- imprisonment from 6 months to 3 years and/or a fine of MAD100,000 to MAD5 million for any person who carries out operations for which he has not been approved;
- the court may also order the closing of the establishment where the offence was committed and the publication of the judgment in the newspapers it designates at the convicted person's expense.

Criminal sanction applicable to legal entities provided by the Law for failure to be authorised is the closing of the entity where the offence was committed.

Regulated activities

What finance and investment activities require authorization?
Activities requiring authorization include:

- receiving funds from the public;
- credit transactions;
- issuing means of payment to customers and their management;
- foreign exchange transactions;
- transactions on gold, precious metals and coins;
- life and health insurance, assistance, credit insurance and any other insurance transactions;
- leasing of movable or immovable property;
- investment services (including, in particular, the management of financial instruments, trading of financial instruments on own account or on behalf of third parties or the receipt and transmission of orders on behalf of third parties).

Last modified 6 Jan 2020

**Are there any possible exemptions?**

Moroccan law provides exemption from licensing for certain limited transactions.

Thus, any person can perform the following operations:

- grant its contractors, in the exercise of its professional activity, payment deadlines or advances, in particular in the form of commercial credit;
- conclude lease with option to purchase contracts for housing;
- carry out treasury transactions with companies that have, directly or indirectly, capital ties with it and giving to one of them effective control over the other companies;
- issue securities and debt securities negotiable on a regulated market;
- grant advance on salaries or loans to its employees for social reasons;
- issue vouchers and cards issued for the purchase of specified goods or services from it;
- take or repurchase securities listed on the stock exchange, negotiable debt securities or securities issued by the public treasury;
- provide cash as a guarantee of securities lending transactions.

Last modified 6 Jan 2020

**Do any exchange controls or other restrictions on payments apply?**

In Morocco there is a foreign exchange regulation implemented by the foreign exchange office. The foreign exchange office is a public authority under the supervision of the Ministry of Finance. Investment and funding made outside Morocco are subject to prior approval of the foreign exchange office. Investment and funding made to Africa are encouraged by the office.

Moroccan residents are entitled to an annual tourist allowance in foreign currency of the equivalent of MAD20,000 per trip up to a maximum of MAD45,000 per calendar year.

The tourist allowance that will be issued, for travel, by a bank, exchange office or money transfer intermediation company duly authorised to carry out manual exchange, must be used within 60 days from the issue or returned to the bank counters in the event of non-use.

Last modified 6 Jan 2020

**What are the rules around financial promotions?**
Moroccan law defines the concepts as well as the persons authorized to carry out financial solicitation (démarchage).

A financial solicitation occurs when a person in contacted without having requested it, by any means whatsoever (mail, phone etc.), to offer a potential transaction on financial instruments.

Only financial intermediaries and natural legal persons authorised by the financial intermediaries are authorised to carry out financial solicitation.

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

Banking institutions headquartered in Morocco must have the legal status of a fixed-capital public limited company or of a cooperative company with floating capital.

**Is it possible to conduct lending or investment business through a branch or establishment?**

Credit institutions headquartered abroad may apply for the establishment of a subsidiary or the opening of branch in Morocco.

**FinTech**

**FinTech products and uses**

**What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?**

**Crowdfunding**

The law on collaborative financing or crowdfunding was adopted by the Government of Morocco to regulate the activity of electronic collaborative funding platform (plateforme électronique de financement collaboratif, or PFC). This law created the status of the collaborative funding company (société de financement collaboratif, or SFC) to manage PFCs and defined a system for the accreditation of SFC and for the supervision and monitoring of collaborative financing. The law also defines the SFC commitments and obligations, in particular with regard to public information, advertising and reporting.

**Blockchain, smart contracts and cryptocurrencies**

In 2017, the foreign exchange office in Morocco initially banned the use of crypto currencies sending a negative signal to the players of the Blockchain industry.

Then, the Governor of Bank Al Maghrib caused a turnaround by integrating the Blockchain and cryptos currencies into the digitalization charter of the 2019- strategic plan 2023 of Bank Al Maghrrib.

This unblocking has enabled Blockchain operations to be set up in Morocco, although adequate regulation and the creation of tools to ensure the security of the value chain are still expected.
In particular, the Kingdom of Morocco has created a Digital Development Agency (ADD) in charge of promoting and developing new technologies.

Last modified 6 Jan 2020

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

Bank Al-Maghrib and the Moroccan Capital Market Authority (AMMC) are the main entities that supervise and regulate companies that provide banking and financial products and services.

It is prohibited to carry out a regulated activity in Morocco without a permit or exemption. A banking or financial activity is subject to authorization when it is identified as a regulated activity. As far as Fintechs are concerned, this is still a new concept in the Moroccan legal sphere. Strictly speaking, there are no specific regulations prohibiting or authorizing a particular type of FinTech activity.

However, the creation and operation of a high-tech company must be analysed on a case-by-case basis, taking into account existing laws and regulations applicable to banking, finance and insurance.

Financial regulators and legislators in Morocco have nevertheless been receptive to innovation in the field of information technology. For example, Moroccan law introduces the concept of participatory banking and Islamic banking for its contribution to the Fintechs.

It also introduces the concept of payment institution and agent of payment. In addition, the same company recognizes its electronic currency.

Electronic payment platforms and regulation of peer-to-peer lenders

Electronic payment platforms

Electronic payment platforms are considered as regulated payment service activities, offered by payment institutions and requiring an authorisation from Bank Al-Maghrib in accordance with Moroccan law.

Regulation of peer-to-peer lenders

The exercise of a regulated banking activity is considered as such if the company in question provides or facilitates loans and borrowings between individuals or between individuals and companies, through an electronic platform. Such activity may be carried out if the company is authorised as a credit institution, financing company or payment institution.

Regulation of payment services

When a company provides payment services as part of a regular activity in Morocco, it must be approved in advance by Bank Al-Maghrib. The provision of such services without authorization is a criminal offence.

Money laundering regulations

Moroccan law provides the regulations applicable to this type of offence.

In addition, the Anti-Money Laundering Act designates Bank Al-Maghrib as the authority responsible for controlling and supervising taxable persons within its field of competence.

In this respect, it is responsible, with regard to these persons subject to tax, for:

- Ensure that taxable persons comply with the provisions of the Law anti-money laundering;
- Establish the procedures for implementing the provisions of the said law (relating to the obligation of supervision and the obligation of internal monitoring).

Last modified 6 Jan 2020
What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

THE INITIAL INVESTMENT

Investment in FinTech companies can be made by the family and friends of the founders and other wealthy individuals (investors) in exchange for an equity stake. These investments are used to finance the company and growth the company's initial investment before more significant investments are available.

The people who invest can also bring their know-how and expertise to contribute to the development of the company.

CROWDFUNDING

Crowdfunding can be appropriate for a FinTech start-up company. It is the investment by individuals, in a company, through an intermediary platform.

VENTURE CAPITAL AND DEBT

Private equity is a financial activity that consists of a professional investor entering, for a fixed period of time, into the capital of companies, not listed on the stock market, requiring equity capital. Venture capital is one component of this.

It can finance start-up, growth, transmission or recapitalization in the event of difficulties.

It is an alternative source of financing available to companies facing the constraints and limits imposed by traditional sources of financing such as equity, bank financing and public offerings.

Venture capital financing is a type of equity investment that typically targets early-stage FinTech companies with an established business and business history. Venture capital is a viable alternative to traditional loans because it is unlikely that the company has the tangible assets or long history necessary to attract traditional debt financing from financial institutions.

Investors provide equity or quasi-equity financing to companies in the creation or start-up phase of their business.

Depending on the maturity of the project to be financed, venture capital is subdivided as follows:

- the creation finances the start-up of the company's activity;
- post-creation occurs when the company has already completed the development of a product and needs capital to start production and marketing.

SENIOR BANK DEBT

Once a FinTech company is established and proven, bank debt becomes a more viable source of financing, whether secured or unsecured, depending on the company's creditworthiness and assets. Unlike financing in financial markets, which often includes restrictive covenants, bank financing generally involves the imposition of restrictive covenants and financial controls that will apply throughout the duration of the facility.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Assignment of receivables / assignment of contract
The assignment of a receivable as well as the assignment of a contract brings together three persons: the original creditor (the assignor), the new creditor (assignee) and the debtor, who does not change.

The debtor will have to pay his debt to the assignee and no longer to his original creditor.

**Subrogation**

Subrogation, which may be conventional or legal, is governed by Moroccan law. This is an amendment to the legal relationship consisting in substituting one person for another.

**Novation**

Novation constitutes a mechanism for the extinction of an obligation by the creation of a new obligation in substitution. In other words, novation is a contractual effect which, either not as a result of the change of creditor or as a result of the change of debtor, modifies the conditions for the performance of a contract.

*What are the main considerations when transferring a loan and related security?*

The main considerations to be taken into account when transferring a loan are as follows:

- the consent of the parties;
- eligibility of the lender;
- formalities of enforcement;
- confidentiality;
- protection of personal data;
- banking monopoly.

**Projects**

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

**Energy and power**

Regarding electrical energy, it is the National Electricity Office (ONE), a public body with industrial and commercial functions, which is responsible in particular for producing and managing electricity. Subject to prior approval by the ONE and eligibility of the project, private companies may create and operate means of electricity generation. Electricity transmission is also operated by the ONE.

Regarding energy production infrastructure (hydroelectricity, renewable energy, wind power, etc.), it is owned by the private companies in charge of the various projects.

**Oil and gas**

Morocco's National Office of Hydrocarbons and Mines (Office national des hydrocarbures et des mines i.e. ONHYM) was created on 17 August 2005 to contribute to economic development by developing Morocco's natural oil and mining resources (excluding phosphates).

Regarding Gas distribution, this activity is carried out by private companies such as Afriquia or Akwa Group.
Telecommunications sector

A majority of the telecommunications networks are owned by private companies (Maroc télécom, Orange, Inwi). Nevertheless, the State remains, in part, the owner of part of the capital of certain companies.

The telecommunications sector is regulated and managed by the National Telecommunications Regulatory Agency (ANRT), which is a Moroccan public body.

Transport infrastructures

THE RAILWAY NETWORK

Rail infrastructures are owned by the National Railway Agency (ONCF). The ONCF is responsible for operating the country’s rail network and is a public body with industrial and commercial functions. It is financially independent and placed under the supervision of the Ministry of Equipment and Transport.

HIGHWAYS

The Moroccan highway network is owned to a very large extent by the Moroccan State through the Moroccan Highways National Company (ADM), which is a public limited company with public capital.

ADM’s capital is mainly held by the public purse and the Hassan II fund. A tiny part of the capital is held by private institutions.

AVIATION

The airports are managed by the National Office of Airports (ONDA).

The aviation sector is regulated by the Directorate-General for Civil Aviation.

Other infrastructures

Social infrastructure (schools, hospitals, jails, etc.) is owned in some cases by the State.

Are there special rules for investing in energy and infrastructure?

There are no specific regulations applicable to investments in energy and infrastructure in Morocco, subject to antitrust clearance.

The State also encourages investors to invest in the energy sector.

Depending on the projects under consideration, prior authorisation from the relevant authorities should be obtained.

What is the applicable procurement process?

The public procurement is based on constitutional principles:

- Freedom of access to public procurement;
- Competitive bidding of candidates;
- Guarantee of competitors’ rights;
- Equal treatment of competitors;
- Transparency in the choice of the project owner.

These principles imply the respect of some basic rules:
• Preliminary definition of needs;
• Compliance with disclosure obligations;
• Call for competition;
• Choice of the most advantageous offer.

Public procurement must:
• Obey principles and rules laid down by the regulations in force;
• Be carried out in accordance with the conditions and forms.

Under Moroccan law, three procedures limit competition:
• Restricted tender process;
• Negotiated contracts;
• Services on purchase orders.

This decree also allows public purchasers to use certain procedures known as exceptional procedures under the competition rule in very specific cases under the regulations in force, and this:
• to deal with certain cases of force majeure;
• to take into account the specificities of certain departments, but also of certain services;
• as a facility for management services.

**What are the most common forms of funding / investing in energy and infrastructure?**

The different forms of funding/investing in Morocco are mainly:

**Loan**

The bank loan deals with all types of projects. However, it is necessary to provide a minimum amount of equity capital and to bear a certain level of risk. To grant loans, banks often require the personal guarantee of the project owner, who must, for example, accept a mortgage on his home or the pledge of his movable property.

**Investment capital**

This type of investment can be made at different stages of the company's development cycle. In most cases, investment funds are specialized according to the development phase in which they operate:

• Venture capital or seed capital for investments in start-ups;
• Growth capital for investments in developing companies, with at least 3 to 5 years of activity. The equity investment generally takes the form of a capital increase and is intended to help the company financing ambitious growth projects;
• Transmission capital for investments in mature companies with stable growth, and corresponds to the sale of shareholders (usually creators) of their shares in the company.

**Restructuring**

**Enforcement and sanctions**
When can there be regulatory investigations?

Bank Al Maghrib is responsible for (i) monitoring credit institutions’ compliance with the legal provisions applicable to them, (ii) verifying the adequacy of the administrative and accounting organisation and the internal control system of those institutions and (iii) to ensure the quality of their financial situation.

In the course of its duties, BAM is authorized to carry out on-the-spot and documentary inspections of the above-mentioned establishments by its agents or by any person commissioned for this purpose by the Governor.

In addition, BAM may ask the bodies under its control to communication of all documents and information necessary to the performance of its control mission.

What regulatory penalties may apply?

In the event of a breach of the legal provisions, there are disciplinary sanctions (financial penalty, warning, warning or injunction) or criminal sanctions such as a fine or imprisonment or the closure of institutions.

What criminal penalties may apply?

The criminal sanctions that may apply to credit institutions and their employees are listed under Moroccan law. These include, in particular:

- imprisonment of up to three (3) years;
- fine of up to MAD2 million;
- closure of the establishment where the offence was committed;
- publication of the judgment in the newspapers designated by the court at the convicted person's expense.

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Moroccan law provides that acts and agreements drawn up in Morocco, acts and agreements concluded in a foreign country relating to property, rights or transactions whose base is located in Morocco and all other acts and agreements concluded outside Morocco and producing their legal effects in Morocco are subject to registration formalities.

Moreover, stamp duties, in whatever form, shall be imposed on all acts, documents, books, registers or records drawn up in order to constitute the title to or justification of a right, obligation, or discharge and, in general, to establish a legal fact or legal relationship.

It should be noted that the Moroccan law exempts acts recording credit transactions between individuals and credit institutions and similar bodies as well as real estate credit transactions concluded between individuals and finance companies are exempt from registration and stamp duties.
**Do tax authorities take priority on enforcement?**

The Treasury has a general lien on moveable properties and other personal effects belonging to taxpayers wherever they are located. Therefore, when the tax has not been paid on the due date and in the absence of a claim with a request for suspension of payment, the Treasury accountant must send the taxpayer a letter of formal notice at least 20 days before the first act of prosecution is notified.  

*Last modified 6 Jan 2020*

**Is withholding tax on interest payments applicable?**

Credit institutions and similar bodies are permanently exempt from withholding tax on interest and other similar income.

