management irregularities and regulatory violations are discovered in the course of off-site reviews and on-site inspections, sanction procedures may be initiated against the intermediary and/or the directors which could result in the imposition of administrative penalties.
What criminal penalties may apply?

Following the inspections carried out, in the event of breaches of the regulatory provisions, the regulators may impose criminal penalties such as fines and/or imprisonment.

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

Registration taxes may apply on a lump-sum basis of €200 both on the grant of a loan and on the transfer of receivables for the purpose of financing. Additional stamp duties may apply both to the documentation of the loan and on the assignment.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

Registration taxes are also applicable to the grant of security, depending upon the nature of such security. In principle (eg for a mortgage or pledge), registration taxes apply as follows:

- €200, if the security is securing the Italian company's own obligations; or
- 0.5% of the secured amount, if the security is securing third party obligations; and
- nominal stamp duty (usually at the rate of €16 per page).

In the case of mortgages over real estate, mortgage tax is payable at 2% of the secured amount (0.5% of cancellation) unless the mortgage has been released to cover a receivable covered by the Substitutive Tax (in which case, it is exempt from any indirect tax, see below).

In the case of securities securing a loan (or a financing structure set up via the issuing of a bond, according to the law), provided that:

- the loan has an initial contractual duration of at least 18 months and one day;
- the loan is advanced by an EU-incorporated bank or an Italian branch of an EU incorporated bank; and
- the facility agreement is executed in Italy.

The payment of registration taxes, mortgages and cadastral taxes, stamp duties, governmental duties and all the other taxes and duties (other than income tax and withholding taxes) on related documents, including (and in particular) all documents relating to a security package, can be substituted (at the option of the bank) by an alternative tax (ie the imposta sostitutiva, or the Substitute Tax). The Substitute Tax is an umbrella tax applicable (currently) at a rate of 0.25% on the principal amount of the loan (the amount of the Substitute Tax is typically retained by the bank from the relevant drawn amount).

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

The assignment of a debt would be subject to the following registration taxes:

- €200, if the assignment is securing the Italian company's own obligations; or
- 0.5% of the secured amount, if the assignment is securing third party obligations; and
• nominal stamp duty (usually at the rate of €16 per page).

As said, please lease note that the Substitute Tax may also apply to guarantees related to the issuing of bonds.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g., secured bond holders)?

Yes, the Italian state usually has a special privilege on any debt associated with indirect tax.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Interest paid by an Italian resident borrower to an Italian resident lender (including an Italian permanent establishment of a non-resident entity) is not subject to withholding tax. In the case of lenders not resident in Italy, interest payments are subject to a final withholding tax.

If so:

What is the rate of withholding?

Domestic withholding tax on interest payments is applicable at 26%.

What are the key exemptions?

Exemptions from withholding tax apply in the case of medium- and long-term loans when the interest is paid to:

• a bank or a financial institution authorized or licensed to carry out banking activities within the territory of Italy, and resident in Italy for tax purposes (and not acting through a permanent establishment located outside of Italy);

• a credit institution which is resident or established in an EU member state, and not acting through a permanent establishment located outside of the EU;

• an insurance company incorporated in and authorized under the laws of an EU member state; and

• an institutional investor not resident in Italy, but resident or established in a state or territory allowing for an adequate exchange of information, provided that it is subject to supervision in the respective jurisdiction of establishment.

An exemption from withholding tax may be applicable under the EU Interest and Royalties Directive as implemented in Italy.

An exemption may also be applicable under the double tax treaties entered into by Italy. However, double tax treaties signed between Italy and other EU countries usually only reduce the amount of withholding tax applicable to a 10% rate.

Some exemptions may also apply to interest on loans granted or guaranteed by public entities.

Would the same analysis apply to interest payments under a debt security (e.g., a bond)?

Yes.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower?
(other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

In general terms interest on bonds paid to foreign qualified investors is exempt from withholding tax and the securities to the bond may benefit, upon specific option, to the Substitutive Tax regime.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities both under OHADA Law and the Regulations of the CREPMF.

Under the General Regulation of the CREPMF, offering and selling debt securities is subject to prior authorization of the CREPMF and the stamp of approval of the information notes.

Any proposed public offer for listed securities must be approved in advance by the Regional Council (Article 123).

An information note is to be established and must contain information according to the types of public offer in question and is subject to prior distribution.

When issuing public debt securities by a State or a group of States, their governments draw up an information note which is transmitted to the Regional Council before the date of issue of the securities.

That note is exempt from the prior visa before its distribution to the public.

The note for the issuance of public debt securities by local public authorities or guaranteed by a State or a group of States is subject to the prior visa of the Regional Council (Article 2 of Decision No. CM 05/09/2005 modifying article 136 of the General Regulations relating to the organization, operation and Control of the WAMU Financial Market).

Last modified 3 Aug 2020

What are common issuing methods and types of debt securities?

The most common types of debts securities issued in the WAEMU are bills and bonds.

Other different types and forms include:

- asset-backed securities
- debt securities
- derivative securities
- hybrid securities such as convertible bonds
- equity-linked securities such as convertible bonds
- exchangeable bonds
Issuance of treasury bills and bonds:

The issuance of Treasury bills and bonds (issued by the State, under the responsibility of the Minister of Finance) is subject to a tender or a syndication procedure, organized with the assistance of the WAMU Securities Agency (Agence UMOA-Titres).

Open tenders: Primary subscription of treasury bills and bonds are reserved to credit institutions, brokerage firms and regional financial investors holding settlement accounts with the Central Bank. Other investors, whether they are private individuals or corporations, may also subscribe through credit institutions or brokerage firms established on the territory of the Union.

Targeted tender: States may decide to hold part of their issuance through targeted auctions restricted only to their Primary Dealers.

Any investor wishing to acquire the security put out to tender can subscribe through them.

Issuance of Treasury Bonds by Way of Syndication is carried out in accordance with the applicable regulatory provisions as set out by the CREPMF.

What are the differences between offering debt securities to institutional/professional or other investors?

The main difference between offering debt securities to institutional/professional or other investors lies in the fact that institutional and professional investors are more experienced and sophisticated and able to understand the information provided on the listing documents and make sound investment decisions.

Other investors, including retail investors, need more detailed information and advice to be able to understand the investment documents and make sound financial decisions. They also need more protection.

There is, generally, no essential distinction between professional and other investors. However, one distinction is the channel through which financial securities are issued; for instance, bonds issued through public offerings and bonds issued on the market through auction.

When financial instruments are issued through public offerings, an investment syndicate made up of brokerage firms handles the sale to investors and the general public. After they are issued, they are listed on the BRVM.

As for financial securities to be issued through auction, primary subscription of treasury bills and bonds is restricted to credit institutions, brokerage firms and regional financial investors with settlement accounts with the Central Bank. Other investors, whether they are private individuals or corporations, may also subscribe to bills and bonds on the primary market through credit institutions or brokerage firms established on the territory of the Union.

Securities issued through auction are not listed on the regional stock exchange (BRVM).

When is it necessary to prepare a prospectus?

It is necessary to prepare an information note (concept used in the WAMU instead of prospectus) for any proposed public offer for listed securities, which must be approved, in advance, by the Regional Council. It must contain specific information according to the types of public offer concerned. (Article 123 of the General Regulations of the CREPMF).

When a State or a group of States intend to issue public debt securities, their governments draw up an information note which is transmitted to the Regional Council before the date of issue of the securities.

Any solicitation transaction must be accompanied by the sending or handing over to the solicited person of the information note or any other explanatory document, endorsed where appropriate, with the approval of the Regional Council before any initial issuance (Article 157).
What are the main exchanges available?

The Regional Stock Exchange (BRVM) is the main stock exchange available and it is shared by the eight member states of the WAEMU. The stock market is divided into two markets which correspond to two levels: the primary market and the secondary market.

The primary market

The role of the primary market is to bring together companies looking for financings and capital holders.

The BRVM is regulated and issuers are to comply with different rules and regulations.

On the primary market, securities are issued by companies (issuers).

New issuance of securities is and may be done through the primary market during an IPO or a capital increase.

Securities issuance of a company that goes public can be done on the primary market and those securities may be purchased by investors. The latter will then put those securities back up for sale on the secondary market.

The secondary market

This market is far from being active. On the secondary market, stakeholders and investors exchange issued (on the primary market) securities to be offered to savers. Investors will be able to trade these securities among themselves on the secondary market.

Transactions on this market are conducted through certified intermediaries such as banks, non-bank financial institutions, regional financial institutions, asset managers and brokerage firms.

Is there a private placement market?

Yes, there is a private placement market in Ivory Coast and with the multiplication of private financial institutions in the WAEMU zone, more financing investments are thus being provided for companies and individuals.

That multiplication, combined with technological changes and developments, make access to offers and opportunities easier and more and more investments are being made through the private market in several sectors such as real estate, insurance and the like.

There is no dominant standardization of private placement documentation, the ones from the Loan Market Association (LMA) are sometimes used.

Are there any other notable risks or issues around issuing or investing in debt securities?

Risks are of different types:

Foreign exchange risk: the rate of a currency may increase and cause the value of assets denominated in a different currency to decrease.

Interest rate risk: interest rate variations may lead to more cost or loss of income for an investor.

Liquidity risk is the risk of the impossibility to sell a financial instrument at a certain price.

Inflation risk may occur when repayment is made in a depreciated currency or when an investor ends up with a rate of return below the rate of inflation.

Regulatory risk: changes in Laws or Regulations may have an impact on investments in debt securities.

Solvency risk: borrowers may be unable to meet their commitments and creditors may lose their claims.
Political risk: this type of risk is associated with a political situation where authorities change their tax systems, the ability to repatriate capital and the like.

Risks or issues around issuing debt securities mainly lie on issuers being required to assume responsibility for information relating to debt securities. Any applicable offer document must have the stamp of approval of the CREPMF, failure of which may result in the nullity of the proposed financial transaction and result in criminal and civil penalties.

**Establishing and investing in debt / hedge funds**

*Are there any restrictions on establishing a fund?*

**Generally**

Establishing and operating a fund, offering fund securities are regulated activities under the General Regulations of the CREPMF and therefore subject to regulation by that organization and other organizations.

**Collective Investment Schemes**

Collective investment schemes include the following arrangements:

Undertakings for Collective Investment in Transferable Securities (UCITS) are financial institutions that collect savings from economic actors and issue stocks or shares. The savings collected are used to set up securities portfolios and to provide financing for businesses.

The activities of UCITS are classified collective asset management which has two subcategories:

- Management for proper account: funds collected from third parties by the fund are invested in all types of securities and other financial products such as bonds, equities, negotiable debt securities and the like.
- Discretionary management: the fund is managed privately as the collective investment funds belong to third parties.

**What are common fund structures?**

Two types of UCITS have been authorized on the Regional Financial Market.

Common forms of funds include:

- open-ended, Investment Companies with Variable Capital, ICVCs (SICAV in French);
- mutual investment funds (*Fond Commun de Placement, FCP*);
- qualified investor structures that invest in products such as corporate shares or bonds, real property, commodities (for example, precious metals) and derivatives.

**What are the differences between offering fund securities to professional / institutional or other investors?**

**Retail funds**

Considered as laypersons, retail investors need more detailed information and advice to be able to understand the investment documents and make sound financial decisions. They also need more protection.
Based on those considerations, UCITS for instance, being one type of entity through which retail investments are made, are to be authorized by the CREPMF and are subject to considerable regulation.

**Institutional/Professional funds**

They are usually subject to less protective regulations.

Institutional and professional funds are considered more experienced and sophisticated and able to understand and make sound financial and investment decisions.

However, there is a legal and regulatory framework in place to secure subscribers based on the control mechanisms set up by the Central Depository/ Settlement Bank (DCBR) and the CREPMF.

**Are there any other notable risks or issues around establishing and investing in funds?**

Investment management is a regulated activity and entities wishing to conduct such an activity are to be authorized by the CREPMF.

Risks and issues are of different types:

Currency or Foreign exchange risk: investments in securities may be made in different currencies. The rates of currencies may change and the value of a fund's investment be affected. Investments in a foreign market may entail exchange of currencies where an investor may have to exchange a domestic currency into a foreign currency, at an actual exchange rate, and convert it back into his domestic currency. Such conversion transactions may constitute risks that need to be mitigated.

Liquidity risk is the risk of the impossibility to sell a financial instrument at a certain point of time.

Diversification risk: investors may be exposed to risks when they invest in only one asset class or in a very limited number of assets. Such restrictive investments do not help in mitigating the risks inherent to the lack of diversification on such investments.

Solvency risk: borrowers may be unable to meet their commitments and creditors may lose their claims.

Political risk: this type of risk is associated with a political situation where authorities change their tax systems, the ability to repatriate capital and the like.

Risks and issues are to be nuanced as there are substantial protections such as the one provided for by the CREPMF acting as a regulatory agency entrusted with the protection of household savings invested in securities or any other type of investment through public offerings within the WAMU.

Further protection is provided, for instance, under Article 15.3 (Instruction N. 45 / 2011 of the CREPMF) and requires that UCITS' assets be kept by a single depository, distinct from the UCITS management company.

National and Sub-Regional Legislations recognize the segregation of the assets of the Depositary's UCITS Clients from the sub-custodian's own assets.

Those assets are, in some way, protected through entities like the deposit guarantee fund (Fonds de Garantie des Dépôts, the FGD-UMOA) in the WAMU.

The FGD-UMOA's mission is to provide deposit guarantees for customers of credit institutions and decentralized financial systems (DFS), approved in the WAMU.

As such, it is responsible for the compensation of depositors in the event of unavailability of their assets, within a limit defined by the Council of Ministers of the WAMU.
Are there any restrictions on marketing a fund?

Marketing is a proposition for the acquisition of investment products. It is, mostly, dealt with under the concept of solicitation.

Individuals intending to conduct public solicitation activities (business providers, direct sellers) are required to obtain a professional card issued by the Regional Council (General Regulation of the CREPMF, Article 108: The solicitation of the public).

Financial institutions, such as banks, wealth management companies, management and intermediation companies (SGI), business providers, individual or legal persons authorized for that purpose, are allowed, as of right, to have recourse to solicitation after reporting to the Regional Council (Article 155).

Solicitation of the WAMU’s public by a non-resident entity, or on behalf of it, to propose the acquisition of investment products is subject to prior authorization of the Regional Council and the assent of BCEAO (General Regulation, Article 176).

Reverse solicitation: is not specifically provided for under the applicable rules and regulations.

Prospective investors do, sometimes, make the first move, take the initiative to contact investors for potential acquisition of financial products. The financial entity needs to have evidence that the potential investor solicited them.

Are there any restrictions on managing a fund?

Fund management in the WAMU is regulated under the General Regulations of the CREPMF and various implementing instruments.

The CREPMF regulate and authorize public offerings by delivering its approval. It monitors all private organizations on the market. For this purpose, it certifies all commercial stakeholders: brokerage firms, fund managers, and individual entities (intermediaries and soliciting dealers).

The collective management of transferable securities is carried through UCITS, divided into open-ended investment company (SICAV), in Mutual Funds (FCP) or any other form of Undertaking for Collective Investment in transferable securities (UCITS) approved by the Regional Council.

Undertakings for Collective Investment in Transferable Securities.

UCITS’ management is governed by the regulations in accordance with the General Regulations of the CREPMF and Instructions 44, 45, and 46.

Mutual funds that hold more than 5 billion FCFA assets are required to set up a system of controls and monitoring specified under article 7 of Instruction N° 46/2011 (Revised) Relating to the Classification and Allocation Rules Assets of Collective Investment Organizations on the Regional Financial Market of the WAMU such as a supervisory committee, an Internal Control reporting system, and a reporting system for the FCP Custodian. The maximum assets that a Mutual Fund can hold is set at twenty-five (25) billion FCFA.

Any FCP which comes to hold assets in excess of 25 billion FCFA must declare it without delay to the Regional Council.

No FCP can hold, during six consecutive months, an asset greater than 25 billion FCFA, in which case the FCP must, within a six (6) month period, be transformed into a SICAV or be subject to a demerger.

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

There is no specific legislation on derivatives. Provisions on derivatives can be found in different legal texts.

Certain restrictions do apply.

Businesses and entities proposing derivative contracts and products are to receive prior authorizations (from CREPMF and BCEAO).
The 2014 Uniform Act on commercial companies and Regulation 09/2010 contain some provisions on derivatives. As per article 744 of that Uniform Act, public limited companies issue transferable securities whose form, class and characteristics shall be defined by the competent body of each state party.

Residents are authorized to conduct transactions on foreign exchange derivative markets through licensed intermediaries or foreign banks (article 12 of Regulation 09/2010).

Authorized transactions must be backed by trade or financial transactions, subject to compliance with all other regulatory provisions applying to the aforementioned transactions.

A limited number of commercial or financial transactions on derivatives can be conducted by residents. They are authorized to carry out commodity derivative transactions on commodity futures markets (Article 13: Commodity derivatives).

They may use foreign exchange derivatives to hedge foreign-exchange risks, for the following commercial or financial transactions:

- imports and exports of goods and services by residents;
- foreign loan transactions by residents (draw-downs and payments); and
- direct foreign investments in a resident enterprise under negotiation.

Residents may use derivatives to hedge price risks. Those derivatives must be backed by commodity imports or exports carried out by the residents. They are not authorized to purchase commodities on foreign markets for delivery in commodity derivative transactions (Article 18).

What are common types of derivatives?

The main types of derivatives are:

- futures;
- forwards;
- options; and
- swaps.

The value of the derivatives is derived from the value of an underlying asset or group of assets, the main classes of which are:

- Assets: commodities, shares or bonds;
- Interest rates, exchange rates, or indices;
- Foreign currencies.

Are there any other notable risks or issues around entering into derivatives contracts?

- Market risk
- Liquidity risk
- Counterparty risk
- Commodity price risk
- Exchange rate risk
- Interest rate risk
Risks are not that notable as the majority of the activities are conducted between sophisticated persons and are to a certain extent reserved for banks, and national and regional financial institutions which have a depository account with the Central Bank.

Residents are authorized to conduct transactions on foreign exchange derivative markets through licensed intermediaries or foreign banks (Article 12 of Regulation 09/2010).

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Lending is only a regulated activity in relation to mortgages and consumer lending. In these circumstances, a lender will need to be authorized by the BCEAO to conduct such business.

Mortgage and consumer loans are subject to a range of regulatory requirements.

There are, however, some restrictions on lending.

WAEMU residents who intend to borrow and invest abroad are required to get prior authorization from the Minister of Finance.

They must be at least 75% financed through foreign loans.

Foreign entities that intend to lend to WAEMU residents who want to invest abroad are required to finance those latter at a minimum percentage of 75% (Article 10: Investment transactions).

There are particular restrictions for regulated mortgage contracts including on how the loans must be advertised. It is forbidden to advertise repayments or to refer to social security benefits that are not insured for the duration of the contract.

Lenders administer the loans on an ongoing basis; and borrowers who fall behind with their payments are dealt with.

Regulated credit agreements, on the other hand, have specific requirements around how the agreement is drafted and formatted and what information must be included.

Borrowing

Yes, there are some restrictions on borrowing.

Regulation 09/2010 does, for example, provide one restriction pursuant to Article 10: Investment transactions, under which foreign investments made abroad by WAEMU residents are subject to prior authorization from the Minister of Finance.

Moreover, they must be at least 75% financed through foreign loans.

Another restriction is provided for under article 11 where loans contracted by residents from non-residents must, except by special decision of the Minister of Finance, be carried out through licensed intermediaries in all cases where the monies borrowed are made available to the borrower in the country. The licensed intermediaries thus called upon to intervene will ensure that the transactions comply with the applicable laws and regulations.

All foreign loans are subject to mandatory declaration to the External Finance Directorate and the BCEAO, for statistical purposes.

In Ivory Coast, consumer credit is regulated through Consumer Law, Law n° 2016412 of June 15, 2016. It is advisable for borrowers to consider whether either the mortgage or consumer lending regimes apply to their activities, in which case they will benefit from the protections mentioned under that Law.
What are common lending structures?

Lending structures in Ivory Coast depend on the parties’ projects and needs.

They can have recourse to individual lending where one lender provides for the loan or to syndicated loans where two or more lenders provide loans to one or more borrowers.

Syndicated loans involve large loans where the different participating banks share the risks as their liability is limited to the amount of their contribution.

Those syndicated loans are very complex transactions requiring the appointment of facility agents. Security agents are also appointed as provided for under Article 5 of the Uniform Act on Securities adopted on December 15, 2010.

Loans structuration depend on different parties’ objectives, they can be commercial loans, concessional loans, non-concessional loans, equity loans, long term loans, short term loans, or alternative forms of financing.

Loan durations

The duration of a loan can also vary between:

- a term loan, provided for a set period of time that usually lasts between one and ten years but can last a bit longer up to thirty years;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be withdrawn, repaid and redrawn if repaid; it provides for more flexibility and it can be reused as it is repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a bridge loan gives access to short term loans that allow to meet short-term liquidity gaps or needs.

Loan security

A loan can either be secured, unsecured or guaranteed. For more information, refer to, among other texts, the Uniform Act on Securities.

Loan commitment

A loan can also be:

- committed, whereby it provides for terms and conditions imposed on the borrower and the lender is obliged to provide the loan if those terms and conditions are fulfilled; or
- uncommitted, meaning that the lender is not committed to provide the loan.

Loan repayment

The funds can be repaid on demand, in instalments, or scheduled to be repayable in full at maturity.

What are the differences between lending to institutional / professional or other borrowers?

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective as they are considered as more experienced and knowledgeable that other categories of borrowers.

By contrast, lending in the context of mortgages and to consumers is a more regulated activity and as such requires more protection and BCEAO authorizations. For more information, see Consumer Law, Law n ° 2016412 of June 15, 2016.
**Do the laws recognize the principles of agency and trusts?**

Ivorian laws do, specifically, recognize the principle of agency but not the principle of trust.

However, the Uniform Act on Securities recognizes the concept of Security Agent which may be considered as a corresponding concept to the Security trustee.

The security agent is provided for under Article 5 of the Uniform Act on Securities which provides that "Any security or other guarantee to secure the discharge of an obligation may be made, registered, managed and executed by a financial institution or a national or foreign credit company acting in its own name and as surety agent appointed for that purpose by the creditor of the secured debt."

*Last modified 3 Aug 2020*

**Are there any other notable risks or issues around lending?**

Yes, there are some risks and issues around lending.

Generally, contractual principles apply to loan agreements and other finance documents.

Those risks may be credit risks, default risks, interest rate risks which may be capped to a certain rate, percentage, exchange rate risks for cross-border transactions, security risk value.

**Specific types of lending**

Banks also acting as lenders in the real estate sector have access to other sources for their lending activities through, among others, the creation, in 2010, of the WAEMU Regional Mortgage Refinancing Fund (Caisse Régionale de Refinancement Hypothécaire de l'UEMOA). That fund was created by the West African States Central Bank, the West African Development Bank (Banque Ouest Africaine de Développement (BOAD)) and the CREPMF.

Through that fund, they are able to access international capital markets and get resources for the funding of their mortgage activities.

One of its missions is to provide resources for the refinancing of mortgage loans to credit institutions in the WAEMU through the issuance of loans on the regional financial markets or through concessional financing from development partners.

Insurers in the WAEMU also invest in real estate, through pension funds, for long-term capital to the housing industry. Ivory coast has two main pension funds: the National Social Insurance Fund (CNPS) dedicated to the private sector and a shareholder of two banks, Société Générale and Attijariwafa Bank, and several investments funds (Amethis, Yelen and AfricInvest). The other fund is the General pension fund for civil servants (Caisse générale de retraite des agents de l'État).

**Standard form documentation**

Banks have their own standard form documentation that are used during bilateral finance transactions.

Cross-border financial transactions are sometimes based on the Loan Market Association standard documentation or on other standard forms.

*Last modified 3 Aug 2020*

**Are there any other notable risks or issues around borrowing?**

Missed payments can lead to risk defaults and collections processes which can have an impact on one’s credit history or rating.

It can also lead to difficulties in accessing to credit in the future.

There is also a possibility of loss of property in case of default as collateral pledging can be very important on the borrower’s part.

*Last modified 3 Aug 2020*
Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

There are some restrictions on key areas affecting the giving of guarantees and security.

**Capacity**

Capacity or the power of a company in such an area is to be assessed on the basis of the constitutional documents of the company granting a guarantee or security. Such giving of guarantees and security have to be approved by a resolution of the board of Directors of the company.

**Insolvency**

Guarantees and securities may be declared void in situations provided for under the Uniform Acts.

Acts done by the debtor during the suspicion period from the date of suspension of payments to the date of the decision to open proceedings shall as of right be non-binding or may be declared non-binding on the body of creditors as defined under Article 72 of the Uniform Act on Collective Proceedings for Debt Clearance.

The following shall as of right be non-binding on the body of creditors if and when they are done during the suspicion period: any conventional mortgage or conventional pledge, any constitution of pledge, granted on the debtor’s property for debts previously contracted, any provisional registration of a conservatory judicial mortgage or a conservative judicial pledge.

**Financial assistance**

A company is prohibited from purchasing its own shares. Managers are prohibited from contracting, under any form whatsoever, loans from the company, obtaining an overdraft on a current account or otherwise from the company or making the company endorse or guarantee their commitments towards third parties.

This prohibition shall also apply to spouses, ascendants and descendants of the persons referred to above, including any intermediary through whom these persons act.

Last modified 3 Aug 2020

What are common types of guarantees and security?

**Common forms of guarantees**

Under OHADA, personal securities are surety bond and autonomous guarantee and counter guarantee.

Surety bond: A surety-bond shall be a contract whereby the surety undertakes, and the creditor accepts, to discharge an existing or future debt contracted by the debtor in the event of the latter failing to do so.

Autonomous guarantee and counter guarantee:

An autonomous guarantee shall mean an agreement by which the guarantor undertakes, following an obligation signed by the principal and on its instructions, to pay a fixed sum of money to a beneficiary either at the earliest demand of the latter or as per the agreed terms. The autonomous counter guarantee shall mean the agreement by which the counter guarantor undertakes, following an obligation signed by the principal and on its instructions, to pay a fixed sum of money to a guarantor either at the earliest demand of the latter or as per the agreed terms.

Transferable securities consist of possessory lien, assets held or transferred as security, pledge of real property, pledge of intangible assets and privileges.

**Common forms of security**
Pledge

Liens

Mortgage

Different types of security are suitable for securing different types of assets.

Under Ivorian law it is possible to grant security over all of the assets of a company or on individual assets. Granting security over all of a company’s assets will tend to be achieved by way of a debenture which will include:

- a mortgage over real estate; and
- a pledge over movable goods.

Moreover, guarantees and security, to be enforceable as against third parties need to be perfected and registered.

Are there any other notable risks or issues around giving and taking guarantees and security?

To be valid, a guarantee needs to be in writing and contain some necessary elements:

General contractual principles apply to consideration for a guarantee.

The underlying obligations will usually be the consideration for the guarantee and the execution of the underlying obligations, and the guarantee should be concomitant to avoid a possible qualification of past consideration.

There should generally be no issue as in the majority of cases, the guarantee is provided for in an underlying document as in the case of a loan agreement.

A guarantee may be set aside for different reasons and a beneficiary of a guarantee should take those into account and avoid them.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Investment activities/services:

In Ivory Coast, investment activities/services are mainly regulated by the following Laws and Regulations:

Investment Code of Ivory Coast adopted on August 1, 2018, through Ordinance No. 2018-646 of August 1, 2018, and Decree 2018-64

The General Regulations of the Regional Council for Public Savings and Financial Markets (Règlement Général du Conseil régional de l'épargne publique et des marchés financiers, CREPMF) (General rules of the CREPMF);

General rules of the Regional Stock Exchange (Bourse Régionale Des Valeurs Mobilières, BRVM);

Framework Law on Banking Regulations of the WAMU, December 3, 2010

Regulation No. 09/2010/CM/UEMOA/ on External Financial Relations of the Member States of the West African Economic and Monetary
Union (WAEMU)

Ordinance no. 2009-385 of December 1, 2009 (Banking Law)

**Consumer credit, Corporations, Mortgages, Funds and platforms**

**Corporations**

Revised Uniform Act on commercial companies and economic interest groups (the Revised Uniform Act), adopted on January 30, 2014

**Mortgages**

Uniform Act Organizing Securities of December 15, 2010

**Funds and platforms**

Regulation No. 02/2010 / CM / UEMOA relating to securitization mutual funds and securitization transactions in the WAEMU (Règlement n° 02/2010/CM/UEMOA relatif aux Fonds communs de titrisation de créance et aux opérations de titrisation dans l'UEMOA)

Instructions 44, 45, and 46 of CREPMF and regulation on the organization and functioning of the financial market of the WAEMU.

Regulation No. 03/2010 / CM / UEMOA relating to covered bonds in the WAEMU

**Other key market legislation credit**

Regulation n ° 06/2013 / CM / UEMOA of June 28, 2013, on Treasury bills and bonds issued by auction or syndication with the assistance of the WAMU Securities Agency (Agence UMOA-Titres)

Decision No CM / SJ / 001 / 03/2016 Relating to the Implementation of the Monetary Penalties Mechanisms Applicable on the Regional Financial Market of the WAMU

Ivoirian Financial Markets Act 1974

Regional financial markets Instruction 2011

Uniform Act on simplified recovery procedures and measures of execution

WAEMU Instruction governing activities of electronic money issuers 2015

Ivory Coast Electronic Transactions Act 2013

Last modified 3 Aug 2020

**Regulatory authorization**

**Who are the regulators?**

The Financial Market Authority is the Regional Council for Public Savings and Financial Markets (CREPMF). It regulates the functioning of the market and authorizes public offering procedures by granting visas.

It enacts rules and regulations concerning the regional stock market, market access conditions, publicity rules and information of the public.

It has the power to control the different stakeholders operating in the regional market.
The Regional Stock Exchange (BRVM) is responsible for organizing the stock market; ensuring the listing and trading of securities; ensuring the dissemination of stock market prices and information; promoting and developing the market.

The Central Bank of the West African States (BCEAO) issues currency, manages monetary policies, and organizes and monitors banking activities in general.

The WAMU Securities Agency (Agence UMOA Titres) assists states using the regional and international capital markets to raise their needed resources to finance and fund their economic development through the identification of the most suitable means.

What are the authorization requirements and process?

The main authorization requirements are the granting of an approval and/or a visa depending on the type of entity or individual. Under the General rules of the CREPMF, some investment activities require an approval (agrément) from the CREPMF and others require authorization(s) from both the CREPMF and BCEAO (Regulation 09/2010).

In accordance with the applicable, the conduct of the following activities on the regional financial market, without this list being exhaustive, is subject to the approval or authorization of the Regional Council: securities trading, maintaining securities accounts, reception and transmission of orders, presentation of daily buy and sell offers, asset management mandates, financial marketing or solicitation, collective asset management, debt securitization (titrisation des créances), financial rating, financial transaction guarantee (garantie des opérations financières),

Once applications are received, they are assessed within a one- to three-month period from the date of filing of the application.

The application fee depends on the type of entity and the nature of the activity ranging from XOF500,000 to XO50 million.

The application process will end up with an individual decision by the Regional Council (CREPMF).

A list of authorized entities and individuals can be found with the CREPMF and the Regional Stock Exchange (BRVM).

What are the main ongoing compliance requirements?

Approved or authorized entities have continuous obligations such as sufficient guarantees, in particular with regard to the composition and amount of their capital, their organization, their human, technical and financial resources, the integrity and experience of their managers, as well as their own measures to ensure the security of clients' transactions.

They must undertake, in writing, that any modifications made to their statutes during the course of their existence are subject to the prior authorization of the Regional Council when they relate to a distribution of capital between shareholders, a change in the scope or nature of the guarantees presented, a change in the accounting methods and information used, any other modification of the statutes is the subject of information to the Regional Council.

In case of failure of those entities to comply with key requirements, the Regional Council can take steps to restore compliance with the rule. If violations continue, it can decide on the sanctions to be taken, in accordance with the provisions of the General Regulations, in particular the suspension of all or part of their activities.

What are the penalties for failure to be authorized?

A person, be it a natural or legal person, undertaking a regulated activity without being approved, authorized or exempted is liable to a certain number of sanctions.

Failures are classified into four categories and subject to a quantum of financial penalties.

The quanta apply to any stakeholder in the regional financial market as well as to any natural or legal person responsible for non-compliance.
Failure, for instance, to obtain a visa by the Regional Council results in the nullity of transactions, both with regard to the applicant and the solicited public. In addition, issuers are liable to sanctions from the Regional Council, without prejudice to legal proceedings (Article 115 of the General Regulation of the CREPMF).

Regulated activities

What finance and investment activities require authorization?

Generally

Combined provisions of the General Rules of the CREPMF and the Regulation 09/2010 provide for the financial and investment activities that require authorization.

Under the General rules of the CREPMF, the following activities qualify as investment activities that require an approval (agrément): issuing and distributing securities; trading and intermediation on the securities market; trading and intermediation on the derivatives market; organization and operation of stock exchanges; organization and operation of commodities and futures exchanges; management of securities portfolios and custody of securities; and provision of investment advice.

Persuant to article 8 of Regulation 09/2010, the following activities require an authorization from CREPMF and BCEAO: the issue, the exposure, the sale of securities of foreign states, public authorities or foreign companies and international institutions; the solicitation of residents with the aim of constituting deposit funds with foreign private individuals and offshore establishments; any publicity or marketing... edited on the territory of a WAEMU's Member State with the aim of investing offshore funds or subscribing to operations related to offshore real estate constructions.

Consumer credit

Consumer credit activities, including hire-purchase and rental with option purchase, discount, reverse repurchase, acquisition of receivables, guarantees, purchase financing, leasing and service delivery are regulated activities.

Furthermore, these activities can only be offered by firms who are authorized and listed on the financial services register.

Are there any possible exemptions?

All transfers of securities listed on the Regional Stock Exchange are made through an SGI, except in the case of an exemption granted by the Regional Stock Exchange (Article 37 of the General Regulation of the CREPMF).

Moreover, pursuant to article 95, no one may, as a usual profession, without the prior authorization from the Regional Council, provide investment advice, in particular of a stock market nature, to third parties.

However, SGIs and banking institutions are authorized to exercise the activity of stock market investment advice by way of derogation from the preceding article (Article 96).

Do any exchange controls or other restrictions on payments apply?

Transfers are, in principle, free.

However, some exchange controls and other restrictions on payments apply.

Under article 2 of Regulation n°09/2010/CM/UEMOA, foreign exchange transactions, capital movements (issuance of transfers and/or
receipt of funds) and settlements of all kinds from a WAMU Member State to a foreign country or in the WAMU space between residents and non-residents can only be made through the BCEAO, the Administration or the Post Office, a licensed intermediary or a licensed manual exchange agent.