*Last modified 6 Jan 2020*

**Are foreign lenders and debt security holders subject to tax on interest payments?**

No.

*Last modified 6 Jan 2020*

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

Yes.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in the Netherlands or to request that they be admitted to trading on a regulated market operating in the Netherlands unless an approved prospectus has been made available to the public.

The Dutch Authority for the Financial Markets (Autoriteit Financiële Markten) has published additional guidelines on issuing debt securities to the public in the Netherlands and/or their admission to trading on a regulated market operating in the Netherlands.

What are common issuing methods and types of debt securities?

Customarily the issuing entity itself will issue debt securities in the form of bonds which can take any of a number of forms.

What are the differences between offering debt securities to institutional / professional or other investors?

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in the Netherlands or to request that they be admitted to trading on a regulated market operating in the Netherlands unless an approved prospectus has been made available to the public.

Some exclusions and exemptions that could apply and relate to the type of investors are that no prospectus will need to be made publicly available for the offer of debt securities to the public in the Netherlands in the event that:

- the securities are offered exclusively to qualified investors;
- the securities are offered to fewer than 150 persons, other than qualified investors;
- the securities on offer can only be acquired for an equivalent value of at least €100,000 per investor; or
- the denomination per security is at least €100,000.

Last modified 6 Dec 2019
When is it necessary to prepare a prospectus?

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in the Netherlands or to request that they be admitted to trading on a regulated market operating in the Netherlands unless an approved prospectus has been made available to the public.

Below, the most relevant exclusions and exemptions are discussed.

No prospectus will need to be made publicly available for the offer of debt securities to the public in the Netherlands in the event that:

- the securities are offered exclusively to qualified investors;
- the securities are offered to fewer than 150 persons, other than qualified investors;
- the securities on offer can only be acquired for an equivalent value of at least EUR100,000 per investor;
- the denomination per security is at least EUR100,000; or
- the offer of securities to the public have a total consideration in the European Union of less than EUR 1,000,000 calculated over a period of 12 months.

Lastly, no prospectus will need to be made publicly available for offering debt securities to the public in the Netherlands or requesting that the debt securities will be admitted to trading on a regulated market operating in the Netherlands, if:

- the debt securities have a total consideration in the EU of less than EUR 5 million - this threshold is lower than the EUR 8 million maximum threshold possible under the Prospectus Regulation. For offers below EUR 5 million, the issuer in the Netherlands must: (i) notify the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten, AFM) of the offering of securities to the public; and (ii) complete an information document in the form required under Dutch law, submit the completed form to the AFM and make the information document available to investors;
- it concerns a very specific type of securities.

What are the main exchanges available?

Currently, the following exchanges are authorized to operate as a regulated market in the Netherlands:

- Euronext N.V.;
- Euronext Amsterdam N.V.;
- ICE ENDEX; and
- Nxchange.

Furthermore, TOM B.V. is authorized as a multilateral trading facility in the Netherlands.

Is there a private placement market?

Yes.

Are there any other notable risks or issues around issuing or investing in debt securities?
There are no specific risks under Dutch law (other than regulatory considerations and general doctrines).

Issuing debt securities

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document and oral statements concerning the issue of the offering document or the content of the offering document can give rise to both civil and criminal liability under Dutch law. The requirements are specified in case law on this subject. The Netherlands furthermore has various investor protection statutory provisions relevant to liability for an inaccurate offering memorandum.

Investing in debt securities

There are no specific Dutch law related risks or issues in relation to the issue of debt securities.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Undertakings for Collective Investment in Transferable Securities (UCITS)

According to Dutch law, no party may offer units in UCITS in the Netherlands:

- unless the management company of the UCITS has been licensed by the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten) to manage UCITS or is otherwise exempt form this license obligation; or

- in the case of a company for collective investments in securities without a separate management company, if the company for collective investments has not been licensed by the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten) or is otherwise exempt from this license obligation.

Alternative Investment Funds

According to Dutch law, no party may offer units in a collective investment scheme in the Netherlands:

- unless the management company of the collective investment scheme has been licensed by the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten) to manage collective investment schemes or is otherwise exempt form this license obligation; or

- in the case of a collective investment company without a separate management company, if the investment company has not been licensed by the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten) or is otherwise exempt form this license obligation.

What are common fund structures?

Common forms of funds include:

- open-ended and closed-ended funds;

- retail and non-retail funds (including Alternative Investment Funds (AIFs));

- Undertakings for Collective Investments in Transferrable Securities (UCITS) and non-UCITS funds; and

- qualified investor structures that invest in, for example, corporate shares or bonds, real property, commodities (for example, precious metals) and derivatives.
What are the differences between offering fund securities to professional / institutional or other investors?

Licensed fund vehicles/managers in the Netherlands may offer units to both retail investors and professional investors. Depending of the type of investor being dealt with (ie professional/institutional versus retail), different information provision requirements will be applicable. Higher levels of protection apply when offering units in fund vehicles to retail investors.

Are there any other notable risks or issues around establishing and investing in funds?

There are no specific risks to highlight here, other than the general regulatory framework that applies.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Yes.

Funds may only be marketed in the Netherlands once an authorization has been obtained. Furthermore, certain detailed marketing requirements may apply if marketing is targeted at retail investors (eg restrictions in relation to cold calling).

Are there any restrictions on managing a fund?

Yes.

Funds may only be managed after having obtained the relevant authorization.

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

The European Market Infrastructure Regulation applies to all derivative transactions and requires transactions to be reported to regulators, for transactions between dealers to be cleared or subject to other risk mitigation techniques such as initial margin and variation margin requirements.

Furthermore, as derivatives qualify as financial instruments, restrictions under the Markets in Financial Instruments Directive (2014/65/EU) as implemented in the Dutch Financial Supervision Act (Wet op het Financieel Toezicht) may apply (eg requirements that are applicable on the provision of investment services).

Furthermore, please note that in the Netherlands it is not usual to enter into a derivative contract with a non-professional party as this would be considered high risk.

What are common types of derivatives?
The following derivatives are common types in the Netherlands:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps);
- options (call options and put options); and
- warrants.

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007 to 2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. The European Commission has sought in particular, to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative positions;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result the derivatives market has seen and continues to see the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

The following lending activities require, in principle, authorization:

- providing banking activities, including lending;
- offering, directly or indirectly, credit to a consumer and managing or performing a credit agreement with a consumer;
- performing advisory services to a consumer in relation to credit;
- providing brokerage services to a consumer in relation to credit; and
- crowdfunding activities.

Borrowing

The following borrowing activities require, in principle, authorization:

- providing banking activities, including borrowing;
- crowdfunding activities; and
- attracting, obtaining or having the disposal of ‘callable funds’.

Callable funds is a term used by the Dutch legislator that includes deposits and other repayable funds as entailed in the definition of a
What are common lending structures?

In acquisition finance transactions, the most common lending structure is one by means of which funds are lent to a parent (holding company) or acquisition company which then uses the proceeds of the funds lent (together with an equity contribution (which can be structured as a debt instrument as well), to acquire the relevant target concerned. Senior/mezzanine structures are not commonplace anymore (the most dominant structure is currently a senior only structure). Direct lending and unitranche structures now also play a major part in the lending landscape in the Netherlands. The equity/debt mix is currently around 40/60 to 50/50.

Real estate finance transactions usually entail an opco/propco structure, whereas other forms of financing structure customarily entail lending directly to the relevant borrowing entity.

Loan durations

Senior financing customarily has a duration of five to seven years with mezzanine maturity dates being at least six months longer than the senior financing.

Loan security

Loan documentation usually contains a joint and several liability structure for all obligors. Security extends to receivables, moveable assets, shares, intellectual property and real estate.

Loan commitment

Committed loans are customary in the Netherlands.

Loan repayment

Repayment of loans can take any of a number of forms, the most common being amortizing (for A Facilities) and bullet (for B Facilities). The Loan market for repayment generally follows the Loan Market Association standard.

What are the differences between lending to institutional / professional or other borrowers?

The following financial services only need authorization in the event that the service is provided to a consumer:

- offering, directly or indirectly, credit to a consumer and managing or performing a credit agreement with a consumer;
- providing advisory services to a consumer in relation to credit; and
- providing brokerage services to a consumer in relation to credit.

Therefore, if these services are solely provided to institutional or professional (ie non-consumer) borrowers, the services are not regulated under the Financial Supervision Act (Wet op het financieel toezicht). However, in the event that a financial entity has obtained an authorization, various rules will be applicable to this financial entity (eg rules concerning its governance structure, conduct of business and operational management).

A bank (ie a credit institution) will need authorization in the event that banking services are provided to consumers and/or
non-consumers. The rules that are applicable to banks (e.g., rules concerning their governance structure, conduct of business, operational management, proper service providing and financial health of the company) are applicable to all activities that the bank performs, including lending to consumers and non-consumers. However, the more professional the client of the bank is, the less far-reaching the rules concerning proper service providing are (e.g., the more professional, the less (pre-) contractual information duties will be applicable to the bank).

Furthermore, based on Dutch civil law, a (special) duty of care is applicable to financial entities, including banks. This (special) duty of care requires that banks should, in all their activities, take the interest of their clients (consumers and non-consumers) into account. The more professional the client of the bank is, the less far-reaching the (special) duty of care of the bank towards its client will be.

Please note that this concept is developed in Dutch legal precedents and that it is subject to continuous change. The (special) duty of care that a bank might have, is highly dependent on the specific circumstances of the case.

In conclusion, lending to institutional/professional borrowers is subject to less regulatory oversight and so is less burdensome from a compliance perspective.

Do the laws recognize the principles of agency and trusts?

The principle of agency is recognized under Dutch law.

Although a trust cannot be created under Dutch law, foreign trusts may be recognized by the Dutch courts under certain conditions.

Are there any other notable risks or issues around lending?

There are no specific Dutch law risks around lending.

Generally

Although there are no specific Dutch law risks around lending, regard needs to be had to certain general doctrines of law (comparable to similar doctrines in non-Dutch jurisdictions) when extending loans, such as ultra vires, corporate power, fraudulent conveyance and other laws of general application.

Specific types of lending

Lending to consumers is highly regulated under the Dutch Financial Supervision Act (Wet op het Financieel Toezicht). Furthermore, based on Dutch civil law, a (special) duty of care is applicable to financial entities, including banks. This (special) duty of care entails that financial entities should, in all their activities, take the interest of their clients (consumers and non-consumers) into account. The more professional the client of the financial entity is, the less far-reaching the (special) duty of care of the financial entity towards its client will be. Please note that this concept is developed in Dutch legal precedents and that it is subject to continuous change. The (special) duty of care that a financial entity might have, is highly dependent on the specific circumstances of the case.

Standard form documentation

The Netherlands frequently uses standard Loan Market Association-based documentation in extending credit.

Are there any other notable risks or issues around borrowing?

There are no specific Dutch law risks around borrowing.

Borrowers should be aware of the potential implications of the EU's Bank Recovery and Resolution Directive (BRRD, as amended), which
outlines certain measures for dealing with failing financial institutions.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to 'bail in' obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. 'Bail in' describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of English or other EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

Last modified 6 Dec 2019

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the giving of guarantees and security are as follows.

Perfection pledges over moveable assets and receivables which are pledges on a non-disclosed basis need to be registered with the Dutch tax authorities in order to become effective. Pledges over receivables pledged on a disclosed basis need to be notified to the relevant debtors concerned, whereas mortgages over real estate and registered vessels and aircraft need to be registered with the Dutch registrable property registry (kadaster).

When receivables are pledged on a non-disclosed basis, the debtor remains entitled to validly discharge the debt by paying the pledgor (as opposed to the pledgee) until the debtor has received notification of the pledge.

Guarantees have essentially three forms under Dutch law, ie joint and several liability (whereby all debtors are obliged, as their own debt, to pay the relevant obligations concerned), a suretyship (whereby a debtor guarantees the performance of the obligations of another person) and an abstract guarantee (being a guarantee payable on demand, irrespective of the existence of any underlying obligation).

Last modified 6 Dec 2019

What are common types of guarantees and security?

Common forms of guarantees

Guarantees have essentially three forms under Dutch law, ie joint and several liability (whereby all debtors are obliged, as their own debt, to pay the relevant obligations concerned), a suretyship (whereby a debtor guarantees the performance of the obligations of another person) and an abstract guarantee (being a guarantee payable on demand, irrespective of the existence of any underlying obligation).

Common forms of security

Pledges on shares, receivables, moveable assets, intellectual property and mortgages on registrable objects.

Last modified 6 Dec 2019

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

The nature of the guarantee has an impact on the extent of your recourse claim (ie with a suretyship the recourse claim relates to the full amount paid under the suretyship arrangement whereas with a joint and several liability the recourse claim is limited to the amount the that concerns the joint and several debtors in their relationship with each other (dat hem in hun onderlinge verhouding aangaat).
Giving or taking security

When receivables are pledged on a non-disclosed basis, the debtor remains entitled to validly discharge the debt by paying the pledgor (as opposed to the pledgee) until the debtor has received notification of the pledge. In addition, perfection requirements need to be observed in order to create valid security (for pledges of receivables on a non-disclosed basis and pledges of moveable assets the perfection requirement is met by offering the pledge deed for registration with the Dutch tax authorities and for disclosed pledges on receivables the perfection requirement is met by notifying the relevant debtors concerned. Mortgages are perfected by registering the mortgage in the public registers).

Financial regulation

Law and regulation

*What are the main laws and regulations that apply to entities that are involved in finance and investments generally?*

**Generally**

Financial Supervision Act (*Wet op het financieel toezicht*),
Market Conduct Supervision Decree (*Besluit gedragstoezicht financiële ondernemingen*),
Prudential Rules Decree (*Besluit prudentiële regels Wft*),
Exemption Regulation (*Wrijstellingsregeling Wft*),
Economic Offences Act (*Wet Economische Delicten*).

**Consumer credit**

Financial Supervision Act (*Wet op het financieel toezicht*),
Consumer Credit Act 1974 (as amended), as implemented in Book 7 of the Civil Code (*Burgerlijk Wetboek*),
Consumer Credit Act (*Wet op het consumentenkrediet*).

**Mortgages**

Financial Supervision Act (*Wet op het financieel toezicht*),
Mortgage Credit Directive (2014/17/EU), as implemented in Book 7 of the Civil Code (*Burgerlijk Wetboek*),
Market Conduct Supervision Decree (*Besluit gedragstoezicht financiële ondernemingen*).

**Corporations**

Financial Supervision Act (*Wet op het financieel toezicht*),
Book 2 of the Civil Code (*Burgerlijk Wetboek*),
Corporate Governance Code 2016.

**Funds and platforms**

The European Venture Capital Funds (EuVECA) regulation (345/2013/EU),
The European social entrepreneurship funds (EuSEF) regulation (346/2013/EU).

**Other key market legislation**
Regulatory authorization

Who are the regulators?

The Netherlands has a 'twin-peaks' supervisory model. This entails the division of supervision into two areas:

- prudential supervision, on the soundness of financial entities and the stability of the financial industry (this area is supervised by the Dutch Central Bank (de Nederlandsche Bank)); and
- market conduct supervision, on the market conduct of entities that are active on the financial markets (this area is supervised by the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten)).

In addition, since 4 November 2014, the European Central Bank – in cooperation with the Dutch Central Bank (de Nederlandsche Bank) – carries out the prudential supervision on Dutch 'significant banks' directly and Dutch 'less significant banks' indirectly. The market conduct supervision of all - significant and less significant - banks remains with the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten).

What are the authorization requirements and process?

Depending on the nature of a firm and the activities it intends to engage in, authorizations may be required from one or more of the European Central Bank, Dutch Central Bank (de Nederlandsche Bank) and/or the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten) for authorization.

- The European Central Bank issues banking (ie credit institution) licenses. The license application must be submitted to the Dutch Central Bank (de Nederlandsche Bank), which will then process the application in close cooperation with the European Central Bank.
- The Dutch Central Bank (de Nederlandsche Bank) issues authorizations to financial entities, including insurers, payment institutions and pension funds.
- The Dutch Authority for the Financial Markets (Autoriteit Financiële Markten) issues Authorizations to financial entities, including investment firms, trading venues, (managers of) collective investment schemes (Alternative Investment Fund Managers and Undertakings for Collective Investment in Transferable Securities) and financial service providers.

Some of the authorization processes require a mandatory advice of the Dutch Central Bank (de Nederlandsche Bank) from the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten) and vice versa. This means that the regulatory authorities cannot authorize certain entities without the opinion of the other regulatory authority in the 'twin-peaks' supervisory model.

All communications, including the application, may be in English (including physical meetings). If deemed necessary, eg for technical legal reasons, some documents/communications may have to be in Dutch.
As part of the authorization process, depending on the type of authorization, the regulatory authorities might assess key individuals (eg daily policymakers, members of the supervisory board) on their suitability for their prospective role within the financial entity and/or on their integrity in general.

Authorized financial entities are listed in the AFM Register (register kept by the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten)) and/or DNB Register (register kept by the Dutch Central Bank (de Nederlandsche Bank). In addition, the European Central Bank keeps a list of significant and less significant banks in countries that adopted the Euro. This list is published on its website.

Depending on the type of application, an application fee applies (ranging from €1,000 to €150,000). There may also be ongoing yearly fees applicable and fees for specific acts/authorizations of the regulatory authorities (eg a declaration of no objection). In principle, the regulator has 13 weeks, for banks 26 weeks, to decide on the application. However, in practice this term is – depending on the circumstances – often extended.

Last modified 6 Dec 2019

What are the main ongoing compliance requirements?

The main ongoing compliance requirements for authorized financial entities, include rules concerning:

- the governance structure;
- the conduct of business;
- operational management;
- proper service provision (eg know-your-customer requirements and provision of information to customers); and
- the financial health of the company (eg concerning equity capital, solvency and liquidity).

Last modified 6 Dec 2019

What are the penalties for failure to be authorized?

Failure to be authorized can, among others, lead to:

- orders for incremental penalty payments and publication thereof;
- administrative fines (with a maximum of € 5 million (exemptions may apply, eg higher fines in case of recidivism) and publication thereof;
- criminal sanctions, including a fines or imprisonment; and
- directions or public warnings.

Last modified 6 Dec 2019

Regulated activities

What finance and investment activities require authorization?

Generally

A financial entity must not carry on a regulated activity unless authorized or exempt.

Among others, the following finance and investment activities require, in principle, authorization:

- providing banking activities;
- providing investment firm activities (eg provision of execution only services, investment advice, portfolio management, equity based crowdfunding and dealing in financial instruments);
• offering alternative investment fund or undertaking for collective investment management and marketing;
• offering and/or servicing of financial products, eg investment objects and consumer credit;
• brokerage and advisory services in relation to financial products, eg investment objects and consumer credit; and
• attracting, obtaining or having the disposal of ‘callable funds’ (eg crowdfunding).

Callable funds are deposits and other repayable funds as entailed in the definition of a credit institution under the Capital Requirements Regulation (Regulation (EU) 575/2013). No authorization, but an exemption is required for financial entities in this regard. With this exemption, financial entities may for example give out bonds to the public which would normally be covered by a restriction on these activities for which authorization is required.

**Consumer credit**

The following activities require, in principle, authorization:

• directly or indirectly offering credit to a consumer and/or managing or performing a credit agreement with a consumer;
• providing advisory services to a consumer in relation to credit; and
• performing brokerage activities to a consumer in relation to credit (this authorization requirement may, under certain circumstances, apply to debt collection agencies).

**Are there any possible exemptions?**

Yes, to certain regulated activities specific exemptions/exclusions may apply.

**General exclusion**

Firms that have obtained authorization in another EEA member state to perform regulated activities, in principle, would not need to obtain a Dutch authorization. These firms could, in principle, ‘passport’ their EEA authorization into the Netherlands and perform the regulated activities there.

**Specific exclusions**

For each type of regulated activity there are a number of specific exemptions that could also apply (eg an exemption to the requirement to obtain an authorization to provide banking activities may be available for group finance companies and an exemption to the requirement to obtain an authorization to provide investment services or perform investment activities may be available for the intragroup provision of these activities/services).

**Do any exchange controls or other restrictions on payments apply?**

The Netherlands does not operate any exchange controls.

Imports of physical foreign currency from non-EU member states may need to be declared to customs authorities.

EU rules on payments must be complied with and there may also be anti-money laundering and tax considerations to take into account.

**What are the rules around financial promotions?**

**Rules**
The Civil Code (Burgerlijk Wetboek) and the Financial Supervision Act (Wet op het financieel toezicht) lay down several rules on promotions regarding financial products (including consumer credit, mortgage and investment services).

Financial entities should provide their services 'carefully'. Furthermore, the rules require financial entities to ensure that financial promotional materials are accurate, clear and not misleading and recognizable as having a commercial objective. Furthermore, although exemptions apply, the information must be provided in writing and in the Dutch language.

In relation to advertisements for consumer credit services on television, radio, internet and printed media, additional rules apply, including the following requirements that:

- The advertiser must be clear about the costs of a loan, including stating the highest interest rate which may be applicable.
- The advertisement must not include promotional rates.
- A warning statement and symbol must be included in advertisements. This statement reads: 'Attention! Borrowing money costs money' (Let op! Geld lenen kost geld) (Warning). Other mandatory texts and illustrations as prescribed by the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten) must also be included.

If a consumer credit supplier does not communicate this required information, it may be held by the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten) to be engaging in unfair trade practices, resulting in damage-claims and enforcement by the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten). Furthermore, additional rules apply in relation to the advertising of complex financial products such as investment insurances or bank saving products.

As of 19 April 2019 the marketing, distribution or sale of binary options to retail investors in and from the Netherlands is prohibited; the marketing, distribution or sale of CFDs to retail investors in and from The Netherlands is restricted.

EXEMPTIONS

Several very specific exemptions apply, for example, such as the following:

- Where it is clear that mortgage credit is to be provided for the sole purpose of purchasing a house for personal use, it is not necessary to include the warning in promotional material.
- The language of the promotional information does not have to be Dutch if the consumer has asked for this and the financial entity has agreed, if parties have agreed on another applicable jurisdiction in a contract regarding a financial product or if the information is essential and the Dutch Authority for the Financial Markets (de Autoriteit Financiële Markten) has agreed on the use of the particular language.
- The information does not have to be provided in writing in cases the law provides for this (for example in case of non-personal information, if it is allowed to provide information on the website of the financial entity) or in the event that the customer has approved the information to be transmitted through another durable medium and this fits the relationship.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common types of legal entities are private limited companies (besloten vennootschap met beperkte aansprakelijkheid, B.V.) and public limited companies (naamloze vennootschap, N.V.), both of which are body corporates with separate legal personality and limit the
liability of their members.

Funds

The most common types of legal entities for funds are private limited companies (besloten vennootschap met beperkte aansprakelijkheid, B.V.), public limited companies (naamloze vennootschap, N.V), cooperative societies (coöperatieve vennootschap, c.v.) and Mutual Funds (Fonds voor Gemene Rekening, FGR).

Is it possible to conduct lending or investment business through a branch or establishment?

Yes

Financial entities that have obtained an EEA authorization to perform lending (e.g. banks) or investment activities could, in principle, passport their EEA authorization into the Netherlands and consequently perform the activities in the Netherlands through a branch office or as a cross-border service (ie without branch office).

A branch office:

- is a member of a financial entity that has its registered office in an EEA member state other than the Netherlands;
- does not have separate legal personality; and
- permanently exists in the Netherlands.

It should be noted that, depending on the business activities, a branch may qualify as a ‘permanent establishment’ and therefore may be subject to Dutch taxation.

Moreover, depending on the offered services, branch offices (or cross-border service providers) may be subject to certain code of conduct requirements as laid down in the Civil Code (Burgerlijk Wetboek) and the Financial Supervision Act (Wet op het financieel toezicht).

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

With the implementation of the amended Payment Services Directive (EU/2015/2366), platforms providing account information services, payment initiation services and transferring payments is more and more seen in the market. Also marketplace lending remains popular. There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
• consumer loans; and
• small and medium-sized enterprises (SME) (Midden-en Kleinbedrijf or MKB) lending.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes P2P-type structures often operated through an electronic platform provider as well as crowdfunding and also direct to retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the block using sophisticated algorithms and add the verified block to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledger restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another, or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which
automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Cryptocurrencies are at the moment not regulated, but regulators and legislators aim to regulate cryptocurrencies and virtual wallets soon (eg by way of the 5th Anti-Money Laundering Directive).

**Initial coin offerings and token-based products**

**WHAT IS AN INITIAL COIN OFFERING (ICO)?**

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.
Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

As the Authority for Financial Markets (Autoriteit Financiële Markten) tends to broaden its regulatory authority and scope, it remains point of discussion whether robo advice may be seen as investment advice or is a merely a tool, which is not regulated. These discussions take place on a case-by-case basis.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Regulated entities, such as banks, are required to notify the Dutch Central Bank (De Nederlandsche Bank) of any material cloud outsourcings.

Last modified 6 Dec 2019

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

GENERAL

Supervisors

The Netherlands has a ‘twin-peaks’ supervisory model. This entails that financial regulatory supervision is divided into two areas:

- prudential supervision, on the soundness of financial entities and the stability of the financial industry (this area is supervised by the Dutch Central Bank (de Nederlandsche Bank or DNB)); and
- market conduct supervision, on the market conduct of entities that are active on the financial markets (this area is supervised by the Autoriteit Financiële Markten (AFM)).

In addition, since 4 November 2014, the European Central Bank – in cooperation with DNB carries out the prudential supervision on Dutch ‘significant banks’ directly and Dutch ‘less significant banks’ indirectly. The market conduct supervision of all (significant and less significant) banks remains with the AFM.

Main laws and regulations

The main laws and regulations that apply to FinTech products are the:

- Financial Supervision Act (Wet op het financieel toezicht);
- Market Conduct Supervision Decree (Besluit gedragstoezicht financiële ondernemingen);
- Prudential Rules Decree (Besluit prudentiële regels Wft);
- exemption regulation as part of the Financial Supervision Act (Vrijstellingsregeling Wft); and
- Anti-Money Laundering Directive (2015/849/EU), as, among others, implemented in the Anti-Money Laundering Act (Wet ter
General financial regulatory regime

A financial entity must not carry on a regulated activity in the Netherlands unless authorized or exempt. Where FinTech products and/or applications involve financial activity which requires regulatory authorization, the entities providing such products and/or applications must be authorized.

AFM AND DNB INNOVATIONHUB

The InnovationHub is a joint initiative of the AFM and DNB. It provides support on queries that entities may have about supervision and regulations on innovative financial products and services.

The InnovationHub can be used for:

- explanation of specific supervision rules and policy rules applying to innovative products and services;
- guidance in navigating the Dutch supervisory landscape; and
- information on potential supervision issues, e.g. when developing an innovative concept.

REGULATORY SANDBOX

Since December 2016, AFM and DNB are easing access of innovative services to the financial services market through the regulatory sandbox. The regulatory sandbox allows for tailored supervision that is driven by meeting the purpose of the standards, rather than the standards themselves. The purpose of providing the tailored policy options is to enable market operators to roll out their innovative financial products, services and business models without unreasonable obstacles.

Electronic payments platforms and regulation of peer-to-peer lenders

ELECTRONIC PAYMENTS PLATFORMS

In the Netherlands, the role of FinTech businesses in the electronic payments sector is growing. Depending on the characteristics of the performed activities, based on the Dutch Financial Supervision Act (Wet op het financieel toezicht or FSA), electronic payments platforms mostly engage in the following regulated activities for which authorization is likely to be required:

- pursuing the business of providing payment services;
- issuing electronic money; and
- conducting the business of a bank.

Pursuing the business of payment service provider

Electronic payments platforms established in the Netherlands in principle require authorization as payment service provider when pursuing the business of providing payment services (e.g. the execution of payments or direct debits).

Issuing electronic money

Electronic payments platforms established in the Netherlands in principle require authorization as an electronic money institution when they issue electronic money. Electronic money has four characteristics, which are set out below.

Electronic money:

- is a monetary value stored on an electronic carrier or remotely in a central accounting system;
- represents a claim on the issuer;
- is intended to be used to perform payment transactions; and
- with which payments to parties others than the issuer can be made.

Conducting the business of a bank
A payment platform established in the Netherlands (e.g., pre-finance payment settlements) may require authorization as a bank.

**REGULATION OF PEER-TO-PEER LENDERS**

Peer-to-peer (P2P) lending (also known as loan-based crowdfunding) is a generic term, that in itself is not regulated in the Netherlands. Whether a regulated activity in terms of Dutch regulatory law is carried out depends on the lending structure.

Based on the FSA, authorization is likely to be required for P2P lending, when it is structured in such a way that the entity performs one of the following activities:

- in the course of business offering credit to a consumer and/or advisory or brokerage services in relation thereto;
- attracting, obtaining or having the disposal of callable funds and/or performing brokerage services in relation thereto; and
- conducting the business of a bank.

**Regulation of payment services**

The amended European Union Payment Services Directive (2015/2366/EU) is implemented in the FSA and delegated regulations thereto. When a person established in the Netherlands pursues the business of providing payment services, it will require authorization by the Dutch Central Bank (de Nederlandsche Bank or DNB) to become an authorized payment institution under the FSA, unless an exemption or exception applies.

- A party pursues the business of providing payment services if the payment service is an identifiably separate activity. This is, generally, not the case if the payment service is performed merely in support of principal activities of the entity that are not payment services.
- Payment services are any business pursuit listed in the Annex I to the amended Payment Services Directive.

**Application of data protection and consumer laws**

As of 25 May 2018, the processing of personal data in the Netherlands is regulated by the General Data Protection Regulation (Regulation (EU) 2016/679, the “GDPR”). The Dutch GDPR Implementation Act (Uitvoeringswet Algemene Verordening Gegevensbescherming) constitutes the local implementation of the GDPR in the Netherlands. Businesses (including FinTech businesses) that process personal data may be subject to the obligations set out in the GDPR. The GDPR sets out rules with regard to e.g., the grounds for processing personal data lawfully, notification obligations, transparency obligations and transfer of personal data to countries outside the European Economic Area. The GDPR empowers supervisory authorities to impose fines of up to 4% of annual worldwide turnover, or EUR 20 million (whichever is higher) sanctions for violations of the GDPR.