Licensed intermediaries are allowed to perform the following activities to a destination abroad, under their responsibility and on the basis of supporting documents (art. 7 of the Regulation n°09/2010/CM/UEMOA):

- the transfer of money required for contractual debts amortization as well as short-term repayment of loans granted for the financing of commercial and industrial operations;
- the transfer of the liquidation proceeds of investments or the sale of foreign securities by non-residents;
- the required settlements, either for transactions on derivative instruments or for transactions on commodity derivatives and basic products.

Payments to foreign destinations in respect of capital transactions, other than those provided above, must be done based on an application for foreign exchange authorization submitted to the Minister of Finance.

**What are the rules around financial promotions?**

A financial promotion is a proposition for the acquisition of investment products. It is, mostly, dealt with under the concept of solicitation.

Individuals intending to conduct public solicitation activities (business providers, direct sellers) are required to obtain a professional card issued by the Regional Council (General Regulation of the CREPMF, Article 108: The solicitation of the public).

Financial institutions, such as banks, wealth management companies, management and intermediation companies (SGI), business providers, individual or legal persons authorized for that purpose, are allowed, as of right, to have recourse to solicitation after reporting to the Regional Council (Article 155).

Solicitation of the WAMU's public by a non-resident entity, or on behalf of it, to propose the acquisition of investment products is subject to prior authorization of the Regional Council and the assent of BCEAO (General Regulation, Article 176).

Last modified 3 Aug 2020

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

The types of legal entity that are generally used to undertake financial or investment activity are limited companies, they can be private law companies incorporated as a public limited company.

That type of entity is used for the Regional stock exchange (BRVM) and the Central Depository/Settlement Bank under Article 12 of the General Regulation, where they are specifically characterized as “private law companies incorporated as a public limited company.”

Management and intermediation companies are to be established as Public Limited Companies (Société Anonym, Article 30).

**Funds**

Open-ended investment companies (SICAV) are also to be established as Public Limited Companies (Instruction N ° 21/99 Relating to the Classification of UCITS, Article 2).

Last modified 3 Aug 2020

**Is it possible to conduct lending or investment business through a branch or establishment?**
Yes, it is possible to conduct lending or investment business through a branch or establishment in Ivory Coast.

A company can conduct lending or investment business in Ivory Coast through an establishment (also known as a branch), but the entity must be incorporated as a public limited company during the registration process with the trade register.

Furthermore, overseas companies carrying on a trade in Ivory Coast through a permanent establishment will be subject to Ivory Coast corporation tax.

**FinTech**

**FinTech products and uses**

*What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?*

The most common technology products and fintech applications used or being developed in the finance and investment marketplace are:

**PEER-TO-PEER FUNDING PLATFORMS AND MARKETPLACE LENDING**

Marketplace lending is characterized by wide variety of market participants and financing mechanisms. Among the principal characteristics of new marketplace lenders, one can name:

- the use of non-bank lending platforms established as a specialist corporate or special purpose vehicle (SPV) based structure;
- recourse to technology to leverage and optimize the lending platforms;
- bringing together borrowers and lenders, through platforms rather than using the traditional financing mechanisms.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- prepaid cards;
- consumer loans;
- small and medium-sized enterprises (SME) lending; and
- residential property and commercial property lending.

**HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?**

Money raising is organized from a large number of people who contribute small amounts in order to fund projects, usually via internet. Recourse to those platforms has been increasing.

**BLOCKCHAIN, SMART CONTRACTS AND CRYPTOCURRENCIES**

Blockchain, smart contracts and cryptocurrencies are not regulated neither under WAEMU nor in Ivory Coast.

The Central bank (BCEAO) did not hide their negative position as far as cryptocurrencies are concerned. Such a position stems from a series of concerns especially in terms of protection of personal data, compliance with competition rules, national security and monetary policy. They have reiterated their concerns over Facebook's project to create a cryptocurrency called Libra under the following terms: "This cryptocurrency project is the source of many concerns among regulators, particularly in terms of protection of personal data, compliance with competition rules, national security and monetary policy," said the Central Bank's representatives in their monitoring report for financial services backed by electronic payment.

Money creation is strictly controlled by a central authority, which issues and destroys it.
It is in the same line of thought that the CREPMF have, many times, recalled the regulations. On the money market, only a bank can hold an authorization and provide a financial guarantee from the BCEAO to be able to collect money from the public against the payment of interest.

The situation is not different in the financial market, where only an SGI has the same authorization from CREPMF.

**INITIAL COIN OFFERINGS AND TOKEN-BASED PRODUCTS**

Initial coin offerings and token-based products have not been subject to rules and regulations within the WAEMU. Their use is not tolerated in the WAEMU zone. Ivory Coast, being part of the eight WAMU member countries, has not allowed the creation or use of digital currency.

Money creation is strictly under the power and control of a central authority, BCEAO.

Please refer to response above it (Topic 13).

**ARTIFICIAL INTELLIGENCE AND ROBOT ADVISORY SYSTEMS**

Artificial intelligence and robot advisory systems are not specifically regulated in the WAEMU or in Ivory Coast.

However, as a tool using telecommunications, it is subject to the provisions contained in the telecommunication code.

In Ivory Coast, telecommunication activities are controlled by the regulatory authority, which is ARTCI (Ivory Coast Telecommunications Regulatory Authority).

Such an activity is not regulated; however, its use is being promoted withing the WAEMU zone, including among youngsters as was the case of a competition organized under the auspices of the of the regional stock exchange, the "BRVM Fintech Innovation challenge" launched by the Regional Stock Exchange (BRVM). The Ivorian recipient, Mr. Cédric Arthur Yao, presented "the Fetish project," an application dedicated to technical analysis on the stock market. The aim of the proposed analysis model was to allow a short, medium and long-term investment orientation for securities and to anticipate possible price rises and falls. The intention of the Fetish application was to integrate this technical analysis model into a digital application.

**DATA ANALYSIS AND CLOUD COMPUTING**

Cloud services are at their early stage in Ivory Coast.

They are used by banks for investments to improve customer experience and credit risks. Governments are also using them to provide certain public services.

_Last modified 3 Aug 2020_

**Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?**

**General financial regulatory regime**

The Regional council for public savings and financial market (CREPMF) is the regulator for the provision of financial products and services.

**General**

The conduct of regulated financial activities requires prior authorizations, approvals, generally, from the CREPMF and the BCEAO.

Some restrictions, specific laws, regulations and procedures may apply to fintech products.

Entities providing fintech products and services with regulated financial activity components are required to be authorized and comply with different laws, rules and regulations such as data protection and the like.

**Electronic payments platforms and regulation of peer-to-peer lenders**
Electronic payments platforms are governed through BCEAO Instructions, mainly Instruction N° 008-05-2015 governing the terms and conditions for the exercise of the activities of issuers of electronic money in the Member States of the West African Monetary Union (WAMU).

E-money transactions done through cards, internet and telephone are regulated under said instruction.

The definition of e-money has been made, taking into account “good international practice” and is characterized by a monetary value electronically stored, issued against funds provided in at least an equal amount and that has been accepted as a means of payment by both individual and corporate third parties.

Banks, payment services companies and microfinance institutions (MFIs) are allowed to issue e-money and can conduct e-money transactions.

Banks and payment services companies holding existing BCEAO licenses along with e-money authorizations, as FI issuers, must notify BCEAO (two months) in advance of any deployment, while microfinance institutions (MFIs) must get prior authorization from the Minister of Finances after BCEAO consent.

Nonfinancial companies may also issue e-money after obtaining a license. These issuers are called Etablissements de Monnaie Electronique (EMEs or non-FI issuers). They must meet separate standards on corporate governance and related matters to obtain a license. These EME companies must be solely dedicated to e-money issuance, (i.e. providing payment, transfer, and cash-in/out services. They cannot provide savings or credit services. EMEs can own shares only in other entities involved in e-money issuance.

**Peer-to-peer lenders**

It is important to mention that there is no specific regulation regarding this matter.

However, the need to regulate this type of product in order to protect consumers has been noted in some countries. The Regional Council and the BCEAO are conducting reflections in this direction, in order to propose protection mechanisms for consumers.

**Regulation of payment services**

Structures or establishments intending to exercise payment services are required to be duly approved or authorized, beforehand, by the Central bank. Banks and financial payment institutions authorized by laws regulating banking are allowed to conduct transactions related to payment services.

However, they are required to inform BCEAO, at least two months before the start of their electronic money issuance activities or the marketing to the general public, of any new money-related electronic service.

Electronic money institutions must be approved by the Central Bank before starting their electronic money issuing activities.

The exercise, by decentralized financial systems, of activities linked to electronic money, is subject to the prior authorization of the BCEAO. (Article 8 of the Instruction).

Electronic money institutions must have a specific legal form and corporate purpose. They must be constituted in the form of Joint Stock Companies or Companies with Limited Pluripersonal Liability, Mutuals, Cooperatives or Economic interest Groups.

With the exception of banks, financial payment institutions and decentralized financial systems, the issuance of electronic money can only be carried out by a legal person whose corporate object relates exclusively to this activity.

Diverse forms of electronic payment are available in Ivory Coast. These include the use of credit and debit cards, mobile phones, online payment services such as Paypal, Alipay or Apple using the iTunes card, bank transfers and payment upon delivery.

**Application of data protection and consumer laws**

Data Protection in Ivory Coast is regulated under Law No. 2013-45 of June 19, 2013 on the protection of personal data provides for the processing, transfer and other activities. The transfer of personal data to third countries is allowed subject to sufficient protection guarantees. The Ivorian's Data Protection Act 2012 (DPA) regulates the processing of personal data within the Ivory Coast. It implements the Supplementary Act on Personal Data Protection within ECOWAS.

Sensitive data collection, processing is subject to prior authorization from the Ivorian Telecommunications Regulatory Authority (Autorité
That Law regulates, among others, direct solicitation marketing by electronic means (Article 14).

The General Regulation of the CREPMF also regulates solicitation of the WAMU public (Article 176...).

Furthermore, there is a 2016 Ivorian consumer code that provides for consumer protection rules. It introduces competition rules and regulates consumer protection agencies in the marketplace.

**Money laundering regulations**

The applicable law is Law n° 2016-992 of November 14, 2016 relating to the fight against money laundering and the financing of terrorism (AML/CFT) and a decree gives competence to the Coordinating Committee to identify, assess, understand and mitigate the money laundering and terrorist financing risks to which the country is exposed. It is responsible for coordinating and conducting the work of the National Risk Assessment (ENR) and the elaboration of the National Strategy on AML/CFT.

The Money Laundering, Terrorist Financing and Transfer of Funds (Information on the Payer) Regulations 2015 give the National Financial Intelligence Processing Unit CENTIF responsibility for supervising the anti-money laundering controls of businesses that offer certain services, such as lending, providing payment services and issuing and administering other means of payment.

Generally, where a firm is authorized and supervised by the CENTIF, it will also be authorized and supervised by the CENTIF for complying with anti-money laundering requirements. Electronic currencies and other cryptocurrencies tend to represent a higher money-laundering risk.

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**

**Seed investment**

Foreign business angels, especially French ones, provided some fintech businesses with initial investments. For instance, Julaya, an Ivory Coast-based fintech startup raised USD550,000 to fund its activities in the country.

Startups may have support from individual or entities investors, experienced angels and partnerships with local and pan-African payment startups.

Such seed investment is often used to fund the establishment and early growth of the business before larger investment is sought and available.

**Crowdfunding**

The crowdfunding sector is at its early stage in Ivory Coast. Crowdfunding platforms have been launched bringing together individuals, entities and charities to finance personal and charitable projects.

“Orange collecte” has created a mobile crowdfunding platform and other telecom operators are expected to follow.

Crowdfunding has also been seen as a possible alternative through which foreign aid may be sent in order to resolve issues such as corruption. However, legal and regulatory obstacles have slowed that initiative that has been considered by foreign countries such as the UK.

**Venture capital and debt**

Venture capital funding is a type of equity investment usually targeted at early stage fintech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending, given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund, examples of which
include Santander InnoVentures and Citigroup's Citi Ventures. The benefit of having a CVC as an investor for a fintech startup is that the fund is able to share its knowledge and expertise of the fintech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), which is secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

**Senior bank debt and capital markets funding**

Once a fintech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding, which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**Incentives and reliefs**

The investment code is intended to help investors with their potential projects in Ivory Coast. Indeed, international investors are urged to rely on local companies in the conduct of their operations in order to benefit from certain incentives offered by the new legal system.

The objective is, of course, to open up opportunities for SMEs and to give an inclusive character to Ivorian economic growth. Thus, large foreign companies eligible for the benefits of the new Code are entitled to tax credits provided that they apply a local content policy on job creation, opening of social capital to nationals and the outsourcing.

In concrete terms, an additional tax credit of 2% is granted to foreign investors whose number of executives and supervisory staff (management bodies such as directors, production manager, operational manager, sales manager, etc.) of Ivorian nationality represents 90% of the total workforce of these two categories of employees.

The same tax credit is granted to companies subcontracting to national companies the realization of goods intended to be incorporated into a final product in Ivory Coast or abroad. It also applies to companies that open their capital to nationals.

*Last modified 3 Aug 2020*

**Portfolio sales**

**Loan transfers and portfolio sales**

*What are common ways of buying and selling loans?*

Loans are commonly bought and sold.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio.

The most common ways of selling loans are:

Novation is a transfer of title of a party's rights and obligations. It's a tripartite arrangement between the existing parties and the transferee and results in a new contract between the continuing party and the transferee and the transferor being released from its obligations.

Assignment – a transfer of rights only and not of obligations. Subject to any contractual restrictions, assignment can be done without the consent of the debtor. An assignment can be effected as either an equitable assignment or a legal assignment.

The Loan Market Association documentation is sometimes used for loan transfers.

*Last modified 3 Aug 2020*

*What are the main considerations when transferring a loan and related security?*
Loans contracted by residents from non-residents must, except by special decision of the Minister of Finance, be carried out through licensed intermediaries in all cases where the monies borrowed are made available to the borrower in the country. The licensed intermediaries thus called upon to intervene will ensure that the transactions comply with the applicable laws and regulations.

All foreign loans are subject to mandatory declaration to the External Finance Directorate and the BCEAO, for statistical purposes. The repayment of any foreign loan, either by purchase and transfer of foreign currencies or by crediting foreign accounts in XOF or in EUR, must be declared for statistical purposes to the External Finance Directorate and the BCEAO and said transactions must be carried out through a licensed intermediary.

Before transferring a loan, a number of issues, below, must be taken into account:

- Confidentiality: whether disclosure of information relating to the loan is allowed, to a potential transferee for instance.
- Data protection: whether there is any personal or restricted data or information in the loan that should not be disclosed.
- Lender eligibility: whether there are any restrictions on potential transferee entities.
- Undrawn commitment: whether the transferee will be subject to continuing obligations for further funding or reduction of claims.
- Transfer mechanics: whether there are any procedures to be followed for the transfer.
- Consent: whether the consent or notification of any other parties is required for the transfer.

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Ownership of energy assets and infrastructure in Ivory Coast varies according to the asset class.

The key sectors are discussed below.

Energy

ELECTRICITY

Ivory Coast is expanding its production capacity following a higher demand for electricity not only at a national but also at a sub-regional level.

To have a more competitive sector and get the needed investments to respond to such a higher demand and proceed to the rehabilitation and expansion of distribution and transmission networks, new regulations have also been introduced in recent years. These take into account the attraction of the private investment and inclusion of the private energy companies which has led to a rise of the country's electricity capacity production.

The investments needed to upgrade the energy sector is expected to come from the private sector and in order to attract private investments from private companies, the government, through the Ministry of Petroleum, Energy and Renewable Energy Development (Ministère du Pétrole, de l’Energie et du Développement des Energies Renouvelables, MPEDER) offered incentives such as tax breaks. Though not negligible, more investment is needed, estimated at around EUR6 billion to develop and upgrade the sector for the 2021-2030 period.

In Ivory Coast, the energy sector is managed by and is under the control of the Energies de Côte d’Ivoire (CIENERGIE), a state company. It deals with the management of state-owned sector assets, ensures the financial equilibrium of the sector, manages the management of the purchasing functions, and movements of energy and the monitoring of the project management of works coming back to the state.

The regulator of the energy sector is the National Regulatory Authority of the Electricity Sector (ANARE). It monitors compliance with regulations, manages disputes between industry players, ensures the protection of consumers' interests and issues opinions on operating licenses and regulatory texts.
Gas

In Ivory Coast, gas industries are privatized. A number of private sector companies provide production, transportation and distribution services. Private sector companies involved own the generation, transmission and distribution assets are, in particular, FOXTROT, CNR, AFREN.

Biomass production has been introduced as a vital component of the country's renewable energy plans. The national grid is to be supplied by independent biomass energy producers. Feedstock coming from cocoa, palm oil, cotton, coffee and sugar plantations are used. A biomass power plant is currently under construction with a two-phase plan. The project, which costs XOF105 billion (EUR157.5 million), is a partnership between SIFCA, French electricity company EDF and French firm Bouygues, and it is set to become Africa's largest biomass power plant.

Tenders for two other biomass projects have been launched by the Ivorian authorities. The cost of the one to be built in the town of Boundiali is estimated at XOF29 billion (EUR43.5 million) and the other one to be built, a 20MW cocoa biomass plant is set to cost XOF21 billion (EUR31.5 million) and will be established in the city of Gagnoa.

Both will be established under build-own-operate (BOO) contracts.

Telecom Infrastructure

Telecommunication networks (fixed and mobile) is characterized by, composed of private ownership. Companies providing a number of services in the sector are Orange CI, MTN CI and MOOV CI.

The Ivorian Telecommunications Regulatory Authority (ARTCI) is the regulator of the telecommunications sector in Ivory Coast. It is also responsible for broadcast services and wireless communications services.

Aviation

Access to financing in the aviation sector is difficult to obtain and may be quite costly when available. Financing from commercial banks are hard to get including for aircraft acquisition.

Guarantees from the government were, at times, sought but reticence was encountered on the part of the government.

Aviation leasing is quasi inexistent on the continent and costly when in foreign markets.

However, financing through Export Credit Agencies (ECAs) have become a source of financing.

Are there special rules for investing in energy and infrastructure?

Generally

There is no specific regime governing or restricting investment in energy or infrastructure projects in the Ivory Coast over and above existing regulation for investors and funders more generally but a particular proposed investment may be subject to legislative or regulatory control (e.g. merger control rules). As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory position relevant to that project must be considered. For example, a project involving development on land will require planning permission or a development consent order; and a project may require environmental authorizations/permits and/or sector specific regulatory consents or licenses. If a public body (e.g. a government department, a local authority or a National Health Service Trust) is procuring a project using private finance, and the public body is to benefit from central government funding towards the cost, the project will be subject to central government approval. Key sector-specific issues are flagged in the sections below.

Whether an investor can invest will depend on the terms of the procurement of that project if it is a public-sector project and, in respect of an existing/operational project, that will depend on whether there are any contractual restrictions on Change of Control. This is less of a concern on private sector infrastructure although investors would need to consider whether any licenses/consents/permits would be affected by their acquisition of an interest.
Energy

ELECTRICITY

The electricity industry is managed by the Ivorian Electricity Company (CIE), which is by the state company. It is responsible for the distribution of electricity.

There are also independent power producers such as the Ivorian Electricity Production Company (CIPREL), AZITO Energy, AGGREKO.

In its efforts to encourage private investment, a liberalization of the sector regulations has been undertaken. Private producers have been part of the electricity generation process since 1985; however, production, transmission, and distribution were left under state monopoly, with these activities being managed by CIE since 1990.

With the adoption of a new Electricity Code in 2014, CIE's monopoly on transmission, distribution, and marketing of electricity was terminated.

Power generation is currently reliant to a significant degree on independent power producers (IPPs).

What is the applicable procurement process?

In Ivory Coast, the key principle is that any contract procured by the public sector is awarded fairly, transparently and without discrimination on the grounds of nationality and that all potential bidders are treated equally.

In general, in the energy and infrastructure areas, public procurement is relevant where the Ivorian government, or a public entity, is seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset.

The relevant procurement legislation applies to certain public bodies, including central government departments, local authorities, police and fire authorities, various non-governmental bodies such as the Competition and Markets Authority. A regulated procurement is required where certain financial thresholds are met and on most major infrastructure projects (where limited exclusions do not apply), it is likely that those thresholds will be met so a regulated procurement would need to be run.

Investing in energy and infrastructure

In most cases, the public sector will need to publish a contract notice in the gazette and typically run one of the following procedures:

Open procedure – This is suitable for easy-to-evaluate projects and tenderers simply submit a tender in response to the National Authority for the Regulation of Public Procurement (ANRMP) notice. Change and negotiations to the tender are not permitted.

Restricted procedure – There is a shortlisting of at least five tenderers following an expression of interest stage and tenderers submit a bid. Again, no negotiation is permitted other than clarification and finalization of the contract terms.

Competitive dialogue – This is often the most common procedure for complex infrastructure projects and involves a shortlisting of at least three bidders who are invited to dialogue with the public sector to develop detailed solutions which are capable of being accepted by the public sector. Clarification and further negotiations are allowed following final tender but only on the basis of confirming the financial and other commitments in a tenderer's bid.

Competitive procedure with negotiation – This is sometimes described as a hybrid procedure as it allows dialogue with bidders but also allows the public sector to award a contract on the basis of an initial tender (or further stages) but clarification and negotiation is not allowed following final tender.

Financing energy and infrastructure

An investor may choose, however, to seek to invest in a project (by acquiring an interest in a private sector partner) that has already been procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the original awarded contract rather than procurement regulations themselves.
Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement-related considerations that need to be borne in mind.

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector and any refinancing gains to be shared with the public sector.

What are the most common forms of funding / investing in energy and infrastructure?

The principal forms of private sector funding/investment in energy and infrastructure in the Ivory Coast (including in relation to public-private partnerships) are:

Funding

Common forms of funding in energy and infrastructure include:

- loans made on a corporate finance basis (balance sheet debt);
- loans made on a project-finance basis (to a special purpose project company) on medium to long-term bases – such loans may later be syndicated to other funders;
- refinancing of the debt in operational projects; and
- asset financing – this is particularly relevant in the rail sector.

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

When there is a presumed violation of compliance requirements, the Capital Markets Authority (CREPMF) launches an investigation when it believes that there a potential violation of the rules and regulations.

The enforcement of investigations can be done at any time when the financial market authority considers there is a violation of law. The financial market authority can find information from different actors in the market (shareholders, parent companies and subsidiaries, of any legal or natural person having a direct or indirect relationship of interest with the stakeholders).

This investigation can result in sanctions.

What regulatory penalties may apply?

Also, the regional council, in application of article 30 of the appendix relating Composition, Organization, Functioning and attributions of the CREPMF, can impose a disciplinary, financial and administrative sanction for any action, omission or maneuver that would be contrary to the general interest of the financial market and its proper functioning and/or prejudicial to the rights of savers.

The CREPMF does not have the power to impose criminal sanctions, but it does have the power to pronounce:

- pecuniary sanction;
- administrative sanction; and
- disciplinary sanction.
When there is violation of law, the financial authority can apply pecuniary sanctions (fines), administrative sanction (withdrawal or suspension of authorization) and disciplinary sanction. This sanction does not prevent the application of criminal penalty.

Those sanctions are imposed without prejudice to legal sanctions which may be pronounced against their authors on the basis of a claim for compensation brought on an individual basis by aggrieved persons as a result of these conducts (appendix relating Composition, Organization, Functioning and attributions of the CREPMF, article 30).

**What criminal penalties may apply?**

According article 36 of the appendix relating Composition, Organization, Functioning and attributions of the Regional Council of the Public Savings and Financial Markets, regulators have powers to impose criminal penalties in certain cases, to any person who, intentionally:

- does not respect the restriction, suspension, or prohibition of professional activity that has been notified to him by the Regional Council;
- spreads false information in the public about the stock market and its products;
- performs a stock market maneuver aimed at hindering the regular operation of the market;
- overrides a decision to reject an application or withdraw a visa taken by the Regional Council;
- infringes the monopolies of stock exchange trading and securities accounts vested in management and intermediation companies;
- commits an insider trading.

In addition, in the case of a legal person, the *de jure or de facto* managers will be liable to the same proceedings if they become aware of these acts.

The financial conduct authority can't apply criminal penalties. They may just apply the sanctions specified above. Criminal penalties are applied by national court.

**Tax**

**Tax issues**

**Are stamp, registration, transfer or other similar taxes applicable?**

**Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?**

Treasury bills and Treasury bonds incomes are tax-free throughout the territory of the Member States of the WAEMU. But for non-members, the tax rates are different from one country to another. In Ivory Coast, the common tax rate one securities income is equal to 12%. Bonds with issuance of minimum five years have a tax rate of at least 6%.

**Advance of loan**

No stamp, registration, transfer or other similar taxes are payable on the advance of a loan.

**Transfer or assignment of a debt under a loan**

A written instrument transferring or assigning a debt under a loan is chargeable depending on the deed. So, if it is a private act, it is chargeable according to the operation. If it is a notary public's act, it is chargeable at a fixed price (2,000-90,000) or proportional tax (0.5%-12%). If it is a bailiff's act, it is chargeable according to the operation. The act could be chargeable to 10% if the act concerns business capital.
Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

There is no stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security.

However, most security interests created must be registered at Land Property and Mortgage Office of Ivory Coast.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?

ISSUE OF DEBT SECURITIES

Bearer bonds

The issuance of a debt security in Ivory Coast normally requires the bearer to register.

However, no specific rate is provided for when the debt security is issued.

Registered bonds

No specific rate is provided.

TRANSFER OF BONDS

Bearer bonds

In Ivory Coast, all transfers, assignments and other transfers of receivables for pecuniary interest are taxable at a rate of 1%.

Registered bonds

A written instrument transferring a debt security which is a registered bond is, in principle, chargeable. There are several types of stamps applicable. The written instruments transferring bonds are taxed in 1%.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?

Secured lenders and secured debt security holders take priority over tax authorities on enforcement of security.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

In Ivory coast, withholding tax is applicable on interest payment under a loan.

If so:

What is the rate of withholding?

Foreign banks are subject to 18% tax on loan interest.
What are the key exemptions? For example, is there an exemption for interest payments to banks, to local lenders/debt security holders, on listed debt, to lenders/debt security holders entitled to the benefit of a double tax treaty etc.?

The exemptions listed by the Ivorian tax code are:

- some capital depreciation that are allowed after request;
- interest on amounts recorded in savings bank books;
- structures working in microfinance;
- current accounts;
- cooperatives;
- interest and loan issued by the State or the national investment bank;
- loans issued by the public treasury; and
- interest on loans from certain companies subject to income tax on movable capital.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes, the analysis described above is applicable to both interest payments under a loan or other form of debt security.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

The lender will be taxed on interest payments under a loan in the jurisdiction of the borrower.

The entity receiving interests is supposed to record and declare it under their corporate income tax heading.

There is no withholding tax on interest for natural persons.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes, it will.

Suppression of income tax on interest on Treasury bills and bonds taken out by natural persons (Article 12).

The General Tax Code subjects the income from non-bond loans to the tax on receivables (IRC) and fixes the applicable rates as follows:

- 10% for bonds and bonds of 3, 6, 9 or 12 months;
- 5% for those whose maturity is 3 to 5 years.
Japan

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

To issue debt securities (corporate bonds), the issuing entity must determine the offering terms and approve them through the relevant corporate organ as designated by the Companies Act.

An offer of debt securities is categorized as either a private placement or a public offering under the Financial Instruments and Exchange Act. If an offer is regarded as a public offering, the issuer is required to file a Securities Registration Statement through the Electronic Disclosure for Investors' NETwork (EDINET) before solicitation and deliver a prospectus to those who wish to purchase the securities. Solicitation is allowed only after a waiting period (15 days in principle) from the filing of the Securities Registration Statement.

However, the waiting period may prevent a company from issuing the securities in a timely manner. For this reason, a company issuing bonds by way of a public offering often adopts the Shelf Registration Scheme instead of filing the Securities Registration Statement. This permits an issuer which has submitted the Shelf Registration Form in advance to issue and allocate bonds immediately after submission of Shelf Registration Supplements.

Once the company files a Security Registration Statement or submits a Shelf Registration Form, periodic disclosure obligations including the issuance of an Annual Securities Report is triggered. Conversely, if an offer is regarded as a private placement where only qualified institutional investors (QIIs) or 49 or fewer non-QIIs are solicited within a six-month period, the periodic disclosure obligations are not triggered.

What are common issuing methods and types of debt securities?

The following are common types of debt securities:

- corporate bonds;
- convertible corporate bonds;
- equity-linked bonds; and
- asset-backed securities.

The most common debt securities are corporate bonds issued pursuant to the Companies Act.
What are the differences between offering debt securities to institutional / professional or other investors?

Offers exclusively to qualified institutional investors (QIIs) will constitute a private placement and will not trigger periodic disclosure obligations, provided that the securities allocated to such QIIs will not subsequently transfer to non-QIIs.

Last modified 5 Dec 2019

When is it necessary to prepare a prospectus?

As noted previously, it is necessary to prepare and deliver a prospectus before or upon the allocation of debt securities in a public offering. The prospectus may be delivered in electronic form with the consent of the recipients of the prospectus.

Last modified 5 Dec 2019

What are the main exchanges available?

The Tokyo Stock Exchange is the primary exchange in Japan. More than 20 convertible bonds are listed on the Tokyo Stock Exchange as of March 2017.

Last modified 5 Dec 2019

Is there a private placement market?

Private placements of debt securities are common in Japan. Private placement bonds issued by Japanese and overseas companies may be listed on the TOYKO PRO-BOND Market.

Last modified 5 Dec 2019

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

The Companies Act stipulates that a company issuing debt securities must appoint a bond administrator unless either:

• the minimum par value of each bond is JPY100 million or more; or
• the number of bondholders is 49 or less.

The bond administrator, which is appointed among banks or other financial institutions, will manage the bonds on behalf of the issuers and owe a duty of care towards the bondholders. In practice, most bonds do not have bond administrators.

Last modified 5 Dec 2019

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally

The establishment of a fund, the offering of fund interests and the operation of a fund are regulated under the Financial Instruments and Exchange Act (including applicable secondary legislation such as any relevant Cabinet Order and Cabinet Office Ordinance) and subject to regulatory oversight by the Financial Services Agency.
Collective investment schemes

The regulations apply to the offering of interests in collective investment schemes, which include the following interests (subject to certain specific exceptions detailed in relevant legislation):

- the right to receive dividends of profits or a distribution of assets arising from businesses by way of cash, securities and/or bills of exchange contributed by equity owners (equity partners); and
- the rights emanating from a partnership contract, an anonymous partnership agreement, an investment limited partnership agreement, a limited liability partnership agreement or the membership rights of an incorporated association.

What are common fund structures?

Common fund structures include:

- a partnership created by a partnership contract under the Civil Code;
- a partnership created by an anonymous partnership agreements under the Commercial Code;
- an investment limited partnership created by an investment limited partnership agreement under the Investment Limited Partnership Act; and
- a limited liability partnership created by a limited liability partnership agreement under the Limited Liability Partnership Act.

What are the differences between offering fund securities to professional / institutional or other investors?

The main difference between offering fund interests to professional/institutional or other investors is whether certain exemptions to the broker license requirement are applicable.

Under the Financial Instruments and Exchange Act of Japan, a license is required to solicit the sale of fund interests to Japanese investors. However, a commonly used exemption, known as the Article 63 Exemption, exempts an issuer from the broker license requirement provided that a standard notification to make use of the exemption is made. Due to the availability of the exemption, foreign companies often offer fund units to Japanese investors without the requisite broker license.

The basic requirements for the application of this exemption are as follows:

- The foreign issuer must offer the fund units by themselves.
- At least one Japanese qualified institutional investor (QII) must be involved in the issue.
- If the pool of Japanese investors includes non-QIIs, then such non-QIIs must be eligible to be solicited (so-called “Eligible non-QIIs”) and there must be no more than 49 eligible non-QIIs.

In addition, professional investors may also be exempt from other restrictions (as detailed below).

If the Article 63 Exemption applies, the general partner (GP) must fulfill certain obligations including the following:

- the creation and annual filing of a business report with the regulatory authority;
- maintaining proper accounting books and business records; and
- making filed information available for public inspection at each business location or by making the information available on a website.
Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

The general partner (GP) of a fund is also subject to certain conduct restrictions and obligations including the following:

- a prohibition on the provision of fraudulent information in connection with the solicitation or sale of financial instruments;
- a prohibition on the indemnification of its customers against losses incurred as a result of the investment;
- a prohibition on licensing any third party to use the GP's name or conduct the GP's business operations;
- a prohibition on providing a definitive judgement on the investment;
- certain advertising restrictions;
- disclosure obligations before and upon the sale of financial instruments;
- a duty of care and loyalty to its customers;
- a duty to conduct solicitation and sales activities in accordance with the customer's investment skills, history, purpose, and financial status;
- a prohibition on soliciting and selling fund interests to investors where a segregation of the invested capital is not secured;
- a duty of good care in investment management; and
- a duty to provide a written investment report to customers.

Some of the requirements above may not apply when engaging with professional investors.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

An offer of fund interests is categorized either as a private placement or a public offering under the Financial Instruments and Exchange Act. A public offering of fund interests refers to an acquisition of fund interests by 500 or more investors as a result of solicitation. In a public offering, the Securities Registration Statement via the Electronic Disclosure for Investors' NETwork (EDINET) requires the offeror to deliver a prospectus to investors who wish to purchase the securities prior to solicitation. When the company files the Security Registration Statement or submits the Shelf Registration Form, periodic disclosure requirements will be triggered. These obligations include the filing of an Annual Securities Report.

The marketing of funds is regarded as a sale of financial instruments under the Act on Sales of Financial Instruments. The act requires a firm marketing funds to establish a solicitation plan which ensures the appropriateness of sales activities and to fulfil a firm's duty to disclose to investors any risk pertaining to the funds.

The execution of agreements to purchase fund interests is designated as a transaction requiring the use of anti-money laundering measures. In particular, the firm marketing the funds must confirm the investor's identity, objective in transacting, business scope and the identity of any substantial controllers (i.e. a shareholder owning 25% or more of all shares). Records confirming this information must be kept for seven years. The parties must also report any suspicious transaction which might involve criminal proceeds to the relevant administrative agency.

Are there any restrictions on managing a fund?

For an Investment Limited Partnership, general partners must ring-fence the invested amounts and any other assets invested in the fund.
from their own invested amounts and/or assets.