The Dutch Data Protection Authority (Autoriteit Persoonsgegevens or “Dutch DPA”) is the authority for the supervision of the GDPR (and Dutch GDPR) Implementation Act. In relation to FinTech-related matters, the Dutch DPA may be involved insofar privacy aspects are concerned, for example by supervising compliance with the privacy provisions set out in PSD2.

**CONSUMER LAWS**

There are no consumer regulations specifically aimed at the FinTech industry. Businesses (including FinTech businesses) that provide services or products to consumers may be subject to certain information requirements set out in the Dutch Civil Code. These requirements are an implementation of the Consumer Rights Directive and (among other things) the Unfair Contract Terms Directive. For the provision of online services and products, additional (consumer protection) requirements may apply, e.g., with regard to the use of cookies, misleading advertising and unsolicited direct marketing.

The Authority for Consumers & Markets (Autoriteit Consument & Markt or ACM) is the authority for the supervision of consumer-related regulations. ACM cooperates with other regulatory authorities, including the Netherlands Authority for the Financial Markets (Autoriteit Financiële Markten) and the Dutch Central Bank (De Nederlandsche Bank), in order to stimulate and boost FinTech businesses to contribute to the competition in the financial industry.

**Money laundering regulations**

Although the Wwft has a broader scope, it can generally be said that where an entity is authorized and/or supervised by the DNB or AFM, it will also be obliged to comply with the Wwft obligations.

Cryptocurrency and virtual wallets are set to be regulated under the implementation of the Fifth Anti-Money Laundering Directive.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING

The crowdfunding sector is well established, and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform, such as Geldvoorelkaar or Lendico.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

Banks in the Netherlands are currently also either funding or starting hybrid forms of marketplace lending. For example, Rabobank launched Rabo&Co, an online platform where its high-net-worth bank clients can provide up to 49% of loans provided to entrepreneurs who are clients of Rabobank (Rabobank always provides at least 51% of the loan).

The EU is planning to adopt harmonised legislation on the operation of cross-border crowdfunding platforms.

ACCELERATORS

There are various incubators or accelerators which offer support, facilities and funding for startups, often in return for an equity stake. Well-known accelerator programs are Startup-bootcamp and Rockstart.

Venture capital and debt

Venture capital (VC) funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. VC provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of VC and involves an equity investment by a corporate fund, examples of which include Liberty Global Ventures, ABNAMRO Digital Impact Fund and Prime Ventures. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), which is secured
against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through VC.

**Warehouse and platform funding**

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

Another alternative form of funding is by way of peer-to-peer (P2P) lending platforms such as Geldvoorelkaar, CrossLend, Lendex and Lendico, which bring individual borrowers and lenders together without the involvement of traditional banks.

**Senior bank debt and capital markets funding**

**SENIOR BANK DEBT**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**CAPITAL MARKETS FUNDING**

Companies that have grown to a certain size may raise finance by way of an Initial Public Offering (IPO). An IPO is the initial sale of company shares on a public exchange, such as Euronext Amsterdam.

**Incentives and reliefs**

In the Netherlands, until January 2021, interests and royalties are not subject to withholding taxes. Additionally, the Netherlands applies, under certain conditions, a full exemption on profits derived from (foreign) activities. The Netherlands also has an extensive tax treaties network that offers the possibility to repatriate profits with no, or minimal tax leakage. As a result, the Netherlands is an attractive European hub for investing in or expanding FinTech businesses worldwide. In addition, the following tax incentives may be available to FinTech businesses.

**RESEARCH AND DEVELOPMENT (R&D) WAGE TAX CREDIT**

The WBSO (R&D tax credit) of the Ministry of Economic Affairs is intended to provide entrepreneurs an incentive to invest in research. Provided that certain conditions are met, the R&D tax credit results in a reduction of wage tax and national insurance contributions due by employers in connection with R&D activities in the Netherlands.

**INNOVATION BOX**

The innovation box regime aims to encourage investments in technical R&D. Under the innovation box regime, profits derived from certain qualifying self-developed intangibles (eg software) are taxed at an effective rate of 7% if certain conditions are met.

**30% RULING**

Only 70% of the wages of qualifying expats in the Netherlands are subject to income tax; this is because they are entitled to a substantial income tax exemption of up to 30% for a maximum period of five years.

**ADVANCE TAX RULINGS (ATRs) AND ADVANCE PRICING AGREEMENTS (APAs)**

The Netherlands has an extensive and reliable advance-ruling practice. The Dutch tax authorities can provide advance rulings for various types of structures and activities.

**NO NET WEALTH TAX, STAMP DUTY OR LUMP-SUM TAX**
The Netherlands has no net wealth tax, stamp duty or lump-sum tax.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Loan portfolios are most commonly purchased by either taking assignment of the loan receivables themselves (which can take place on a disclosed or a non-disclosed basis) or by means of a ‘transfer of entire contractual position’ (whereby both rights and obligations under the relevant loans are transferred).

The concept of novation is not known under Netherlands law and, in the event that non-Dutch law governed loan agreements are transferred by means of novation, there is a real risk that underlying Dutch security can be extinguished as, under Dutch law, the continued existence of security rights is codependent on the continued existence of the claim they purport to secure.

Last modified 6 Dec 2019

What are the main considerations when transferring a loan and related security?

In order to affect a ‘transfer of entire contractual position, the consent of all the parties to the agreement is required if not given in advance.

Bankers liens are commonplace in the Netherlands whereby a bank takes security for all present and future obligations of a debtor. While these types of security can prove useful for the purposes of cross collateralization (and cross acceleration), careful structuring is required if loan portfolios are transferred to transferee lenders whilst the transferor lender still has the benefit of bankers liens (which, if not terminated appropriately, can give the transferor lender the benefit of the relevant security for new claims it originates on the debtors concerned).

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

The ownership of infrastructure assets in the Netherlands varies according to the asset class. The main asset classes are usually considered to be:

- economic infrastructure (energy, aviation, telecommunications, water, roads and waste); and
- social infrastructure (education, health and justice/prisons, housing).

Key sectors are considered below.

Energy

Pursuant to mandatory EU law requirements, gas and electricity industries in the Netherlands are privatized, with generation, transmission, distribution and supply services provided by a number of private sector companies. Entities carrying out eg transmissions...
services are limited in their ability to eg carry out supply services and vice versa. The relevant private sector companies own the generation, transmission and distribution assets. TenneT TSO B.V. (Tennet), a fully state-owned entity, is the sole owner and operator of the Netherlands’ high voltage transmission grids.

Regional TSOs own and operate regional distribution grids supplying household and (limited) commercial consumers; Tennet distribution grids link regional grids and link the Dutch energy grid to other EU member state and Norway’s distribution grid through land and marine interconnectors (eg NorNed and Britned interconnectors). For future offshore energy project purposes, Tennet has been designated the sole TSO required by law to organise, facilitate and operate offshore grids. On certain (existing) offshore projects, private entities other than Tennet may own transmission lines; Interconnector ownership is shared between participating TSOs such as National Grid and Tennet in case of Britned.

In certain instances, including on major energy infrastructure, projects may be procured by the public sector and depending on the terms of the procurement, the asset may either be publicly or privately owned.

From a public policy perspective and in accordance with international agreements entered into by the Netherlands among other parties, there is an impetus towards sustainable power generation instead of fossil fuel power generation which is embodied mostly in direct subsidies and grants (SDE+) and partly (for smaller scale projects) via local tax incentives.

The Netherlands Authority for Consumers and Markets (ACM) is the principal body with responsibility for regulation of the energy sector in the Netherlands.

Telecoms infrastructure

The telecommunications networks (fixed and mobile) in the Netherlands are privately owned by a number of service providers.

The Netherlands Authority for Consumers and Markets (ACM) is the principal body with responsibility for regulation of the telecommunications sector in the Netherlands.

Transport infrastructure

NATIONAL RAIL

The Dutch Railway Act determines the roles, responsibilities and authorizations of the parties involved in rail transport (government, infrastructure management, transport companies and supervisory bodies). The Dutch government legally owns the railway track.

Dutch Railways (NS) is the largest national passenger rail transport company in the Netherlands and all its shares are held by the Dutch State, with more than 1 million travelers per day and approximately 4,800 train journeys on the Netherlands’ 2,100 kilometers of railways. To do so, NS has almost 3,000 railway cars with seating for more than 260,000 passengers. NS is also responsible for the commercial exploitation of 380 stations not owned by the company.

NS does not operate trains on all of the railway lines in the Netherlands. Regional governments are currently responsible for many regional and urban rail services, which are not part of the main railway network. Other companies provide passenger rail services on 14 railway lines with a total of almost 700 kilometers of track: eg Syntus, Arriva, Connexxion, DB Regionalbahn Westfalen and Prignitzer Eisenbahn.

Cargo rail operators use the same Dutch railway network as well. Deutsche Bahn subsidiary Railion is the predominant cargo rail operator in The Netherlands.

ProRail, a private company whose sole shareholder is the Dutch State, is responsible for construction, maintenance and management of the Dutch rail network, including all relevant facilities such as tunnels, overpasses, overhead power lines, signals, switches and stations, on behalf of the national government. ProRail also allocates capacity on the rail network and is responsible for rail traffic control.

The Human Environment and Transport Inspectorate, Rail and Road Transport unit (Inspectie Leefomgeving en Transport), monitors the safety of the rail transport system on behalf of the national government.

LIGHT RAIL

Light rail tracks are mostly owned by the local public sector. Private companies in general own the trams and subway cars. For example, the Municipality of Amsterdam owns the track and supporting infrastructure in Amsterdam, while trams, tubes and busses are owned by a private company, GVB Activa B.V.
AVIATION

Aviation in the Netherlands is privatized. With regards to airport infrastructure, there are a mixture of ownership structures including private ownership, (local) government ownership and various forms of public-private ownership. All models are regulated by the Dutch government and the Dutch Civil Aviation Authority.

PORTS

The Port of Rotterdam (which is Europe’s largest port and operated by an unlisted public limited company held 70% by the Rotterdam Municipality and 30% by the Dutch government) and the Amsterdam Port Region (a separate entity whose shares are held by the Amsterdam Municipality) are the largest ports in The Netherlands with access to both sea and inland waterways. Both have official designated tasks in relation to eg nautical safety but also manage the use of the harbors. Port operations (ie cargo handling, storage, loading and unloading) are handled by the private sector.

Other infrastructure

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS/PRISONS)

Typically, these are owned by the public sector with the exception of Social Housing projects (please see below) with the private sector’s responsibility being for any or all of the design, build, financing, operation and maintenance of the infrastructure. The majority of social infrastructure assets in the Netherlands are directly financed by the government.

Education

School infrastructure ownership may vary; while primary and secondary school legislation is based on the premise that school boards (either separate entities or municipal authorities) are owners of school buildings and premises this legislation does not prohibit third party ownership. These distinctions also affect the course of effects after the termination of the use of a building as a school; if the building construction costs were paid from a municipal budget, in principle title of ownership of the building will revert to the municipality.

Hospitals

Ownership of public hospitals is mostly held by public sector bodies

Social housing

This is a diverse sector involving many different organizations and individuals including housing developers, building contractors, mortgage lenders, local authorities, housing associations, landlords, owner-occupiers, private renters and those in the social rented sector. Typically, on a social housing project, housing associations own the relevant housing stock. Although housing associations tend to be private limited companies their governance is constrained by public sector regulation and, effectively, operate as quasi-public sector entities.

DEFENSE

Typically, defense assets are owned by the public sector.

WASTE

While municipalities operate waste collection facilities, many waste treatment or collection facilities are operated also by the private sector, who would be responsible for design, build, operation or maintenance of the facility. Certification and registrations in addition to material environmental law requirements apply in relation to any operations involving waste, in order to ensure proper handling of waste.

WATER

Water and wastewater services in the Netherlands are delivered by enterprises whose tasks and obligations are statutorily set and whose business operation is subject to statutory requirements and administrative monitoring, which own the relevant infrastructure assets. The Water Boards and the Directorate-General for Public Works and Water Management are responsible for safeguarding and quality of surface water. The Water Boards and the Province manage groundwater. According to the Drinking Water Act, all these parties are collectively responsible for the protection of the Netherlands’ water resources.
Are there special rules for investing in energy and infrastructure?

Generally

There is no specific regime governing or restricting investment in energy or infrastructure projects in the Netherlands over and above existing regulation for investors and funders more generally but a particular proposed investment may be subject to legislative or regulatory control (eg merger control rules). As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory position relevant to that project must be considered.

For example, a project involving development on land will require planning permission and a project may require environmental authorizations/permits and/or sector specific regulatory consents or licenses.

Whether an investor can invest will depend on the terms of the procurement of that project if it is a public sector project and, in respect of an existing/operational project, that will depend on whether there are any contractual restrictions on ‘change of control’. This is less of a concern on private sector infrastructure although investors would need to consider whether any licenses/consents/permits would be affected by their acquisition of an interest.

Energy

The energy markets in the Netherlands have a complex system of arrangements between suppliers, generators, transmission and distribution, which are heavily regulated. In particular, there are complex arrangements in respect of licensing, subsidies and demand/charging mechanisms with suppliers, customers and TenneT and these are subject to change/regular updates meaning that investors must have a good understanding of the current framework and the potential directions in which the market may move. Investors need to understand how technology changes may impact on the overarching regulatory framework and vice versa.

Investors should also consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with any license conditions or the granting of specific subsidies. In particular, if a breach of those conditions could lead to the revocation of a license/subsidy that might make the potential target less attractive or viable. This is particularly relevant in relation to the SDE+ subsidies, which may be essential to ensure that sustainable power production can occur while being price competitive but whose conditions set strict requirements in relation to change of control particularly in the early stages of projects.

Telecoms infrastructure

There is a complex regulatory environment for this sector including how access and interconnectors (between networks) are regulated under the Telecommunications Act. The rights required to access private or public land in order to install and maintain essential equipment in, over or under that land should also be considered carefully. This equipment might be cables sunk beneath the ground or a mobile mast sited on the ground.

The industry is largely privatized, therefore investors should consider if any permits/consents/licenses will be affected by their interest.

Transport infrastructure

ROADS

For certain types of road projects, procuring public sector authorities (ie central government or a local authority) may delegate certain of their duties to private sector partners. Investors assuming such duties will, therefore, need to understand the nature and extent of the duties they are assuming and whether they are able to subcontract these duties to an appropriate person. There is usually a restriction on the change of control of a private sector partner during the construction period. Following the construction period, the private sector may be allowed a change of control subject to certain restrictions. The precise scope of the restrictions will depend on the contractual terms.

Other infrastructure

On publicly-procured infrastructure, it is quite common for long-term projects to have a ‘change in control’ clause which restricts change in ownership structures of the private sector. For example, in most sectors there is a restriction on change in control during the construction period, but this is often relaxed subject to certain restrictions. How strict these restrictions are will often depend on the
sector. For example, the defense sector usually gives the Ministry of Defense a strong degree of discretion (particularly on the grounds of national security) as to whether to accept a change in control over its private sector partner.

**What is the applicable procurement process?**

Public procurement in the Netherlands is governed by the Dutch Procurement Act 2012 which contains a national implementation of the three EU Directives on concessions, government sectors and the special sectors as well as a (limited) national framework.

The key principles are that contracts procured by the public sector must be awarded transparently, based on objective and proportionate requirements and criteria and without discrimination on the grounds of nationality and that all potential bidders are treated equally.

**Investing in energy and infrastructure**

Public procurement is relevant where the Dutch government, or a branch of it, is seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would be financing a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset. The relevant procurement legislation applies to the State, a province, a municipality, the Water Boards and bodies governed by public law.

In most cases, the public sector will need to publish a contract notice in the *Official Journal of the European Union* (OJEU) and typically run one of the following procedures:

- **Open procedure** – This is suitable for easy-to-evaluate projects and tenderers simply submit a tender in response to the OJEU notice. Change and negotiations to the tender are not permitted.

- **Restricted procedure** – There is a shortlisting of at least five tenderers following an expression of interest stage and tenderers submit a bid. Again, no negotiation is permitted other than clarification and finalization of the contract terms.

- **Competitive dialogue** – This is often the most common procedure for complex infrastructure projects where a dialogue with tenderers is necessary in order to find solutions that fulfil the contracting authority's needs and requirements. It involves a shortlisting of at least three bidders who are invited to dialogue with the public sector to develop detailed solutions which are capable of being accepted by the public sector. Clarification is allowed following final tender but only on the basis of confirming the financial and other commitments in a tenderer's bid.

- **Competitive procedure with negotiation** – This procedure can be used under the same circumstances as the competitive dialogue and is suitable for complex infrastructure projects. Main difference with the competitive dialogue is that the negotiations in a competitive procedure with negotiation are not aimed at finding a solution, but at improving the received bids (price and/or quality aspects). The minimum requirements and award criteria cannot be negotiated.

An investor may choose, however, to seek to invest in a project (by acquiring an interest in a private sector partner) that has already been procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the original awarded contract rather than procurement regulations themselves. However, the procurement regulations on modification of contracts and significant changes can be a point of attention.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement-related considerations that need to be borne in mind.

**Financing energy and infrastructure**

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector.

**What are the most common forms of funding / investing in energy and infrastructure?**

**Funding**
The most common forms of funding both energy and infrastructure projects is by means of a combination of debt and equity structures. The debt structures can vary but most commonly are senior only structures. Repayment profiles are, as is the case with energy and infrastructure projects internationally, adopted to have regard to the cash flow ability of the investment concerned.

**Investing**

The most common forms of funding both energy and infrastructure projects is by means of a combination of debt and equity structures. The debt structures can vary but most commonly are senior only structures. Repayment profiles are, as is the case with energy and infrastructure projects internationally, adopted to have regard to the cash flow ability of the investment concerned.

**Restructuring**

**Enforcement and sanctions**

**When can there be regulatory investigations?**

If the Authority for the Financial Market (de Autoriteit Financiële Markten) or the Dutch Central Bank (de Nederlandsche Bank) considers that an authorized firm or regulated individual may have breached ongoing compliance requirements, it can launch a formal investigation. This may result in criminal or administrative sanctions.

**What regulatory penalties may apply?**

The following regulatory penalties may, among others, apply:

- orders for incremental penalty payments and publication thereof;
- an administrative fine (with a maximum of €5 million) (exemptions may apply) and publication thereof;
- withdraw regulated status against the financial entity; and
- informal measures, including an instruction by the regulator, a letter of warning or a disciplinary discussion.

**What criminal penalties may apply?**

Following formal investigation, an offence can be charged criminally. The Dutch regulators do not have criminal powers themselves. They will have to report the criminal offence to the District Attorney, who can then decide whether or not to prosecute the offence.

Offences that can be charged criminally include:

- insider dealing and misleading statements and practices;
- breaches of the Money Laundering Regulations; and
- conducting regulated activities when not authorized.

The criminal penalty could entail a fine, a community service order and/or imprisonment.
Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

No stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

No stamp, registration, transfer or other similar taxes are payable on the taking, transfer or assignment of a mortgage, debenture or other security. Registration fees may apply to the registration of mortgages on the Public Register (but this will usually be dealt with, in practice, by the notary arranging the notarial deed).

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

No stamp, registration, transfer or other similar taxes are payable on the issue, transfer or assignment of a debt security.

Last modified 6 Dec 2019

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

Secured lenders and secured debt security holders take priority over the tax authorities (Belastingdienst) on enforcement of a security.

Last modified 6 Dec 2019

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

No, there is no withholding tax on interest payments.

However, interest payments on hybrid loans are subject to withholding tax because hybrid loans are treated as equity. A loan is a hybrid loan if for example (i) the amount of interest due depends on the profits of the debtor, (ii) the loan is subordinated to all other creditors, and (iii) the loan has no fixed maturity (or has a maturity of 50 years or longer). If these conditions are met, the interest payments made by the debtor are re-qualified as dividends for tax purposes and consequently subject to 15% dividend withholding tax

If so:
What is the rate of withholding?

N/A.

What are the key exemptions?

N/A.
Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Last modified 6 Dec 2019

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding tax (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No, unless the lender holds 5% or more of the shares in the borrower, and holds its participation with tax avoidance being the primary goal or one of the primary goals. In that instance, the lender is charged with corporate income tax at a rate ranging between 19% and 25% in 2019 and 16.5% and 25% in 2020, depending on the total amount of income received.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

Issues of debt securities to retail investors are regulated under the Financial Markets Conduct Act 2013 (FMCA). Debt securities must be issued under a compliant trust deed and offers must be made in a registered product disclosure statement, and a licensed supervisor must be appointed to act on behalf of the holders of the debt security and supervise the issuer's performance. The supervisor is a party to the trust deed, with certain rights held in trust by the supervisor for the benefit of the holders of the debt securities.

Non-bank deposit takers (NBDT) are regulated under the Non-Bank Deposit Takers Act 2013. NBDTs make regulated offers of debt securities to retail investors and carry on the business of borrowing and lending money, but are not registered banks. NBDTs are licensed and prudentially regulated by the Reserve Bank of New Zealand. Issues of debt securities by NBDTs are regulated under the FMCA (as above).

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in New Zealand are bonds or notes issued on a stand-alone basis or under a program. These can be as corporate or State-Owned Enterprise bonds, bills of exchange, commercial paper and promissory notes.

Many different types of debt securities are offered in New Zealand. Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities and high-yield bonds;
- guaranteed securities, subordinated securities, perpetual debt securities (i.e. debt securities that have no specified redemption date);
- asset-backed securities;
- derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- hybrid securities (securities with both debt and equity features);
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer);
- exchangeable bonds (debt securities convertible into the equity of a third party);
- depositary receipts (a security issued by a depositary conferring on the holders beneficial ownership of certain underlying assets held by the depositary for the holders); and
What are the differences between offering debt securities to institutional/professional or other investors?

The Financial Markets Conduct Act 2013 (FMCA) regulates the issuing of debt securities to retail investors. Retail investors are investors who do not fall within the definitions of wholesale investors in the FMCA. Wholesale investors include:

- investment businesses;
- a person who meets certain 'investment activity' criteria;
- a person who is 'large' (net assets or turnover of more than NZD$5 million);
- a government agency; and
- an eligible investor who certifies that they fall within certain criteria.

A person is also a wholesale investor if the minimum amount payable by the person on acceptance of the offer is at least NZD$750,000.

Warning statements and acknowledgements need to be given to eligible investors. Otherwise issuers of debt securities to wholesale investors only need to comply with the conduct obligations in Part 2 of the FMCA, which apply to all financial service providers.

When is it necessary to prepare a prospectus?

It is necessary to register a product disclosure statement for all regulated offers of managed investment products, derivatives, debt securities and equity securities. A regulated offer is an offer made to a retail investor.

What are the main exchanges available?

The main exchange is the NZX Main Board. It is privately owned by NZX Limited, which itself is a listed company. NZX operates five other markets – NZX Debt Market, NZX Dairy Derivatives Market, NZX Equity Derivatives Market and the Fonterra Shareholders' Market. Market operators are licensed by the Financial Markets Authority under the Financial Markets Conduct Act 2013.

There are three other licensed market operators in New Zealand – ASX 24 (operated by Australia Securities Exchange Limited), ICE Futures USA and ICE Futures Europe. There are also some smaller unlicensed secondary markets such as Unlisted.

Is there a private placement market?

Both New Zealand banks and some non-financial corporates make use of private debt markets.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Debt securities may only be issued to retail investors under a product disclosure statement that complies with the Financial Markets...
Conduct Act 2013 (FMCA). Misleading or deceptive statements in a product disclosure statement or any advertising can lead to civil and criminal liability under the FMCA.

**Investing in debt securities**

Debt security terms and conditions typically contain provisions which may permit their modification without the consent of all investors and confer significant discretions on the trustee, which may be exercised without the consent of investors and without regard to the individual interests of particular investors. The conditions also provide for meetings of investors to consider matters affecting the investors interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

*Last modified 13 Dec 2019*

**Establishing and investing in debt / hedge funds**

*Are there any restrictions on establishing a fund?*

The establishment, management and offering of funds (managed investment schemes) are regulated under the Financial Markets Conduct Act 2013.

A managed investment scheme means a scheme to which each of the following applies:

- the purpose or effect of the scheme is to enable persons taking part in the scheme to contribute money, or to have money contributed on their behalf, to the scheme as consideration to acquire interests in the scheme;
- those interests are rights to participate in, or receive, financial benefits produced principally by the efforts of another person under the scheme (whether those rights are actual, prospective, or contingent, and whether they are enforceable or not); and
- the holders of those interests do not have day-to-day control over the operation of the scheme (whether or not they have the right to be consulted or to give directions).

An interest in managed investment scheme is a managed investment product.

*Last modified 13 Dec 2019*

*What are common fund structures?*

The most common fund structures are open-ended (managed funds) and closed-ended (e.g. property funds), both retail and non-retail. Most are established as unit trusts although limited partnerships are becoming more common, particularly for property-related funds. Funds will also typically become Portfolio Investment Entities to obtain certain New Zealand tax benefits.

Discretionary investment management services are an alternative investment mechanism whereby a financial advisor (authorized under the Financial Advisors Act 2008 or licensed under the Financial Markets Conduct Act 2013) can acquire and dispose of assets on behalf of an individual using the investor's funds in accordance with an agreed Investment Authority.

*Last modified 13 Dec 2019*

*What are the differences between offering fund securities to professional / institutional or other investors?*

**Retail funds**

Retail funds must comply with a range of registration requirements, have a licensed manager and a licensed supervisor, and have compliant offering documents. The fund's assets must be held by the supervisor or an independent custodian, and investments must be undertaken in accordance with a registered statement of investment policy and objectives. Retail funds are subject to a high level of regulatory oversight by the Financial Markets Authority (FMA).
Institutional/professional funds

Funds offered to wholesale investors (as defined in the Financial Markets Conduct Act 2013 (FMCA)) do not have to comply with the same requirements as retail schemes. The FMA’s oversight of wholesale funds is limited to conduct obligations under the Fair Dealing provisions in Part 2 of the FMCA. Indications are that FMA will look to increase its scrutiny of wholesale funds in the future.

Last modified 13 Dec 2019

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

Funds that are offered to retail investors must comply with a range of compliance obligations in the Financial Markets Conduct Act 2013 (FMCA), including having a licensed manager and licensed supervisor.

Currently discretionary investment management service (DIMS) providers must be either authorized under the Financial Advisors Act 2008 (FAA) or licensed under the FMCA. From 29 June 2020 all DIMS providers will need to be licensed under the FMCA.

Last modified 13 Dec 2019

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Marketing of retail funds is strictly regulated under the Financial Markets Conduct Act 2013. Disclosure documents must comply with heavily prescribed regulatory requirements, and a great deal of information must be placed on the public register.

Last modified 13 Dec 2019

Are there any restrictions on managing a fund?

The manager of a retail fund must be licensed by the Financial Markets Authority (FMA). The licensing process is comprehensive with significant ongoing monitoring by the licensed supervisor of the fund and the FMA. Capital adequacy requirements must be met and restrictions apply to related party transactions. Investment must be made in accordance with the fund’s registered statement of investment policy and objectives.

Last modified 13 Dec 2019

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

Derivatives contracts can only be offered to retail investors by a licensed derivatives issuer. Licenses are issued by the Financial Markets Authority (FMA) under the Financial Markets Conduct Act 2013 (FMCA). The licensing process is comprehensive with significant ongoing monitoring by the FMA.

There are no restrictions for offering derivatives contracts to wholesale investors apart from conduct obligations under the Fair Dealing provisions in Part 2 of the FMCA.

Last modified 13 Dec 2019

What are common types of derivatives?

Derivatives contracts are entered into in New Zealand for a range of reasons including hedging, trading and speculation.
The four most common types of derivatives are futures, forwards, options (call options and put options) and swaps (such as interest rate or currency swaps).

These are either privately traded over-the-counter derivatives or exchange-traded derivatives.

The value of the derivatives contracts is based on the value of the underlying assets. The main classes of underlying asset seen in the New Zealand are:

- equity;
- fixed income instruments;
- commodities;
- foreign currency; and
- credit events.

Are there any other notable risks or issues around entering into derivatives contracts?

The issuing of derivatives in New Zealand was largely unregulated until the coming into effect of the Financial Markets Conduct Act 2013 (FMCA) on 1 December 2014. A small number of issuers were approved as Authorized Futures Dealers by the previous regulator, the Securities Commission, under the now-repealed Securities Markets Act 1988. Those issuers were transitioned to the FMCA by 1 December 2016, and there are currently 25 licensed derivatives issuers. The FMA has taken enforcement action against derivatives issuers operating from outside of New Zealand who have registered to the Register of Financial Service Providers and claimed to be regulated in New Zealand without being licensed. Several of these businesses have been struck off the register.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Yes.

The Credit Contracts and Consumer Finance Act 2003 places restrictions on advertising content related to consumer loans. The Responsible Lending Code imposes on lenders of consumer finance and credit contracts obligations to abide by when issuing loans.

Financial institutions do not have to be registered banks in order to take deposits and make loans.

Banks may face restrictions on residential home loan lending due to Loan to Value Ratio (LVR) restrictions imposed via bank registration conditions. These restrict banks on the amount of low deposit lending they can do. Note that this only applies to residential investment and would exclude commercial transactions.

Borrowing

When borrowing money secured over residential homes by mortgage, certain LVR restrictions exist. These restrictions specify the minimum deposit requirements when buying an owner-occupied property to live in or when buying residential investment property. Certain exceptions do apply.

Non-bank deposit takers must comply with the Non-Bank Deposit Takers Act 2013.
What are common lending structures?

Lending in New Zealand can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

 Syndicated facilities by their nature involve more parties (such as agents and trustees which fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, e.g. term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities etc.

Loan durations

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Loan security

A loan can either be secured, unsecured or guaranteed or limited resource. For more information, see Giving and taking guarantees and security.