The Financial Instruments and Exchange Act requires a fund manager to prepare documents detailing the fund’s investment activity. The specific types of required documents vary depending on the structure of the fund and the license it holds.

Last modified 5 Dec 2019

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

Under the Financial Instruments and Exchange Act, a person entering into a derivatives contract for financial instruments (such as securities and currencies), financial indicators (such as exchange rates) or certain credit derivatives must be registered with the Prime Minister.

In addition, under the Commodity Derivatives Act, derivatives contracts for commodities (such as crude oil and gold) or related commodity indices as well as activities related to the brokerage, intermediation or agency of such commodity derivatives must only be conducted by a duly licensed entity (licensed by the Minister of Agriculture and the Ministry of Economy, Trade and Industry, in principle).

The requirement for sellers to explain the risk of the derivatives at issue to potential customers when soliciting derivative contracts is an important regulation under the Financial Instruments and Exchange Act concerning derivatives.

Last modified 5 Dec 2019

What are common types of derivatives?

The over-the-counter derivatives market is limited when compared with the market in the UK or US.

The market in derivatives has increased in recent years and derivative contracts are entered into in Japan for a range of reasons including hedging and speculation. Derivatives may be traded over-the-counter or on an organized exchange.

Common types of derivatives are:

- forwards;
- futures;
- options;
- swaps; and
- credit derivatives.

Last modified 5 Dec 2019

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis of 2007–2008, derivatives and particularly over-the-counter (OTC) derivatives have attracted significant regulatory attention.

A notable transparency initiative introduced in 2012 for the purposes of the regulation of OTC derivatives is the requirement to use an electronic trading system for certain types of OTC derivatives transactions.

As of September 2016, new regulations under the Financial Instruments and Exchange Act require financial institutions to collect and post collateral for OTC derivative transactions which do not use a central clearing house to effect the transaction. This requirement aims to enhance the security of large derivative transactions by limiting the instances of default.

Based on the recent amendments to the Financial Instruments and Exchange Act in May 2019, which are effective as of June 2020, derivative transactions backed by cryptocurrency defined under the Payment Service Act are also subject to registration requirements.
Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Lending is a regulated activity. In general, a lender will need to obtain a moneylending business license or certain other licenses such as a banking license. Though the application of the Money Lending Business Act (for instance, the requirement to hold a moneylending business license) to a foreign company lending money from outside Japan to a party inside Japan is not very clear, it would be prudent for a foreign company to obtain a moneylending business license.

To obtain a moneylending business license, an entity must satisfy certain requirements. For instance, a company must:

- have minimum net assets of JPY50 million;
- have at least one office in Japan;
- have at least one director with at least three years of experience in moneylending operations;
- not conduct any operations against public benefits;
- in respect of each office it operates, have ‘full-time chiefs of moneylending operations’ who have passed a required examination and registered with the relevant regulatory authorities (the ratio of the ‘number of chiefs of moneylending operations’ against the ‘number of persons engaged in money lending operations’ must be 0.02 or more); and
- in respect of each office it operates, have at least one full-time director or employee who has at least one year of experience in moneylending operations.

Certain of the requirements above can restrict the ability of a foreign company to obtain a moneylending business license.

Borrowing

Borrowing is generally not regulated.

What are common lending structures?

Lending in Japan can be structured in a number of different ways to include a variety of features, depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or a syndicated basis (multiple lenders each providing parts of the overall facility). Facilities can be divided into tranches for instance, with senior and mezzanine loans.

Syndicated facilities in tranches by their nature involve more parties (such as agents, trustees and senior lenders and/or mezzanine lenders), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate or an independent agent taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific funding objectives. Types of loans include term loans, working capital loans, bridge loans, project facilities and letter of credit facilities.

Loan durations

The duration of a loan can vary between:
• a term loan, provided for an agreed period of time;
• a revolving loan or commitment line, provided for an agreed period of time, which may be used multiple times up to the maximum outstanding amount agreed;
• an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
• a bridge loan intended for use in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Loan security

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

Loan commitment

A loan can be:

• committed, meaning that the lender is obligated to provide the loan if certain conditions are fulfilled; or
• uncommitted, meaning that the lender has discretion as to whether or not to provide the loan.

In most cases, loans are made available as committed facilities.

Loan repayment

A loan can be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or on a scheduled basis (usually in full at maturity).

What are the differences between lending to institutional / professional or other borrowers?

There are no notable differences between lending to institutional or professional companies such as qualified institutional investors (as defined in the Financial Instruments and Exchange Act) and lending to other companies.

Lending to individuals is subject to the requirement that the ratio of the outstanding amount of total lending against an individual’s annual salary must be one third or less, unless certain exemptions apply (for instance, relating to the purchase of real estate by an individual). This is referred to as the Total Volume Control.

Do the laws recognize the principles of agency and trusts?

Yes, both principles are recognized as a matter of Japanese law.

For instance, it is possible to appoint an agent (dairenin) to act on behalf of other parties or a trustee (jutokusha) to hold rights and other assets on trust for trust beneficiaries (juekisha), such as lenders or secured parties.

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to several Japanese laws, including the Interest Rate Restriction Act and the Civil Code. The maximum interest rate permitted is between 15% and 20% depending on the lending amount. The maximum rate allowed
for liquidated damages in the case of the borrower's default is 1.46 times the applicable maximum interest rate allowed.

## Specific types of lending

When lending to individuals, the Total Volume Control which limits the amount that may be outstanding by reference to an individual's salary will apply. For this purpose, the lender is required to use credit information held by a designated credit bureau to check the individual borrower’s financial credibility.

## Standard form documentation

The Japan Syndication and Loan-Trading Association has standard form documentation often used by Japanese lenders. Foreign lenders typically use their own standard form documentation.

Last modified 5 Dec 2019

### Are there any other notable risks or issues around borrowing?

There are none to highlight for the summary purposes of this site.

Last modified 5 Dec 2019

## Giving and taking guarantees and security

### Are there any restrictions on giving and taking guarantees and security?

Some key areas affecting giving and taking of guarantees and security are as follows.

#### Capacity

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the powers of directors that would otherwise restrict the provision of security. For instance, a decision to borrow and/or to give a guarantee in respect of a significant amount must be made by the board of directors and may not be entrusted to any individual director. Furthermore, a transaction giving rise to a conflict of interest (such as a guarantee by a company for the obligations of its directors) must be approved by the board of directors, with the director in conflict abstaining from the vote on the relevant resolution. Each director of a company owes the duty of care of a good manager and a duty of loyalty to the company. As such, a director must be able to demonstrate that adequate corporate benefit is derived from the giving of a guarantee or security.

#### Insolvency

Guarantees and security may be at risk of being set aside under Japanese insolvency laws if they are:

- provided with little or no consideration within six months of or after the company’s suspension of payment;
- provided after the company becomes unable to pay its debts generally and the creditor is aware of the suspension of payment or the company's inability to pay its debts generally; or
- provided after the application for commencement of bankruptcy proceedings and the creditor is aware of such application.

Guarantees and security may also be challenged on other grounds relating to insolvency.

#### Provision of profit

A company may not provide any benefit to its shareholders in relation to or in connection with the exercise of shareholder rights by a shareholder.

### Obligation of a lender taking a guarantee from an individual
A lender taking a guarantee from an individual is required to use credit information held by a designated credit bureau to verify the individual's credit worthiness. However, the Total Volume Control lending requirement (that the amount of total lending against the individual's annual salary must be one third or less) does not apply to guarantees given by an individual.

**Upstream guarantees**

Upstream guarantees are possible. However, if there is no adequate consideration for or corporate benefit derived from such guarantee, a breach of the directors' duties would be an issue.

_Last modified 5 Dec 2019_

**What are common types of guarantees and security?**

**Common forms of guarantees**

Two types of guarantees may be given.

**(NORMAL) GUARANTEE (HOSHO)**

A guarantor has the right of defense of demand which permits a guarantor to require that the beneficiary first demand performance by the principal obligor. The further right of defense of reference permits a guarantor to require that the beneficiary first enforce against the principal obligor's property by demonstrating that the principal obligor has sufficient financial resources to satisfy the debt and that the satisfaction of the obligation could be easily performed by enforcing against the principal obligor.

**JOINT AND SEVERAL GUARANTEE (RENTAI-HOSHO)**

A joint and several guarantor does not have the right of defense of demand or the right of defense of reference. Under this type of guarantee, the guarantor owes the same obligation as the primary obligor.

Under the amended Civil Code that is effective as of 1 April 2020, regardless of the type of the principal obligation, if the guarantor of such obligation is an individual, the amount guaranteed by such individual must be subject to a clear cap. As a result, in the case of a guarantee of any type of principal obligation, including tenant's obligation under a lease agreement or purchaser's obligation under a continuous sales and purchase agreement, as long as an individual is the guarantor, the guarantee must specify the maximum amount of the guarantor's obligation. Otherwise, such individual guarantee would be invalid.

**Common forms of security**

Three basic types of security interest can be created under Japanese law.

**(MORTGAGE (TEITOUKEN)**

A mortgage may be created on rights to real property and certain other types of property such as automobiles, aircraft and factories.

**(PLEDGE (SHICHIKEN)**

A pledge may be created on an asset that can be assigned to others such as chattels, real property and rights. For a pledge (other than a pledge on right without a deed) to be effective, the asset must be 'delivered' (hikiwatashi) to the pledgee. In the case of a pledge on movable property, the pledgee must continuously possess the pledged asset for the pledge to remain valid.

**(SECURITY BY WAY OF TRANSFER (JOTO-TAMPO)**

A security by way of transfer is not a statutory security. It is commonly used to avoid the potentially stringent requirements for a pledge on a movable property, in particular, that the pledgee must continuously possess the pledged asset. A security by way of transfer enables the pledgor to possess and use the pledged asset even during the security period.

_Last modified 5 Dec 2019_
Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

To be valid, a guarantee must be in writing.

There is a further risk that a guarantee may be set aside if improperly obtained, for instance, by undue influence. It is best practice for a party taking the benefit of a guarantee to take steps to avoid claims of undue influence by, for example, requiring the guarantor to obtain independent legal advice.

Giving or taking security

Once granted, security must be properly perfected. Perfection formalities may include:

- ‘delivery’ of the pledged assets to the security holder (e.g. a pledge on a movable property);
- registration of the security (e.g. a mortgage on a real property); and
- notification to the obligor of the right pledged.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Financial Instruments and Exchange Act (Kinyu Shohin Torihiki Hou) (securities transactions)

Foreign Exchange and Foreign Trade Act (Gaikokukawase oyobi Gaikokuboeki Hou) (foreign transactions)

Payment Services Act (Shikinkessai ni kansuru Houritsu) (fund transfer business other than banking)

Trust Act (Shintaku Hou) (trusts)

Consumer credit

Consumer Contract Act (Shohisha Keiyaku Hou) (consumer contracts)

Mortgages

Act on Securitization of Assets (Shikin no Ryudoka ni kansuru Houritsu) (securitization of assets using special purpose companies or special purpose trusts)

Secured Bonds Trust Act (Tanpotsuki Shasai Shintaku Hou) (trusts relating to secured bonds)

Mortgage Securities Act (Teito Shoken Hou) (mortgage securitization)

Corporations

Companies Act (Kaisha Hou) (company)
Banking Act (Ginko Hou) (banking)

Money Lending Business Act (Kashikingyo Hou) (moneylending business)

Funds and platforms

Limited Partnership Act for Investment (Toshijigyouyugensekininkumiaikeiyaku ni kansuru Houritsu) (partnerships to conduct investment business)

Act on Investment Trusts and Investment Corporations (Toshishintaku oyobi Toshihojin ni kansuru Houritsu) (investment in securities using investment trusts and investment corporations)

Limited Liability Partnership Act (Yugensekinjigyoukumiaikeiyaku ni kansuru Houritsu) (limited liability partnerships)

Other key market legislation

Interest Rate Restriction Act (Risoku Seigen Hou) (interest rate)

Act on Prevention of Transfer of Criminal Proceeds (Hanzai niyoru Shueki no Itenboshi ni kansuru Houritsu) (anti-money laundering)

Regulatory authorization

Who are the regulators?

The Financial Instruments and Exchange Act delegates control over the disclosure of information related to securities and the regulation of securities to the Financial Services Agency, an external bureau of the Cabinet Office.

The Prime Minister has regulatory authority to order a financial instruments business or an intermediary service to:

- improve its operations;
- suspend its businesses; or
- rescind its registration.

What are the authorization requirements and process?

Any firm engaged in financial instruments business or the provision of financial instruments intermediary services must register with the Prime Minister.

The activities of a firm engaged in financial instruments business includes the sale and purchase of securities, derivatives transactions, public offerings and private placements. A firm providing financial instruments services typically conducts intermediary services in connection with the sale and purchase of securities, public offerings or private placements.

A registration tax is payable upon submission of an application for registration. The fee is ¥150,000 for registration of a financial instruments business and ¥90,000 for registration of a financial instruments intermediary service.

When an application for registration is filed, the regulatory authority records certain mandatory information in a central registry.

What are the main ongoing compliance requirements?

Registration does not require regular renewal.
Firms conducting financial instruments business and providers of financial instruments intermediary services are subject to compliance with general legal and regulatory requirements including disclosure obligations. Failure to comply with applicable law and regulation may result in the revocation of the firm’s registration.

Minimum capital requirements apply to financial instruments businesses. A first-class financial instruments business must maintain minimum capital of ¥50 million while a second-class financial instruments business must maintain a minimum of ¥10 million in capital. There are no minimum capital requirements for providers of financial instruments intermediary services.

Last modified 5 Dec 2019

What are the penalties for failure to be authorized?

A person or a corporation undertaking a regulated activity without prior registration is deemed to have committed a criminal offence and is subject to imprisonment and/or a fine.

Last modified 5 Dec 2019

Regulated activities

What finance and investment activities require authorization?

Generally

An individual or a firm cannot undertake certain financial and investment business activities unless duly authorized.

The Banking Act requires a license from the Prime Minister for the conduct of banking activity. Banking activity includes the acceptance of deposits or instalment savings, the administration of loans and bill discounting.

A financial instruments business or financial instruments intermediary service cannot operate without prior registration. Activities which fall within the scope of a financial instruments business and providing a financial instruments intermediary service includes the sale and purchase of securities, market transactions in derivatives, public offerings and private placements. Similar activities conducted by a financial instruments business operator or a registered financial institution also require authorization.

Consumer credit

A financial instruments business lending money or an intermediary service providing for the borrowing of money must register under the Money Lending Business Act. The Prime Minister or a competent prefectural governor has the authority to order a lending business to improve its operations, suspend its business altogether or rescind its registration.

Last modified 5 Dec 2019

Are there any possible exemptions?

Registration is not required for a non-resident financial instruments businesses or financial instruments intermediary service providers conducting investment advisory or investment management business in foreign countries, in respect of certain financial instruments businesses.

A person or corporation conducting a private placement to qualified institutional investors or a fund manager consisting of qualified institutional investors may notify the Prime Minister in advance of the placement in lieu of registration.

A lending business or intermediary service is exempt from registration for the following activities under the Money Lending Business Act:

- non-business loans;
- loans subsidiary to the sale, transportation, storage and intermediation of sale of goods; and
- loans by a business operator to its employees; and
Do any exchange controls or other restrictions on payments apply?

Strict regulations are not generally imposed on foreign direct investment in Japan. However, in exceptional cases, pre- or post-acquisition notices may be required under the Foreign Exchange and Foreign Trade Act.

The Foreign Exchange and Foreign Trade Act applies to the following four categories of investment:

- inward direct investments conducted by a foreign investor;
- capital transactions;
- payments to and from foreign countries; and
- foreign trade (import and export).

Capital transactions, payments to and from foreign countries and foreign trade are regulated concurrently by the Ministry of Finance and the Ministry of Economy, Trade and Industry. Foreign trade transactions are regulated exclusively by the Ministry of Economy, Trade and Industry.

Based on the recent amendment to the Foreign Exchange and Foreign Trade Act in August 2019, the category of “restricted business sectors” requiring off-shore investors to make a prior filing with the Bank of Japan has been expanded to include, among others, the information and communication technology sector such as data processing service and internet user support services.

In addition, Japan's Cabinet approved and submitted to the Diet a draft bill of further amendments to the Foreign Exchange and Foreign Trade Act in October 2019. Under these amendments, the current pre-filing threshold of 10% for foreign investors making investments in Japanese listed companies in the “restricted business sectors” will be reduced to 1%. However, certain exemptions from this prior-filing requirement will be introduced under the amendments. For instance, proprietary trading by foreign securities firms and transactions by foreign banks or insurance companies could generally be exempted from pre filings.

Business operators, such as banks, insurance companies, financial instruments businesses, trust companies, lending businesses or other operators specified by the Act on Prevention of Transfer of Criminal Proceeds must, in respect of certain transactions, confirm:

- the purpose of a transaction;
- the identity of the relevant customer;
- the occupation or business of the relevant customer; and
- the identity of persons substantially controlling the customer’s business.

What are the rules around financial promotions?

Rules

When a financial instruments business enters into a contract for the sale and purchase of securities, a derivatives transaction, a public offering, a private placement or certain other types of transaction, specified disclosure requirements must be met before and upon execution of the transaction contract. For example, a financial instruments business must deliver explanatory documents to a customer and provide information to enable a customer to make an informed investment decision.

Exemptions

When a financial instruments business executes a contract for the transactions referred to above with professional investors, certain exemptions apply. For instance, the requirement to provide risk information when soliciting business and the prohibition on re-solicitation do not apply.
Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common forms of legal entities in Japan are:

- the Kabushiki Kaisha (KK), which is a joint-stock company; and
- the Godo Kaisha (GK), which is similar to a limited liability company.

While the KK is the most traditional and commonly used type of corporate entity in Japan, GKs are becoming increasingly common due to their streamlined structure which provides more flexibility in corporate governance and management decisions, lower annual costs and decreased regulation.

For both KKs and GKs, the liability of members is limited to the amount of their contribution. There are no minimum capital requirements which apply to KKs and GKs generally, unless they conduct specific types of activity which are otherwise subject to further regulation.

Funds

An Investment Limited Partnership (LPS) formed under the Limited Partnership Act for Investment is the most commonly used investment vehicle. An LPS consists of:

- one or more general partners (GPs) who manage the fund and assume unlimited liability with respect to debts owed by the fund; and
- one or more limited partners (LPs) who do not engage in management of the fund, but whose liability is limited to the amount contributed by the LPS.

An LPS is formed by agreement between its GPs and LPs. It may invest only in the types of investment targets specified in the Limited Partnership Act for Investment. Furthermore, an LPS may not invest a majority of its contributed assets in shares, options or other securities issued by foreign companies. For this reason, a limited partnership formed outside of Japan (such as in the Cayman Islands) is typically used if the fund is targeted towards non-Japanese entities.

An LPS does not pay corporate tax on its investment income because it is treated as a pass-through entity. Taxes are instead levied on each partner.

Is it possible to conduct lending or investment business through a branch or establishment?

Lending business

Yes, a foreign-established company may conduct lending business through a branch registered in Japan.

Investment business

Yes, a foreign-established company may conduct investment business through a branch registered in Japan.
FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

Peer-to-peer (P2P) lending is considered a type of ‘cloud funding’, which encompasses various types of transactions including, among others, contribution, buying and selling and capital investment. P2P lending is a lending system available on an online platform that matches individual investors or lenders with borrowers, such as small and medium-sized enterprises or individuals. P2P lending reduces funding and investment costs through the simplification and automation of lending procedures. Additionally, because investors can make a series of smaller investments through P2P platforms, they are able to diversify their investment risks.

HOW PRACTICAL IS PEER-TO-PEER LENDING IN JAPAN?

A business lending money or an intermediary service providing for the borrowing of money, which includes lenders and P2P platform providers, must register under the Money Lending Business Act. A partnership agreement (Tokumei-Kumiai) scheme may be used where registration is not practicable for lenders; they invest in platform providers as silent partners instead of lending. It should be noted however that in addition to the platform provider being required to register as a lending business, it would also need to register as a Financial Instruments Business for the sale of its equity interests under the Financial Instruments and Exchange Act.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (e.g. in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third-party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known...
within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

No license is required to manage or use blockchain technology in Japan because it consists only of a distributed computer network system and distributed ledger system.

**WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?**

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

Smart contracts are likely to be used in various industries to conduct business, including by an investment fund raising funds by issuing electronic tokens to investors and using the funds raised to invest in target assets or businesses at the direction of the majority of investors. The investors are then eligible to receive dividends in proportion to the amount of the tokens in their possession. This investment fund programs the aforementioned process (fundraising-investment-dividend) in advance through implementation of the fully-automated smart contract mechanism.

**WHAT ARE CRYPTOCURRENCIES?**

Cryptocurrencies such as bitcoin or ethereum are digital, virtual currencies generated using blockchain technology.

In Japan, cryptocurrencies are not considered traditional legal currencies, such as US dollars or Japanese yen. In 2014, Mt. Gox, which was then the world’s largest virtual currency exchange, filed for bankruptcy protection in Japan due to misappropriation of customer assets by Mt. Gox operators. Recognizing the risk of virtual currency abuse by business operators for money laundering or other purposes, both the Payment Services Act (PSA) and the Act on Prevention of Transfer of Criminal Proceeds (APTCP) were amended on 25 May 2016 to address this concern. Furthermore, incidents involving loss of users’ cryptocurrencies have continued to arise following the Mt. Gox incident. In light of this situation, the PSA was further amended in May 2019 to strengthen the cryptocurrency regulations for user protection purpose.

The PSA:

- provides a definition of cryptocurrency;
- requires business operators of ‘Virtual Currency Exchange Services’ to register with the Financial Services Agency (FSA); and
- requires those Virtual Currency Exchange Services business operators to comply with various obligations in order to protect customers.

These amendments were seen as significant legal developments for the FinTech sector in Japan.

**Initial coin offerings and token-based products**

**WHAT IS AN INITIAL COIN OFFERING (ICO)?**

An ICO can be considered a form of crowdfunding, which typically operates by raising funds through the issuance of digital tokens. This funding method is often used by startup FinTech ventures. An ICO is similar to an Initial Public Offering (IPO); however the main difference
is that investors typically do not have any voting rights or control rights similar to those associated with shares issued in an IPO. Therefore, company directors are free to manage their companies without having to worry about direct interference from shareholders.

In Japan, there are currently only a few instances of fund raising using ICOs. A unique service called 'VALU' has had more success recently in Japan. VALU is provided by a FinTech company whose target users are individuals rather than companies. On the VALU platform, individual users are provided their own ‘total market price’ which is automatically calculated based on their number of followers on social networking sites such as Facebook or Twitter, and these individual users can issue unique tokens to investors similar to the way companies issue shares to investors for funding.

It is also expected that Japanese financial regulations or cryptocurrency regulations will apply to ICOs depending on their structure. For example, if a company sells a cryptocurrency (as defined in the PSA) in the course of an ICO, registration is required and relevant restrictions would be imposed on the company in accordance with the PSA and the APTCP.

Under the amendments to the Financial Instruments Exchange Act in May 2019, it is now clear that tokens having the feature of a ‘security’ (the so-called ‘Security Token’) is classified as a ‘Type 1 security’ which is the most liquid type of securities consisting of shares of stocks, corporate bonds and debentures, share options, etc. Therefore, the issuance of Security Tokens is clearly subject to the securities disclosure requirement that mandates the filing of a Security Registration Statement prior to the offering of such tokens to the prospective investors, unless a private placement exemption applies.

Artificial intelligence and robo advisory systems

Automated advice tools known as ‘robo advisors’ have been introduced gradually as part of asset maintenance or investment management services. Robo advisors can provide advisory services to a wider range of individuals through personalized data analysis, and are comparable to those advisory services offered to high-net-worth clients and traditionally provided by private bankers. Investment advice services provided by robo advisors include portfolio selection, investment management and intermediary services, among others. Robo advisory providers must register as a financial instruments business and satisfy capital and organizational requirements in accordance with the Financial Instruments and Exchange Act.

Data analysis and cloud computing

The situation is the same as in England and Wales. Cloud computing enables delivery of IT services through internet-based tools and applications and cloud-based storage makes it possible to save masses of data on remote servers, accessible through the internet. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The Financial Services Agency (FSA) is the Japanese governmental authority tasked with regulating companies dealing in financial businesses, which would include FinTech businesses. There are many types of FinTech products currently available, and various types of laws or regulations may apply to such products, depending on their nature and conditions. There are three main laws, among others, which govern FinTech products:

- the Financial Instruments Exchange Act (FIEA);
- the Payment Services Act (PSA); and
- the Act on the Prevention of Transfer of Criminal Proceeds (APTCP).
Financial Instruments Exchange Act (FIEA)

Financial business activities such as the sale or management of securities or financial instruments are subject to FIEA, which has two main categories of requirements: filing requirements and registration requirements. However, it is still unclear whether FinTech products such as cryptocurrencies are deemed 'securities or financial instruments' to be regulated by FIEA. If FIEA applies, a company dealing in FinTech products would be required to file a Securities Registration Statement and other periodical reports with the FSA as part of its filing requirements, and would also be required to obtain a certain form of registration from the FSA as its registration requirement.

Payment Services Act (PSA)

From May 2016, PSA clearly regulates virtual currency businesses, which would include the purchase, sale or exchange of virtual currency for Japanese customers. Virtual currency exchange companies which intend to enter into the Japanese market should consider the feasibility of both obtaining the registration from the FSA and complying with the restrictions on registrants.

The restrictions imposed by PSA include:

- segregation of customer funds and virtual currencies;
- provision of mandatory information to customers; and
- preparation and maintenance of transaction records for customers.

Act on the Prevention of Transfer of Criminal Proceeds (APTCP)

APTCP contains the Japanese anti-money laundering and counter-terrorist financing regulations. In general, APTCP requires financial institutions or virtual-currency business operators to implement a 'know-your-customer' process including the verification of customer identities and the maintenance of customer transaction records.

Electronic payments platforms and regulation of peer-to-peer lenders

Electronic Payment Platforms

The Banking Act and PSA regulate businesses which transfer funds between accounts regardless of whether or not such transfers would be considered payments; they require operators of a funds-transfer business to be registered or licensed. Because e-commerce markets such as Rakuten or Amazon use a payment process that contains a funds transfer, such payment platforms necessarily must be registered or licensed. However, as e-commerce market operators are given the authority to receive payments from online stores, whereby customer payments are made directly to these stores, such e-commerce market operators are not deemed to be transferring funds but rather only redeeming received funds. Construed in this manner, e-commerce market operators can avoid the registration obligation.

Peer-to-Peer Lenders

When peer-to-peer (P2P) lenders lend money as part of their business, even if such lenders are individuals, they must register as a money lending business. Since this would place an onerous registration requirement on lenders using P2P platforms, a partnership agreement (Tokumei-Kumiai) is used instead. Under this scheme, P2P investors do not lend but rather invest in platform providers as silent partners. An entity operating as a P2P platform provider, however, has an obligation to register as a money lending business and a financial instruments business under the Money Lending Business Act and the Financial Instruments and Exchange Act.

Regulation of payment services

In Japan, payment services are regulated mainly by two pieces of legislation:

- PSA regulates funds transfer services, issuance of prepaid payment instruments and virtual currency exchange businesses.
- Instalment Sales Act (ISA) regulates credit card issuers, merchant acquirers, payment service providers and merchants maintaining credit card services.

Funds transfer services are services provided by an entity other than a bank that involves the transfer of money in an amount of JPY 1 million or less, using a system to send money remotely. Where the amount transferred exceeds JPY 1 million, only banks are permitted to provide such service under the Banking Act. Credit card transactions are understood to be out of scope of the definition of funds transfer because such transactions are regulated by ISA instead. Prepaid payment instruments and credit cards share common features, such that
they are both used in exchange for providing goods or services; however, they differ in the credit directions, in that consumers grant credit to business operators when issuing prepaid payment instruments, while business operators grant credit to consumers in credit card transactions.

Payment service providers must register their business or notify their transactions to each governing agency and maintain their internal compliance systems depending on the type of payment service and the relevant legislation. Since PSA and ISA were established separately and are regulated by separate governmental agencies, it is sometimes unclear which regime would apply to new and unique service providers. Where it is unclear which regime a business needs to be registered under, confirmation should be obtained from the governmental agencies when establishing the business.

Application of data protection and consumer laws

The Act on Protection of Personal Information (APPI) regulates the processing of personal data in Japan. For matters under its jurisdiction, the FSA has issued guidelines regarding the application of APPI which should be followed in general.

APPI was amended recently and a new concept of ‘de-identified information’ was introduced, meaning it would not be necessary to obtain consent to transfer de-identified information to a third party and such de-identified information can be used for any purposes regardless of the purpose for which the personal information was originally obtained. This rule may accelerate FinTech innovation in Japan. On the other hand, the new APPI also introduced other regulations including a new concept for ‘sensitive information’ which requires that a business entity obtain prior consent to collect ‘sensitive’ information from a data subject.

In 2017 the Banking Act was amended to require that settlement agents for electronic settlement systems be registered as well as imposing a duty on settlement agents to explain certain matters (e.g. compensation) to consumers. The amendments are due to become effective in 2018.

Money laundering regulations

Under APTCP, business operators such as banks and money lending business operators should conduct identity verification procedures when lending money or intermediating such money lending while also creating and maintaining records regarding identity verification. If the transactions are not conducted face-to-face, business operators should ask the borrowers for a copy of their identity verification documents and send any documents related to the transaction to them as a transfer-prohibited postal item.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

GENERAL

The basic funding arrangements for FinTech companies are substantially different from those used by more traditional companies. Initial funding in a FinTech startup may be provided by family and friends of the founder or other high-net-worth individuals (known as business angels) who are interested in the firm’s business for seed financing, and after this initial stage, the FinTech startup would receive investments from venture capital (VC) as a series A round.

CROWDFUNDING

Crowdfunding is a method of funding for a new project or business to raise small amounts of capital from a large number of individuals through the internet. Firms using the crowdfunding system are subject to the Financial Instruments Exchange Act (FIEA) and must register with the competent authority. However, FIEA was amended on 23 May 2014 to relax registration requirements to promote the growth of crowdfunding businesses. There are two types of registration available under FIEA for crowdfunding businesses: Type I registration or Type II registration. Applicability of these registration types depends on the form of securities issued to investors. For example, Type I registration is required in the case of issuance of shares or share options through crowdfunding.

Venture capital and debt

VENTURE CAPITAL
Startups typically receive investments as equity from VC funds which are private equity investment vehicles. VC funds often invest in startups by purchasing preferred stock. Startups will enter into many complex agreements with VC funds, such as shareholder agreements and investment agreements. In addition, as described above, VC funds often demand preferred stocks which must be designed in line with the requirements of the Company Act and comply with certain processes in order to issue the preferred stocks legally.

VENTURE DEBT

It is rare for startups to raise funds such as venture debt, since such small or medium-sized firms do not have enough ability to make payments against the principal and interest on the debt. However, in some cases, startups can borrow money from banks or other companies as bridge financing until receiving investment from VC funds.

Warehouse and platform funding

Warehouse financing is available to businesses in Japan. Warehouse financing may be suitable for FinTech companies which own a portfolio of assets and are aware of any difficulty in raising money from capital markets.

Peer-to-peer (P2P) lending platforms such as maneo, which is the pioneer in this field in Japan, are also accessible to FinTech companies in Japan. However, because there are numerous restrictions on businesses conducting P2P lending services in Japan, including those arising under Money Lending Act and Financial Instruments and Exchange Act, P2P lending platforms are still not very popular in Japan.

Senior bank debt and capital markets funding

In general traditional banks take a stringent attitude towards lending money to venture-backed companies, but have become more open to lending money to FinTech startups.

Japan has both debt and equity capital markets which are accessible to businesses.

An Initial Public Offering (IPO) is one of the funding arrangements for the companies including FinTech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange, such as the Tokyo Stock Exchange's market of the high-growth and emerging stocks. Recently more and more venture-backed companies conduct an IPO and FinTech startups are expected to do the same.

In line with current trends, FinTech startups are now raising finance by way of a rights offering, for example:

- QUQINE JAPAN, which manages a virtual currency exchange, raised about JPY 1.7 billion through a rights offering in 2016.
- Exchange Corporation K.K., which offers a credit service without the use of cards (Paidy), raised about JPY 50 million in 2014 and about JPY 1.5 billion in 2016 through a rights offering.
- More recently, Kyash K.K., which offers a free remittance application (Kyash), raised more than JPY 1 billion through a rights offering.
- freee K.K., which offers cloud accounting software, raised JPY 800 million in 2014 and JPY 4.5 billion in 2015 through a rights offering.

Incentives and reliefs

The National Diet (Japan's legislature) recently amended the Consumption Tax Law (Japanese Value Added Tax) such that the purchase of virtual currency became exempted in 2017. The Ministry of Economy, Trade and Industry issued its 'FinTech Vision', which provides their basic policies and recognition of issues. The Governor of Tokyo announced that the Tokyo Metropolitan Government is planning to reduce corporate taxes and subsidize personnel expenses to attract FinTech companies.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?
A loan can be sold on an individual basis or packaged with other loans as a portfolio grouped by certain underlying terms.

Occasionally, loans are transferred for syndication. For example, a single lender may make an initial loan due to time constraints and subsequently syndicate the loan by transferring part of the loan to other lenders.

**Assignment of rights**

Subject to contractual restrictions, the assignment of rights can be completed without the consent of the debtor. Partial assignments are also possible. Perfection can be accomplished through notice to or acknowledgement by the debtor on an instrument bearing a certified date (Notice or Acknowledgement).

**Assignment of contractual status**

Subject to the consent of the debtor, a total or partial assignment of a lender's contractual status, including any or all rights and obligations, is possible. A transfer of a revolving loan includes a transfer of the lender's obligation to lend money to the debtor and therefore cannot be accomplished only through the assignment of rights.

**Novation**

A novation results in the formation of a new contract between the continuing party and the transferee, while the transferor is released from all its obligations.

**Sub-participation**

Sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the purchaser taking on double the credit risk, being that of the seller and of the borrower. Some participation agreements have a triggering event (such as poor financial performance by the original lender) which requires a change to the sub-participation arrangements to effectively transfer the loan to avoid the new lender assuming the original lender's risk.

Loan transfers are commonly documented using standard form agreements made available by the Japan Syndicate and Loan-Trade Association and consisting of a master agreement for all transactions between the parties and an individual agreement for a specific transaction between the parties. In the case of any discrepancy between the two documents, the tailored individual agreement will prevail for the specific transaction. For more complex transactions, a more bespoke form of sale and purchase agreement is typically used. The form and content of the transfer documentation will depend on the nature of the loan assets.