Loan commitment

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

Loan repayment

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

What are the differences between lending to institutional / professional or other borrowers?

Lending to institutional/professional borrowers is subject to less regulatory oversight and therefore is less burdensome from a compliance perspective.

Lender Responsibility Principles will only apply to consumer credit contracts (except for consumer leases). Subject to this, parties are generally free to contract on their own terms and conditions subject to restrictions which apply generally (for example in relation to...
penalties, and oppressive conduct).

Last modified 13 Dec 2019

**Do the laws recognize the principles of agency and trusts?**

Yes, both principles are recognized as a matter of New Zealand law.

For instance, it is possible to appoint an agent to act on behalf of other parties and a trustee to hold rights and other assets on trust for the lenders or secured parties.

Last modified 13 Dec 2019

**Are there any other notable risks or issues around lending?**

**Generally**

Loan agreements and other finance documents are subject to general contractual principles. There are few general risks or issues particular to lending transactions (such as usury laws or similar), beyond these risks which generally arise in other jurisdictions.

There is a renewed focus on conduct with new standards being imposed on financial service providers to ensure that they serve the needs of customers, treat customers fairly, recognise and prioritise customer interests and effectively manage conflicts of interest. The FMA is expecting this to be actively monitored and managed by boards and senior management with legislation implementing new conduct licensing regime expected to be introduced in Parliament by the end of 2019.

**Specific types of lending**

Loan-to-value ratios limit New Zealand banks on the amount of low-deposit residential mortgage lending. Banks and other institutions must abide by prudent lending standards.

**Standard form documentation**

Banks and other consumer finance providers typically use their own standard form loan agreements and security documents for transactions under NZD2 million, and often for larger transactions also.

Last modified 13 Dec 2019

**Are there any other notable risks or issues around borrowing?**

A range of legislative protections and standards exist in relation to consumer finance transactions, or transactions with individuals (as distinct from companies, trusts or other entities), such as those under the Credit Contracts and Consumer Finance Act 2003, Fair Trading Act 1986 and the Consumer Guarantees Act 1993.

Last modified 13 Dec 2019

**Giving and taking guarantees and security**

**Are there any restrictions on giving and taking guarantees and security?**

Some of the key areas affecting the giving of guarantees and security are as follows.

There are no general restrictions in New Zealand on the giving and taking of guarantees. Guarantees are usually taken in the form of a deed, with appropriate witnessing, to avoid the need for the guarantor to receive consideration or benefit in order to enforce the guarantee.

**Lender responsibility principles**
Lender responsibility principles exist when giving and taking guarantees in relation to a consumer credit contract. Every creditor that takes a guarantee of a consumer credit contract has disclosure obligations to the guarantor as part of this obligation.

**Capacity**

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors’ powers that would be preventative. Under New Zealand law, directors have a general duty to promote the success of the company for the benefit of its members as whole; as such, they will need to be able to show that adequate corporate benefit is derived from the company giving the guarantee or security. This is often more difficult in the case of upstream or cross-stream guarantees or security provided by a subsidiary to its parent or sister company. The safe approach is often to have the members of the company approve the giving of the guarantee or security by resolution.

**Insolvency**

Guarantees and security may be at risk of being set aside under New Zealand insolvency laws if the guarantee or security was granted by a company or individual within a certain period of time prior to the onset of insolvency. This would be the case if the company giving the guarantee or security received inadequate consideration, and as such, the transaction was at an undervalue. For such a transaction to be set aside, certain statutory criteria would have to be met, including that the guarantee or security was given within two years of the onset of insolvency of the affected party. Guarantees and security may also be challenged on other grounds relating to insolvency.

**Major transactions**

In respect of companies incorporated in New Zealand, if the amount guaranteed is greater than half the value of the gross assets of the company, the approval of 75% of the shareholders of the company is generally required before the grant of the guarantee, unless the grant is conditional on later approval in that manner.

**Financial assistance**

It is unlawful for a company to provide financial assistance for the purchase of its own (or of its holding company's) shares unless relevant shareholder and director approvals are obtained and a certificate from directors relating to solvency given. Financial assistance in this context would include giving a guarantee or security in connection with the share purchase.

*Last modified 13 Dec 2019*

**What are common types of guarantees and security?**

**Common forms of guarantees**

Guarantees can take a number of forms.

A particular distinction worth remembering is between a performance guarantee and a payment guarantee:

- **A performance guarantee** is a term used to describe both performance bonds (in the context of trade finance) and ‘see to it’ guarantees (in other contexts):
  - A performance bond describes a financial undertaking used to protect a buyer against the failure of a supplier to deliver goods or perform services in accordance with the terms of a contract. The issuer of the bond undertakes to pay to the buyer a sum of money if the seller fails to deliver the goods or perform the contracted services on time or in accordance with the terms of the contract.
  - A ‘see to it’ guarantee is a promise by the guarantor to see to it that the primary obligor fulfils its obligations under the primary contract. If the primary obligor fails to fulfil its obligations under the primary contract, the guarantor will be in breach of its obligations under the guarantee.

- **A payment guarantee** is narrower in scope than a performance guarantee as it only covers the payment of money rather than other contractual obligations.

Other types include rental guarantees, advance payment bonds, collateral guarantees, bid, tender, warranty bonds, custom bonds and
shipping guarantees.

**Common forms of security**

Common forms under New Zealand law include:

- a mortgage over interest in land;
- a security interest over personal (i.e. non-land) assets; such as inventory, goods, plant and investment securities such as shares;
- possessory security such as a pledge; and
- rights of set-off.

Different types of security are suitable for securing different types of assets.

Under New Zealand law it is possible to grant security over all of the assets of a New Zealand company or individual assets. Granting security over all of a company's assets will tend to be achieved by way of a debenture which will include:

- a mortgage over real estate;
- a fixed charge over assets which are identifiable and can be controlled by the creditors (such as equipment);
- a floating charge over fluctuating and less identifiable assets (such as stock); and
- an assignment by way of charge over receivables and contracts.

Are there any other notable risks or issues around giving and taking guarantees and security?

**Giving or taking guarantees**

To be valid, a guarantee needs to be in writing, signed by the guarantor and provided for good consideration.

Consideration for a guarantee is subject to general contractual principles. In the case of a guarantee, the underlying obligations will usually be the consideration for the guarantee and so it is advisable to execute the guarantee at the same time as executing the underlying obligations to avoid any suggestion of past consideration. Often the guarantee is included in the loan agreement and so this should not be an issue. Also it can be difficult to establish consideration for a guarantee as the primary obligations are between the underlying obligor and beneficiary, for example between the borrower and lender. As a result, guarantees are often executed as deeds to avoid any argument about whether good consideration was provided. Deeds have particular execution requirements under New Zealand law which need to be observed.

Additionally, there is a risk that a guarantee may be set aside if it was procured by undue influence by a borrower or lender. A party being provided with a guarantee should be alive to this issue and take steps to avoid claims of undue influence by, for example, requiring the guarantor to take separate legal advice.

Lender responsibility principles exist when taking guarantees. Failure to abide by these could result in issues for the guarantor. Every creditor that takes a guarantee of a consumer credit contract has disclosure obligations to the guarantor as part of this obligation.

**Giving or taking security**

A security document may need to be executed as a deed if it:

- contains a mortgage over land;
- confers a statutory power of sale and power to appoint a receiver; or
- contains a power of attorney.

Once granted, security needs to be properly perfected before it is valid against third parties. Perfection formalities can range from having
the secured asset delivered to the security holder, registration of the security and notice being given to third parties. Mortgages over land are registered on on-line electronic land titles register - Land Information New Zealand, also known as LINZ. Security interests over non-land assets are protected by registering a finance statement on the New Zealand Personal Property Securities Register.

There are no general notarization requirements for security documents under New Zealand law.

Like guarantees, for a period after a new security interest has been granted (known as the hardening period), it is at risk of being set aside in certain circumstances under insolvency laws. Reviewable transactions include those conducted at an undervalue and preferences and invalid floating charges.

**Financial regulation**

**Law and regulation**

*What are the main laws and regulations that apply to entities that are involved in finance and investments generally?*

**Generally**

- Anti-Money Laundering and Countering Financing of Terrorism Act 2009
- Personal Property Securities Act 1999
- Fair Trading Act 1986
- Consumer Guarantees Act 1993
- Corporations (Investigation and Management) Act 1989
- Commerce Act 1986

**Consumer credit**

- Credit Contracts and Consumer Finance Act 2003
- Land Transfer Act 2017
- Property Law Act 2007

**Mortgages**

- Credit Contracts and Consumer Finance Act 2003

**Corporations**

- Companies Act 1993
- Limited Partnerships Act 2008

**Funds and platforms**

- Financial Markets Conduct Act 2013
- Financial Markets Conduct Regulations 2014
- Financial Service Providers (Registration and Dispute Resolution) Act 2008
- Financial Advisors Act 2008
- Financial Advisors (Custodians of FMCA Financial Products) Regulations 2014
- Financial Services Legislation Amendment Act 2019

**Other key market legislation**

- Non-Bank Deposit Takers Act 2013
Reserve Bank of New Zealand Act 1989
Income Tax Act 2007

Last modified 13 Dec 2019

Regulatory authorization

Who are the regulators?

The Financial Markets Authority (FMA) regulates the conduct of financial service providers in both retail and wholesale markets markets and is responsible for enforcing securities, financial reporting and company law as they apply to financial services and securities markets. The FMA also authorizes and regulates licensed financial product markets.

The Reserve Bank of New Zealand regulates banks, insurers and non-bank deposit takers and manages monetary policy to maintain price stability, promotes the maintenance of a sound and efficient financial system, and supplies New Zealand banknotes and coins.

The Commerce Commission enforces competition, fair trading and consumer credit laws. Together with the Ministry of Business, Innovation and Employment (MBIE) and the Treasury, these five regulators form the Council of Financial Regulators in New Zealand.

The Inland Revenue has responsibility for the collection of tax and the administration of the Inland Revenue Acts in New Zealand, including the Income Tax Act 2007.

What are the authorization requirements and process?

The Financial Markets Conduct Act 2013 (FMCA) includes a licensing regime for providers of market services in New Zealand. Application fees range from NZD2,139 to NZD10,695.

All financial service providers with a place of business in New Zealand (including those who do not need to be licensed under the FMCA) must register under the Financial Service Providers (Registration and Dispute Resolution) Act 2008. Annual registration fees apply. From 29 June 2020 the registration requirements will change requiring every person who is in the business of providing a financial service to retail clients to register if those financial services are provided to persons in New Zealand, regardless of where the financial services are provided from.

Registration under the Reserve Bank of New Zealand Act 1989 is required if an entity wishes to use a name or title that includes restricted words ('bank', 'banker', 'banking' or any other derivatives) for banks or classes of banks licensed overseas, representative bodies and associated persons of a registered bank, unit trust associated with a registered bank or non-financial institutions. Specific conditions of authorization are required for each of the different types of entity.

Any entity can apply to become a registered bank with the Reserve Bank of New Zealand. They take into account a number of factors (qualitative and quantitative) when determining an application.

To become an Authorized Financial Advisor you must meet a number of eligibility requirements prescribed by the Financial Markets Authority. This includes registering on the Financial Service Providers Register and joining a dispute resolution scheme. From 29 June 2020, any person who provides a financial advice service will be required to be licensed under new provisions in the FMCA.

Non-bank entities that take deposits from the public need to obtain a license under the Non-Bank Deposit Takers Act 2013.

What are the main ongoing compliance requirements?

Registered banks are required to meet minimum prudential, reporting and other standards on an ongoing basis, and comply with specific and standard conditions of registration.

Failure to comply can result in sanctions for banks and, in serious cases, loss of registration.
Key prudential requirements for banks operating in New Zealand relate to capital, liquidity, governance, disclosure, credit ratings, outsourcing, connected exposures, open bank resolutions and macro prudential issues. The Reserve Bank of New Zealand has the discretion to take enforcement action and to decide what enforcement action to take for non-compliance.

There is also legislation expected to be introduced into Parliament by the end of 2019 which would implement a new conduct licensing regime (regulated by the Financial Markets Authority) for banks, insurers and non-bank deposit takers requiring these entities to meet high standards of fair customer treatment and regulating sales target-based incentives. Providers of financial services in New Zealand must be registered under the Financial Services Provider (Registration and Dispute Resolution) Act 2008 and, if those services are provided to retail clients, must join an approved dispute resolution scheme.

When entering into a consumer credit contract, lenders must comply with 'lender responsibilities'. This includes providing clear and concise information, helping the borrower make informed decisions, assessing affordability, ensuring that the credit agreement is not oppressive and that the borrower is not treated oppressively.

Any financial advisor has disclosure obligations to meet and must exercise care, diligence and care when carrying out its required conduct obligations.

Reporting entities have obligations imposed on them by the Anti-Money Laundering and Countering Financing of Terrorism Act 2009. These obligations include: carrying out a risk assessment, design; implementation and maintenance of a compliance program that sets out procedures, policies and internal controls; undertaking customer due diligence; and monitoring and reporting suspicious transactions.

Audits, reviews and an annual report must be submitted to the relevant anti-money laundering/countering financing of terrorism supervisor.

What are the penalties for failure to be authorized?

An unregistered individual that knowingly breaches the Financial Service Providers (Registration and Dispute Resolution) Act 2008 by providing a financial service without being registered, or is not a member of an approved dispute resolution scheme could be liable to a term of imprisonment of up to 12 months and/or a fine of up to NZD100,000. For a person that is not an individual this fine cannot exceed NZD300,000.

Providing a financial advisor service without permission can lead to a fine between NZD10,000 and NZD50,000 whereas holding out as an authorized financial advisor can result in a fine for the individual of up to NZD10,000 and of up to NZD50,000 for an entity.

Providing a market service without a license may give rise to civil liability for a pecuniary penalty of up to NZD200,000 for an individual and up to NZD600,000 in any other case. A range of other civil liability orders are available, including compensatory orders. From 29 June 2020 this will also apply to persons providing financial advice service without a license.

A person that falsely holds itself out as a registered bank can be penalized. An individual can be imprisoned for up to 18 months or to a fine of up to NZD200,000. A body corporate can be fined up to NZD2 million.

Regulated activities

What finance and investment activities require authorization?

Generally

The Financial Markets Conduct Act 2013 (FMCA) requires managers of managed investment schemes, supervisors of managed investment schemes and debt issuers, independent trustees of restricted superannuation schemes, issuers of derivatives, providers of discretionary investment management services, and crowd funding and peer-to-peer lending platform providers to be licensed. From 29 June 2020 providers of financial advice services will also be required to be licensed under the FMCA.
Consumer credit

The Financial Services Providers (Registration and Dispute Resolution) Act 2008 requires businesses that provide a financial service to be registered and be a member of an approved dispute resolution scheme.

A financial service means:

- a financial advisor service;
- a broking service;
- a licensed non-bank deposit taker;
- a registered bank;
- dealing with investment portfolios and securities;
- being a creditor under a credit contract;
- operating a money or value transfer service;
- issuing and managing means of payments such as credit and debit cards;
- a licensed market service;
- acting as a custodian of a registered scheme;
- operating a financial product markets;
- changing foreign currency;
- trading financial products or foreign exchange on behalf of other persons;
- providing forward foreign exchange contracts;
- acting as an insurer;
- giving financial guarantees;
- participating in a regulated offer of financial products as the issuer or offeror; and
- acting in any of the following capacities in respect of an offer of regulated products or financial products:
  - as an issuer;
  - as a supervisor; or
  - as an investment manager.

A person or entity wishing to use the word 'Bank' or related words in its name is required to be registered under the Reserve Bank of New Zealand Act 1989.

Last modified 13 Dec 2019

Are there any possible exemptions?

The Governor General may make regulations exempting any service or person from registration under the Financial Service Providers (Registration and Dispute Resolution) Act 2008 (FSP). He or she can prescribe specific terms and conditions of the exemption if required.

The minister responsible for the Anti-Money Laundering and Countering Financing of Terrorism Act 2009 may exempt requirements of the Act such as reporting obligations.

The Financial Markets Authority (FMA) can grant exceptions to having to register under the FSP or to having to comply with obligations under the Financial Advisors Act 2008; this is provided when the cost of compliance would be unreasonable or not justified by the benefit of compliance or that the relevant person, transaction or service was adequately regulated by an overseas jurisdiction to the standard of
Under the Financial Markets Conduct Act 2013 general exemptions apply for services being provided to wholesale investors and for certain other types of offers. Specific exemptions can also be granted by the FMA on an individual or class basis.

Exemptions exist regarding the use of a restricted word under the Reserve Bank of New Zealand Act 1989 where the word signifies a geographic place name, the name of a natural person or that it could not be reasonably mistaken as being the name of a financial institution.

**Do any exchange controls or other restrictions on payments apply?**

There are no exchange controls on foreign-exchange transactions undertaken in New Zealand, either by New Zealand residents or non-residents. The New Zealand dollar has a floating exchange rate and there are no restrictions on the amount of funds which may be brought into or taken out of New Zealand.

Anti-money laundering controls may apply in certain circumstances.

**What are the rules around financial promotions?**

**Rules**

Regulated offers of managed investment products, debt securities and equity securities are required to be made in a registered product disclosure statement prepared in accordance with the Financial Markets Conduct Act 2013. A regulated offer is an offer made to a retail investor. General fair dealing provisions also apply with respect to disclosure.

**Exemptions**

Exemptions apply to offers made to wholesale investors and certain other types of offers.

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

**Generally**

The most common form of legal entities are limited liability companies established under the Companies Act 1993. Another common form of investment entity is a limited partnership. Both are bodies corporate with separate legal personality that limit the liability of their members (shareholders/limited partners). Trusts, often with corporate trustees, are also commonly used as a vehicle for private investment.

**Funds**

Managed investment schemes are usually established as unit trusts. Limited partnerships are becoming more commonly used as investment entities, particularly for closed-ended schemes.

Managers and other type of issuers are usually established as companies.
Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

Overseas companies can register branches of their companies in New Zealand. Consent may be required from the Overseas Investment Office (OIO) if the business involves the acquisition of a ‘significant business assets’ or ‘sensitive land’ in New Zealand.

Standard compliance requirements will apply to the branches.

Any reporting entity under the Anti-Money Laundering and Countering Financing of Terrorism Act 2009 (AML/CFT Act) must ensure its branches in a foreign country comply. Failing to ensure branches and subsidiaries comply with the AML/CFT Act could result in civil liability.

Specific tax rules apply to loans made by or to a New Zealand branch.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

Peer-to-peer (P2P) funding matches people who want loans with people who are potentially willing to fund those loans. The matching is done through an intermediary platform – a P2P lending service.

In New Zealand, the provision of a P2P lending service is a market service that requires a license from the Financial Markets Authority under the Financial Markets Conduct Act 2013.

A person provides a P2P lending service if:

- they provide a facility by means of which offers of debt securities are made; and
- the principal purpose of the facility is to facilitate the matching of lenders with borrowers who are seeking loans for personal, charitable or small-business purposes.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes P2P-type structures often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis. However, it is relevant to note that there is currently no permitted secondary market for investments in marketplace lending platforms in New Zealand.

ISSUES FOR STARTUP MARKETPLACE LENDERS

The requirements for a P2P lending service license (including governance and management requirements, as well as operational functionality) are not insignificant; and New Zealand currently offers no regulatory sandbox or testing period. The integrity of credit scoring and servicing/collections processes have been critical to establish funding support for existing marketplace lenders.

It is also important for startup marketplace lenders to ensure that the platform’s interest and fees structure is fully compliant with
applicable consumer credit regulation, while still providing sufficient revenue for the platform (and yield for investors). Anti-money laundering and fraud prevention processes must also be considered.

As well as the initial incorporation, licensing and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform (for instance, through securitization).

**Blockchain, smart contracts and cryptocurrencies**

**WHAT IS BLOCKCHAIN?**

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the block using sophisticated algorithms and add the verified block to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (e.g. in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third-party intermediary. It may be public and open ('permissionless' or 'unpermissioned') or structured within a private group ('permissioned').

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an 'address'). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

**WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOs)?**

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.
WHAT IS A CRYPTOCURRENCY?

A cryptocurrency is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding.

It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- a prospective return on the investment.

Key aspects to consider will include:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’, are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Personalised ‘robo advice’ is currently prohibited in New Zealand under the Financial Advisors Act 2008 (FAA). An exemption was granted in June 2018 to allow entities to provide personalised digital advice on approval by the Financial Markets Authority. Currently 8 entities...
have been approved to provide digital advice facilities under the exemption. From 29 June 2020 new provisions in the Financial Markets Conduct Act 2013 will come into effect which provide for licensing of entities wishing to provide digital financial advice services.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

All persons providing financial services by way of business must be registered under the Financial Service Providers (Registration and Dispute Resolution) Act 2008 (FSPA) and, if providing services to retail customers, be a member of an approved disputes resolution scheme.

The Financial Markets Authority (FMA) is the licensing body and market conduct regulator for persons who are registered, licensed, appointed, accredited or authorized under the Financial Markets Conduct Act 2013 (FMCA) (discussed below), the Financial Markets Supervisors Act 2011, the Financial Advisors Act 2008 and the FSPA.

The Reserve Bank of New Zealand (RBNZ) is the conduct regulator for registered banks, non-bank deposit takers and licensed insurers.

GENERAL

Under the FMCA, a person must not provide a market service without holding, or being authorized to provide the service under, a market services license from the FMA that covers the service. A 'market service' includes acting as a:

- manager of a registered managed investment scheme;
- provider of a discretionary investment management service;
- peer-to-peer (P2P) lending intermediary;
- crowdfunding intermediary; and
- from 29 June 2020, a financial advice service.

An offer of financial products that is received by a retail investor in New Zealand will require disclosure and will be regulated under the FMCA unless the issuer demonstrates that it has taken all reasonable steps to ensure that retail investors in New Zealand may not accept the offer.

Where FinTech products and applications involve financial activity which requires regulatory authorization, then firms providing such products and applications must be authorized by the FMA.

THE FMA’S APPROACH TO FINTECH

It is an express purpose of the FMCA to promote innovation and flexibility in the financial markets.

The FMA has stated that it wants to see innovative financial products and services coming to market, delivering customer benefits and supporting the integrity of New Zealand's capital markets. It will encourage innovation where it improves the range or quality of financial services in New Zealand. The amendment of the FMCA to provide for licensed digital financial advice services is an example of this.

The FMA has so far discounted the use of a regulatory sandbox in New Zealand but has said that it will maintain an open and flexible approach for businesses that wish to engage with the FMA at an early stage on innovation in financial services and that it will also ensure
that it supports an appropriate environment for innovation to flourish.

**Electronic payments platforms and regulation of peer-to-peer lenders**

**ELECTRONIC PAYMENT PLATFORMS**

Retail payment systems are used to transfer funds from consumers to merchants in exchange for goods and services. They include credit and debit cards, the EFTPOS system, as well as cash, checks and bank transfers.

Retail payment systems are subject to relatively light-handed regulation in New Zealand.

**PEER-TO-PEER LENDERS**

A P2P lending service is one where a person provides a facility by means of which offers of debt securities may be made, and the principal purpose of the facility is to facilitate the matching of lenders with borrowers who are seeking loans for personal, charitable or small business purposes.

Providing a P2P lending service requires a market services license from the FMA. The eligibility criteria for a P2P lending services license under FMCA include the following.

- The provider has fair, orderly and transparent systems and procedures for the service.
- The service is designed primarily for offers by persons other than the provider.
- The provider has adequate systems and procedures for checking the identity of each issuer of debt securities, assessing the risk of investors not being repaid in full or not receiving interest and for disclosing information about that checking and assessment to investors.
- The provider has a fair dealing policy to exclude issuers that have engaged in misleading or deceptive conduct.
- The provider has adequate systems and procedures for ensuring that each issuer does not raise more than NZD2 million in any 12-month period under the service.
- The provider has adequate systems and procedures for handling conflicts of interest.

**Regulation of payment services**

Retail payment systems are used to transfer funds from consumers to merchants in exchange for goods and services. They include credit and debit cards, the EFTPOS system, as well as cash, cheques, bank transfers and new forms of app-based payment.

Retail payment systems are subject to relatively light-handed regulation in New Zealand:

- RBNZ has a mandate to promote the maintenance of a sound and efficient financial system; however the performance and efficiency of retail payment systems are not the primary focus of the RBNZ.
- Payments New Zealand is the operator of a number of payment systems in New Zealand (including the Consumer Electronic Clearing System, which includes proprietary EFTPOS) but has no role in determining the allocation of costs or incentives within retail payments systems or the business models that schemes operate under. It was established in 2010 by eight banks with a mandate to open access to and preserve the integrity of New Zealand's payment systems. Forty organisations now make up the Payments NZ community - 12 Participants (banks and financial institutions) and 28 Members (payment system organisations (such as card schemes, merchants, smaller non-shareholding banks, tech providers, retailers, fintechs and payments infrastructure owners) that want to be actively involved in the ongoing development and strategic direction of payment systems.

In February 2016, the New Zealand government asked the Ministry of Business, Innovation and Employment (MBIE) to examine whether New Zealand’s retail payment systems were producing good economic outcomes. In particular, MBIE asked are:

- consumers and merchants benefiting from ongoing innovation in payment systems;
- card payment systems being used efficiently; and
- consumers and merchants bearing a fair share of the costs?
Following a public consultation process, Payments NZ have been working with industry to advance the Payments Direction strategic initiative and engaging with banks and card schemes to improve the transparency of merchant service and interchange fees. The Payments Direction initiative aims to deliver a core payments system that:

- simplifies and removes friction from customers’ payment experiences;
- gives customers choice across a greater range of value propositions;
- enables newcomers to partner and compete with existing players;
- ensures relevant opinions are heard in relation to design and governance matters; and
- balance innovation with preserving security and need to meet increasingly complex compliance requirements.

By 2020, Payments NZ is expecting to have endorsed the implementation of a shared application programming interface (API) framework and a 365-day service availability for the settlement before interchange (SBI) system - both of which are key initiatives aimed at future-proofing the core payments system. Other key priorities include investigating and developing opportunities relating to the use of proxy identifiers to identify bank accounts, request to pay (API-enabled push payments), speeding up payments and the ISO 20022 payments messaging format.

### Application of data protection and consumer laws

The Privacy Act 1993 governs the collection, use and disclosure of personal information and the access by individuals to that information. Following a comprehensive review, this will be repealed and replaced with a new Privacy Act which is currently progressing through Parliament and expected to come into force in 2020. Amongst other things, the new legislation proposes stronger powers for the Privacy Commissioner, mandatory reporting of privacy breaches, new offences and increased penalties.

The Unsolicited Electronic Messages Act 2007 regulates and prohibits unsolicited commercial electronic messages with a New Zealand link from being sent and requires commercial electronic messages to include accurate information about the person who sent the message and a functional unsubscribe facility. The act also prohibits address-harvesting software or a harvested-address list from being used to send unsolicited messages in contravention of the act.

The Credit Contracts and Consumer Finance Act 2003 sets out the requirements for borrower disclosure, responsible lending processes and reasonable fees in the context of consumer lending.

New Zealand has trade practices and fair dealing legislation that requires all businesses to ensure that they do not engage in misleading or deceptive conduct, make unsubstantiated claims or enter into unfair contract terms with consumers.

### Money laundering regulations

The Anti-Money Laundering and Countering Financing of Terrorism Act 2009 has the purposes of:

- detecting and deterring money laundering and the financing of terrorism;
- maintaining and enhancing New Zealand’s international reputation by adopting (where appropriate in the New Zealand context) recommendations issued by the Financial Action Task Force; and
- contributing to public confidence in the financial system.

Generally, where a firm provides a financial service by way of business and is required to be registered under the FSPA, it will be supervised by the FMA for compliance with anti-money laundering requirements.

If a reporting entity establishes a business relationship or conducts an occasional transaction or activity that involves new or developing technologies, or new or developing products, that might favor anonymity (such as bitcoin and other cryptocurrencies), the reporting entity must take any additional measures that may be needed to mitigate and manage the risk of such technologies or products being used in a money laundering offence.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

**SEED INVESTMENT**

Initial investment in FinTech businesses may be provided by family, friends and close business associates of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

Offers of financial products by a FinTech business to its close business associates (directors, senior managers, etc) or to relatives of directors do not generally require disclosure under the Financial Markets Conduct Act 2013 (FMCA).

**SMALL OFFERS**

Offers of financial products by a FinTech business to persons who are likely to be interested in the offer (having regard to previous contact with that person or that person’s statements or actions) do not require disclosure under the FMCA if the financial products are equity or debt securities and provided that not more than NZD2 million is raised from not more than 20 investors in any 12-month period.

**CROWDFUNDING**

The crowdfunding sector is well established in New Zealand, and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through a licensed crowdfunding service, such as Snowball Effect or Equitise.

In New Zealand, a person provides a crowdfunding service if they provide a facility by means of which offers of shares in a company are made and the principal purpose of the facility is to facilitate the matching of companies who wish to raise funds with many investors who are seeking to invest relatively small amounts. Providing a crowdfunding service in New Zealand requires a market services license issued by the Financial Markets Authority (FMA). The eligibility criteria for a license for a crowdfunding service include requirements that the provider has:

- fair, orderly and transparent systems and procedures for providing the service;
- an adequate anti-fraud policy;
- adequate disclosure arrangements to give investors information to assist in the decision to acquire shares;
- an adequate fair dealing policy;
- adequate systems to ensure that each issuer does not raise more than NZD2 million in any 12-month period under the service; and
- adequate systems for handling conflicts of interest.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access. Offers of shares are limited to NZD2 million in any 12-month period.

**ACCELERATORS**

There are various angel networks, incubators or accelerators in the New Zealand market which offer support, facilities and funding for startups, often in return for an equity stake.

**Venture capital and debt**

Venture capital (VC) funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. VC provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of VC and involves an equity investment by a corporate fund. The benefit of having a CVC as an
investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), which is secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through VC.