**What are the main considerations when transferring a loan and related security?**

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise. Some of the key considerations include:

- **confidentiality** – whether the seller is allowed to disclose information relating to the loan to a potential purchaser;

- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;

- **undrawn commitment** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the purchaser or reduce claims made by the purchaser;

- **transfer mechanics** – whether there are any steps that must be taken to transfer the loan such as obtaining the consent of the borrower, a third party or both;

- **security** – whether the security is properly transferred to the purchaser (for example, a transfer of a revolving mortgage before the principal is fixed requires the mortgagor's consent);

- **perfection** – whether the transfer is perfected by way of notice or acknowledgement or by a registration of the assignment of the claim (in the case of a registration, the assignment is perfected against third parties at the time of the registration, while it is not
perfected against the debtor until the registered matters are notified to or acknowledged by the debtor); and

- allocation of repayments – the allocation of repayments between the seller and the purchaser depends on whether the borrower’s payment obligations accrue before or after the base date (which could be the date of the loan transfer) or if the borrower’s payments are actually made before or after the base date (the latter is often used for a transfer of problematic loans).

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

The ownership of energy and infrastructure assets in Japan varies by industry. The primary infrastructure industries are:

- economic infrastructure (energy, aviation, rail and telecommunications); and
- social infrastructure (including education and health).

Key sectors are detailed below.

Energy

Assets of the gas and electricity industries in Japan are privately owned. Generation, transmission, distribution and supply services are provided by companies in the private sector.

Telecoms infrastructure

Assets of telecommunications networks (such as mobile phones and television) in Japan are also privately owned by several different service providers other than the Japan Broadcasting Corporation/Nippon-Hoso-Kyokai (NHK) and Japan Post Holdings Co., Ltd. NHK is a publicly-owned broadcast business operator established by the Broadcast Act and under the jurisdiction of the Ministry of Internal Affairs and Communications. Japan Post Holdings Co., Ltd. is a mail and logistics operator which was recently partly privatized and listed on the Tokyo Stock Exchange.

Transport infrastructure

Assets of the transport industry in Japan are privately owned.

Social infrastructure

There are public and private schools and hospitals in Japan. The ownership of assets of these schools and hospitals depends on their public or private designation.

Water and wastewater services

Water and wastewater services in Japan are delivered by public organizations which own the relevant infrastructure assets. However, certain public organizations entrust the operation of such services to private companies.

Are there special rules for investing in energy and infrastructure?

Generally
There is no specific regulatory regime governing or restricting investment in energy or infrastructure projects in Japan over and above existing regulations for investors and funders more generally. However, a particular investment may be subject to legislative or regulatory control. For instance, foreign investors should comply with foreign exchange legislation under which foreign investment in certain business sectors (including electricity, gas, heat supply and telecommunications) requires a prior notification to enable authorities to determine whether such investment will be permitted. Further conditions relating to planning and implementation may require co-ordination with authorities.

**Energy**

The Electricity Business Act is the main legislation regulating businesses involved in the generation, transmission, distribution and sale of electric power. An electric business operator is required to obtain a business license or register with a competent authority, or may be required to file a notification prior to commencing operations. As for the business of distribution and sale of electric power, based on the amendments to the Electricity Business Act that became effective as of 1 April 2016, all business operators are able to engage in such business subject to registration, in contrast to the monopoly of the transmission business by certain utility companies. The operator of a power plant is required to meet certain technical requirements.

The Atomic Energy Fundamental Act, the Act on Compensation for Nuclear Damage and other specialized regulations govern the production and supply of nuclear power. A company which intends to have a power-generating nuclear reactor is required to obtain a business license from the Nuclear Energy Council and to maintain its facilities to meet certain technical requirements.

The Gas Business Act is the primary legislation regulating businesses involved in liquefied natural gas (LNG). The primary legislation regulating businesses involving liquefied petroleum gas (LPG) is the Act on Securing the Safety and Optimization of Transactions of Liquefied Petroleum Gas (the LPG Act). The LNG or LPG business operator is required to obtain the relevant business license or register with a competent authority prior to starting its business. The amendments to the Gas Business Act, that became effective as of 1 April 2017, enable all business operators to engage in the distribution and sale business involving LNG subject to registration, as is the case for business involving LPG (in contrast to the monopoly of transmission business involving LNG by certain utility companies). The LNG or LPG business operator is required to have appropriate safety regulations in place and submit those regulations to the competent authority.

**Telecoms infrastructure**

The Telecommunications Business Act is the primary legislation regulating businesses involved in telecommunications. A telecommunications business operator is required to obtain a business license and may be required to file a notification prior to starting its business. Television broadcasting is primarily governed by the Broadcast Act.

**Transport infrastructure**

The railway industry is primarily governed by the Railway Business Act. A railway business operator is required to obtain a business license. Railway operations are subject to government inspections, for instance, to ensure compliance with safety regulations.

**Other infrastructure**

The operation of schools is primarily regulated under the School Education Act, the National University Corporation Act and the Private Schools Act. An operator of a private school is required to obtain prior government approval.

**What is the applicable procurement process?**

The Public Accounting Act and the Local Autonomy Act set out the procedure for public procurement in Japan.

**Investing in energy and infrastructure**

There are three types of procurement process:

- an open bid where all contractors may bid;
• a selective bid where contractors designated by the central government or local public authorities may bid; and
• a single tender where a specific contractor may secure the public contract under special circumstances, such as urgent circumstances or where the relevant service or product considered can only be provided by a single supplier.

Where the government tenders a design and construction contract for a public project to private companies, a construction company may sometimes participate in the bid as a part of a consortium. A common form of a consortium involves a construction company as bidder, who subcontracts the building design or other consultation work to a construction consultant. As part of the bidding process, it is necessary for bidders who form a consortium to submit relevant information about subcontractors (such as past records of such subcontractor and a quotations) to the government in the course of the bidding process.

The general procedure for an open bid consists of the following:
• notification of tender opportunities;
• pre-bid meeting;
• commence bidding; and
• determine winning bid.

The general procedure for a selective bid consists of the following:
• qualification examination for the selective bid;
• notice of designation;
• commence bidding;
• determine winning bid; and
• conclusion of a contract.

The general procedure for a single tender consists of the following:
• selection of a counterparty, and
• conclusion of a contract.

Financing energy and infrastructure

When inviting bidders, public organizations may require the bidders to describe their funding arrangement or financial plan for the tendered public project. Specifically, bidders are required to provided information, such as their expected composition ratio of equity and debt and a redemption schedule of for such debt and equity.

Public organizations occasionally obtain funds directly from financial institutions by a procurement process.

What are the most common forms of funding / investing in energy and infrastructure?

The principal forms of private sector funding/investment in energy and infrastructure in Japan are as follows.

Funding

Common forms of funding in energy and infrastructure include:
• senior debt – loans made on a corporate finance basis, loans made on a project finance basis to a special purpose company and bond finance; and
• mezzanine debt – mezzanine loans and mezzanine bond finance.

Each method of funding can be greenfield funding (funding at the outset of a project) or brownfield funding (refinancing or additional
funding through the course of a project).

**Investing**

Common forms of investing in energy and infrastructure include:

- equity investments in ordinary shares;
- equity investment in preferred or subordinated shares; and
- other equity investments such as acquiring partnership interests.

Investments above are often made into a special purpose vehicle which subcontracts with other civil companies to build or operate the relevant infrastructure.

Each method of investment can be made by way of green field investment or brown field investment.

A listed infrastructure fund market which is similar to a listed real estate investment trust market was established in the Tokyo Stock Exchange in April 2015. Most listed infrastructure funds take the form of an investment corporation (toshi hojin).

**Restructuring**

**Enforcement and sanctions**

*When can there be regulatory investigations?*

The Securities and Exchange Surveillance Commission (SESC) may investigate breaches of relevant law and regulations, market misconduct and criminal violations. Following an investigation by the SESC, administrative disciplinary actions may be recommended to the Financial Service Agency or criminal charges may be filed by public prosecutors.

*What regulatory penalties may apply?*

Regulatory penalties include any of the following:

- a public announcement of misconduct;
- revocation of the relevant license;
- business suspension; and/or
- administrative fines.

*What criminal penalties may apply?*

Criminal penalties may be imposed in cases involving:

- false statements;
- insider trading;
- rumour spreading;
- fraud; and
Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

Stamp duty may be imposed depending on the type of instrument, if the instrument is executed within Japan. Registration tax is payable for registration of a real estate mortgage, a chattel mortgage or an assignment of a loan repayment right.

ADVANCE OF LOAN

Loan agreements are subject to stamp duty. The amount of stamp duty assessed varies depending on the loan amount. For example, JPY 100,000 would be assessed on a loan agreement with a loan amount of between JPY 100 million and JPY 500 million.

No registration, transfer or other similar taxes are payable on an advance of a loan.

TRANSFER OR ASSIGNMENT OF A DEBT UNDER A LOAN

Stamp duty is payable on an instrument evidencing an assignment of a loan repayment right. The assessed amount is JPY 200 per instrument.

Registration and transfer taxes are not, in principle, chargeable on the transfer or assignment of a loan. However, when utilizing the registration of an assignment of a loan repayment right in order to perfect the loan rather than informing a debtor of the transfer, which is the ordinary and tax-exempt method of perfection, a registration tax of JPY 7,500 would be imposed on each filing.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

TAKING OF A MORTGAGE OR SECURITY INTEREST

A mortgage instrument is not subject to stamp duty.

Registration tax is payable upon registration of a real estate mortgage, a chattel mortgage or an assignment of a security interest. The assessed amount is 0.4% of the loan amount for real estate mortgages however, a tax reduction measure can apply in certain cases such as where the mortgage concerns a factory. The assessed amount of registration tax for the filing of a chattel mortgage or assignment of a security interest is JPY 7,500.

TRANSFER OR ASSIGNMENT OF A MORTGAGE OR SECURITY INTEREST

Stamp duty is generally not chargeable on an instrument evidencing the transfer or assignment of a mortgage. If the instrument includes an assignment of a loan repayment right, an assessment of JPY 200 would apply.

The transfer of a real estate mortgage is assessed with a registration tax at a rate of 0.2% of the loan amount. When the transfer is caused by inheritance or as the result of a merger, a reduced taxation rate of 0.1% is applicable.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?

ISSUE OF DEBT SECURITY
Bond instruments are subject to stamp duty when issued by a company in hardcopy (paperless bonds are not subject to stamp duty). The assessed amount differs based on the stated amount of the bond. For example, JPY 200 is assessed per bond instrument with a stated amount of JPY 5 million or less.

No registration, transfer or other similar taxes are payable on the issue of bonds.

TRANSFER OR ASSIGNMENT OF DEBT SECURITY

No stamp duty, registration, transfer or other similar taxes are assessed on the transfer or assignment of bonds.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?

Secured lenders and secured bond holders take priority over national and local taxation authorities regarding the enforcement of security, provided that the relevant debts are secured before the mandated deadline for tax payment. Also, once a loan or bond is secured, the priority position of the lenders and bond holders are maintained even if the collateral subject to the mortgage is transferred to a taxpayer with a tax liability to national or local tax authorities.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

There is no withholding tax when persons resident in Japan (including a domestic corporation) receive interest payments under a loan. Interest paid to persons not resident in Japan (including foreign corporations) is generally subject to withholding tax.

If so:

What is the rate of withholding?

The applicable withholding tax rate on interest paid to persons not resident in Japan (including foreign corporations) is 20.42%.

What are the key exemptions?

Double taxation treaties entered into by Japan may provide exemption, in whole or in part, from withholding tax on interest payments.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

For a bond, the withholding tax rate on interest paid to persons not resident in Japan (including foreign corporations) is 15.315%. The double tax treaties that may apply to interest payments under a loan may also apply to interest payments under bonds.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding tax (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

No.
Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both Luxembourg and EU law.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Luxembourg or to request that they are admitted to trading on a regulated market operating in Luxembourg unless an approved prospectus has been made available to the public.

Certain forms of companies cannot offer securities.

The International Capital Market Association has published standard form selling restrictions for offers of debt securities in Luxembourg. These restrictions are aimed at preventing a breach of:

- the rules on financial promotion; and
- the rules on accepting deposits in Luxembourg.

Worth noting the creation of the Luxembourg Capital Markets Association in 1ST March 2019.

Last modified 10 Dec 2019

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Luxembourg are bonds or notes issued on a stand-alone basis or under a program.

Many different types of debt securities are offered in Luxembourg. Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities and high-yield bonds;
- guaranteed securities, subordinated securities or perpetual debt securities;
- asset-backed securities;
- derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer, such as the so-called CPECs);
• depositary receipts (a security issued by a depositary conferring on the holders beneficial ownership of certain underlying assets held by the depositary for the holders); and
• warrants (securities giving the holders the option to purchase the equity of the issuer or a related company)

Last modified 10 Dec 2019

What are the differences between offering debt securities to institutional / professional or other investors?

The Regulation (EU) 2017/1129 of the European Parliament of 14 June 2017 on the prospectus to be established when securities are offered to the public or admitted to trading on a regulated market, and repealing the Prospectus Directive ("Prospectus Regulation") makes a distinction between professionals (qualified investors) and other investors for the purpose of its disclosure requirements. The obligation to publish a prospectus does not apply to the offers of securities to the public addressed solely to qualified investors. Moreover, this obligation does not apply neither to offers of securities whose denomination per unit amount to at least €100,000.

According to the provisions of the Luxembourg law dated 16 July 2019 on prospectuses for securities ("Prospectus Law"), the obligation to publish a prospectus does not apply to some types of investors, such as qualified investors, which are defined as:

• professional clients listed under Sections 1 to 4 of Annex II of Directive 2014/65/EU on markets in financial instruments ("MIFID II"), such as credit institutions and investment firms; and
• persons or entities that are, on request, treated as professional clients in accordance with Section II of that Annex II of MIFID II, or recognized as eligible counterparties in accordance with article 2430 of MIFID II, unless they have requested to be treated as non-professional clients.

If the denomination of the securities is equal to or above €100,000 (or the equivalent in another currency), the 'wholesale' rules apply. If the denomination is under €100,000, the 'retail' rules apply. Additional disclosure requirements apply for retail securities.

Last modified 10 Dec 2019

When is it necessary to prepare a prospectus?

Under the Luxembourg law dated 16 July 2019 on prospectuses for securities, any communication to any person(s), in any form and by any means that contains sufficient information on the terms of the offer and the securities being offered requires a prospectus so as to enable a potential investor to make their decision whether to purchase or subscribe for such securities.

An exemption from publishing a prospectus will apply, inter alia, to an offer:

• addressed solely to qualified investors (as explained below);
• addressed to fewer than 150 individuals or legal entities per EU or European Economic Area member state other than qualified investors, or where the offer is for a total of at least €100,000;
• addressed to investors who acquire securities for a total consideration of at least €100,000 per investor and for each separate offer; or
• involving securities with a total consideration of less than €8 million (such limit shall be calculated over a period of 12 months).

If the offer is deemed not to be made to the public, a prospectus which complies with the Rules and Regulations of the Luxembourg Stock Exchange may still be required if an application is made for the securities to be admitted to trading on a regulated market. An exemption from both the offer to the public and the admission to trading on a regulated market is needed to avoid having published a prospectus.

Last modified 10 Dec 2019

What are the main exchanges available?

In Luxembourg, the Luxembourg Stock Exchange operates two different markets for trading debt securities:

• the regulated market qualifies as a European-regulated market as defined in the Directive 2014/65/EU on markets in financial instruments. This market offers a European passport that facilitates listing on other EU-regulated markets through a notification
procedure.

- the Euro MTF is a multilateral trading facility. Offering documents are subject to less stringent disclosure and reporting requirements but issued debt securities do not benefit from the European passport.

The Luxembourg Stock Exchange also offers the possibility to list securities on the securities official list (SOL), without any trading.

Last modified 10 Dec 2019

Is there a private placement market?

Luxembourg has an active private placement market.

There is no dominant standard for documentation but efforts have been made by the Loan Market Association and International Capital Markets Association to standardize private placement documentation.

Last modified 10 Dec 2019

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil and criminal liability under Luxembourg law. Luxembourg has various bondholder protection statutory provisions relevant to liability for an inaccurate offering memorandum. In this respect, article 12 of the Luxembourg law dated 16 July 2019 on prospectuses for securities provides that an administrative fine of a maximum amount of €700,000 may be imposed on an issuer providing incomplete or inaccurate information in a prospectus or if it publishes or causes to be published false information in a prospectus or a supplement to the prospectus. There are general fraud statutes and liability may also arise under common law through a civil action for deceit, negligent misstatement or misrepresentation. Criminal penalties (article 13 of the Prospectus Law) and publication of decisions (article 14 of the of the Luxembourg law dated 16 July 2019 on prospectuses for securities) are also possible.

Investing in debt securities

Debt security terms and conditions typically contain provisions which may permit their amendment without the consent of all bondholders, which may be exercised without the consent of bondholders and without regard to the interests of particular bondholders. The conditions also provide for meetings of bondholders to consider matters affecting the bondholders' interests. These provisions typically permit defined majorities to bind all bondholders including bondholders who did not attend and vote at the relevant meeting and bondholders who voted against the majority. Luxembourg law provisions applicable to bondholders' meetings can be excluded. Selling restrictions should also be considered.

Last modified 10 Dec 2019

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally

Establishing a fund, offering a fund and operating a fund, among other things, are regulated activities and are therefore subject to supervision of the Commission de Surveillance du Secteur Financier. Reserved alternative investment funds (RAIF) as well as partnerships (qualifying as alternative investment funds) are exempt from being subject to the supervision of the Commission de Surveillance du Secteur Financier. However, these investment funds will have to appoint an alternative investment fund manager who is in turn subject to the supervision of the Commission de Surveillance du Secteur Financier.
Collective investment schemes

The Commission de Surveillance du Secteur Financier has set out the following specific restrictions in relation to hedge funds in its Circular 02/80:

- risk diversification rules regarding short sales;
- borrowings;
- restrictions applicable to investments in target Undertakings for Collective Investment; and
- use of derivative financial instruments and other techniques.

There are no other specific restrictions in relation to hedge or debt funds other than those mentioned in the relevant laws.

What are common fund structures?

Common forms of funds include:

- Specialized Investment Funds which may qualify as Alternative Investment Funds (AIF);
- Undertakings for Collective Investments in Transferable Securities;
- Undertakings for Collective Investments pursuant to part II of the Luxembourg law of 17 December 2010 which may qualify as AIF;
- Reserved Alternative Investment Funds;
- companies investing in risk capital (these companies are not considered to be investment funds as they are not subject to diversification rules); and
- partnerships which may qualify as AIF.

What are the differences between offering fund securities to professional / institutional or other investors?

Retail funds

Retail funds, which are mainly Undertakings for Collective Investments in Transferable Securities, are subject to substantial regulatory oversight and restrictions.

Institutional/professional funds

Non-retail funds are Specialized Investment Funds or Reserved Alternative Investment Funds which generally fall into the category of Alternative Investment Funds and will therefore have to appoint an Alternative Investment Fund Manager. As such, certain obligations with respect to marketing arrangements, reporting, governance etc are applicable.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

Managing investment funds is a regulated activity and therefore subject to authorization and supervision of the Commission de
Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Undertakings for Collective Investments in Transferable Securities (UCITS)

Luxembourg Undertakings for Collective Investments in Transferable Securities (UCITs) may be offered for sale in Luxembourg without any restriction (private or public offer, institutional clients or not and whatever their number) as soon as they are registered on the official list of UCITs of the Commission de Surveillance du Secteur Financier.

Alternative Investment Funds (AIFs)

Under the Alternative Investment Fund Manager Directive, marketing is defined as a direct or indirect offering or placement at the initiative of the Alternative Investment Fund Manager (AIFM) or on behalf of the AIFM of units or shares in an AIF it manages to or with investors domiciled or with a registered office in the EU.

An AIFM can only market an AIF to EU investors if it is authorized by a relevant EU regulator – registration with one EU regulator opens access, subject to certain further limited conditions, to marketing to professional investors across the EU under a EU passport or if it complies with national private placement regimes (where available).

Are there any restrictions on managing a fund?

An investment fund will either have to be managed by itself (not very common), by a management company or an Alternative Investment Fund Manager (AIFM) depending on the qualification of the investment fund itself.

The management functions of a management company are defined by the Luxembourg law which cannot be contravened, except if the management company holds the relevant license:

- portfolio management;
- administration, such as:
  - legal and fund management accounting services
  - customer inquiries
  - valuation of the portfolio and pricing of the units (including tax returns)
  - regulatory compliance monitoring
  - maintenance of unitholder register
  - distribution of income
  - unit issue and repurchase
  - contract settlements (including certificate dispatch)
  - record-keeping; and
- marketing.
Investment management functions which an AIFM must at least perform when managing an Alternative Investment Fund (AIF) are:

- portfolio management; and
- risk management.

The additional functions that an AIFM may perform in the course of the collective management of an AIF are restricted to the following:

- administration, such as:
  - legal and fund management accounting services;
  - customer inquiries;
  - valuation and pricing, including tax returns;
  - regulatory compliance monitoring;
  - maintenance of unit-/shareholder register;
  - distribution of income;
  - unit/shares issues and redemptions;
  - contract settlements, including certificate dispatch; and
  - record-keeping;
- marketing; and
- activities related to the assets of AIFs, namely services necessary to meet the fiduciary duties of the AIFM, facilities management, real estate administration activities, advice to undertakings on capital structure, industrial strategy and related matters, advice and services relating to mergers and the purchase of undertakings and other services connected to the management of the AIF and the companies and other assets in which it has invested.

In order to apply for a license to act as a management company, self-managed company or AIFM, the relevant entity will have to submit various documents to the Commission de Surveillance du Secteur Financier in order to verify that the relevant company has sufficient technical and human infrastructure, expertise and policies in place.

However, AIFMs based in Luxembourg may be exempt from a full AIFM license and will only have to be registered with the Commission de Surveillance du Secteur Financier, in case either of the following is applicable:

- The AIFM is established in Luxembourg and which either directly or indirectly, through a company with which the AIFM is linked by common management or control, or by a substantive direct or indirect holding, manages portfolios of AIFs whose assets under management, including any assets acquired through use of leverage, in total do not exceed a total threshold of €100 million.
- The AIFM is established in Luxembourg and which either directly or indirectly, through a company with which the AIFM is linked by common management or control, or by a substantive direct or indirect holding, manages portfolios of AIFs whose assets under management in total do not exceed a threshold of €500 million when the portfolios of AIFs consist of AIFs that are unleveraged and have no redemption rights exercisable during a period of five years following the date of initial investment in each AIF.

Last modified 10 Dec 2019

**Entering into derivatives contracts**

*Are there any restrictions on entering into derivatives contracts?*

Under Luxembourg law, there is no specific restriction for entering into derivative contracts such as:

- options;
- futures;
contracts for difference; or

rights to or interests in investments.

However, the European Market Infrastructure Regulation, as amended by Regulation (EU) 2019/834 of the European Parliament and of the Council of 20 May 2019 applies to all derivative transactions and requires transactions to be reported to regulators, for transactions between dealers to be cleared or subject to other risk mitigation techniques such as initial margin and variation margin requirements.

In addition, the provisions of the Luxembourg law dated 15 March 2016 on over-the-counter derivatives, central counterparties and trade repositories, as amended, grant powers to the Luxembourg supervisory authority of the financial sector (Commission de Surveillance du Secteur Financier) and the supervisory authority for insurance companies (Commissariat aux Assurances) in the context of Regulation 648/2012/EU (the European Market Infrastructure Regulation) as amended by Regulation (EU) 2019/834 of the European Parliament and of the Council of 20 May 2019 and specifies that the Commission de Surveillance du Secteur Financier and the Commissariat aux Assurances are vested with powers of supervision, intervention, inspection and investigation to the extent defined in the European Market Infrastructure Regulation as amended by Regulation (EU) 2019/834 of the European Parliament and of the Council of 20 May 2019 and that they may impose certain sanctions.

Last modified 10 Dec 2019

What are common types of derivatives?

Derivative contracts are entered into in Luxembourg for a range of reasons including hedging, trading and speculation.

Derivatives may be traded over-the-counter or on an organized exchange.

All of the main types of derivative contract are widely used in Luxembourg:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying asset seen in Luxembourg are:

- equity;
- fixed income instruments; and
- foreign currency.

Last modified 10 Dec 2019

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007-2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. The European Commission has sought, in particular, to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative positions;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen and continues to see the introduction of a significant amount of new regulations and this has led to substantial compliance costs for market participants.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Lending is a regulated activity in Luxembourg except, generally, in the following instances:

- one-off and ancillary lending activities;
- intra-group loans; or
- loans granted to a 'restricted circle of previously known persons' (cercle restreint de personnes préalablement connues), which are not considered as granted to the 'public', which is generally defined as a multitude of non-identifiable persons.

Mortgage and consumer loans are subject to a range of regulatory requirements that do not apply to other loans. For example, for regulated consumer loan contracts:

- the consumer must have at his disposal the information which will enable him to make his decision with full knowledge of the facts;
- before concluding the credit agreement, the credit institutions must assess the consumer's creditworthiness on the basis of a sufficient number of items of information; or
- the consumer is allowed to withdraw from the credit agreement without stating any reason within the period of 14 calendar days after the execution of the credit agreement.

Finally, a public limited liability company or a partnership limited by shares cannot advance monies, grant a loan, guarantee or security for the purchase of its own shares, subject to completing a whitewash procedure.

Borrowing

While borrowers are generally not regulated, borrowers should consider whether either the mortgage or consumer lending regimes apply to their activities, in which case they will benefit from the protections mentioned above.

For legal entities, borrowing should be permitted under its corporate object.

Last modified 10 Dec 2019

What are common lending structures?

Loans can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility). Luxembourg law governed loans can be syndicated but are rare.

Syndicated facilities by their nature involve more parties (such as agents and security agents which fulfil certain roles for the finance parties) are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, asset backed loans, working capital loans, equity bridge facilities, project facilities or letter of credit facilities.

Loan durations

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which
may be redrawn if repaid;

- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

**Loan security**

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

**Loan commitment**

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

**Loan repayment**

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

**Repurchase agreements**

Repurchase agreements are also used as a financing tool.

*Last modified 10 Dec 2019*

**What are the differences between lending to institutional / professional or other borrowers?**

Lending to institutional/professional borrowers is subject to less regulatory oversight.

By contrast, lending in the context of mortgages and to consumers are subject to specific obligations on the lenders set out in the Luxembourg Consumer Code (ie more pre-information of the borrower).

As a more general principle, the Luxembourg courts determination as to whether lender misconduct is serious will be dependent on whether borrower is a professional or not.

*Last modified 10 Dec 2019*

**Do the laws recognize the principles of agency and trusts?**

**Agency**

Agency (mandat) is recognized by the Luxembourg Civil Code as a contract under which a principal grants to an agent power to act in its name and behalf. However, powers of attorney, mandates (mandats) or appointments of agents (including appointments made for security purposes) may terminate by law and without notice upon the occurrence of insolvency proceedings and may be revoked despite being expressed to be irrevocable.

The Law of 5 August 2005, on financial collateral agreements, as amended from time to time (the Collateral Law), provides that financial collaterals may be held by a person designated by the beneficiaries (ie security agents acting for the lender(s)) without owning any secured debt (so no parallel debt mechanism is needed). Security trustee arrangements are also recognized under the Collateral Law.

**Trust**
The concept of a trust is unknown under Luxembourg law. However, foreign law trust arrangements are recognized in accordance with the Hague convention of 1 July 1985 on the law applicable to trusts and on their recognition (Hague Trusts Convention), ratified by a Luxembourg law dated 27 July 2003 on trusts and fiduciary contracts, as amended from time to time.

Luxembourg law has implemented the concept of fiduciary (fiducie), which, however, does not offer the same features of a trust.

**Are there any other notable risks or issues around lending?**

**Generally**

Luxembourg loan agreements and finance documents are subject to general contractual principles. For instance:

- They should be entered into in *bona fide*.
- Penalty clauses (*clauses pénales*), and similar clauses on damages or liquidated damages are allowed to the extent that they provide for a reasonable level of damages.
- Compounding of interests is subject to certain conditions.
- Specific performance may not always be available and may result only in damages.

**Specific types of lending**

Specific to the area of mortgage lending is the issue of whether a lender falls within the recently formed Luxembourg mortgage loan regime. The Mortgage Credit Directive, implemented in Luxembourg in the Luxembourg Civil Code, aims to prevent the irresponsible lending and borrowing practices that were exposed during the global financial crisis. The Mortgage Credit Directive applies to first and second ranking mortgages. It imposes a number of requirements on lenders including the need to:

- conduct affordability tests before lending;
- provide standard information about the mortgage to enable borrowers to compare products; and
- ensure that staff are suitably trained.

**Standard form documentation**

Apart from consumer, mortgage or small corporate loans, major loan financings are not typically governed by Luxembourg law. However this may change as credit providers are using more regularly Luxembourg law.

Syndicated finance transactions are governed by documentation based on recommended forms published by the Loan Market Association (LMA). Bilateral finance transactions are more likely to be documented on bank standard form documentation prepared in-house.

**Are there any other notable risks or issues around borrowing?**

Borrowers should be aware of the potential implications of the EU’s Bank Recovery and Resolution Directive (BRRD), which outlines certain measures for dealing with failing financial institutions, implemented in Luxembourg by the Law of 18 December 2015 on the resolution, reorganization and winding up measures of credit institutions and certain investment firms and on deposit guarantee and investor compensation schemes.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to ‘bail in’ obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. ‘Bail in’ describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of Luxembourg or other EEA law
contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract, corporate interest and financial assistance matters are to be considered.

**Giving and taking guarantees and security**

*Are there any restrictions on giving and taking guarantees and security?*

Some of the key areas affecting the giving of guarantees and security are as follows.

**Capacity**

It is important to verify the constitutional documents of an entity giving a guarantee or granting security to ensure it has an express (or ancillary) power to do so and that giving a guarantee or granting security is not a (shareholder) reserved matter. If the provision of a guarantee or security exceeds the corporate object of the entity, it will still be bound to third-parties (*ultra vires*), unless there is evidence that the beneficiary of such act knew that the acts exceeded the corporate object of the entity or could not, in the light of the circumstances, have been unaware of that fact.

**Corporate interest**

The entry into the guarantee or security must be in the interest of the entity, which is a subjective and factual concept. The corporate interest must be assessed on a case-by-case basis by the board of the entity. The granting of a guarantee or security interest for the obligations of its parent (upstream) or its sister companies or affiliates (cross stream) is often more difficult. The concept of ‘group of company’ is not recognized as such and the interest of the group is not sufficient to justify the granting of upstream or cross-stream guarantees/security interests. Therefore, the Luxembourg entity giving the cross stream or upstream guarantee/security interest should:

- have some personal interest in granting such assistance (notably through the expected benefits) and act independently from third party considerations;
- take a commensurate risk in regard of the benefit deriving from the operation; and
- not face a financial exposure exceeding its financial means.

It is standard to include a guarantee limitation to address this issue, except for security interests which are deemed to be limited *per se*.

**Financial assistance**

It is unlawful for certain companies to provide financial assistance for the acquisition of its own shares by a third party. A whitewash procedure is envisaged by the Luxembourg law on commercial companies dated 15 August 1915, as amended from time to time, but it is rarely applied in practice.

**Insolvency**

Contractual commitments and guarantees are affected by the opening of insolvency proceedings. In case of such opening of insolvency proceedings secured/guaranteed creditors are registered as members of the general body of creditors. The Law of 5 August 2005, on financial collateral agreements, as amended from time to time, institutes however a framework whereby:

- Luxembourg or foreign bankruptcy and pre-bankruptcy rules are excluded in respect of financial collateral arrangements.
- Immunity from annulment risks in bankruptcy proceedings applies to collateral arrangements governed by the Law of 5 August 2005, on financial collateral agreements, as amended from time to time and to similar collateral arrangements governed by foreign law (provided that the collateral provider is established or resident in Luxembourg).
- There is primacy of financial collateral arrangements over (certain) foreclosure measures.
What are common types of guarantees and security?

Common forms of guarantees

FIRST DEMAND GUARANTEE (GARANTIE À PREMIÈRE DEMANDE)
This creates an abstract, autonomous and independent contractual recourse by the beneficiary against the guarantor. The guarantor may not rely on any exception, or exemption, derived from the underlying debt arrangement.

SURETYSHIP (CAUTIONNEMENT)
The suretyship is an accessory to the main monetary obligation. The guarantor may rely on exceptions, or exemptions, derived from the underlying debt arrangement.

It is worth noting that Luxembourg law only envisages payment guarantees (and not performance guarantees).

Other contractual arrangements can also be assimilated to a personal guarantee (e.g. "promesse de porte-fort", personal commitment letters).

Common forms of security

The most common types of security agreements are:

- pledge agreements over financial instruments and claims (including among others, intragroup or trade receivables and investors commitments);
- assignment for security purposes of financial instruments and claims;
- commercial pledges over assets (other than financial instruments);
- mortgages; or
- repurchase agreements.

It is worth noting that security must be granted on an asset by asset basis, except that pledges over ongoing business concerns are permitted but rarely used in practice.

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

A civil guarantee must be created by an agreement in writing pursuant to the provisions of the Luxembourg Civil Code. Such a guarantee shall contain some handwritten information (e.g. the amount of the undertaking in letters and figures). Said restrictions do not apply to commercial guarantees.

Giving or taking security and mortgages

Mortgages must be executed as a notarial deed, involving notarial fees, stamp duties and the attendance by each party to the execution of the notarial deed (powers of attorney are permitted).

Once granted, security and mortgages need to be properly perfected before it can be invoked against third parties. Perfection formalities can range from the entry into the agreement, having the pledge registered in the register of shares/shareholders of the company, notices given to third parties or registration in public registers (depending on the asset).

Notarization is not required for pledge agreements under Luxembourg law.
The entry into the guarantee or security must be in the interest of the entity, which is a subjective concept. The corporate interest must be assessed on a case-by-case basis by the board of the entity. The granting of a guarantee or security interest for the obligations of its parent (upstream guarantee) or its sister companies or affiliates (cross stream) may rise some issues. The concept of group of company is not recognized as such and the interest of the group is not sufficient to justify the granting of upstream or cross stream guarantees or security interests.

Therefore, the Luxembourg entity giving the cross stream or upstream guarantee or security interest should:

- have some personal interest in granting such assistance (notably through the expected benefits) and act independently from third party considerations;
- take a commensurate risk in regard of the benefit deriving from the operation; and
- not face a financial exposure exceeding its financial means.

It is standard to include a guarantee limitation to address such an issue, except for security interests which are deemed to be limited per se.

Pledge agreements and, more generally, security interests governed by the Law of 5 August 2005, on financial collateral agreements, as amended from time to time (such as pledges over financial instruments and claims) are bankruptcy remote:

- they are valid even if entered into during the hardening period; and
- they can be enforced even after the opening of a bankruptcy proceeding.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Law of 5 April 1993 on the financial sector, as amended from time to time

Consumer credit

The Luxembourg Consumer Code

Mortgages

Articles 2114 to 2203 of the Luxembourg Civil Code

Mortgage loans are governed by the Luxembourg Consumer Code (please refer to the legislation in the 'Consumer credit' section above)

Companies

Articles 1832 to 1873 of the Luxembourg Civil Code

Law of 10 August 1915 on commercial companies, as amended from time to time
Funds and platforms

Law of 10 August 1915 on commercial companies, as amended from time to time

Law of 13 February 2007 on specialized investment funds

Law of 17 December 2010 on undertakings for collective investment

Law of 12 July 2013 on alternative investment fund managers

Law of 23 July 2016 on reserved alternative investment funds

Law of 15 June 2004 relating to companies investing in risk capital

Grand-ducal regulation of 8 February 2008 regarding Undertakings for Collective Investment in Transferable Securities (UCITS)

CSSF Regulation No. 10-04 regarding organizational requirements, conflicts of interest, conduct of business, risk management and content of the agreement between a depositary and a management company of UCITS

CSSF Regulation No. 10-05 regarding mergers, master-feeder structures and notification procedures

CSSF Circular 07/283 regarding specialized investment funds

CSSF Circular 08/380 regarding eligible assets for investments by UCITS

CSSF Circular 11/498 regarding undertakings for collective investment

CSSF Circular 18/698 regarding authorisation and organisation of investment fund managers incorporated under Luxembourg law – special provisions on the fight against money laundering and terrorist financing applicable to investment fund managers and entities carrying out the activity of registrar agent

Other key market legislation

Law of 5 August 2005, on financial collateral agreements, as amended from time to time

Law of 18 December 2015 on the resolution, reorganization and winding up measures of credit institutions and certain investment firms and on deposit guarantee and investor compensation schemes

Bank Recovery and Resolution Directive (2014/59/EU) (recovery and resolution)

Capital Requirements Regulation (Regulation (EU) 575/2013) (capital requirements)

Market Abuse Regulation (Regulation (EU) 596/2014) (market abuse)

Law of 23 December 2016 on market abuse

Law of 30 May 2018 on markets in financial instruments

LuxSE Rules and Regulations

Law of 8 April 2019 on the measures to be taken in relation to the financial sector in the event of the withdrawal of the United Kingdom of Great Britain and Northern Ireland from the European Union

The law of 22 March 2004 on securitisation
Regulatory authorization

Who are the regulators?

The Luxembourg Supervision Commission of the Financial Sector (Commission de Surveillance du Secteur Financier) is the regulator which supervises the professionals and products of the Luxembourg financial sector.

It supervises, regulates through regulations and circulars, authorizes, informs, and, where appropriate, carries out on-site inspections (investigation power) and issues sanctions. Moreover, it is in charge of promoting transparency, safety, soundness and fairness in the markets of financial products and services and is responsible for the enforcement of laws on financial consumer protection and on the fight against money laundering and terrorist financing.

The Commission de Surveillance du Secteur Financier has 5 main missions: (i) prudential supervision of certain entities, (ii) public oversight of the audit profession, (iii) compliance with professional obligations, (iv) power of sanction and (v) national, European and international cooperation.

What are the authorization requirements and process?

Depending on the type of vehicle, it must apply to the Commission de Surveillance du Secteur Financier for authorization.

The following vehicles must apply for an authorization:

- Banks,
- Payment institutions and electronic money institutions,
- Professionals of the financial sector ("PFS") being either investment firms, specialised PFS or support PFS,
- Investment vehicles and managers governed by the laws, regulations and circulars referred to in the "Law and regulation" section.

The regulator must assess whether the vehicle meets the requirements set out under Luxembourg law to approve the relevant application. According to the Law of 5 April 1993 on the financial sector, as amended from time to time, the Commission de Surveillance du Secteur Financier has to respond to an application within six months of receipt of the application or, if the application is incomplete, within six months of receipt of the informed needed. Absent this decision during this time frame, it is deemed equivalent to a notification of refusal. However, the Commission de Surveillance du Secteur Financier is usually responsive.

As mentioned above, credit institutions and must be authorized to exercise their financial activities.

Credit institutions

Banks located in Luxembourg must hold a bank license granted by the Minister of Finance.

Credit institutions from the European Economic Area ("EEA") benefit from the passport for banking services and the freedom to provide banking services in Luxembourg.

Non-EEA credit institutions coming occasionally and temporarily to Luxembourg to provide services must hold an authorization granted by the Minister of Finance.

Application forms dealing with the following criteria shall be completed and sent to the Commission de Surveillance du Secteur Financier and shall include, inter alia, legal form, capital base, central administration and infrastructure, managing body, shareholders, professional standing, knowledge, competences and experience, governance and remuneration policy, external auditing and deposit guarantee and investor compensation.
Professionnels du secteur financier (PFS)

PFS include investment firms referred to in Part I, Chapter 2, Section 2, Subsection 1 of the Law of 5 April 1993 on the financial sector, as amended from time to time (1993 Law).

Specialized PFS are referred to either in Part I, Chapter 2, Section 2, Subsection 2 or in Article 13 of the 1993 Law and which do not belong to the categories of the first and third indent of such definition.

Support PFS are referred to in Part I, Chapter 2, Section 2, Subsection of the 1993 Law.

Application forms dealing with the following criteria should be completed and sent to the Commission de Surveillance du Secteur Financier and should include, inter alia:

- legal form;
- capital base;
- central administration and infrastructure;
- shareholders;
- professional standing and experience;
- external audit; and
- participation in an authorized investor compensation scheme (only for investment firms).

Procedure

Authorizations are subject to prior examination by the Commission de Surveillance du Secteur Financier and final granting by the Minister of Finance.

Fees to be paid to the Commission de Surveillance du Secteur Financier depends on the entity, its form and business. The Commission de Surveillance du Secteur Financier charges an annual fee as well as a fee for the examination.

Supervised entities are listed on the webpage of the Commission de Surveillance du Secteur Financier.

What are the main ongoing compliance requirements?

All entities under the supervision of the Commission de Surveillance du Secteur Financier must comply with all Luxembourg laws and regulations on an ongoing basis.

In respect of credit institutions, banks shall transmit to the Commission de Surveillance du Secteur Financier mainly financial and accounting data relating to their activities on a monthly, quarterly, half-yearly or annual basis, depending on the object.

The Commission de Surveillance du Secteur Financier must assess whether the application meets the threshold required by Luxembourg law and regulations.

For the instructions relating to the ongoing information to be provided by a PFS, please refer to circulars CSSF 05/187, CSSF 10/433 CSSF 08/364, IML 96/124.

What are the penalties for failure to be authorized?

A person or company undertaking a regulated activity without being authorized or exempt commits a criminal offence and is liable to imprisonment and fines. Administrative sanctions and nullity of the agreements is also possible.
Regulated activities

What finance and investment activities require authorization?

Generally

A person must not carry on a regulated activity in Luxembourg unless authorized or exempt (known as the general prohibition).

Any activity dealing with financial matters, advice or money constitutes a financial activity. The existence of a money flow is an important indication to establish whether an activity qualifies as a financial sector activity. However, the Commission de Surveillance du Secteur Financier shall decide for each specific activity whether authorization is required.

- Specified activities include accepting deposits, dealing in, managing, arranging and advising on investments, and establishing collective investment schemes.
- Specified investments include deposits, shares, debt instruments, options, futures, units in a collective investment scheme and government and public securities.

Consumer credit

Consumer credit activities, including credit brokering, operating an electronic system in relation to lending and entering into a regulated credit agreement as lender are deemed regulated activities.

The granting of consumer loans requires prior authorization unless covered by the exemptions set out in article L. 224-3 of the Luxembourg Consumer Code, including inter alia granting of loans for an amount below €200 and above €75,000 and loans granted to acquire or maintain ownership of real estate land, or an existing building or a building to be constructed.

Are there any possible exemptions?

Regulated activities may be undertaken without authorization if either a general or specific exclusion applies.

General exclusions

General exclusions include:

- one-off and ancillary regulated activities;
- intra-group activities;
- loans granted to a ‘restricted circle of previously known persons’ (cercle restreint de personnes préalablement connues), which are not deemed to be granted to the ‘public’, which is generally defined as a multitude of non-identifiable persons; or
- the exercise of a financial sector activity or a connected or ancillary activity, which is not carried out on a regular basis (legal assessment required).

Specific exclusions

A Luxembourg Reserved Alternative Investment Fund (RAIF) is exempt from being authorized by the Commission de Surveillance du Secteur Financier. However, a RAIF will have to appoint an alternative investment fund manager, who is in turn authorized and supervised by the Commission de Surveillance du Secteur Financier.

Loan origination and loan participation and/or acquisition are permissible activities for Luxembourg entities subject to due compliance by the manager and the Luxembourg entity, where applicable, with the requirements set forth in the Commission de Surveillance du Secteur Financier.
**Do any exchange controls or other restrictions on payments apply?**

Luxembourg does not operate any foreign currency controls.

For cases of money transferring from non-EU member states, imports of foreign currency may need to be declared in the custom declarations, but there is no legal restriction on moving money in or out of the country.

Compliance with the EU rules on payments (EU Payments Regulation and the Transfer of Funds Regulations) must be ensured.

There may also be anti-money laundering and tax considerations to take into account.

**What are the rules around financial promotions?**

**Rules**

A financial promotion is a communication of an invitation or inducement to engage in a financial activity made by a person in the course of business. Since such communications can influence consumers, a person is restricted from communicating such promotions unless he/she is an authorized person, or the content of the communication has been approved by an authorized person, or the promotion falls within one of the exemptions.

An unauthorized person who communicates a financial promotion may be held liable for carrying out such activity without being licensed.

**Exemptions**

Promotions are allowed for those persons and entities authorized by the regulator or permitted (ie benefitting from an exemption) to do so.

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

**Generally**

Credit institutions may only be incorporated as a public-law institution, a société anonyme (public limited liability company), a société en commandite par actions (partnership limited by shares) or a société cooperative (cooperative).

Authorization for any activity involving the management of funds belonging to third parties may only be granted to legal persons having the form of a public entity or a commercial company.

The legal form that a professional of the financial sector (professionnel du secteur financier (PFS)) should adopt, as well as the capital base that it must have, depends on the activity that it intends to carry out. The choice of the legal form of the future PFS shall be made while taking into account the general and special legal conditions applicable to the authorization that is sought.

Investment funds may be set up as companies or partnerships.
Is it possible to conduct lending or investment business through a branch or establishment?

Yes, it is possible to conduct lending or investment activities through a branch in Luxembourg.

Branch means ‘a place of business other than the head office which is a part of a credit institution or an investment firm, which has no legal personality and which performs directly, entirely or in part transactions related to the activity of credit institutions or provides investment services and/or activities and which may also perform ancillary services for which the investment firm has been authorized.’

The exercise of these activities by a branch of a credit institution or investment firm authorized in another member state is not subject to authorization by the Luxembourg authorities provided that these activities fulfil the requirements laid down in article 30 of the Law of 5 April 1993 on the financial sector, as amended from time to time.

Credit institutions and investment firms governed by a non-member state and wishing to establish a branch in Luxembourg are subject to the same authorization rules as those applying to credit institutions and other professionals of the financial sector governed by Luxembourg law.

Foreign companies performing activities in Luxembourg, which lead to the creation of a permanent establishment, may be subject to tax on income attributable to such a permanent establishment.

FinTech

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure (which inter alia can be set up as a (regulated) securitization vehicle);
- applying technology to leverage and optimize the lending platform and user experience;
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship; and
- virtual payment applications (eg using smartphones).

Instead of having a central institution (such as a regulated credit establishment) granting loans, these are made by ‘peers’ (eg retail or institutional investors, or funds), subject however to certain restrictions as lending activities are regulated activities.

Alternative credit providers involved in FinTech applications are gaining market share, based on a specific framework. In this respect, loan origination and loan participation or acquisition (as these terms are defined in the CSSF Frequently Asked Questions, version 11, dated 6 July 2017 cannot exclude the possibility that a Luxembourg court will find otherwise based on the law dated 5 April 1993 on the financial sector as amended from time-to-time.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
• small and medium-sized enterprises (SME) lending; and
• residential property and commercial property mortgage lending.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P) type structures often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

ISSUES FOR STARTUP MARKETPLACE LENDERS

Following the initial incorporation and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform. As the startup lender will not have an established track record, the funding structure will often follow the format of a warehouse securitization structure or fund. Origination of new assets will be funded through drawings on a note issuance facility backed by security over the new assets. Each of the new assets will be subject to eligibility criteria determined by reference to the nature of the underlying asset. In order to provide an efficient financing structure the assets will typically be held through a SPV with origination and servicing provided by the marketplace lender. In order to cover expected losses on the asset pool, the senior facility will be subject to the lending platform maintaining sufficient subordinated capital in the form of equity, or a combination of equity and subordinated debt.

While the funding may be structured through a revolving loan or note program, if there is tranching of the debt this will typically result in the platform being treated as a securitization for the purposes of the European Union Capital Requirements Regulation, with the attendant requirements to hold risk retention and provide appropriate reporting and disclosures.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the block using sophisticated algorithms and add the verified block to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record, for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).
Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that, once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an 'address'). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

**WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOs)?**

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

**WHAT IS A CRYPTOCURRENCY?**

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

The Commission de Surveillance du Secteur Financier published a warning on virtual currencies on 14 March 2018 in order to state that virtual currencies are not currencies, are not regulated, not guaranteed by a central bank or a deposit guarantee scheme. Their high volatility bears a number of risks including total loss of investment.

**Initial coin offerings and token-based products**

**WHAT IS AN INITIAL COIN OFFERING (ICO)?**

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is expanding). ICOs come in wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.
Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

The Commission de Surveillance du Secteur Financier published a warning on initial coin offerings (ICOs) and tokens on 14 March 2018 in order to state that raising funds from the public in the form of so-called initial coin offerings is not subject to a specific regulation and does not benefit from any guarantee or other form of regulatory protection. ICOs are highly speculative investments that may lead to a total loss of investment.

**Artificial intelligence and robo advisory systems**

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

The Commission de Surveillance du Secteur Financier published the 27 March 2018 its position on Robo-advice as well as, in December 2018, a White Paper on Artificial Intelligence: Opportunities, risks and recommendations for the financial sector. This White Paper aims at better understand what Artificial Intelligence is and the related risk as well as explain some practical use cases for the financial sector. An analysis of the main risks associated and key recommendations to take into account when implementing Artificial intelligence inside a business process are also covered.

**Data analysis and cloud computing**

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Last modified 10 Dec 2019

**Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?**

**General financial regulatory regime**

The Commission de Surveillance du Secteur Financier (CSSF) supervises the professionals and products of the Luxembourg financial sector. It supervises, regulates, authorizes, informs, and, where appropriate, carries out on-site inspections and issues sanctions.

The National Commission for Data Protection (Commission Nationale pour la Protection des Données or CNPD), is the Luxembourg
independent authority verifying the legality of the processing of personal data and ensuring the respect of personal freedoms and fundamental rights with regard to data protection and privacy. Its mission also extends to ensuring the respect of the Law of 30 May 2005 regarding the specific rules for the protection of privacy in the sector of electronic communications and the Luxembourg law of 1 August 2018 on the organisation of the National Data Protection Commission and the general data protection framework (short title).

GENERAL CSSF POSITIONS

The CSSF was one of the first European regulators to take position on FinTech. On 14 February 2014, the CSSF published a communique, with the following points in respect of virtual currencies:

- Virtual currencies are considered as scriptural money (as opposed to cash money in the form of bank notes and coins), since they are accepted as a means of payment for goods and services. The issuing of virtual money is not regulated from a monetary point of view, they are not legal tender and they entail risks.

- No one can be established in Luxembourg to carry out an activity in the financial sector without an authorization by the Minister of Finance and without being subject to the prudential supervision of the CSSF. The potentially interested persons who would like to establish themselves in Luxembourg in order to issue means of payments in the form of virtual currencies, provide payment services using virtual currencies or create a platform to trade virtual currencies, are required to define their business purpose and their activity in a sufficiently concrete and precise manner to allow the CSSF to determine which status they need to receive a ministerial authorization for.

The position of the CSSF in respect of virtual currencies has been confirmed by the European Court of Justice on 22 October 2015.

More generally, the CSSF has a balanced approach toward FinTech companies and applies the existing regulatory framework (ie the current European Union regulatory framework, as implemented in Luxembourg) in a proportionate way. The CSSF has to determine the potential benefits of the submitted innovation and whether there could be regulatory barriers linked to the innovative character of the business model it could address without circumventing the regulatory requirements. One of the main challenges is to identify risks (cyber-risks, fraud and anti-money laundering/combating the financing of terrorism risks), which have to be properly assessed together with the mitigating measures that can be applied.

The CSSF has established a division dedicated to financial innovation and technology, focused on developing, facilitating and securing FinTech businesses.

The blockchain has also been implemented in Luxembourg law with, inter alia, the law of 1rst March 2019 amending the Luxembourg law of 1rst August 2001 on the circulation of securities introducing a new article 18bis in the law of 1rst August 2001 by specifying that securities may be booked and transferred through secure electronic recording devices, in particular through distributed ledgers such as blockchain, providing an alternative to the dematerialisation processes already known.

Electronic payments platforms, payment services and regulation of peer-to-peer lenders

PAYMENT INSTITUTIONS

The services offered by Payment Institutions (PIs) can vary from the provision of payment infrastructures to customers (eg for services industries) to services enabling payments between individuals. It also includes facilitation of secure credit and debit card transactions, both nationally and internationally.

ELECTRONIC MONEY INSTITUTIONS

Pursuant to article 1 (29) of the Luxembourg law of 10 November 2009 on payment services, on the activity of electronic money institutions (EMIs) and settlement finality in payment and securities settlement systems, as amended (PSL), electronic money (Electronic Money) means a monetary value represented by a claim on the issuer, which is:

- electronically, including magnetically, stored;
- issued on receipt of funds for the purpose of making payment transactions; and
- accepted by a natural or legal person other than the Electronic Money issuer.

EMIs are institutions issuing Electronic Money.

In addition to issuing Electronic Money, EMIs are also permitted to supply all services of PIs, to grant loans (under certain conditions)
linked to payment services, to supply operational services and other services closely linked to the issuing of electronic money or to the
supply of payment services.

REGULATION OF PAYMENT SERVICES, PAYMENT INSTITUTIONS AND EMIS

PIs and EMIs in Luxembourg are governed by the PSL, deriving from the interpretation of Directive 2015/2366 on payment services in
the internal market (the second payment services Directive) ("PSD 2") repealing Directive 2007/64/EC of 13 November 2007 on payments
services in the internal market, and of Directive 2009/110/EC of 16 September 2009 on the taking up, pursuit and prudential supervision
of the business of EMIs.

Since 2007, many changes in the digitalization of financial services have led to the need for an update of the Directive 2007/64. The PSD 2
aims to tackle the shortcomings of the first directive in the modern era by impacting PIs and EMIs. PSD 2 introduced two new third-party
payment service providers: Payment Initiation Services Providers and Account Information Service Providers.

Before taking a formal decision to set up an EMI or PI in Luxembourg, the prospective institutions should be approved by the CSSF and
comply with mandatory conditions (e.g., legal form, capital requirements).

PEER-TO-PEER LENDERS

Under Luxembourg law, there is no specific regulatory framework in respect of peer-to-peer lending. As a result, European regulation,
which mainly consists of the following, applies:

• Regulation (EU) 2017/1129 of the European Parliament of 14 June 2017 on the prospectus to be established when securities are
  offered to the public or admitted to trading on a regulated market;

• Directive 2008/48/EC of the European Parliament and of the Council of 23 April 2008 on credit agreements for consumers; and
  Directive 2007/64.

Note that the current position of the European Commission is that there is no need for a specific European regulation in respect of
marketplace lending activities. Priority will be given to updating the current regulatory framework regulating the marketplace lending
activities.

In addition, no one can be established in Luxembourg to carry out an activity of the financial sector without an authorization by the
Minister of Finance and without being subject to the prudential supervision of the CSSF. The potentially interested persons who would like
to establish themselves in Luxembourg to carry out marketplace lending activities are required to define their business purpose and their
activity in a sufficiently concrete and precise manner to allow the CSSF to determine for which status they need to receive a ministerial
authorization.

Under Luxembourg law (article 24-8 of the law of 5 April 1993 on the financial sector, as amended (1193 Law)), professionals carrying on
lending operations are professionals engaging in the business of granting loans to the public for their own account, are required to be
authorized to carry out these activities. The following, in particular, shall be regarded as lending operations for the purposes of this article:

• financial leasing operations involving the leasing of moveable or immovable property specifically purchased with a view to such
  leasing by the professional, who remains the owner thereof, where the contract reserves to the lessee the right to acquire, either
during the course of or at the end of the term of the lease, ownership of all or any part of the property leased in return for payment of
  a sum specified in the contract; and

• factoring operations, either with or without recourse, whereby the professional purchases commercial debts and proceeds to collect
  them for his own account.

This article shall not apply to persons engaging in the granting of consumer credit, including financial leasing operations as defined in
paragraph 2(a) of this article, where that activity is incidental to the pursuit of any activity covered by the law dated 2 September 2011
regulating the access to the profession of craftsman, merchant, industrial as well as certain liberal professions.

Article 24-8 of the 1993 Law shall not apply to persons engaging in securitization operations. Also, authorization to act as a professional
carrying on lending operations may be granted only to legal persons and shall be conditional on the production of evidence showing the
existence of a share capital of not less than €730,000.
Also, applicable regulation will depend on the form of the vehicle used for the purposes of carrying out the marketplace lending activities (eg securitization vehicle or investment fund).

**Application of data protection and consumer laws**

The European General Data Protection Regulation ("GDPR") regulates the processing of personal data in Luxembourg. Where a business determines the purposes and manner in which any personal data is processed or processes personal data upon instructions and on behalf of a third party, it will be regulated by the GDPR and have certain compliance obligations. For instance, depending on the situation, a business may have to carry out mandatory notifications where a personal data breach occurs, or where it wishes to put in place a system allowing the surveillance of its employees. In any case, businesses will have to abide by the "data protection by design and by default" principles, which include e.g. the provision of transparent information to individuals whose personal data is processed, and the maintenance of extensive internal compliance documentation.

The Luxembourg law of 1 August 2018 on the organisation of the National Data Protection Commission and the general data protection framework (short title). The Luxembourg law of 30 May 2005, laying down specific provisions for the protection of persons with regard to the processing of personal data in the electronic communications sector, regulates unsolicited direct marketing by electronic means.

**Cloud computing**

On 17 May 2017, the CSSF published the Circular 17/654, as amended by Circular 19/714 (Circular) on IT outsourcing based on a cloud computing infrastructure. The Circular is designed to clarify the regulatory framework for the use of a cloud computing infrastructure supplied by an external service provider. The Circular confirms that CSSF considers that cloud computing is a form of outsourcing. The Circular applies immediately to financial professionals, including credit institutions, investment firms, specialized financial sector professionals (FSPs), support specialized financial sector professionals, as well as PIs, and EMI.

According to the CSSF, cloud computing is a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (eg networks, servers, storage, applications and services) that can be rapidly provisioned and released with minimal management effort or service provider interaction.

**Money laundering regulations**

The CSSF is in charge of supervising the anti-money laundering (AML) controls of supervised entities (eg FinTech companies) which have to comply with:

- the law of 12 November 2004 as amended (Title I, coordinated version);
- the Luxembourg law of 27 October 2010 enhancing the AML and counter-terrorist financing legal framework;
- the grand-ducal regulation of 29 October 2010; and
- the CSSF Regulation N°12-02 on the fight against money laundering and terrorist financing.

Generally, where a firm is authorized and supervised by the CSSF it will also be authorized and supervised by the CSSF for complying with AML requirements. Electronic currencies such as bitcoin and other cryptocurrencies tend to represent a higher money-laundering risk.

Last modified 10 Dec 2019

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**

**SEED INVESTMENT**

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of
the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital (VC) providers.

For instance, in Luxembourg, the Digital Tech Fund provides seed financing to entrepreneurs running innovative startup companies active in the field of digital technologies. The fund's aim is to foster long-term innovation, support the technology startup ecosystem in Luxembourg and facilitate the transfer of new digital technologies developed at the University of Luxembourg into successful spin-off companies.

CROWDFUNDING

The crowdfunding sector may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

ACCELERATORS

In Luxembourg, the Luxembourg House of Financial Technology (LHoFT) has been recently created. The LHoFT is a public-private joint venture that drives technology innovation for Luxembourg's financial services industry, connecting the domestic and international FinTech community.

Among other benefits, the LHoFT offers:

- startup incubation;
- co-working spaces; and
- a soft-landing platform.

The LHoFT connects and creates value for the entire Luxembourg FinTech ecosystem: financial institutions, FinTech trailblazers, the IT industry, research and academia as well as regulatory and public authorities.

Venture capital and debt

Venture Capital (VC) funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. VC provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of VC and involves an equity investment by a corporate fund. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

European Venture Capital Funds (EuVECA) constitute alternative investment schemes that focus on startups and early stage companies such as FinTechs. EuVECA have been implemented by the Regulation no 345/2013 on European Venture Capital Funds (Regulation 345/2013). As part of its drive to improve the functioning of Europe's capital markets and to develop alternative sources of finance for small and medium-sized enterprises, including VC, in July 2016 the European Commission announced amendments to Regulation 345/2013 to encourage more fund managers to establish funds under this regime. A political agreement between the co-legislators was reached on 30 May 2017 and the revised regulation should be formally adopted soon.
Warehouse and platform funding

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

Another alternative form of funding is by way of peer-to-peer (P2P) lending platforms such as Lendix and CrossLend, which bring individual borrowers and lenders together without the involvement of traditional banks.

Senior bank debt and capital markets funding

SENIOR BANK DEBT

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

CAPITAL MARKETS FUNDING

Luxembourg has both debt and equity capital markets which are accessible to businesses.

A FinTech that has grown to a certain size may finance itself by way of an Initial Public Offering (IPO). An IPO is the initial sale of company shares on a public exchange, such as the Luxembourg Stock Exchange.

Marketplace loan securitisations have been launched in Luxembourg, where loans originated via marketplace lending platforms are packaged together and sold to investors as bonds. For example, in 2015 CrossLend set up a securitization vehicle to carry out P2P lending. The CrossLend subsidiary issuing the bonds decided to be regulated in Luxembourg because of Luxembourg’s expertise in securitization, as well as the accessibility and responsiveness of the Commission de Surveillance du Secteur Financier (CSSF).

CONVERTIBLE BONDS/LOAN NOTES

A popular funding tool for fast-growing FinTech businesses is to issue convertible bonds or loan notes which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

Incentives and reliefs

A range of support initiatives make Luxembourg the ideal place to engage in a FinTech startup. FinTech startups can combine private funding with public funding schemes for research, development and innovation.

Also, FinTech companies can obtain funding from the €150 million Luxembourg Future Fund (which aims to stimulate the diversification and sustainable development of the Luxembourgish economy – ie companies active in the information and communications technology, cleantech and other technology sectors excluding health technologies and life science sectors), as well as the Digital Tech Fund. Meanwhile, incubator and accelerator facilities offer physical space designed to foster business development and provide invaluable networking opportunities.

Different platforms such as the Luxembourg House of Financial Technology (LHoFT) exist, bringing together financial institutions, FinTech innovations, research, academia and public authorities, to help drive forward the development of products which meet specific industry needs.

Tax incentives

NEW LUXEMBOURG INTELLECTUAL PROPERTY REGIME

Intellectual property (“IP”) rights relating to FinTech may benefit from the new IP regime introduced in Luxembourg law in March 2018.
The new article 50ter of the Luxembourg Income Tax Law provides for a partial exemption of 80% on the net income derived from eligible IP assets.

Under this law, patents and copyrights on computer software, among others, including those related to FinTech, are eligible assets for the preferential tax treatment. However, assets of marketing nature, such as trademarks, are outside of the scope.

Eligible income that will qualify for preferential tax treatment includes net income from direct use, royalties from the granting of licenses or income from the sale of eligible IP assets.

The proportion of net income qualifying for the preferential tax treatment will be determined based on the nexus ratio, which is the proportion of eligible expenditure to total expenditure. Total expenditure, under the law, basically includes research and development ("R&D") expenses directly related to the IP assets in question.

All costs not directly related to an eligible IP asset (e.g. real estate costs, interest, financing costs and acquisition costs of IP assets) are not eligible and fall outside the scope of the calculation of the tax exempt income.

The eligible expenditure can be uplifted by 30%. This uplift is allowed as long as the eligible expenditure does not exceed the total amount of expenditure.

The IP activity of the company should be properly documented to demonstrate the link between the eligible IP assets and the related expenses. The taxpayer must also be ready to share this information with the Luxembourg tax authorities, if need be.

DEDUCTIBILITY OF INTERESTS

Payments of interest made by a Luxembourg borrower to a lender through a P2P platform are, in principle, exempt from withholding tax.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Buying and selling loans is very common.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are:

- **Assignment of claims** – Subject to any contractual restrictions, assignment can be done without the consent of the debtor (although it has to be notified in accordance with article 1690 of the Luxembourg Civil Code).

- **Assignment of contract** – Assignment generally require the consent of the debtor (as this right be seen as a novation).

- **Novation** – Under novation contracts, the parties agree to terminate the existing debt and a new debt is created. Novation can only occur in three situations under Luxembourg law:
  - substitution of debt;
  - change of debtor; and
  - change of creditor.

Loan transfers are commonly documented using standard form contracts made available by the Loan Market Association (LMA). For more complex transactions, a more bespoke form of sale and purchase agreement would tend to be used. The form and content of the transfer documentation will depend on the nature of the underlying assets being sold.
**What are the main considerations when transferring a loan and related security?**

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the legal advisors. Some of the key considerations include:

- **Confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **Data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **Lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **Undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- **Transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its term;
- **Consent** – whether a transfer requires the consent or notification of any other parties; and
- **Preservation of security/perfection formalities** – whether the underlying security is preserved in favor of the new lender and whether any perfection formality is needed for the transfer to be enforceable.

*Last modified 10 Dec 2019*

**Projects**

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

Various industries have been privatized or liberalized in Luxembourg further to the EU liberalization and free-market policy.

In Luxembourg, rail, roads, waste, health, justice/prisons, defense, social housing and education are mostly publicly owned.

Telecoms, space related activities, aviation, energy are mostly privatized, however, the most important companies operating in this field in Luxembourg are owned by the public sector (eg Post, Luxair, Enovos, SES).

*Last modified 10 Dec 2019*

**Are there special rules for investing in energy and infrastructure?**

There are no overall domestic restrictions, except in relation to certain utilities. Obligations resulting from anti-money laundering legislation and regulations should also be taken into account.

Luxembourg has an open policy towards foreign investments, promoted by means of, *inter alia*, grants of subsides.

Luxembourg is part of the Belgo-Luxembourg Economic Union which mainly aims at supporting, stimulating and protecting investments. It has signed some 100 bilateral investment treaties with various states around the world which generally create a legal and regulatory framework preventing protectionism with respect to foreign investments.

No governmental approvals are required for project finance transactions. However, a business license may be required if the activity in Luxembourg goes beyond the pure financing of the project and involves carrying out commercial activities in Luxembourg. In such case, a business license must be sought from the *Direction Générale PME et Entrepreunariat*.

Public procurements are regulated.

*Last modified 10 Dec 2019*
What is the applicable procurement process?

Contracts with public entities are subject to public bid restrictions imposed by EU law and national laws. These rules impose a public tender process, governed by the public procurement rules implemented by the Luxembourg law dated 8 April 2018 on public procurement, as amended from time to time.

The key principles are that contracts procured by the public sector are awarded fairly, transparently and without discrimination on the grounds of nationality and that all potential bidders are treated equally.

The procurement process is as follows:

Prerequisite

The submission criteria are detailed in the tender documents accompanying the public contract notice or are sent directly to the business (procedure without publication). The following information is provided:

- award criteria, the weighting given to each criterion and the rating system;
- the minimum criteria for participation in case of a public tender;
- deadlines;
- penalties for delays;
- possible bonus for termination of works before the deadline;
- technical description of variants; and
- insurance policies to take out.

Preliminary steps

When the business has identified a potentially interesting public procurement notice or if it has been invited by a contracting authority to tender a bid, it must verify that:

- the means (human, technical, financial etc) at its disposal meet the contract requirements; and
- it can meet the deadlines.

Types of procedures

There are several types of public procurement procedures, amongst others:

- open procedures, which require the procurement contracts to be publicly advertised;
- restricted procedure may be used in the cases mentioned in article 66 of the Luxembourg law dated 8 April 2018 on public procurement;
- exceptional procedures, which depend on the scope of the procurement contract (regarding procurement contract below or above certain thresholds);
- negotiated procedure or restricted procedure without publication;
- negotiated procedure (regarding, inter alia, rescue services, police, customs);
- negotiated procedure with or without prior publication (in instances mentioned in article 19 and 20 of the Luxembourg law dated 8 April 2018 on public procurement, as amended from time to time); and
- competitive dialogue (in instances mentioned in article 68 of the Luxembourg law dated 8 April 2018 on public procurement, as amended from time to time).

Preparing the tender
A business must meet all requirements detailed in the tender documents. This document defines the works or services to be carried out, the tendering conditions and the documents requested by the contracting authority.

Bid documents which do not meet the conditions laid down in the tender documents are rejected.

However, since the reason for a rejection will be provided, any business that believes it has been treated unfairly may lodge an appeal. The bid document allows the business to:

- present itself or the members of the group of businesses;
- highlight its experience;
- put forward its financial means and guarantees;
- put forward the advantages it has over the competition; and
- define its project.

The business may, within a reasonable time limit, request clarifications concerning the contract from the contracting authority. Answers are sent to all the participants.

**Tendering the bid**

To be eligible, a company must meet the deadlines for submission of the application/tender. The tender may be submitted personally in exchange for a receipt or sent by mail with acknowledgement of receipt.

**Administrative certificates**

Depending on the procedure, the business must also prove that it has fulfilled its professional obligations by attaching the following documents to its tender:

- a non-liability certificate from the Joint Social Security Centre (Centre Commun de la Sécurité Sociale);
- a certificate of compliance with respect to value added tax obligations and liability from the Land Registration and Estates Department (Administration de l’Enregistrement des Domaines et de la TVA);
- a non-liability certificate from the Luxembourg Inland Revenue (Administration des Contributions Directes – (ACD)), delivered on simple request at the competent tax office of the ACD; and
- an extract from the criminal records.

Where applicable, national and foreign subcontractors must also provide these certificates.

*Last modified 10 Dec 2019*

**What are the most common forms of funding / investing in energy and infrastructure?**

**Funding**

Sources of financing are mostly provided by leading foreign financial institutions and private investors but also by investment funds offering structured solutions for public projects established within a public-private partnership.

Common forms of funding in energy and infrastructure include:

- loans made on a corporate finance basis (balance sheet debt);
- loans made on a project-finance basis (to a special purpose project company) on medium- to long-term bases – such loans may later be syndicated to other funders;
- bonds; and
- mezzanine debt.
Investing

Common forms of investing in energy and infrastructure include:

- equity investment in special purpose vehicles or entities that may have a portfolio of interests, such as share capital and subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of equity).

Restructuring

Enforcement and sanctions

**When can there be regulatory investigations?**

When the *Commission de Surveillance du Secteur Financier* considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

**What regulatory penalties may apply?**

When a rule breach has taken place, the *Commission de Surveillance du Secteur Financier* may impose a financial penalty or censure, or withdraw regulated status against the firm and/or regulated individuals. The regulator will publicize these penalties.

**What criminal penalties may apply?**

Following formal investigation, the Luxembourg criminal courts have powers to impose criminal penalties in certain cases, including:

- insider dealing and misleading statements and practices;
- breaches of the money laundering regulations; and
- conducting regulated activities when not authorized.

Tax

Tax issues

**Are stamp, registration, transfer or other similar taxes applicable?**

**Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?**

Luxembourg law does not require the lending of funds, transfer or assignment of a loan to be registered with tax authorities. Hence, no registration tax is payable on the lending of funds or the transfer or assignment of a loan.
Registration duties may be payable upon voluntary registration.

No stamp duty, transfer tax or other similar taxes are payable on the lending of funds, transfer or assignment of a loan.

**Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?**

Luxembourg law does not require the act of taking, transferring or assigning a debenture or other security to be registered. Hence, no registration tax is payable upon the taking, transferring or assigning of a debenture or other security.

The grant, transfer and assignment of a debenture or other security may, however, be registered on a voluntary basis.

The grant and renewal of mortgages, as well as their transfer and assignment, should be registered and should underly registration duties.

No stamp duty, transfer tax or other similar taxes are payable upon the grant, transfer or assignment of a mortgage, debenture or other security.

**Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?**

Luxembourg Law does not require the issue, transfer or assignment of debt securities to be registered. Hence, no registration tax is payable upon the issue, transfer or assignment of debt securities.

The issue of debt securities, the transfer of debt securities and the assignment of debt securities may be registered on a voluntary basis.

No stamp duty, transfer tax or other similar taxes are payable upon the issue, transfer or assignment of debt securities.

**Do tax authorities take priority on enforcement?**

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?

On the enforcement of security, the tax authorities have priority over secured lenders and secured debt security holders.

**Is withholding tax on interest payments applicable?**

Interest payments are not subject to withholding tax (WHT) in Luxembourg except in the following cases:

- Interest payments to a silent partner in proportion to the profit realized may be subject to a 15% WHT.
- Interest payments on profit sharing bonds may be subject to a 15% WHT.
- Interest payments can be requalified into dividends and are then subject to a 15% withholding tax where a Luxembourg company is over-indebted in light of thin capitalization rules or where a Luxembourg company does not comply with transfer pricing regulations.
- Interest payments made by Luxembourg resident paying agents to Luxembourg resident individuals are subject to a 20% WHT. There is an exemption from WHT if the amount due does not exceed €250.
- Where interest payments are made or credited by foreign paying agents located in a member state of the EU or in a state of the European Economic Area, the Luxembourg resident taxpayer may opt for a 20% WHT.
Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding tax (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities in Mauritius. Save for certain exclusions or exemptions, it is unlawful to offer debt securities to the public or to request that they are admitted to trading on a regulated market unless a registered prospectus has been made available to the public.

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Mauritius are bonds or notes issued. Many different types of debt securities are offered. Some common forms include:

- derivative securities such as securities linked to the value of one or more reference asset, including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- hybrid securities (securities with both debt and equity features);
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer);
- exchangeable bonds (debt securities convertible into the equity of a third party);
- project bonds (green bonds, debt securities that are issued to finance the construction of a single asset, a portfolio of projects, or to refinance bank debt that will promote progress on environmentally sustainable activities); and
- warrants (securities giving the holders the option to purchase the equity of the issuer or a related company).

What are the differences between offering debt securities to institutional/professional or other investors?

Under the Securities Act 2005, one of the circumstances in which a prospectus must be used is where an offer of securities is made to the public in Mauritius. An exemption from this requirement to publish a prospectus applies where offers are made solely to sophisticated investors (which include authorized entities, governments and central banks). However, if the debt securities are to be admitted to trading on the Stock Exchange of Mauritius, a prospectus would still be required.
When is it necessary to prepare a prospectus?

A prospectus is required when an offer of securities is made to the public. There are exemptions to this rule under Mauritius laws.

What are the main exchanges available?

The Stock Exchange of Mauritius

The Stock Exchange of Mauritius operates two markets:

- the Official Market; and
- the Development and the Enterprise Market.

The Official Market

The Official Market, or the Main Board of the Stock Exchange of Mauritius, lists some of the largest companies in Mauritius, spanning across different sectors of activity of the local economy.

The Development and the Enterprise Market

The Development and the Enterprise Market is a market targeted towards small and medium-sized enterprises and newly set-up companies which possess a sound business plan and demonstrate good growth potential.

Is there a private placement market?

There is an active private placement market in Mauritius.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil and criminal liability under Mauritian law. Mauritius has various investor protection statutory provisions relevant to liability for an inaccurate offering memorandum. There are also general fraud statutes and liability may also arise under civil law.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Establishing a fund, offering securities in a fund and operating a fund, among other things, are activities requiring a license under the Securities Act 2005 and are regulated by the Financial Services Commission.
What are common fund structures?

Common forms of funds include:

- open-ended funds;
- closed-end funds;
- retail and non-retail funds;
- professional collective investment schemes;
- specialized collective investment schemes (investing in real estate, derivatives, commodities or any other product authorized by the Financial Services Commission); and
- expert funds available only to expert investors.

What are the differences between offering fund securities to professional / institutional or other investors?

Professional Collective Investment Schemes which offer their shares solely to sophisticated investors or as private placements or expert funds which offer their shares solely to expert investors are exempted from most ongoing obligations/regulations generally imposed on collective investment schemes.

Are there any other notable risks or issues around establishing and investing in funds?

Typically, funds are managed by a fund manager, who has the discretion to acquire or dispose of assets using the investor funds in line with a pre-determined investment strategy and subject to safeguards set out in the constitutive documents of the fund and also set out in a fund management agreement.

Fund management requires a license under the Securities Act 2005.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Offering securities is covered by the Securities Act 2005 and guidelines for the advertising and marketing of financial products issued by the Financial Services Commission.

Offering to the public

By virtue of the Securities Act 2005, no person shall make an offer of securities to the public unless:

- the entity whose securities are being offered is in existence at the time of the offer;
- the offer is made in a prospectus that complies with the Securities Act 2005; and
- the Financial Services Commission has given a provisional registration to the prospectus.

Solicitation

Under the Securities Act 2005, solicitation is widely defined.
No person other than the holder of an investment dealer license or an investment advisor, shall solicit another person to enter in securities transactions.

A person shall be deemed to solicit another person where they induces another person to buy, sell or exchange securities or to participate in transactions involving securities or offers persons services, recommendations or advice for those purposes by:

- seeking to meet such person at their place of residence, work or public places;
- contacting such person by telephone, letters, circulars, the internet or other electronic means or telecommunication system; or
- publishing or causing an advertisement to be published or circulated.

**Guidelines for the Advertising and Marketing of Financial Products**

The Financial Services Commission has also provided Guidelines for the Advertising and Marketing of Financial Products, which regulates advertisements in connection with the conduct of an activity or the provision of a service which requires a license, approval, authorization or registration.

---

**Are there any restrictions on managing a fund?**

A Collective Investment Scheme Manager shall:

- maintain a minimum unimpaired capital of MUR 1 million (approximately USD27,300);
- observe some prohibitions;
- abide by general rules of conduct;
- have internal control rules;
- contract specific insurance policies;
- abide by standards for publicity and sales literature; and
- keep certain books and records.

---

**Entering into derivatives contracts**

**Are there any restrictions on entering into derivatives contracts?**

A person entering into a derivatives contract by way of business in Mauritius shall be licensed by the Financial Services Commission.

---

**What are common types of derivatives?**

The most common types of derivatives are:

- futures;
- options;
- swaps; and
- forwards.
Are there any other notable risks or issues around entering into derivatives contracts?

Since the financial crisis, the Financial Services Commission has been closely following international developments to keep pace and act accordingly.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Lending by way of business is a regulated activity and requires a license from the Bank of Mauritius.

Borrowing

Borrowers are not regulated. However, credit facilities not exceeding MUR 3 million (approximately USD82,000) are regulated by the Borrower Protection Act 2007.

What are common lending structures?

Lending can be tailor-made to the requirements of the parties. A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Loan durations

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Loan security

A loan can either be secured, unsecured or guaranteed.

Loan commitment

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.
Loan repayment

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

Last modified 6 Dec 2019 | Authored by Juristconsult Chambers

What are the differences between lending to institutional / professional or other borrowers?

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

Last modified 6 Dec 2019 | Authored by Juristconsult Chambers

Do the laws recognize the principles of agency and trusts?

Mauritius laws recognize the principles of agency and trust.

Last modified 6 Dec 2019 | Authored by Juristconsult Chambers

Are there any other notable risks or issues around lending?

Loan agreements are contractual in nature. There are also restrictions on capitalization of interest.

Last modified 6 Dec 2019 | Authored by Juristconsult Chambers

Are there any other notable risks or issues around borrowing?

Borrowers are afforded very little protection under Mauritius laws in the event of default.

Last modified 6 Dec 2019 | Authored by Juristconsult Chambers

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

There are restrictions pertaining to the type of entity taking the security and the type of property which may be given as security.

Last modified 6 Dec 2019 | Authored by Juristconsult Chambers

What are common types of guarantees and security?

The most common guarantees and security are:

- corporate guarantees;
- personal guarantees;
- fixed/floating charges;
- pledges; and
- mortgages.

Last modified 6 Dec 2019 | Authored by Juristconsult Chambers
Are there any other notable risks or issues around giving and taking guarantees and security?

The main risk is in the event of insolvency where such guarantee/security will have priority only in accordance with a ranking determined by law which may see a secured creditor rank lower than it would initially rank if not for the insolvency.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Financial Services Act 2007
Securities Act 2005
Investment Promotion Act 2000
Business Facilitation Act 2017
Code of Commerce 1809
Environment Protection Act 2002

Banking

Bank of Mauritius Act 2004
Banking Act 2004

Consumer Credit

Borrower Protection Act 2007
Code Civil Act 1805

Mortgage

Code Civil Act 1805

Corporations

Companies Act 2001
Foundations Act 2012
Limited Partnerships Act 2011
Protected Cell Companies Act 1999

Funds

Securities (Collective Investment Schemes and Closed-end Funds) Regulations 2008
Regulatory authorization

Who are the regulators?

The Financial Services Commission

The Financial Services Commission is the integrated regulator for the non-bank financial services sector and global business.

The Bank of Mauritius

The Bank of Mauritius is the regulator of financial institutions under its purview, namely banks, non-bank deposit-taking institutions, and money changers and foreign exchange dealers.

What are the authorization requirements and process?

Depending on the type of activity to be carried out, applications are made with the Financial Services Commission or the Bank of Mauritius for authorization.

The regulators will assess whether the application meets the applicable criteria and then accept or refuse such application accordingly.

The application fee depends on the type of application, ranging from USD1,000 to USD9,500.

What are the main ongoing compliance requirements?

There are minimum capital requirements which must be met, compliance procedures to be followed and anti-money laundering reporting obligations.

Failure to comply with the above and existing detailed rules and regulations may ultimately result in sanctions by the regulators and a loss of the corresponding license.

What are the penalties for failure to be authorized?

Any person who carries out a regulated activity without a license commits a criminal offense and on conviction is liable to pay a fine not exceeding MUR 1 million (approximately USD27,300) and to imprisonment for a term not exceeding eight years.

Regulated activities

What finance and investment activities require authorization?

Activities regulated by the Financial Services Commission

GENERALLY

No person shall carry out or hold themself as carrying out any financial services in Mauritius without a license issued by the Financial Services Commission.

SPECIFIC ACTIVITIES
These include financial service providers/activities such as distribution of financial products, specialized financial services/institutions, including credit finance and factoring, dealing in, managing, arranging and advising on investments and establishing collective investment schemes and closed-end funds.

**Activities regulated by the Bank of Mauritius**

- Banking Businesses
- Foreign Exchange Dealers
- Money Changers
- Moneylenders
- Non-Bank Deposit-taking institutions

*Are there any possible exemptions?*

**Generally**

There are no general exemptions but discretionary exemptions may be granted by the regulators on a case-by-case basis.

**Moneylending**

There is a list of exemptions provided in the Banking Act 2004 for entities that can carry on the business of moneylending without a license.

*Do any exchange controls or other restrictions on payments apply?*

**Generally**

Any transaction is subject to anti-money laundering laws and tax.

**Exchange Controls**

There are no Mauritius currency exchange restrictions in respect of payments.

**Payments in cash**

Subject to exemptions, any person who makes or accepts any payment in cash in excess of MUR 500,000 (approximately USD15,200) or an equivalent amount in foreign currency, or such amount as may be prescribed, shall commit an offence.

*What are the rules around financial promotions?*

**Solicitation**

Under the Securities Act 2005, solicitation is widely defined.

No person other than the holder of an investment dealer license or an investment advisor, shall solicit another person to enter in securities transactions.
A person shall be deemed to solicit another person where they induces another person to buy, sell or exchange securities or to participate in transactions involving securities or offers services, recommendations or advice for those purposes by:

- seeking to meet such person at their place of residence, work or public places;
- contacting such person by telephone, letters, circulars, the internet or other electronic means or telecommunication system; or
- publishing or causing an advertisement to be published or circulated.

Guidelines for the Advertising and Marketing of Financial Products

The Financial Services Commission has also produced Guidelines for the Advertising and Marketing of Financial Products, which regulates advertisements in connection with the conduct of an activity or the provision of a service which requires a license, approval, authorization or registration.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common types of legal entities used are companies limited by shares. Such companies can be private companies (having less than 50 shareholders) or public companies (having more than 50 shareholders).

Limited Partnerships and trusts are also commonly used.

Funds

Funds and fund managers usually take the form of companies limited by shares. We are seeing an increasing number of shares being set up as limited partnerships.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

A company can conduct lending or investment business in Mauritius through a branch but this does not create a separate legal entity.

Foreign companies with a branch in Mauritius need to comply with Part XXII of the Companies Act 2001, which imposes registration, accounting, disclosure, appointment of local agents and other requirements. Such requirements apply only to body corporates. Foreign companies with a place of business or those carrying on business in Mauritius through a permanent establishment will be subject to tax in Mauritius.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being
**developed in the finance and investment marketplace?**

**Peer-to-peer funding platforms and marketplace lending**

There is no definition for marketplace lending under Mauritian Law inasmuch as it is a new area and there is no adequate legal and regulatory framework.

In relation to peer-to-peer lending, the Financial Services Commission, which is the non-bank financial services regulator, has issued a draft Financial Services (Peer-to-Peer Lending) Rules 2017 (P2P Rules) for discussion in or around November 2017.

The aim of these P2P Rules is to, *inter alia*, establish a sound and conducive automated environment or platform for the offer and execution of alternative peer-to-peer lending, other than bank lending, for the benefits of borrowers and stakeholders in the non-banking sector of Mauritius. The small and medium-sized community of entrepreneurs/innovators will be a key category of borrowers targeted by these P2P Rules.

**Blockchain, smart contracts and cryptocurrencies**

To provide an impetus to blockchain and its associated products like smart contracts and cryptocurrencies, Mauritius set up the Mauritius Blockchain Center of Excellence in January 2018, which was a joint initiative of the Office of the President of the Republic of Mauritius in collaboration with the US Embassy.

The aim of this center is to capitalize on the potential of blockchain, which is perhaps the biggest innovation in computer science to date. This new platform is intended to shape the world of finance, business and science as never before and transform the old order for the better.

The mission of the Mauritius Blockchain Center of Excellence will be threefold: blockchain education, community building, and development of use cases, which solve real world problems.

Mauritius aims to leverage its competencies through its ease of conducting business, strategic location, and keenness to advance technology to become a significant blockchain epicenter. The center will collaborate with other stakeholders to bring blockchain expertise to Mauritius and help develop a local blockchain brain trust and opportunities for Mauritius.

Mauritius is further preparing to create an "Ethereum Island" to serve as a hub for innovators from throughout Africa and Asia, through a collaboration between the government of Mauritius and a number of private entities, including ConsenSys, a solutions provider capitalizing on the Ethereum blockchain. As another example, in 2018 Rogers Capital, a Mauritian company, has partnered with BlockCerts, a private blockchain platform, in line with the same vision and even more: expanding blockchain initiatives into Africa.

**Initial coin offerings and token-based products**

ICO and token-based products are still at a very nascent stage in Mauritius but they will be called upon to develop, expand and become crucial in the Mauritian FinTech landscape.

**Artificial intelligence and robo advisory systems**

AI and robo-advisory systems are still at a very nascent stage in Mauritius but they will be called upon to develop, expand and become crucial in the Mauritian FinTech landscape. Regtech is the buzz at the moment and many operators are looking at exploiting this potential.

In November 2018, a report, named *The Mauritius Intelligence Strategy*, issued by the AI Working group commissioned by the government, was published. Its purpose was to show Mauritius’ dedication towards making AI a cornerstone of the next development model by recognizing the potential of the technology to improve growth, productivity and the quality of life. The report makes recommendations to achieve objectives set. The Working group also focused on how to create a regulatory framework to enable the development of AI as well as possible incentives, fiscal or otherwise.

**Data analysis and cloud computing**

Cloud computing is quite prominent in Mauritius and with many back office operations being structured in Mauritius, data analysis is also gaining popularity and momentum.
Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

At the beginning of 2019, the Financial Services Commission stated that the Framework relating to FinTech in Mauritius was finalized. The latter was published via the Government Gazette in March 2019. Throughout this framework, among other initiatives to position Mauritius as the African Fintech Hub, rules regarding the creation of a license for digital asset custodians were set out, a precedent not only in Africa but worldwide.

In its quest to become the blockchain hub of the Indian Ocean, Mauritius also issued an open call for innovators to take advantage of the country's new Regulatory Sandbox License (RSL). The sandbox allows companies operating in areas such as financial, medical and communications technology to start operating despite the absence of a formal legislative or licensing framework. Modeled after similar approaches employed in Australia, Singapore and the UK, the RSL is open to all innovators, but there is an emphasis on attracting blockchain innovators across all verticals. The expectation is that completed projects will help drive domestic and cross-border commerce and eventually expand into a smart city concept that links to other hub cities.

Since launching in November 2016, the RSL has fielded several project proposals, with most under the FinTech umbrella.

To be considered for approval, applicants must demonstrate their project is innovative, beneficial to the Mauritian economy and it cannot be accommodated in the investor's home jurisdiction because of legal or regulatory gaps. Qualified applicants can obtain licensure in as little as 30 days, provided that all relevant information is received and risks are properly addressed.

Electronic payments platforms and regulation of peer-to-peer lenders

The Financial Services Commission, which is the non-bank financial services regulator, has issued a draft Financial Services (Peer-to-Peer Lending) Rules 2017 (P2P Rules) for discussion in or around November 2017.

The aim of these P2P Rules is to, inter alia, establish a sound and conducive automated environment or platform for the offer and execution of alternative peer-to-peer lending, other than bank lending, for the benefits of borrowers and stakeholders in the non-banking sector of Mauritius. The small and medium sized community of entrepreneurs/innovators will be a key category of borrowers targeted by these P2P Rules.

Regulation of payment services

Payment services are regulated in Mauritius by the central bank, the Bank of Mauritius, which has as one of its responsibilities to regulate the banking and credit system to ensure a proper distribution of credit and a sound financial structure.

Application of data protection and consumer laws

The new Data Protection Act 2017 repeals and replaces the previous Data Protection Act 2004. The Data Protection Act 2017 is to a large extent in line with the provisions of European General Data Protection Regulation (GDPR).

Money laundering regulations

Money Laundering is regulated by the Financial Intelligence and Anti Money Laundering Law. This law, inter alia, provides for the offences of money laundering; the reporting of suspicious transactions; the exchange of information in relation to money laundering; mutual assistance with overseas bodies in relation to money laundering; and for matters connected therewith and incidental thereto.

In February 2019, Mauritius was taken out of the European Commission's high-risk third countries list. After undergoing a peer review assessment from the OECD's Forum on Harmful tax Practices, the latter found Mauritius' tax regimes not to be harmful given the changes and steps taken to ensure the compliance of Mauritian provisions with international standards.
What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals, (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

Crowd funding is becoming more prevalent and FinTech startups are having recourse to crowd funding as well in their early stages.

Venture capital and debt

Venture capital funding is a type of equity investment for FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending, given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Warehouse and platform funding

Warehouse and platform funding is not common in Mauritius.

Senior bank debt and capital markets funding

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base.

Incentives and reliefs

There is a tax-holiday of eight years for new companies involved in innovation-driven activities on the income derived from the totality of Intellectual Property Assets. Besides that there are no other tax incentives.

Following the Mauritian Budget Highlights 2019/20, further fiscal measures were taken to promote the FinTech field in Mauritius. Thus under the Innovation Box Regime, existing companies will now also benefit from the eight-year income tax holiday on income derived from intellectual property assets developed in Mauritius after June 10, 2019. Peer-to-peer Lending operators will now be granted a five-year tax holiday provided that the company starts its operation before December 31, 2020. Ecommerce platforms will now also benefit from a five-year tax holiday, provided that they are incorporated before June 30, 2025.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

The most common ways of selling loans are:

- novation;
- assignment; and
- sub-participation.

Last modified 6 Dec 2019 | Authored by Juristconsult Chambers
What are the main considerations when transferring a loan and related security?

The main considerations are as follows:

- confidentiality – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- data protection – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- lender eligibility – whether there are any restrictions around the type of entity to which the loan can be transferred;
- undrawn commitments – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- transfer mechanics – whether there are any steps that need to be taken to transfer the loan in accordance with its terms;
- registration – the costs associated with the registration of such a transfer; and
- consent – whether a transfer requires the consent or notification of any other parties.

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Energy and infrastructure assets are both publicly and privately owned. This varies widely depending on the projects. For instance, there are several energy and infrastructure projects which are Public Private Partnerships.

Are there special rules for investing in energy and infrastructure?

There are no special rules for investing in energy and infrastructure, but each project may be subject to regulations and restrictions, for example an Environmental Impact Assessment (EIA) license may be required for certain activities. The application fee for an EIA license is MUR15,000 (approximately USD400).

1An exhaustive list of undertakings requiring an Environmental Impact Assessment can be found in Part B of the Environment Protection Act 2002.

What is the applicable procurement process?

The choice of procurement methods available to a public body is set out below.

Procurement of goods, other services and works

- open advertised bidding;
- restricted bidding;
- request for sealed quotations;
- direct procurement;
• community or end-user participation; or
• departmental execution.

**Procurement of consultancy services**

• request for proposals on the basis of:
  • quality and cost;
  • quality alone;
  • quality and fixed budget; or
  • least cost and acceptable quality;
• direct procurement; or
• open advertised bidding.

**What are the most common forms of funding / investing in energy and infrastructure?**

**Funding**

Common forms of funding in energy and infrastructure include:

• loans made on a corporate finance basis (balance sheet debt);
• loans made on a project-finance basis (to a special purpose project company) on medium to long-term basis;
• bond finance;
• loans from foreign institutions and countries;
• mezzanine debt (in some sectors);
• refinancing of the debt in operational projects; and
• asset financing (this is particularly relevant in the rail sector).

**Investing**

Common forms of investing in energy and infrastructure include:

• equity investment in special purpose vehicles or entities that may have a portfolio of interests;
• share capital and subordinated sponsor loans; and
• secondary market investment in operational projects (acquisition of equity).

**Restructuring**

**Enforcement and sanctions**

**When can there be regulatory investigations?**

The Financial Services Commission (FSC) is tasked as the regulator to monitor, regulate and supervise Mauritius' non-banking financial
activities.

The FSC will intervene when there are illegal, dishonorable and improper practices, market abuse and financial fraud in relation to any activity in the financial services and global business sectors.

**What regulatory penalties may apply?**

The FSC has powers to impose a range of penalties. These include: giving directions; issuing warnings; issuing public censure; imposing an administrative penalty; revoking a license; disqualifying a licensee from holding a license; and disqualifying the officer of a licensee.

**What criminal penalties may apply?**

The FSC may institute criminal proceedings against any person in respect of any offence under the relevant Acts it manages. This may take the form of fines and/or imprisonment.

**Tax**

**Tax issues**

*Are stamp, registration, transfer or other similar taxes applicable?*

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

There are no stamp, registration, transfer or similar taxes payable on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

There is no stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a security, unless registration is necessary for the perfection of the security. Securities, such as mortgages or fixed and floating charges, would require the security agreements to be registered and inscribed for the security to be constituted.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?

There are no stamp, registration, transfer or similar taxes payable in advance, on transfer or on assignment of a loan unless registration is necessary for the perfection of the security.

**Do tax authorities take priority on enforcement?**

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?

Secured lenders and secured debt security holders take priority over the Mauritius Revenue Authority on enforcement of security.
Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

No.

What are the key exemptions? For example, is there an exemption for interest payments to banks, to local lenders/debt security holders, on listed debt, to lenders/debt security holders entitled to the benefit of a double tax treaty?

On interest payable by any person, other than by a bank or non-bank deposit taking institution, under the Banking Act, to any person, other than a company resident in Mauritius, a withholding tax of 15% will apply.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

*Are there any restrictions on issuing debt securities?*

There are restrictions on offering and selling debt securities under Mexican law.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Mexico or to request that they are admitted to trading on a regulated market operating in Mexico unless a prospectus approved by CNVB has been made available to the public.

*What are common issuing methods and types of debt securities?*

The main types of debt securities depend on the type of issuer. Typically, banks and other financial institutions issue short-term notes and commercial paper while private companies and local governments issue long-term structured notes under programs.

Debt can be issued under a short (less than a year) or a long (more than a year) term. It can be issued directly as corporate debt (certificados bursátiles, pagarés, obligaciones) (e.g., a bond issuance) or structured debt through a trust (certificados bursátiles fiduciarios).

Debt can be issued in a single series or under a program.

*What are the differences between offering debt securities to institutional/professional or other investors?*

Institutional investors are heavily regulated and subject to the supervision of regulatory authorities including the National Banking and Securities Commission (CNBV), National Retirement Savings System Commission (CONSAR) and Banco de México (BANXICO). Generally, institutional investors can only invest in those assets that applicable regulations explicitly permit.

The Securities Market Law defines institutional investors as any entity which, under federal law, is deemed as such or is a financial entity (that is, Mexican and foreign banks, broker-dealers, insurance companies, AFORES, investment funds, private pension funds, among others), including fiduciary divisions.

*When is it necessary to prepare a prospectus?*
Generally, all debt public offerings require registration with the CNBV and filing a prospectus for approval, except for:

- short-term offerings that require issuers to file only an offering statement (aviso de oferta); and
- issuances under programs, which only require an information memorandum (suplemento) because the prospectus was filed when the relevant program was authorized.

**What are the main exchanges available?**

Currently, the regulated exchanges in Mexico are Bolsa Mexicana de Valores (Mexican Stock Exchange) and Bolsa Institucional de Valores (BIVA).

Since 2014, the Mexican Stock Exchange has been part of the Mercado Integrado Latinoamericano (MILA), an agreement that integrates the stock exchange markets of Chile, Colombia, Mexico, and Peru, as part of economic integration efforts among the Pacific Alliance member countries. MILA is not a regulated stock exchange but an agreement between regulated stock exchanges establishing a regional market to trade equities from the four countries.

In October 2015, BIVA formally applied for a concession to organize and operate a new stock exchange in Mexico, which was granted by the Mexican financial authorities in August 2017.

**Is there a private placement market?**

Mexico has an active private placement market.

**Are there any other notable risks or issues around issuing or investing in debt securities?**

**Issuing debt securities**

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil and criminal liability under Mexican law. Mexico has various investor protection statutory provisions relevant to liability for an inaccurate offering memorandum. There are also general fraud statutes and liability may also arise under Mexican law through a civil action for deceit, negligent misstatement or misrepresentation.

**Investing in debt securities**

Debt security terms and conditions typically contain provisions which may permit their modification without the consent of all investors and confer significant discretions on the common representative, which may be exercised without the consent of investors and without regard to the individual interests of particular investors. The conditions also provide for meetings of investors to consider matters affecting the investors' interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

**Establishing and investing in debt / hedge funds**

**Are there any restrictions on establishing a fund?**

The establishing of an investment fund requires authorization from the National Banking and Securities Commission (CNBV). The
Authorization request is required to include, among other information, a draft copy of the by-laws, the names of the founding shareholders and the members of the board of directors of the management company and a draft copy of the prospectus.

All regulated funds are treated the same way and are referred to as mutual funds in Mexico. Mexican law does not generally distinguish between open-ended and closed-ended funds or retail and hedge funds. They are defined differently under the Investment Funds Law (Ley de Fondos de Inversión): the defining characteristic of an open-ended retail fund is that it has the legal obligation to repurchase or redeem its own shares while it is expressly forbidden for a closed-ended retail fund to repurchase its own shares from its investors if they are not listed on any stock exchange. In practice, closed-ended retail funds are rare in Mexico.

What are common fund structures?

The most popular types of investment funds in Mexico are:

- the variable yield mutual fund or equity mutual fund (Fondo de Inversión de Renta Variable); and
- the mutual fund for investment in debt securities or fixed fund (Fondo de Inversión en Instrumentos de Deuda).

What are the differences between offering fund securities to professional / institutional or other investors?

Generally, Mexican law does not distinguish between the regulation of open-ended and closed-ended funds or retail and institutional/professional funds. Mutual funds can be marketed to both persons and corporations and to the public in general.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

The only legal structure used in Mexico to set up a fund is a stock corporation (Sociedad Anónima or SA). The Investment Funds Law was amended in 2014 to permit the establishment of a special type of SA for mutual funds, so that mutual funds are now required to comply with fewer regulatory requirements.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Investment funds can be marketed by management companies, insurance companies, brokers, brokers' dealers and distributors. These entities must be authorized to market the funds.

The marketing of the investment fund management companies must be clear to avoid confusion and allow for simple interpretation. The broadcasting of announcements with ambiguous information is forbidden. The advertising material must not contain any false information, omission, ambiguity, hyperbole or deception, which might induce the public to make wrong or inaccurate conclusions about the products and services offered by the mutual fund managers.

Although its approval is not required, marketing material must be sent to the National Banking and Securities Commission (CNBV). The Association of Securities Intermediaries (Asociación Mexicana de Intermediarios Bursátiles) (AMIB) can also comment on marketing material.
Are there any restrictions on managing a fund?

Managers of investment funds must be authorized by the National Banking and Securities Commission (CNBV). The portfolio of assets must be deposited in institutions for deposits of securities, which institutions must be licensed.

Last modified 5 Dec 2019

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

In Mexico, entering into derivatives contracts can be carried out in the following markets.

Organized market

In the organized markets, the derivatives contracts are governed pursuant to standardized terms and conditions (active type, underlying, quantity or size of the agreement, expiration of the agreement, price quotations and liquidation procedure). The main feature of these markets is that the seller and the purchaser never trade directly, but through a central counterparty clearing house specialized in derivatives, in order to eliminate the exchange and insolvency risks.

The only institutional, regulated and organized market existing for the trading of derivatives contracts in Mexico is the Mercado Mexicano de Derivados, S.A. de C.V. (MexDer), an affiliate of the Mexican Stock Exchange (Bolsa Mexicana de Valores). MexDer along with Asigna, its triple-A rated clearinghouse (Asigna), offers liquid, transparent Mexican benchmark products based on interest rates, foreign exchange and stock indexes. Asigna acts as a counterpart for all transactions performed on MexDer.

In principle, to trade directly in MexDer, it is required to be:

- a Clearing Member (Socio Liquidador), which is a trust that is a member of MexDer and owns a share in the equity of Asigna, and whose purpose is to settle and, in some cases, enter into exchange-listed futures and option contracts on behalf of clients; or
- a Trader, which is a bank, brokerage firm or any other entity, that may or may not be a member of MexDer, whose purpose is to act as a broker for one or more clearing members in entering into futures and option contracts, and which may access MexDer’s electronic trading system to enter into such contracts.

Over the counter (OTC)

In the non-organized markets, the parties set out the relevant terms and conditions in accordance with their particular needs; the derivatives contracts are designed by institutions pursuant to the particular needs of their clients. In these markets, there is no clearing house and thus each party takes default risk. In the OTC, there are absolutely no limitations regarding the type of derivatives products to be commercialized, as long as there are assets, trade flows or goods that may allow the documentation of such transactions.

Last modified 5 Dec 2019

What are common types of derivatives?

In MexDer, only future, options and interest rate swap agreements are listed. Only futures and options with the following underlying assets are eligible:

- futures – foreign currency, indexes, debt, shares and commodities; and
- options – foreign currency, indexes, and shares.

All other types of derivatives contracts (including forwards and currency swaps) are privately negotiated in non-exchange-traded market transactions (OTC or Over the Counter).

Last modified 5 Dec 2019
Are there any other notable risks or issues around entering into derivatives contracts?

The derivatives market regulation relies on general provisions encompassing the Ministry of Finance and Public Credit (SHCP), Banco de México (BANXICO) and the National Banking and Securities Commission (CNBV). There is no regulation for OTC derivatives, which impairs enforcement and supervisory efforts by CNBV in this area, however, the CNBV aims at maintaining oversight of OTC derivatives transactions to ensure that participants do not engage in regulated activities, such as trading with securities.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Lending is only a regulated activity in relation to mortgages and consumer lending. In these circumstances, and assuming none of the available exemptions apply, a lender will need to be authorized by the National Banking and Securities Commission to conduct such business. The main provisions regulating these activities aim at protecting financial services users, strengthening competition in banking services, and giving the National Commission for the Protection and Defense of Users of Financial Services (CONDUSEF) powers to supervise and impose sanctions.

There are no additional restrictions that apply to foreign lenders making loans to Mexican borrowers.

Borrowing

While borrowers are generally not regulated, it is advisable for borrowers to consider whether either the mortgage or consumer lending regimes apply to their activities, in which case they will benefit from the protections mentioned above.

What are common lending structures?

Lending in Mexico can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents and trustees which fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, equity bridge facilities and project or letter of credit facilities.

Loan durations

The duration of a loan can vary between:

- a term loan, provided for an agreed final period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
• an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
• a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

**Loan security**

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

**Loan commitment**

A loan can be:

• committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
• uncommitted, meaning that the lender has discretion whether or not to provide the loan.

**Loan repayment**

A loan can be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

*Last modified 5 Dec 2019*

**What are the differences between lending to institutional / professional or other borrowers?**

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

By contrast, lending in the context of mortgages and to consumers is a regulated activity supervised by the National Banking and Securities Commission (CNBV) and the National Commission for the Protection and Defense of Users of Financial Services (CONDUSEF).

For more information, see Lending and borrowing – restrictions.

*Last modified 5 Dec 2019*

**Do the laws recognize the principles of agency and trusts?**

It is common to appoint an agent to act on behalf of other parties (as in syndicated loan transactions) and a trustee to hold rights and other assets on trust for the lenders or secured parties. Thus, the common-law principles of agency and trust are recognized in the Mexican legal framework.

*Last modified 5 Dec 2019*

**Are there any other notable risks or issues around lending?**

**Generally**

Loan agreements and other finance documents are subject to general contractual principles. There are no specific limitations on interest rates or the ability of lenders to charge default interest under loan agreements, however, there may be general or practical limitations stemming from usury statutes, judicial precedents and market conditions that may limit the amount of the rate as well as from tax considerations, particularly in the case of transactions among related parties.

In the event of proceedings in Mexico seeking performance of obligations of a Mexican borrower, pursuant to Mexican Monetary Law, the borrower may discharge its respective obligations by paying any sums due in a currency other than Mexican currency, in Mexican currency at the rate of exchange prevailing in Mexico and fixed and published by Banco de México (BANXICO) in the Official Gazette of the Federation of Mexico on the date preceding the date of payment.
**Specific types of lending**

In mortgage and consumer lending, the National Commission for the Protection and Defense of Users of Financial Services (CONDUSEF) is granted authority to provide for a list of 'abusive clauses' which institutions will not be able to include in their adhesion contracts, as well as the regime for its supervision and removal. Financial adhesion contracts are non-negotiable financial contracts which are offered by financial institutions and accepted 'as is' by financial services users seeking the corresponding financial service.

**Standard form documentation**

There are no recommended forms of lending documentation provided by market participants or regulators. Most finance transactions are documented on bank standard form documentation prepared in-house or by external legal counsel.

*Last modified 5 Dec 2019*

**Are there any other notable risks or issues around borrowing?**

In cross-border lending, borrowers are required to consider the identity of the beneficial owner of interest payments, given that tax gross-up clauses are a common feature in loan agreements and withholding tax rates range from 4.9% to 40%, depending on the beneficial owner of the interest. Lower withholding tax rates may be available to tax residents in countries with which Mexico has entered into a tax treaty to avoid double taxation. Interest payments carried out to export-import banks may not be subject to any withholding, provided that the conditions set out by the relevant tax treaty are complied with.

*Last modified 5 Dec 2019*

**Giving and taking guarantees and security**

**Are there any restrictions on giving and taking guarantees and security?**

Some of the key areas affecting the giving of guarantees and security are as follows.

**Capacity**

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the signatories’ powers that would prevent them from executing such documents.

**Insolvency**

Guarantees and security may be at risk of being set aside under Mexican insolvency laws if the guarantee or security was granted by a company with a certain period of time prior to the onset of insolvency (fraudulent conveyance). This would be the case if the company giving the guarantee or security received considerably less consideration, and as such, the transaction was at an undervalue. For such a transaction to be set aside, certain statutory criteria would have to be met, including that the guarantee or security was given within 270 calendar days prior to the declaration of insolvency of the affected party (or 540 calendar days for inter-company claims). Guarantees and security may also be challenged on other grounds relating to insolvency.

**Financial assistance**

The concept of unlawful financial assistance is not recognized in Mexico. However, fair consideration, corporate benefit, arms-length transactions and related concepts are relevant, particularly in insolvency situations.

**Corporate benefit rules**

The granting of downstream guarantees and security interests by a parent company to secure a loan to its subsidiary would generally be valid.

*Last modified 5 Dec 2019*
What are common types of guarantees and security?

Common forms of guarantees

Guarantees to secure compliance with obligations are commonly used in Mexico in all types of transactions. The most common types of guarantees are as follows.

CIVIL GUARANTEE (FIANZA CIVIL)

The Federal Civil Code establishes that the civil guarantee is an agreement by means of which a third party undertakes to pay the creditor if the debtor does not meet its obligations.

SURETY BOND (FIANZA MERCANTIL)

Under Mexican law, a bond is a guarantee issued by an authorized entity which grants bonds on a customary basis. The bond is an agreement between a guarantor and the creditor of the original debtor under which the guarantor undertakes to pay or otherwise comply with the debtor's obligations in case the debtor defaults. The bond can be granted only if a valid underlying obligation exists. A guarantor may validly agree to pay a certain amount of money which is owed and not paid by the debtor, or if the debtor does not comply with a payment obligation.

Surety bonds can be of various types, including administrative, judicial, credit and fidelity bonds.

UNCONDITIONAL ENDORSEMENT (AVAL)

According to the General Law of Negotiable Instruments and Credit Operations, a person may guarantee total or partial payment of amounts described in a negotiable instrument (e.g., promissory note) by means of an unconditional endorsement. The guarantor is jointly liable with the principal obligor and its obligations are valid notwithstanding that the principal obligation is null for any reason whatsoever.

Common forms of security

The most common forms of security are as follows.

MORTGAGE

A mortgage is a security interest granted over real estate assets that are not delivered to the creditor, and that give the creditor the right (in case of default of the secured obligation) to be paid from the value of the asset.

GUARANTEE TRUST

This is a contract under which a person transfers to a trustee the ownership or title of one or more tangible and/or intangible assets in order to secure the obligations of a settlor in favor of a third party.

TRADITIONAL PLEDGE (PRENDA MERCANTIL)

The pledgor (a debtor or a third party) transfers possession of the movable asset to the lender (or a third party for the benefit of the lender) to hold as security for compliance with an obligation. This pledge is commonly used to pledge stock of a private company, for instance, where the lender takes actual possession of endorsed stock certificates.

NON-POSSESSORY PLEDGE (PRENDA SIN TRANSMISIÓN DE POSESIÓN)

Possession and operation of the assets remain with the pledgor. This type of pledge includes the possibility of creating a floating or generic pledge over all present and future movable assets of a business.

SECURITIES PLEDGE (PRENDA BURSÁTIL)

This is a pledge over securities traded in the Mexican stock exchange. Securities are deposited in an account at the S.D. Indeval, S.A. de C.V., Institución para el Depósito de Valores (clearing agency).
Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

A civil guarantee cannot exist without a valid principal obligation. Guarantors are granted certain benefits under Mexican law, known as the benefits of orden, división and excusión. The benefit of orden requires the creditor to proceed against the debtor before proceeding against the guarantor. The benefit of excusión requires the creditor to ensure the assets of the debtor are first exhausted in payment of its obligations before any amounts are claimed from or paid by the guarantor. The benefit of división exists when there are multiple guarantors: it allows one of the guarantors which has been called to trial to have the other guarantors appear at the same trial in order to defend themselves jointly, with each guarantor being liable for its proportionate share of the principal obligation. These benefits may be waived by the guarantor.

Giving or taking security

A mortgage securing a debt above a minimum threshold value (which is determined by local law and varies from state to state) must be in writing and executed before a Mexican notary public. The mortgage instrument, which should precisely describe the property being encumbered and the term of the mortgage, must be registered in the appropriate real property public registry office to be effective against third parties. Other registrations are required depending on the type of property being encumbered. For example, registration in the aircraft registry, the maritime registry and the railroad registry.

Guarantee trusts must be executed in writing. A guarantee trust over immovable property must be executed before a Mexican notary public and the trust instrument must be registered in the appropriate real property public registry office to be effective against third parties. Guarantee trusts over movable property securing a debt above a minimum threshold value must also be executed before a Mexican notary public and the trust instrument should be registered in the federal personal property collateral registry (Registro Único de Garantías Mobiliarias). Other registrations, authorizations and additional actions can also be required depending on the assets being placed in trust.

A traditional pledge must be executed in writing. Special perfection requirements apply depending on the type of asset, such as delivery of bearer instruments to the lender or a third party, delivery and endorsement of registered instruments and registration in the special registry ledger (for example, in the case of shares of a private stock corporation), and delivery of non-negotiable instruments and notices to the underlying debtor, if applicable.

A non-possessory pledge must be executed in writing. A non-possessory pledge securing a debt above a minimum threshold value must be ratified before a Mexican notary public and the resulting instrument registered in the the federal personal property collateral registry (Registro Único de Garantías Mobiliarias) to be effective against third parties.

A securities pledge must be executed in writing and involves a foreclosure agent (executor) and the transfer of the securities to an account at the clearing agency. A Mexican bank or brokerage firm (other than the lender) may be appointed as foreclosure agent and is responsible for selling the securities at market value if a default occurs.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally
Bank of Mexico Law (Ley del Banco de México)
Credit Institutions Law (Ley de Instituciones de Crédito)
Securities Market Law (Ley del Mercado de Valores)
Financial Groups Law (Ley para Regular las Agrupaciones Financieras)
Credit Organizations and Auxiliary Activities General Law (Ley General de Organizaciones y Actividades Auxiliares del Crédito)
General Law of Negotiable Instruments and Credit Transactions (Ley General de Títulos y Operaciones de Crédito)

Consumer credit

Law for the Protection and Defense of the User of Financial Services (Ley de Protección y Defensa al Usuario de Servicios Financieros)
Financial Services Transparency and Regulation Law (Ley para la Transparencia y Ordenamiento de los Servicios Financieros)

Mortgages

State Civil Codes (Códigos Civiles Estatales)

Special types of mortgages regulated in the following laws:

- Credit Institutions Law (Ley de Instituciones de Crédito) (Industrial Mortgage);
- Civil Aviation Law (Ley de Aviación Civil) (Aircraft Mortgage);
- Maritime Navigation and Commerce Law (Ley de Navegación y Comercio Marítimos) (Maritime Mortgage); and
- General Communications Law (Ley de Vías Generales de Comunicación) (Communications Assets Mortgage)

Corporations

General Law of Commercial Companies (Ley General de Sociedades Mercantiles)
Securities Market Law (Ley del Mercado de Valores)

Funds and platforms

Investment Funds Law (Ley de Fondos de Inversión)

Other key market legislation

Monetary Law of the United Mexican States (Ley Monetaria de los Estados Unidos Mexicanos)
Financial Technology Institutions Law (Ley para Regular las Instituciones de Tecnología Financiera)
Payments Systems Law (Ley de Sistemas de Pagos)
Bankruptcy Law (Ley de Concursos Mercantiles)
Bank Savings Protection Law (Ley de Protección al Ahorro Bancario)
Law to Regulate Credit Information Corporations (Ley para Regular las Sociedades de Información Crediticia)
Guaranteed Credit Transparency Law (Ley de Transparencia y de Fomento a la Competencia en el Crédito Garantizado)
Anti-Money Laundering Law (Ley Federal para la Prevención e Identificación de Operaciones con Recursos de Procedencia Ilícita)
Several regulations (circulars) issued by Banco de México, the National Banking and Securities Commission and other regulatory bodies

Last modified 5 Dec 2019

Regulatory authorization

Who are the regulators?

The Ministry of Finance and Public Credit (Secretaría de Hacienda y Crédito Público) (SHCP) plans and directs the Federal Government's economic policy in Mexico, as regards to finance, tax, spending, income and public debt. It supervises the Mexican banking system.

Mexico's central bank, Banco de México (BANXICO), promotes the sound development of the Mexican financial system and the optimal
functioning of the payment systems. BANXICO ensures the stability of the domestic currency's purchasing power.

The National Banking and Securities Commission (Comisión Nacional Bancaria y de Valores) (CNBV), supervises and regulates all entities of the Mexican financial system (including banks, non-bank finance companies, stockbrokerage houses, financial technology institutions and mutual funds) in order to ensure its stability and proper operation and to protect the interests of the general public.

The National Commission for the Protection and Defense of Users of Financial Services (Comisión Nacional para la Protección y Defensa de los Usuarios de Servicios Financieros) (Condusef), promotes financial education and transparency and protects financial services users before entities of the Mexican financial system.

The National Retirement Savings System Commission (Comisión Nacional de Sistemas de Ahorro para el Retiro) (CONSAR), supervises and regulates AFOREs, companies that administer the employees retirement savings.

The Bank Savings Protection Institute (Instituto para la Protección al Ahorro Bancario) has the authority to provide depositary insured institutions with limited deposit insurance in favor of banking depositors and suggest and oversee capital restoration plans to financially assist banks for the benefit of depositors.

The National Insurance and Bonding Commission (Comisión Nacional de Seguros y Fianzas), supervises and regulates insurance and bonding companies.

What are the authorization requirements and process?

Most financial entities require authorization for incorporation from CNBV (in some cases with an opinion from BANXICO confirming such entity's suitability for authorization).

The authorization process includes identifying equity holders, board members and main officers, presenting a business plan and a draft copy of by-laws, describing the proposed capital structure, describing technological infrastructure and identifying the origin of resources used as capital contributions. In most cases the regulator will have three to six months from receipt of a completed application to grant or deny authorization.

Most institutions are required to make a security deposit in favor of the Federal Treasury, representing a percentage of the corresponding institution's minimum capital requirement.

Most authorized financial institutions are listed in the Supervised Entities Registry (Padrón de Entidades Supervisadas).

What are the main ongoing compliance requirements?

Financial institutions are subject to prudential supervision (eg capital adequacy, liquidity, operational and technological risk) and requirements on Anti-Money Laundering and Combating the Financing of Terrorism (AML/CFT), protection of users of financial services and efficiency of operation and competition in financial services.

What are the penalties for failure to be authorized?

A person undertaking a regulated activity without being authorized commits a criminal offence and is liable to imprisonment.

Regulated activities

What finance and investment activities require authorization?
Generally

Main regulated activities include:

- retail banking activities (operation of deposit accounts);
- consumer lending;
- public offering of securities;
- crowdfunding and electronic wallets;
- securities brokerage (trading in securities and other investments);
- investment and asset management (managing investment funds, including distribution and appraisal entities);
- insurance and bonding issuance and brokerage;
- establishment of representative office of foreign financial institutions; and
- investment advisory services (rendering portfolio management and investment advisory services in a regular and professional manner).

Consumer credit

Consumer lending is also a regulated activity that requires governmental authorization.

Are there any possible exemptions?

Mexican Non-Bank Financial Entities (Sociedades Financieras de Objeto Múltiple or SOFOMs) are allowed to provide financing through direct loans, financial leasing and factoring without needing to obtain authorization from Mexican regulators, however, these entities are not allowed to obtain deposits from the general public. There are two types of SOFOMs:

- regulated SOFOMs which are entities with a capital link to a banking or other regulated institution; and
- non-regulated SOFOMs which lack such a capital link.

For each type of regulated activity there are a number of specific exemptions that could also apply, including for activities carried out by family offices, private equity entities and other private wealth management entities.

Do any exchange controls or other restrictions on payments apply?

The Mexican peso is freely convertible into all other currencies and there are no restrictions on the remittance of profits abroad or the repatriation of capital.

What are the rules around financial promotions?

Rules

Mexican legislation regulates investment advisors as individual or entities that without being stock exchange brokers, provide portfolio management and investment advisory services in an habitual and professional manner. Investment advisors are subject to the surveillance of the National Banking and Securities Commission (CNBV) and subject to AML/CFT regulations.

All advertising or promotion by investment advisors to the general public is subject to CNBV's approval, including advertising in...
connection with securities offers, which is made through prospectuses, informative brochures or other offering materials authorized by CNBV.

Exemptions

Exemptions include communications to relatives or employees, foreign investment advisors not having physical presence or agents in Mexico, or the rendering of asset management services to trusts issuing securities to the general public though the stock exchange, as long as there is no services advertisement to an indeterminate number of persons or through mass media.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common type of legal entity is the stock corporation or Sociedad Anonima, which can adopt the variable capital form in order to be a Sociedad Anonima de Capital Variable, the only difference being the flexibility in the latter to increase or decrease its capital stock without having to amend formally its corporate charter.

The Sociedad Anonima are required to adopt the Sociedad Anonima Bursatil or Sociedad Anonima Promotora de Inversión Bursátil forms form when performing an initial public offer of their shares though the Mexican Stock Exchange.

Funds

Investment funds are required to adopt the Sociedad Anonima de Capital Variable form of entity.

Is it possible to conduct lending or investment business through a branch or establishment?

Foreign lenders are able to conduct lending activities in Mexico through a branch or office outside of Mexico.

Foreign financial institutions may conduct lending or investment business by establishing in Mexico affiliates of foreign financial institutions.

Foreign financial institutions may also establish a representative office in Mexico through which they may perform a limited list of activities, including informing and negotiating the terms and conditions of loans and investments to be made by foreign financial institutions. Specific prohibitions are applicable to representative offices such as undertaking any financial intermediation that would require authorization from the Mexican government or acting in transactions that imply the receipt of funds or investments from the public.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?
Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending in Mexico is at an initial stage but has made available most forms of traditional bank funding products. Most common products include:

- debt consolidation;
- consumer loans;
- student lending products;
- small and medium-sized enterprises (SME) lending; and
- factoring.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P) type structures, often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

ISSUES FOR STARTUP MARKETPLACE LENDERS

Marketplace lending businesses can be incorporated under various corporate forms, often as stock corporations (sociedad anónima or SA) – or one of its variations, the investment promotion corporation (sociedad anónima promotora de inversión or SAPI) – which provide flexibility and corporate governance features that facilitate joint venture arrangements and private equity investments. There is also an example of a marketplace lender incorporated as a Popular Finance Company (sociedad financiera popular or SOFIPO), a microcredit financial institution authorized and supervised by Mexico's National Banking and Securities Commission (Comisión Nacional Bancaria y de Valores or CNBV).

Most marketplace lenders operate as agents of investors to make loans on their behalf to third parties interested in obtaining financing. The loan funds are provided by the investors; the marketplace lender then distributes the funds on behalf of investors to various pre-qualified borrowers and also acts as agent of the investors for administrative and collection purposes.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored on the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties
to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the block using sophisticated algorithms and add the verified block to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record, for example, relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third-party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The Financial Technology Law bill (Ley de Tecnología Financiera or LTF) that regulates the FinTech industry in Mexico, indicates that virtual assets, including cryptocurrency, will be defined by Mexico’s Central Bank. However it is understood that these virtual assets will be a representation of verifiable digital value that is neither issued nor backed by a central bank or financial entity; that is, they are not legal tender, however they generate units for exchange, given its acceptance by the general public. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

**Initial coin offerings and token-based products**

**WHAT IS AN INITIAL COIN OFFERING (ICO)?**

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of
access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

**Artificial intelligence and robo advisory systems**

Automated financial advice tools, also known as 'robo advisors' are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

**Data analysis and cloud computing**

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

_Last modified 5 Dec 2019_

**Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?**

**General financial regulatory regime**

Financial Technology Institutions Law (Ley de Tecnología Financiera or LTF) was published on March 9, 2018, in the Official Gazette of the Federation.
GENERAL

FinTech companies in Mexico will need to be analyzed carefully to verify whether it falls under the scope of financial regulations requiring such activities to be carried on by authorized and supervised entities. Relevant regulations include those relating to banking, securities brokerage, insurance, and fund formation, among other services.

The Comisión Nacional Bancaria y de Valores (CNBV) supervises and regulates all entities in the Mexican financial system –including banks, non-bank finance companies, stockbrokerage houses, and mutual funds – in order to ensure its stability and proper operation as well as to protect the interests of the general public. Most financial entities require authorization for incorporation from CNBV (in some cases with an opinion from Mexico's Central Bank – Banco de México or BANXICO).

REGULATORY DEVELOPMENTS

The main elements of the Financial Technology Institutions Law (Ley de Tecnología Financiera or LTF) are:

- **principles** – financial inclusion, consumer protection, financial stability, promotion of competition and prevention of money laundering and financing of terrorism;
- **regulated Financial Technology Institutions (FTIs)** –
  - crowdfunding institutions (instituciones de financiamiento colectivo);
  - electronic payment institutions (instituciones de fondos de pagos electrónicos); and
  - regulatory sandboxes/innovative companies (empresas innovadoras);
- **authorization of FTIs** – to be granted discretionally by the CNBV, with prior approval by the Financial Technology Committee which will be formed by officers of BANXICO, CNBV and the Ministry of Finance;
- **corporate governance** – FTIs will have to be incorporated as Mexican stock corporations (sociedad anónima or SA) or limited liability companies (sociedad de responsabilidad limitada or Sde RL) in order to provide services in Mexico (CNBV will issue regulations on board of directors, officers and committee requirements for FTIs);
- **regulatory sandbox** – innovative companies that obtain a temporary authorization (up to two years) to provide services to a reduced number of clients to test innovative products, services, business models and delivery mechanisms; and
- **a Fintech Council** – the draft bill provides for the creation of a FinTech Council to act as a means of consultation, advice and coordination between public and private sectors.

Crowdfunding institutions

The LTF defines crowdfunding institutions as those that regularly and professionally carry out activities with the purpose of connecting an investor (funds provider) and an applicant (funds requester), through interfaces, websites or any other digital or electronic means of communication.

Crowdfunding institutions may perform the following activities:

- **debt-based crowdfunding** – loans or any other type of financing by investors resulting in a direct or contingent liability of applicants;
- **equity-based crowdfunding** – acquisition on instruments by investors representing the capital stock of applicants; or
- **royalty-based crowdfunding** – acquisition by investors of a portion or share of a present or future asset, or the income, profits, royalties or losses resulting from projects developed by applicants.

Electronic payment institutions

The LTF defines electronic payment institutions as those institutions which regularly and professionally carry out activities through interfaces, websites or any other digital or electronic means of communication, consisting in the issuance, management, redemption and transfer of electronic payment funds, by opening accounts for their clients to make deposits in exchange of electronic payment funds, making transfers to different accounts, and delivering money in amounts equivalent to the electronic payment funds withdrawn from the relevant account.
Electronic payment funds will be those funds that:

- are linked to monetary value equivalent to an amount in Mexican pesos or virtual assets;
- result in a payment obligation against the electronic payment institution;
- are issued against receipt of an amount of money or virtual assets; and
- are accepted by a third party as money or virtual assets.

Application of data protection and consumer laws

Pursuant to the Federal Law on Protection of Personal Data Held by Private Parties (Ley Federal de Protección de Datos Personales en Posesión de los Particulares or Privacy Law), in the processing of personal data, the person or entity collecting personal data (data controller) must provide a privacy notice (Aviso de Privacidad or the Privacy Notice), which must be made available to the data owner prior to the processing of his or her personal data.

The term ‘processing’ is broadly defined in the Privacy Law to include the collection, use, communication, or storage of personal data by any means. Use includes all access, management, procurement, transfer and disposal of personal data.

Consent is required for all processing of personal data, except as otherwise provided by the Privacy Law. Implicit consent (notice and opt out) applies to the processing of personal data; express consent (notice and opt in) applies to the processing of financial or asset data; and express and written consent applies to the processing of sensitive personal data. Consent may be communicated verbally, in writing, by electronic or optical means, via any other technology, or by any other unmistakable indications. Express written consent may be obtained through the data owner's written signature, electronic signature, or any other authentication mechanism set up for such purpose.

The Financial Services Consumer Protection Law (Ley de Protección y Defensa al Usuario de Servicios Financieros) and the Federal Law on Consumer Protection (Ley Federal de Protección al Consumidor) provide that product information and fees must be available to consumers.

Money laundering regulations

The Mexican anti-money laundering law (Ley Federal para la Prevención e Identificación de Operaciones con Recursos de Procedencia Ilícita) and its regulations apply to FinTech entities performing activities listed in such law as vulnerable activities. FinTech entities which fall within the scope of the regulations are required to verify the client's identity, any beneficiaries of transactions, register with the regulators and file monthly reports, among other requirements.

The LTF proposes that full identification of investors and applicants will be required and will further require FTIs to only use banks accounts with authorized financial institutions to receive and transfer funds to their clients and the use of cash would be limited to specific situations authorized by CNBV, taking into account the particular business model of the FinTech entity and the establishing of appropriate limits.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as angel investors) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING
The crowdfunding sector may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform, such as Crowdfunder.mx and Play Business.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

ACCELERATORS

There are various incubators or accelerators in the Mexican market which offer support, facilities and funding for startups, often in return for an equity stake. For example, the Startup Bootcamp Fintech has an accelerator program which offers entrepreneurs free office space, mentorship, global network access, and funding. It is a joint venture between Startupbootcamp and Finnovista (another leading platform for accelerating FinTech innovation in Latin America); and they are supported by leading institutions such as Visa, BanRegio, Gentera and EY.

In early 2013, the Mexican Government created the National Entrepreneur Institute (Instituto Nacional del Emprendedor or INADEM), an administrative body within the Ministry of Economy specifically aimed at developing a stronger entrepreneurial ecosystem. INADEM administers the National Entrepreneur Fund (Fondo Nacional Emprendedor) which is open to support FinTech companies. Some states in Mexico also provide certain incentives and have their own entrepreneurship institutes providing different types of support to the FinTech sector.

Venture capital and debt

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions. There are various examples of Mexican FinTech companies receiving venture capital, such as Kueski (lending platform), Konfio (lending platform), Clip (payment processor platform) and Kubo Financiero (peer-to-peer (P2P) lending platform).

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor. Some of the big corporates in Mexico have started to follow this global practice, albeit through accelerators. Companies such as Telefónica, Cinépolis, Volaris, Axtel, Coca-Cola, Grupo Expansión, Hoteles City Express, Ternium, and Banregio have established initiatives to interact with startups. An active player in Mexico is Telefonica's Wayra.

An additional funding option is venture debt, which is secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital. This alternative is still not common in the FinTech sector in Mexico.

Warehouse and platform funding

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator. Some FinTech companies may see warehouse funding as a temporary form of financing to be followed by a larger capital markets transaction at a later date. This alternative is still not common in the FinTech sector in Mexico.

Another alternative form of funding is by way of P2P lending platforms such as Kubo Financiero, Prestadero and Doopla, which bring individual borrowers and lenders together without the involvement of traditional banks. P2P lending does not involve equity investments; interest is paid on the money borrowed instead.

Senior bank debt and capital markets funding
SENIOR BANK DEBT

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

CAPITAL MARKETS FUNDING

Mexico has both debt and equity capital markets which are accessible to businesses (usually of a certain size).

Raising finance by way of an Initial Public Offering (IPO) has not been a funding option for FinTech companies in Mexico given that they have not reached the size required for an IPO to become available. An IPO is the initial sale of company shares on a public exchange, such as the Mexican Stock Exchange (MSE), currently the only stock exchange operating in Mexico. On 29 August 2017, the Mexican Ministry of Finance and Public Credit (Secretaría de Hacienda y Crédito Público) granted Central de Corretajes (CENCOR) a new concession to operate a new stock exchange in Mexico, which will operate under the name of Bolsa Institucional de Valores (BIVA) and will be supported technologically by NASDAQ. It is anticipated that BIVA will initiate operations in early 2018. It is expected that BIVA will be targeting smaller companies than those listed in the MSE, providing better chances for IPO funding to FinTech companies in Mexico.

FinTech companies in Mexico have not explored funding alternatives through debt capital markets, although there are various alternatives available, such as bonds and securitizations.

CONVERTIBLE BONDS/LOAN NOTES

A funding tool for fast-growing FinTech businesses is to issue convertible bonds or loan notes, which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances. Mexican FinTech companies have started to explore this funding alternative, such as Kueski, a leading online lending platform in Mexico.

Incentives and reliefs

The Mexican Income Tax Law provides a 30% tax credit for research and development (R&D) expenses, including investments in R&D. The tax credit will be equal to current-year R&D expenses in excess of the average R&D expenses incurred in the previous three years. This incentive cannot be combined with other tax incentives.

There is a wide variety of targeted incentives that encourage specific types of economic development, however, FinTech-specific incentive programs are scarce. Prosoft is an initiative aimed at developing a strong, competitive, and global IT sector in Mexico, by supporting companies from strategic sectors to develop innovation ecosystems through collaborations among private sector, government, and the academic sector. The initiative is managed by the Ministry of Economy and provides cash grants for up to 70% of eligible expenses.

Local governments also provide certain incentives that are available to FinTech companies in Mexico.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Buying and selling loans is very common. A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common way of selling loans is through an assignment of all of the assignor’s rights and obligations under the corresponding loans, including any promissory notes documenting disbursements (or its substitution).

Participations in loans are also common as a way of lenders transferring an economic interest in a loan but not changing the legal
relationship between the existing lender and borrower under a loan agreement.

The form and content of the transfer documentation will depend on the nature of the loans being sold. It is customary for the parties to include a template of assignment agreement as an exhibit to the loan agreement.

Last modified 5 Dec 2019

**What are the main considerations when transferring a loan and related security?**

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller’s legal advisors. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and
- **consent** – whether a transfer requires the consent or notification of any other parties.

Last modified 5 Dec 2019

**Projects**

**Financing / investing in energy / infrastructure**

**To what extent are energy and infrastructure assets publicly or privately owned?**

**Generally**

The ownership of energy and infrastructure assets in Mexico varies according to the asset class. Subsurface rights belong to the Mexican state and the Mexican government may grant concessions to use subsurface land for mining, oil and gas drilling and production or for geothermal exploration and production, among others.

**Energy**

Deriving from a comprehensive Energy Reform in 2013, which involved changes at both constitutional and secondary legislation levels, a new legal framework was put in place for the energy sector.

Underground hydrocarbons, including oil and gas, are government-owned property and no private property in hydrocarbons is allowed. However, deriving from the Energy Reform, oil and gas activities such as exploration, production, treatment, refining, processing, storage, transportation and commercialization, were opened to the private sector. Private sector companies are now allowed to participate in exploration and extraction activities and ownership of extracted hydrocarbons is permitted in production sharing and license contracts, in which part of the production is given to the contractor. Owners of land where underground hydrocarbons are discovered are entitled to remuneration from commercial production of the discovered wells. The Hydrocarbons Law provides that landowners may receive a percentage of the contractor’s profit. *Petróleos Mexicanos* (Pemex), the state-owned petroleum company, continues to participate in the sector but as an additional player within the blocks awarded to Pemex through entitlements, which provide Pemex the right to explore and/or produce hydrocarbons directly, or through farm-outs or PPPs.

The Electric Industry Law allows the private sector to participate freely in the generation and sale of electricity and the construction of transmission and distribution infrastructure, while maintaining the electricity grid under the operational control of the Federal Electricity...
Commission (CFE), the state-owned public utility. The new legal framework has created a wholesale electricity market operated by the National Centre for Energy Control (CENACE) as a single independent system operator for the entire grid. Market participants are now able to sell and purchase power directly in the market or through bilateral PPAs, including those awarded through auctions. Operational control of the national grid and the transmission and distribution of electricity are considered strategic areas that remain in the hands of the Mexican government. However, the private sector is able to participate in the transmission and distribution of electricity through agreements and joint ventures with state-owned enterprises. CFE is permitted to participate, through separate subsidiaries, in the different market activities, and is the supplier of basic retail services to residential customers and small and medium-sized commercial customers under regulated tariffs. Nuclear power generation remains under the control of the Mexican government.

**Telecoms infrastructure**

The legal framework for the telecoms and broadcasting sectors is set out in the new Federal Law of Telecommunications and Broadcasting (Ley Federal de Telecomunicaciones y Radiodifusión) (FLTB), which came into force on August 2014. The FLTB states that telecommunications and broadcasting activities are a ‘public service of general interest’, and that the government will at all times maintain the ownership of the radio spectrum. The Federal Government may grant two types of concessions to private sector companies:

- ‘all-inclusive concessions’, which authorize concessionaires to provide all sorts of telecommunication or broadcasting services through their network and that according to their use may be classified as commercial, public, social or private; and
- concessions to use radio-electric spectrum or orbital resources.

**Transport infrastructure**

**RAIL**

Mexican railway lines are owned by the government, which means that only the state can build new railway links. However, the rail service was privatized about 20 years ago dividing the country's railways into different regions and putting them under private management through concessions for up to 50 years.

**URBAN RAIL TRANSIT**

- **Mexico City Metro System** – owned and operated by the Mexico City Government
- **Monterrey Metro System** – owned and operated by the Government of the State of Nuevo León
- **Xochimilco Light Rail** – owned and operated by the Mexico City Government
- **Guadalajara Light Rail** – owned and operated by the Government of the State of Jalisco
- **Suburban Railway of the Valley of Mexico Metropolitan Area** – owned by the Federal Government, built and operated by private sector company under a 30-year concession, and required the collaboration of the Federal, Mexico City, State of Mexico and municipal governments
- **Interurban Train Mexico City–Toluca (under construction)** – owned by the Federal Government, in collaboration with the Mexico City Government, its construction is by private sector companies through public works contracts

**ROADS, BRIDGES AND TUNNELS**

The highway system of Mexico is made up of federal highways, state highways, and rural roads. Federal highways are those that connect with roads from foreign countries, link two or more states of the Federation, and are wholly or mostly built by the Federation with federal funds or through federal concessions by individuals, states, or municipalities. State highways and rural roads are the responsibility of state governments.

_Caminos y Puentes Federales de Ingresos y Servicios Conexos_ (CAPUFE), a government agency under the Ministry of Communications and Transportation (SCT), is in charge of the operation and maintenance of federal roads and bridges, including those under concessions granted to third parties that engage CAPUFE for such services.

**AVIATION**

Aviation for the most part is privatized in Mexico. However, the administration, control and surveillance of airports is restricted to the
federal government. There are certain public bodies (such as Aeropuertos y Servicios Auxiliares – ASA) that participate either with another authority (i.e., state government) or with the private sector to build, maintain, and operate airports across Mexico. Other airport facilities are operated by the Ministry of Defense, the Navy, and municipal authorities.

PORTS

Mexican port privatization started in 1993 with a new Ports Law which dismantled the public port agency (Puertos Mexicanos) and created Independent Port Administrations (Administraciones Portuarias Integrales – API) at each port or group of small ports. APIs are commercial entities controlled by the federal government, the state governments, the National Tourism Fund, and in one case by private capital. Every activity related to port administration, operation, and services is under supervision of the federal government, however, APIs are granted concessions for the use and management of ports and can themselves transfer rights or grant specific services contracts to private sector terminal operators in order to supply port services. The Coordinación General de Puertos y Marina Mercante, under the authority and supervision of the Ministry of Communications and Transportation, has the authority on regulation and administration of ports in Mexico.

Other infrastructure

SOCIAL INFRASTRUCTURE

Most of the social infrastructure is financed by federal or state governments. In particular, public hospitals, prisons, and schools are managed by the Ministry of Health, Ministry of Interior, and the Ministry of Education, respectively. However, for the design, construction and maintenance, the relevant authority will enter into an agreement with the private sector through a bidding process or a public-private partnership. For social housing, in broad terms, the private sector develops the real estate projects for social housing (either by private or public funding), then employees obtain a mortgage from the National Workers’ Housing Fund Institute (Instituto del Fondo Nacional de la Vivienda para los Trabajadores) (INFONAVIT) to be repaid with payroll deductions that employers make and forward to INFONAVIT, as well as mandated contributions that employers make to INFONAVIT as a percentage of each worker’s salary.

DEFENSE

Generally, defense assets are owned by the federal government.

WASTE

The waste management is the responsibility of each local government. The municipal authorities grant concessions to private companies for waste management. The private sector is responsible for the collection, management, transportation, and disposal of the waste once it has obtained the concession.

WATER

The main infrastructure projects such as water dams, river diversions, wastewater and waterways are controlled by the Comisión Nacional del Agua (CONAGUA), a federal body under the supervision of the Ministry of Environment and Natural Resources (SEMARNAT). The construction and maintenance of such assets can be given to the private sector through concessions. For city distribution of water and waste-water (sewerage), each city has its own government body that is in charge of the administration, maintenance, and distribution to the end-user. However, there are few cities where water supply and sanitation services are provided by private companies through concessions.

Are there special rules for investing in energy and infrastructure?

Generally

There is no specific regime governing or restricting investment in energy or infrastructure projects in Mexico over and above existing regulation for investors and lenders more generally but a particular proposed investment may be subject to legislative or regulatory control (e.g., merger control rules) and/or foreign investment restrictions. As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory position relevant to that project must be
considered, including environmental authorizations/permits and/or sector specific regulatory consents or licenses. If a public body is
procuring a project using private finance, and the public body is to benefit from central government funding towards the cost, the project
will be subject to central government approval. Key sector-specific issues are flagged in the sections below.

Whether an investor can invest will depend on the terms of the procurement of that project if it is a public sector project and, in respect of
an existing/operational project, that will depend on whether there are any contractual restrictions on ‘change of control’. This is less of a
concern with private sector infrastructure although investors would need to consider whether any licenses/consents/permits would be
affected by their acquisition of an interest.

Energy

Private investors can participate, alongside PEMEX and CFE, the two large state-owned enterprises, in a wide range of the energy industry
value chain, attracting capital and technology to areas that are in need of renewal. A cornerstone of the energy reform is the objective to
open the energy sector to private and international investment by ending the monopolies of state-affiliated enterprises.

The energy reform has opened five ways in which private investors can take part in the development of Mexico's oil and gas resources, in
all cases after pre-qualification and taking part in a bidding process conducted by the Comisión Nacional de Hidrocarburos (CNH), except
that service contracts can be agreed directly with PEMEX:

- License contracts allow a company to book ownership of oil or gas assets (for financial purposes) at the wellhead after it has paid its
tax dues, with the company paying a signing bonus, payments during exploration and royalties on production.
- Production-sharing contracts allow a company to recover costs and a share of the operating profit, received as a portion of the oil or
gas extracted.
- Profit-sharing contracts allow a company to recover costs and a share of the profit, after it has marketed and sold the resource.
- Under service contracts a company is paid for specified project activities on behalf of PEMEX or the state.
- Farm-outs/migrations allow a company to enter into a joint venture agreement with PEMEX in a project that has already seen
exploration and production efforts.

The public transmission and distribution of electric energy is still reserved to the state, provided by CFE and overseen by the new
regulatory body, the National Energy Control Centre (Centro Nacional de Control de Energía) (CENACE). CENACE is the operator of the
national electric system and wholesale market operator, however, CENACE can authorize private parties to participate in energy
distribution. To incentivize investment in renewables, the government has introduced clean energy certificates, a market instrument that
is part of broader power sector reform designed to support the share of electricity consumption to be generated from clean energy
sources. The revenue from the sale of certificates, which are purchased by producers and large electricity consumers, is intended to be
invested in other renewable energy projects.

Telecoms infrastructure

Foreign investment is authorized with no restriction for telecommunications and satellite communications and up to 49% for radio
broadcasting services.

The Federal Institute of Telecommunications (IFETEL) was created by virtue of the Telecommunications Reform as an independent
regulator with the authority, among other matters, to award and revoke concessions, guarantee economic competition in the
telecommunications and broadcasting markets, and determine the existence of ‘dominant carriers’ (participants with market participation
above 50% in both the broadcasting and telecommunications sector) to whom asymmetric regulation is to be applied (currently, America
Móvil in telecommunications and Televisa in broadcasting, have been deemed ‘dominant carriers’ by IFETEL).

Transport infrastructure

DOMESTIC PASSENGER, TOURISM AND FREIGHT TRANSPORTATION

Pursuant to the Foreign Investment Law, activities such as domestic passenger, tourism and freight transportation (except for messenger
or package delivery services) is restricted to Mexican individuals or Mexican companies without allowing foreign investment (a neutral
investment mechanism may be implemented to allow foreign investment where limited voting shares are issued to foreign investors).

AVIATION
Pursuant to the Foreign Investment Law, domestic air transportation services are subject to a foreign investment limit of 25%. The concessions and permits are granted pursuant to the Civil Aviation Law. Other foreign investment limitations apply.

SHIPPING

Pursuant to the Foreign Investment Law, national commercial freight shipping lines and port administration are activities subject to a foreign investment limit of 49% (a neutral investment mechanism may be implemented to allow foreign investment where limited voting shares are issued to foreign investors). Other foreign investment limitations apply.

RAIL

The Mexican government allows foreign investors to participate with up to 49% of the capital stock in companies providing railway service. Railroad activity with more than 49% foreign participation requires prior authorization from the Foreign Investment Commission.

Other infrastructure

On publicly procured infrastructure, it is quite common for long-term projects to have a 'change of control' clause which restricts change in ownership structures of the private sector. For example, in most sectors there is a restriction on change in control during the construction period but this is often relaxed post construction provided any change in control is not to an 'unsuitable third party'. How strict these restrictions are will often depend on the sector.

Last modified 5 Dec 2019

What is the applicable procurement process?

Public procurement in Mexico is governed at a federal level by the Federal Law for Acquisitions, Leasing and Services for the Public Sector (Ley de Adquisiciones, Arrendamientos y Servicios del Sector Público) and their corresponding laws in the different states and municipalities.

As part of the Energy Reform, CFE and Pemex have their own procurement regulations and the general law mentioned above does not apply to such governmental entities. The Ley de Petroleos Mexicanos and the corresponding procurement regulations issued by its Board of Directors are applicable to Pemex, and the Ley de la Comisión Federal de Electricidad and the corresponding procurement regulations issued by its Board of Directors are applicable to CFE.

Investing in energy and infrastructure

Public procurement is relevant where the Mexican government, or a branch of it, seeks to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset. The relevant procurement legislation (as indicated above) applies to certain public bodies, such as federal government departments, and state and municipal authorities.

Public contracting may be carried out by any of the following:

- open bidding procedure (Licitación Pública);
- invitation to at least three participants; and
- direct adjudication.

The general rule for public contracting is to perform an open bidding procedure; however, applicable regulations expressly provide for exceptional cases under which the corresponding government bodies may observe a different procedure. There are three types of tender processes under federal regulations:

- National (reserved for Mexicans and Mexican products that contain at least 50% of its parts made in Mexico);
- International under international treaties (reserved for Mexicans and foreigners that are nationals from a country with which Mexico has a Free Trade Agreement and contains provisions for public procurement); and
- Open Internationally (open to Mexicans and foreigners irrespective of the origin of goods).
An investor may choose to seek to invest in a project (by acquiring an interest in a private sector partner) that has already been procured and is operational. However, such investments are controlled by contractual mechanisms within the original awarded contract rather than procurement regulations themselves and the parties are required to confirm whether legal thresholds under the Mexican Antitrust Law (Ley Federal de Competencia Económica) are exceeded, in which case the transaction would have to be notified to the Mexican Antitrust Commission (Comisión Federal de Competencia Económica) and obtain clearance before closing.

Financing energy and infrastructure

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector.

In the case of public contracts financed from externally sourced credit granted to the federal government or guaranteed by regional or multilateral financial organizations, the procedures, requirements and other provisions for their contracting are established by the Ministry of the Civil Service (Secretaría de la Función Pública), with the opinion of the Ministry of Finance and Public Credit (Secretaría de Hacienda y Crédito Público).

What are the most common forms of funding / investing in energy and infrastructure?

The principal forms of private sector funding/investment in energy and infrastructure in Mexico (including in relation to Public-Private Partnerships) include the following.

Funding

- Loans made on a corporate finance basis (balance sheet debt)
- Loans made on a project-finance basis (to a special purpose project company) on medium- to long-term bases – such loans may later be syndicated to other funders
- Bond finance
- Fibra E public offering (equity)
- Mezzanine debt (in some sectors)
- Refinancing of the debt in operational projects

Mexico's National Infrastructure Fund (Fondo Nacional de Infraestructura – FONADIN) has been a dynamic Mexican government tool to manage the development of national infrastructure in Mexico via public-private partnerships (PPPs), focusing on the highways, ports, airports, environment, urban mass transportation, water and tourism. FONADIN is one of the most important conduits for PPPs in Mexico by providing support – financing and know-how – for the planning, design, construction and final transfer of projects developed by the private sector. To be eligible for FONADIN support, projects must offer the country significant positive social impact and the prospect of major economic gain.

Investing

- ‘Equity’ investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans
- Secondary market investment in operational projects (acquisition of ‘equity’)

Restructuring

Enforcement and sanctions
When can there be regulatory investigations?

When the National Banking and Securities Commission (CNBV) or the National Commission for the Protection and Defense of Users of Financial Services (CONDUSEF), considers that an authorized firm or regulated individual may have breached ongoing compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

Last modified 5 Dec 2019

What regulatory penalties may apply?

When a rule breach has taken place, the National Banking and Securities Commission (CNBV) or the National Commission for the Protection and Defense of Users of Financial Services (CONDUSEF) may impose a financial penalty or censure, or withdraw regulated status against the firm and/or regulated individuals. The regulator will publicize these penalties.

Last modified 5 Dec 2019

What criminal penalties may apply?

Following formal investigation, the regulators have powers to impose criminal penalties in certain cases, including:

- insider dealing and misleading statements and practices;
- breaches of Anti-Money Laundering and Combating the Financing of Terrorism (AML/CFT) Regulations; and
- conducting regulated activities when not authorized.

Last modified 5 Dec 2019

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

There are no stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

Most security interests must be registered at the Public Registry of Property and Commerce to ensure its validity against third parties. The fees payable for such registrations are generally not material in amount.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

There are no stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security.

Last modified 5 Dec 2019

Do tax authorities take priority on enforcement?
On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g., secured bond holders)?

Secured lenders and secured debt security holders take priority over the Mexican Tax Authorities on enforcement of security.

Last modified 5 Dec 2019

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Yes, to the extent the interest is paid to a person who is not resident in Mexico. An expanded definition of interest applies for these purposes, which includes yields from all forms of credit, public debt, bonds or debentures. Interest payments between persons resident in Mexico are not subject to withholding taxes.

In addition, income deriving from the sale of a right to a receivable of any nature, whether present, future or contingent, by a person who is resident in Mexico to a person who is not resident in Mexico, is also taxed as interest. The amount of deemed interest income in the hands of the non-resident acquirer is determined as the difference between the nominal value of the receivable plus unpaid interest or returns that have not been subject to withholding tax, less the price paid on the sale. As such, the purchase of bad loans by a non-resident could be subject to withholding tax on the difference between the face value and the fair market value of the loans.

If so:

What is the rate of withholding?

The general Mexican withholding tax rate on interest paid to persons not resident in Mexico is 35% (with effect from 2014), unless an exception applies.

What are the key exemptions?

The following types of interest payments are exempt from Mexican withholding tax:

- interest paid on loans to the Mexican Federal Government;
- interest paid on loans with a term of three or more years granted by financial entities resident outside of Mexico and registered with the Mexican tax authorities that are dedicated to the promotion of exports by the provision of special-term loans (thus, for example, to the extent assets and equipment produced outside of Mexico can be financed by way of an export credit loan, Mexican withholding tax may be avoided on the interest payable on the loans);
- interest derived from certain financial debt derivative transactions involving the sale of federal government securities; and
- interest derived from the sale of monetary regulation bonds issued by the Bank of Mexico.

The withholding tax rate is reduced to the following percentages in the following cases:

- 4.9% – interest paid to a financial entity resident outside of Mexico in which the Mexican Federal Government has an equity participation through the Ministry of Finance (SHCP) or the Mexican Central Bank (Banco de Mexico), provided that the financial entity is the effective beneficiary of the payment and meets certain registration requirements;
- 10% – interest paid to an entity that invests or places capital in Mexico that is derived from securities that are issued outside of Mexico to, and placed outside of Mexico with, the general public;
- 10% – interest paid to a person not resident in Mexico that derives from the sale of a right to a receivable, or that is paid to a person not resident in Mexico on certain types of securities, provided specific requirements are met;
- 10% – interest paid to banks, investment banks and certain limited purpose financial companies, in each case, resident outside of Mexico, that are the effective beneficiaries of the interest (To qualify for the reduced rate, the institution concerned must provide information to the borrower to document its status as a qualified institution. It should be noted that the use of back-to-back loan
arrangements as a means of obtaining reduced withholding tax rates is not allowed under Mexican domestic law. The rate is reduced to 4.9% in the case of interest on loans paid to financial institutions resident in double tax treaty partner countries. The reduced rate of 4.9% is provided for through general regulations on an annual basis.

- 4.9% – interest paid on publicly traded securities or securities issued through a recognized stock exchange in a country with which Mexico has entered into a double tax treaty, where the securities are registered with the National Registry of Securities and Intermediaries, and certain information requirements are met (if the information requirements are not met or the securities are issued through an exchange in a country with which Mexico does not have a double tax treaty, the rate is 10%);

- 15% – interest paid to a lessor not resident in Mexico with respect to a finance lease (In this case, the interest is considered to be Mexican-source when the leased asset is used in Mexico, or when the payments made to the non-resident lessor are deductible in whole or in part by a permanent establishment in Mexico, even when the payments are made through an establishment located outside of Mexico); and

- 21% interest payments made by credit institutions to persons not resident in Mexico, other than registered banks;

- interest related to the sale on credit of machinery and equipment; and

- interest in connection with loans to finance the acquisition, installation and commercialization of fixed assets, provided the loan terms are documented in the contract and payment is made to an entity registered with the tax authorities for this purpose.

Furthermore, there could be reduced withholding tax rates available on interest payments to persons not resident in Mexico who are entitled to apply a double tax treaty concluded by Mexico.

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes.

**Are foreign lenders and debt security holders subject to tax on interest payments?**

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

Under Moroccan law, there are certain restrictions on offering and selling debt securities.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Morocco unless an approved information document has been submitted for approval to the Moroccan regulator (AMMC).

The AMMC approves certain financial transactions before their execution and validates, depending on the case, the information document prepared in connection with the financial transaction. The AMMC has provided guidelines and circulars for the issuance of debt securities.

What are common issuing methods and types of debt securities?

Many issuing methods are used in Morocco and bond borrowing is one of them.

However, there are many types of debt securities in Morocco. The most frequently encountered are:

- Obligations;
- Certificates of deposit;
- Financing company bonds;
- Treasury bonds.

What are the differences between offering debt securities to institutional / professional or other investors?

There is a difference between qualified investors and other investors.

The AMMC provides for a list of qualified investors which are a legal entities with the skills and resources to necessary understand the risks inherent to transactions with financial instruments.

Are presumed qualified investors:

- banks;
- undertakings for collective investment in transferable securities;
- insurance and reinsurance undertakings;
- pension and retirement organizations;
- deposit and management fund;
- venture capital investment undertakings;
- undertakings for collective investment in securitisation, as governed by the legislation on the said bodies.

_When is it necessary to prepare a prospectus?_

Offerors wishing to complete a transaction on financial securities are required to prepare an information document which, before its public release, must, in most cases, be approved by the AMMC.

The information document must include all the information necessary for the public to make investors’ judgments about the issuer’s assets, financial position and business.

The information document must be updated as soon as new accounts are closed and new items arise. This update must also be validated by the AMMC.

_What are the main exchanges available?_

The organization, management and development of the stock market are granted to the Casablanca Stock Exchange (Bourse de Casablanca).

The Casablanca Stock Exchange manages the regulated markets of the Stock Exchange.

_Is there a private placement market?_

There is a private placement market in Morocco.

_Are there any other notable risks or issues around issuing or investing in debt securities?_

**Issuing debt securities**

Issuers are required to provide comprehensive information in relation to their financial situation and activities as well as to provide risk factors to bring the attention of investors. Issuers are accountable and liable for misleading or inaccurate information provided in their information document.

**Investing in debt securities**

Specific risks factors related to the securities and the ability of the issuer to repay the securities are generally provided for under the information document. An investor may lose all his investment in case of insolvency of the issuer.
Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

There are some restrictions regarding the establishment of a fund. Thus, legal structures adopted by investment funds belongs to one or the other of the following two categories:

- Venture capital investment funds that may take the form of Venture capital companies or Venture capital mutual funds;
- Conventional vehicles (public limited company (SA) or joint stock company (SAS)).

In addition, venture capital investment funds (organisme de placement en capital risque) (OPCR) and real estate investment funds (organisme de placement collectif en immobilier) de (OPCI) must be approved by the AMMC.

What are common fund structures?

In Morocco, investment funds belongs to one or the other of the following two categories:

Conventional vehicles

- Public Limited Company (SA);
- Joint Stock Company (SAS);
- Foreign companies (Limited Partnership, Limited Liability company and others);
- Limited partnership with shares (SCA).

Private equity: Venture Capital Investment funds (organisme de placement en capital risque) (OPCR)

- Venture Capital company (SCR);
- Venture Capital mutual funds (FCPR).

What are the differences between offering fund securities to professional / institutional or other investors?

The differences are more or less similar to the rules applicable to the offer of the securities.

Are there any other notable risks or issues around establishing and investing in funds?

Managing investments is a regulated activity under Moroccan law and there subject to AMMC authorization.

Managing and marketing debt / hedge funds
**Are there any restrictions on marketing a fund?**

The marketing of a fund’s products may be carried out by banks, management companies, brokerage firm or the deposit and management fund.

*Last modified 6 Jan 2020*

**Are there any restrictions on managing a fund?**

An investment fund is managed by a management company, which is a commercial company that exclusively creates and manages investment products in compliance with regulatory and legal constraints and internally defined investment policies in order to obtain the best performance from it.

**Entering into derivatives contracts**

**Are there any restrictions on entering into derivatives contracts?**

There is no specific restrictions on entering into derivatives contracts. However, general restrictions could significantly affect to enter into derivatives such as the applicable currencies, the bankruptcy regulations or the exchange control rules.

*Last modified 6 Jan 2020*

**What are common types of derivatives?**

Bank Al Maghrib Directive concerning the risk management framework for derivatives products defines derivatives as follows: "A derivative is a financial contract whose value depends on that of an underlying asset or index".

It also specifies that "derivative transactions include interest rate contracts, foreign exchange contracts, property title contracts, commodity contracts and options contracts".

The most common derivatives used to hedge interest rate risk are as follows:

- Cap, floors, collars;
- Swaps;
- Options;
- Futures;
- Forwards.

*Last modified 6 Jan 2020*

**Are there any other notable risks or issues around entering into derivatives contracts?**

It should be mentioned the application of the general instruction of foreign exchange applicable to forward financial instruments.

**Debt finance**

**Lending and borrowing**
Are there any restrictions on lending and borrowing?

Lending

The execution of usual credit transactions requires that the institution concerned has been authorised under the terms of an authorization issued by Bank-Al-Maghrib.

Once authorization has been obtained, any bank wishing to carry out credit operations must comply with a certain number of rules and obligations, both internally, in particular by complying with prudential ratios, and with regard to its client, in particular by exercising a duty of vigilance.

Borrowing

Borrowing is generally not regulated.

Last modified 6 Jan 2020

What are common lending structures?

There is no mandatory lending structure in Morocco, lending can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Loans will be structured to achieve specific objectives, e.g. term loans, working capital loans, equity bridge facilities, project facilities assets financing, etc.

Loan durations

The duration of a loan can vary depending on the parties willingness:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues.

Loan security

A loan can either be secured, unsecured or guaranteed.

Loan commitment

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

Loan repayment

A loan can be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or in full on the maturity date.

What are the differences between lending to institutional/professional or other
**borrowers?**

There are specific provisions concerning external financing operations:

These are external loans granted to Moroccan legal entities registered in the Commercial Register or to branches of foreign companies, registered with the Exchange Office. In this context, a number of documents must be submitted to the bank before the execution of the regulations on the reimbursement of external loan maturities, and declarations must be made to the exchange office.

Finally, there are specific provisions applicable to loans granted to non-residents:

**Financing in Dirhams**

These are the following loans granted to non-residents:

- Loans in Dirhams granted by banks to non-resident foreign individuals and Moroccans residing abroad, intended to finance the acquisition and/or construction of real estate in Morocco;

- Consumer credits granted in Dirhams by banks to foreign personnel working for diplomatic missions accredited in Morocco or international organizations based or represented in Morocco;

- Credit lines and facilities granted to branches registered with the Exchange Office in connection with the execution of contracts in Morocco, which the remuneration is denominated entirely in Moroccan Dirhams.

**Commercial credits**

These are credits granted by the exporter of goods or services, or a Moroccan bank alone or as part of a consortium in favour of non-resident customers, in the form of supplier credits or buyer credits repayable in the short or medium term.

**Do the laws recognize the principles of agency and trusts?**

**Agency (mandat)**

Agency exists under Moroccan law.

**Trust and fiducie**

Neither trust agreement nor *fiducie* has been recognized by the Moroccan jurisdictions.

**Are there any other notable risks or issues around lending?**

There is a general requirement to use MAD for domestic transactions but if another currency is used, an office exchange approval may be needed.

Credit institutions are subject to a general regime for information, advice and warnings in their relations with their customers.

Credit institutions are required to provide more specific information on people with consumer status.

Moroccan borrowers (professionals or consumers) must receive an information from the lenders on the percentage rate of charge (*taux effectif global*) of any credit transaction governed or not by Moroccan Law.

**Are there any other notable risks or issues around borrowing?**
Bank Al-Maghrib regularly issues advisory circulars and directives on various subjects (prudential provisions, overall effective rate).

Financial institutions, as part of their borrowing policy, must comply with the above-mentioned texts.

Moreover, borrowing must be part of the corporate object and of the corporate interest of the borrower.

**Giving and taking guarantees and security**

*Are there any restrictions on giving and taking guarantees and security?*

**Capacity**

The creation of a guarantee or security by a company implies that the latter has the ability to act on it, regarding its corporate documents and provisions applicable under Moroccan law.

In particular, the following conditions must be met:

- the act must fall within the company's corporate purpose;
- the act must not be contrary to the social interest of the company;
- authorization given by the competent corporate bodies of the company to conclude the act;
- power of the signatory;
- where applicable, compliance with the regime of regulated agreements.

**Insolvency**

The court could cancel any provision of a guarantee or security when it is made by the debtor after the date on which payments are suspended.

**Financial assistance**

The principle of prohibition of financial assistance is the prohibition on a company financing or guaranteeing the purchase of its own shares.

**What are common types of guarantees and security?**

**Common forms of guarantees**

Guarantees can take a number of forms, the more common ones being:

- a corporate guarantee (*cautionnement*), which is an undertaking taken by a guarantor towards a beneficiary to pay a debtor's debt in case of non-payment by the latter (such guarantee is ancillary to the principal obligation – the obligations of the guarantor are closely linked to the obligations of the main debtor);

- an autonomous guarantee (*garantie autonome*), which is an undertaking taken by a guarantor, in light of a third party's obligation, to pay a sum of money to a beneficiary on first demand or upon the terms and conditions agreed between the parties (it is a non-ancillary separate and distinct obligation – the guarantor may not raise any exception pertaining to the obligation of the debtor and, unless otherwise agreed between the parties, such guarantee does not follow the guaranteed obligation); and

- a letter of intent (*lettre d'intention, lettre de confort or lettre de patronage*), which is an undertaking to do or not to do, so as to support a debtor in the performance of its obligation towards the creditor (its purpose is to ensure that the debtor will be in a position to satisfy its obligations - otherwise, the issuer of the letter will have to indemnify the creditor for any damages incurred because of such failure).
Common forms of security

MORTGAGES (HYPOTEQUES)

A mortgage is "an accessory real right relating to immovable property registered or in the process of being registered and used to guarantee the payment of a debt".

It may be conventional or forced and is subject to strict conditions for the constitution of the property and the rights that may be mortgaged, the grantor, the principle of speciality, form and publicity.

PLEDGE WITH DISPOSSESSION AND PLEDGE WITHOUT DISPOSSESSION

Moroccan law makes a distinction between the pledge with dispossession which requires the dispossession of the pledged asset (gage) and the pledge without dispossession which does not require such dispossession (nantissement).

There are several types of security interest that are suitable for securing different types of assets such as receivables, bank accounts and securities accounts.

A national electronic register of pledges has been created by the law 21-18 dated 22 April 2019 which should be functional at the beginning of 2020 and administrated by the Ministry of the Economy and Finance.

ASSIGNMENT OF TRADE RECEIVABLES

The Moroccan legislator was inspired by the Dailly assignment under French law to establish the legal framework for the assignment of professional receivables.

Moroccan law defines the transfer as "the delivery, by way of a slip to a banking institution, of the claim held on a third party, a natural person in the exercise of its activity, or a legal person governed by private or public law".

Are there any other notable risks or issues around giving and taking guarantees and security?

The main points that should be checked are as follows.

Risks issued from the reform of security over movable assets and the planned establishment of the national electronic pledge register

Vigilance is needed to the substantive and formal requirements applicable to each guarantee and security to be granted, in particular following the reform of security over movable assets and the planned establishment of the national electronic pledge register.

Some guarantees and securities require, for example, mandatory statements of the validity of the act. This is the case, for example, for the transfer of trade receivables, which requires the insertion of information listed in Moroccan law.

Regarding the pledge without dispossession, a distinction should be made between the scheme before the establishment of the national electronic register and the subsequent scheme. The latter should be launched at the beginning of 2020.

Prior to the establishment of the said register, the pledge must be registered and filed with the clerk's office of the competent commercial court, which will keep an extract from the act making it enforceable against third parties.

Subsequent to the establishment of the register, the pledge must be entered in the said register and notified to the bank holding the debtor's account.

Specific rules applicable to guarantees granted by companies

The Moroccan Law 78-12 provides for rules applicable to certain guarantees granted by companies. For instance, it is not possible for some companies to guarantee the obligations of managers and shareholders and/or directors. Specific advice should be sought...
depending on the form of company.

Handwritten wording to be inserted in a corporate guarantee (cautionnement)

In a guarantee granted by a private deed, it is required that the guarantor write by hand the amount of the secured obligations in words and figures.

Specific rules applicable to corporate guarantee (cautionnement) granted by individuals

The Moroccan Law 31-08 provides for specific rules applicable to corporate guarantees granted by individuals. In particular, the guarantors' undertaking shall be proportionate to its revenues and assets at the time when the guarantee is granted, except if the guarantor's assets are sufficient to satisfy its obligations when the guarantee is called.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

- The Dahir of 12 August 1913 establishing the Code of Obligations and Contracts;
- The Dahir No. 1-96-83 of 1 August 1996 promulgating Law No. 15-95 which establishes the Commercial Code;
- The Dahir No. 1-11-03 of 18 February 2011 promulgating Law No. 31-08 which provides consumer protection measures;
- The Dahir No. 1-14-193 of December 24, 2014 promulgating Law No. 103-12 on credit institutions and similar bodies;
- The circulars and directives of Bank Al-Maghrib (BAM) and the Moroccan capital market authority (Autorité marocaine du marché des capitaux/AMMC);
- The Law No. 18-95 establishing the investment charter (charte de l'investissement).

Last modified 6 Jan 2020

Regulatory authorization

Who are the regulators?

Morocco has two (2) main regulators:

- Bank Al-Maghrib (BAM) which ensures the proper functioning of the banking system and ensures the application of the laws and regulations relating to the exercise and control of the activity of credit institutions and similar bodies;
- L'Autorité Marocaine du Marché des Capitaux/AMMC (Moroccan capital market authority) whose main objective is to ensure effective market and stakeholder supervision and, more generally, to support the market development process.

In addition of these two regulators, there is the Comité des Etablissements de Crédits (the credit institutions committee), which carries out all studies relating to the activity of credit institutions, in particular, their relations with customers and public information. This committee is chaired by the Wali (Governor) of Bank Al-Maghrib.

Last modified 6 Jan 2020

What are the authorization requirements and process?
The exercise of banking activity is subject to obtaining an authorization issued by the Wali (Governor) of Bank-Al Maghrib after consulting the Credit Institutions Committee.

Banking activities in Morocco must be carried out in accordance with the legal requirements relating to legal form, share capital or assets and liabilities.

The regulators assess whether the application meets the required conditions such as:

- the nature of the approval requested;
- the capital providers, the home group and the shareholders of the institution seeking approval;
- the legal documentation and governance of the said institution;
- the presentation of the project, its objectives, its implementation schedule, the related business plan and the human, technical and financial resources necessary for its implementation;
- internal control, risk management, anti-money laundering and anti-terrorist financing and personal data protection systems;
- the approval file of the auditors whose appointment is being considered;
- in the event of affiliation with a financial institution, the supervision exercised by the said institution and the prudential supervision to which it is subject;
- the opinion of the home country supervisory authority where the applicant institution is a foreign financial institution.

What are the main ongoing compliance requirements?

The compliance requirements are:

- compliance with the legal form of institutions carrying out banking activities;
- compliance with legal and economic conditions (minimum share capital, compliance of an asset/liability ratio, condition of good reputation of directors, competence, etc.).

What are the penalties for failure to be authorized?

Criminal sanctions applicable to individuals carrying out a regulated activity without authorization:

- imprisonment from 3 months to 1 years and/or a fine of MAD20,000 to MAD200,000 for any person improperly using a trade name, a company name or an advertisement and, in general, any expression suggesting that he is authorized as a credit institution;
- imprisonment from 6 months to 3 years and/or a fine of MAD100,000 to MAD5 million for any person who carries out operations for which he has not been approved;
- the court may also order the closing of the establishment where the offence was committed and the publication of the judgment in the newspapers it designates at the convicted person's expense.

Criminal sanction applicable to legal entities provided by the Law for failure to be authorized is the closing of the entity where the offence was committed.

Regulated activities

What finance and investment activities require authorization?
Activities requiring authorization include:

- receiving funds from the public;
- credit transactions;
- issuing means of payment to customers and their management;
- foreign exchange transactions;
- transactions on gold, precious metals and coins;
- life and health insurance, assistance, credit insurance and any other insurance transactions;
- leasing of movable or immovable property;
- investment services (including, in particular, the management of financial instruments, trading of financial instruments on own account or on behalf of third parties or the receipt and transmission of orders on behalf of third parties).

*Are there any possible exemptions?*

Moroccan law provides exemption from licensing for certain limited transactions.

Thus, any person can perform the following operations:

- grant its contractors, in the exercise of its professional activity, payment deadlines or advances, in particular in the form of commercial credit;
- conclude lease with option to purchase contracts for housing;
- carry out treasury transactions with companies that have, directly or indirectly, capital ties with it and giving to one of them effective control over the other companies;
- issue securities and debt securities negotiable on a regulated market;
- grant advance on salaries or loans to its employees for social reasons;
- issue vouchers and cards issued for the purchase of specified goods or services from it;
- take or repurchase securities listed on the stock exchange, negotiable debt securities or securities issued by the public treasury;
- provide cash as a guarantee of securities lending transactions.

*Do any exchange controls or other restrictions on payments apply?*

In Morocco there is a foreign exchange regulation implemented by the foreign exchange office. The foreign exchange office is a public authority under the supervision of the Ministry of Finance. Investment and funding made outside Morocco are subject to prior approval of the foreign exchange office. Investment and funding made to Africa are encouraged by the office.

Moroccan residents are entitled to an annual tourist allowance in foreign currency of the equivalent of MAD20,000 per trip up to a maximum of MAD45,000 per calendar year.

The tourist allowance that will be issued, for travel, by a bank, exchange office or money transfer intermediation company duly authorised to carry out manual exchange, must be used within 60 days from the issue or returned to the bank counters in the event of non-use.

*What are the rules around financial promotions?*
Moroccan law defines the concepts as well as the persons authorized to carry out financial solicitation (démarchage).

A financial solicitation occurs when a person in contacted without having requested it, by any means whatsoever (mail, phone etc.), to offer a potential transaction on financial instruments.

Only financial intermediaries and natural legal persons authorised by the financial intermediaries are authorised to carry out financial solicitation.

**Entity establishment**

*What types of legal entity are generally used to undertake financial or investment activity?*

Banking institutions headquartered in Morocco must have the legal status of a fixed-capital public limited company or of a cooperative company with floating capital.

**Is it possible to conduct lending or investment business through a branch or establishment?**

Credit institutions headquartered abroad may apply for the establishment of a subsidiary or the opening of branch in Morocco.

**FinTech**

**FinTech products and uses**

*What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?*

**Crowdfunding**

The law on collaborative financing or crowdfunding was adopted by the Government of Morocco to regulate the activity of electronic collaborative funding platform (plateforme électronique de financement collaborative, or PFC). This law created the status of the collaborative funding company (société de financement collaboratif, or SFC) to manage PFCs and defined a system for the accreditation of SFC and for the supervision and monitoring of collaborative financing. The law also defines the SFC commitments and obligations, in particular with regard to public information, advertising and reporting.

**Blockchain, smart contracts and cryptocurrencies**

In 2017, the foreign exchange office in Morocco initially banned the use of crypto currencies sending a negative signal to the players of the Blockchain industry.

Then, the Governor of Bank Al Maghrib caused a turnaround by integrating the Blockchain and cryptos currencies into the digitalization charter of the 2019- strategic plan 2023 of Bank Al Maghríb.