NEW ZEALAND VENTURE INVESTMENT FUND

The New Zealand Venture Investment Fund (NZVIF) was established by the New Zealand government in 2002 to build a vibrant early stage investment market in New Zealand. It has NZD245 million of funds under management which are invested through two vehicles: the NZD195 million Venture Capital Fund of funds and the NZD50 million Seed Co-investment Fund.

NZVIF does not invest directly into companies but makes its investments either through privately managed VC funds, or alongside experienced angel investors, who it partners with to invest into New Zealand-originated, high-growth potential companies. NZVIF can invest up to NZD25 million into a new VC fund, provided there is at least matching private sector support, a demonstrable track record and an experienced team.

Warehouse and platform funding

FinTech platforms (such as peer-to-peer (P2P) lending platforms) may be able to source institutional funding lines from domestic and international lenders and investors, with those funds available to be lent out through the platform. Access to this type of platform funding depends on the availability of funders with an understanding of, and risk appetite for, exposure to the relevant asset class (e.g. P2P loans).

Warehouse financing may be available for FinTech companies which own or can offer exposure to a sizeable portfolio of assets. The funding is secured by assets acquired by a special purpose trust from the originator. The senior lenders will typically only fund a portion of the assets, with the remainder being financed by way of mezzanine lending and/or subordinated lending from the originator.

Senior bank debt and capital markets funding

SENIOR BANK DEBT

FinTech companies will often start out with overdraft arrangements from a bank supported by the company's directors or shareholders.

Once a FinTech company is more established and has a track record and asset base, bank debt becomes a more viable source of funding for working capital, accounts management and liquidity purposes. In contrast to capital markets funding, which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility.

CAPITAL MARKETS FUNDING

New Zealand has both debt and equity capital markets which are accessible to businesses (usually of a certain size).

Raising finance by way of an Initial Public Offering (IPO) is a potential funding arrangement for FinTech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange, such as the NZX.

Larger FinTech companies may also access funding by issuing bonds to wholesale or retail investors as a way of raising more competitive funding, but retail issues involve significant regulatory compliance costs under the FMCA.

Another potential funding tool for fast-growing FinTech businesses is to issue convertible bonds or loan notes which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

Incentives and reliefs

CALLAGHAN INNOVATION

Callaghan Innovation is a government agency in New Zealand and is tasked with supporting hi-tech businesses in New Zealand with innovation. It is one of the government's key priorities to build a stronger, more competitive economy for New Zealand and to boost the growth of firms in the manufacturing and services sector.
Callaghan Innovation’s main objective is to support science and technology based innovation and its commercialization by businesses in order to improve their growth and competitiveness. It achieves this objective by providing research and development grants, access to experts and undertaking collaborative projects to reduce research and development costs and share industry knowledge.

RESEARCH AND DEVELOPMENT LOSS TAX CREDIT

The aim of the research and development (R&D) loss tax credit is to allow startup companies (with an R&D focus) to refund tax losses caused by qualifying R&D expenditure.

To ‘cash out’ any tax losses from R&D expenditure the startup must meet the eligibility criteria. To be eligible the company must:

- be a tax resident in New Zealand;
- have a net loss in the corresponding tax year;
- have eligible R&D expenditure for the income year;
- have sufficient R&D wage intensity;
- meet the corporate eligibility criteria; and
- own (solely or jointly) the intellectual property and know-how that results from the R&D activity.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Buying and selling loans is common.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio subject to overarching terms.

The most common ways of selling loans are as follows.

Assignment

An assignment is a transfer of rights only, not obligations. Subject to any contractual restrictions, assignment may be able to be achieved without the consent of the debtor. An assignment can be effected as either an equitable assignment or legal assignment depending on whether certain statutory requirements have been satisfied.

Novation

A novation is a full legal transfer of the party’s rights and obligations by agreement. It is a tripartite arrangement between the existing parties and the transferee and results in a fresh contract being formed between the continuing party and the transferee and the transferor being released from its obligations.

Sub-participation

A sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the buyer taking on double credit risk, both on the seller as well as the borrower.

What are the main considerations when transferring a loan and related security?
There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller's legal advisors. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and
- **consent** – whether a transfer requires the consent of or notification to any other parties. Unless the debtor is notified of the assignment, the debtor can still repay the assignor and be released from the debt despite the assignment to the assignee.

**Projects**

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

**Generally**

The extent of public and private infrastructure ownership varies significantly between the five key infrastructure sectors in New Zealand: energy, telecommunications, transport, water and social sectors.

Each of these sectors is considered below.

It is also worth noting that in 2019 New Zealand created its own Infrastructure Commission. A new independent infrastructure body, the New Zealand Infrastructure Commission - Te Waihanga, has been established to ensure that New Zealand gets the quality infrastructure investment needed to improve its long-term economic performance and social wellbeing. It is not a delivery vehicle.

**Energy**

Five major companies generate 95% of New Zealand's electricity (and also themselves, or through related entities, sell electricity at retail). Three of these companies have mixed public/private ownership, with the Crown holding a majority stake. The remaining two major electricity-generating companies are privately-owned.

Transpower New Zealand Limited owns and operates the national electricity transmission infrastructure (the ‘national grid’) and is a state-owned enterprise. There are 29 distribution companies which own the lines connecting consumers to the national grid. These companies and their assets are owned by a mix of publicly listed companies, shareholder co-operatives, community trusts and local government.

Distributors' arrangements with retailers permit retailers to provide consumers with electricity via the distributor's lines. Retailers are privately owned – except for the three large ‘gentailers’ in which the Crown holds a majority share.

With the exception of one company (Genesis Energy Limited), gas and oil assets at the production, wholesale, transmission and distribution levels are owned by private sector companies.

The Electricity Authority regulates the electricity industry and the Gas Industry Company regulates the gas industry. Electricity transmission, some electricity distribution businesses and gas pipeline businesses are subject to Commerce Commission (New Zealand's competition and consumer law regulator) price-quality regulation.
Telecoms infrastructure

Telecommunications infrastructure is largely privately owned. Historically, fixed-line broadband and telephone services are mostly have been provided through copper-based networks, although fiber-based services are now increasingly common with the government’s ultra-fast broadband initiative aiming to achieve 87% national coverage by 2022 (significant additional rural broadband and mobile coverage will also be deployed around New Zealand between 2019 and 2023 due to the expansion of the rural broadband initiative phase two/mobile black spots fund (RBI2/MBSF) programme. Chorus, a private-sector company specifically regulated by the Telecommunications Act 2001, owns and operates the copper network on an open-access basis for retail service providers. Mobile services are wholly provided by the private sector.

As noted above, the government has invested heavily in building an ultra-fast broadband fiber (UFB) network. Crown Infrastructure Partners (CIP), a Crown-owned company, is responsible for managing the UFB network on the Crown's behalf.

Telecommunications providers are regulated by the Commerce Commission.

Transport infrastructure

ROADS

Almost all roads in New Zealand are publicly owned. The State Highway network, which connects towns and cities, is managed on behalf of central government by the New Zealand Transport Agency (NZTA). Local roads are owned and managed by local government in association with NZTA.

Roads and other land transport infrastructure are funded through the National Land Transport Fund, which is administered by the NZTA. The NZTA makes funding decisions in accordance with national and regional land transport plans. NZTA commonly outsources work on state highways to private sector suppliers.

AVIATION

Airports vary considerably in scale and utilization. New Zealand has eight civil airports designated by the New Zealand Customs Service to receive international flights, five of which have regular scheduled international services. 26 airports receive regular domestic services.

Most airports are owned by local government, while some have part ownership by central government or the private sector. Auckland International Airport is owned by Auckland International Airport Limited, a company listed on the New Zealand and Australian stock exchanges. The Auckland City Council retains a 22% ownership in the airport.

Airways New Zealand, a state-owned enterprise, provides air navigational infrastructure.

Aviation capacity is provided by the approximately 26 domestic and 20 international passenger carriers which operate in New Zealand. This infrastructure is for the most part privately provided. Air New Zealand, the national airline, carries approximately 80% of domestic traffic and 40% of international traffic. Air New Zealand is listed on both the New Zealand and Australian stock exchanges, while the Crown retains a 52% ownership.

RAIL

KiwiRail, a state-owned enterprise, owns and controls the rail tracks, associated infrastructure and rolling stock. The rail corridor is technically owned by New Zealand Railways Corporation (also a state-owned enterprise) with KiwiRail licensed to manage the land for a nominal fee.

Wellington and Auckland are the only cities in New Zealand with metropolitan rail services. The metropolitan rolling stock is owned by the respective local government organizations, each of whom contracts the operation of its passenger rail services to the private sector. Transdev is currently contracted to operate both the Wellington and Auckland passenger rail services.

SHIPPING AND PORTS

New Zealand has 16 ports servicing both domestic and international movements. Many are 100% owned by local government, while others have part private ownership.
KiwiRail owns and operates the Interislander, a passenger and freight ferry service connecting the North and South Islands of New Zealand. The Interislander competes with Bluebridge, a private sector company also offering freight and passenger service between the two islands.

**Other infrastructure**

**EDUCATION**

School infrastructure ownership varies among the three types of school: state school, ‘state-integrated’ school and private school. State schools are entirely owned and funded by the government, with boards of trustees responsible for their governance. Private schools are entirely privately owned, typically by a trust, and are not required to offer the national curriculum.

State-integrated schools are former private schools which are regulated like state schools (for example, they follow the national curriculum) but the ownership of school land and buildings is retained by the private owners. Representatives of the private owners sit as trustees on the school's board of trustees.

Historically, opportunities have existed for investment in education infrastructure through New Zealand's Public-Private Partnership (PPP) program (although, at the time of writing, the current Labour-led government has ruled out PPPs in the social infrastructure space). In the New Zealand context, a PPP is a long-term contract for the delivery of a service, where provision of the service requires the construction of a new asset, or enhancement of an existing asset, that is financed from external (private) sources on a non-recourse basis, and full legal ownership of the asset is retained by the Crown.

PPP contracts in the education sector have typically involved the Ministry of Education engaging a private partner to design, finance, build and maintain a particular school. The Crown still owns the land and buildings.

**HOSPITALS**

New Zealand has both a public and private healthcare system. Public hospitals are owned by District Health Boards, who receive central government funding and are responsible for providing and funding health services in their district. Private hospitals are owned and operated by private owners, typically trusts or companies.

**SOCIAL HOUSING AND HOUSING RELATED INFRASTRUCTURE**

Social housing in New Zealand is provided by a combination of central government (through Kinga Ora), local government and private sector Community Housing providers.

Created in 2019, Kinga Ora brings together the people, capabilities and resources of the Government's KiwiBuild Unit, Housing New Zealand and its development subsidiary HLC. This change has been designed to enable a more cohesive and joined-up approach to delivering the government's priorities for housing and urban development in New Zealand. These priorities include addressing homelessness and making homes more affordable for New Zealanders.

Kinga Ora has two key roles:

- being a public housing landlord; and
- partnering with the development community, Mori, local and central government, and others on urban development projects of all sizes.

At the time of writing, new Infrastructure Funding and Financing (IFF) legislation has been recently introduced to Parliament with bi-partisan support. IFF is a new, user-pays tool for funding local roading and water infrastructure. Crown Infrastructure Partners is expected to play a major role in facilitating investment and projects using this legislation.

**WATER**

Much of New Zealand's water infrastructure is used for agricultural purposes. According to the World Bank, 74% of New Zealand's fresh water withdrawals go towards agriculture. Ownership of agricultural irrigation infrastructure varies. Many irrigation projects are owned by
farming co-operatives with varying degrees of investment from local government. Historically central government has played a role in accelerating the development of rural water infrastructure projects through the Irrigation Acceleration Fund (although, this fund was closed by the Labour-led government in 2019).

Domestic water supply infrastructure is owned by local government. Many local authorities directly manage the supply of drinking water, while others contract out the operational and maintenance services.

At the time of writing, the government is in the process of creating an independent water body to regulate drinking water in New Zealand (noting this is a quality, rather than an economic, regulator).

Are there special rules for investing in energy and infrastructure?

Generally

New Zealand has an open economy which operates on free market principles. New Zealand maintains specific foreign investment restrictions in only a few areas of critical interest. There are no specific restrictions on foreign direct investment in the energy and infrastructure industries. Overseas persons investing in New Zealand energy and infrastructure assets or businesses must:

- comply in all respects with the general law of New Zealand in the same way as a New Zealand investor; and
- if applicable, apply for and receive consent from the Overseas Investment Office (OIO) in respect of the particular investment.

Overseas investments in New Zealand assets are screened if they are defined as ‘sensitive’ within the Overseas Investment Act 2005. Three broad classes of asset are currently defined as sensitive within the Act: acquisition of a 25% or more ownership interest in business assets valued at over NZD100 million, all fishing quota investments, and investment in ‘sensitive land’ as defined in Schedule One of the Act. Examples of sensitive land include: residential land, rural land over five hectares; or land bordering or containing foreshore, seabed, river or the bed of a lake.

Proposed investments must meet certain statutory criteria before requiring OIO consent. Once met, this will usually require investors to show their business experience, that they are of good character and, for sensitive land, demonstrate the benefits to New Zealand of their investment.

Investors who need OIO consent:

- generally do not have New Zealand citizenship or are persons who are not ordinarily resident in New Zealand;
- are entities, such as companies, trusts and joint ventures, with more than 25% overseas ownership or control; and
- can include associates (including New Zealanders) of overseas investors.

The most effective way for an overseas person to invest in New Zealand will depend upon practical matters relating to the nature of the investment and the resulting tax consequences in New Zealand and elsewhere.

Overseas persons generally undertake business in New Zealand by:

- incorporating a local company as the subsidiary of an overseas company;
- registering a branch of an overseas company in New Zealand; or
- establishing a joint venture or partnership.

Subject to tax and anti-money laundering reviews, there are no specific restrictions on the movement of funds in or out of New Zealand, or on repatriation of profits. Other than under the terms of any OIO consent, no additional performance measures are imposed on foreign-owned enterprises.

Energy

The energy markets in New Zealand are heavily regulated by the Electricity Authority, the Gas Industry Company and the Commerce Commission. Securing licenses and consents to develop certain natural resources may trigger a process which requires consultation with
local iwi (Maori tribes).

Although a central body manages the electricity market, electricity generation is separated from electricity distribution. Transpower, a state-owned enterprise, owns and operates the entire transmission infrastructure. Electricity generators cannot transmit electricity unless directly to a customer. Distributors enter into transmission agreements with Transpower, as prescribed by the Electricity Industry Participation Code. This code also provides for the processes by which purchasers and generators submit and revise bids and offers for electricity.

The majority of electricity in New Zealand is generated through hydroelectric dams. There is increasing pressure on the country’s freshwater resources, resulting in the Land and Water Forum making ongoing recommendations to the government about freshwater management and preservation. Government implementation of these recommendations will influence the allocation of freshwater for electricity generation.

Geothermal energy is an emerging industry governed by unusual rules. No individual or business can own a geothermal resource, but consents can be awarded for development and use under the Resource Management Act 1991. There is no licensing regime under which rights to investigate geothermal resources can be secured.

The oil industry is regulated by New Zealand Petroleum and Minerals. The government has rights to all oil in New Zealand and in the country’s Exclusive Economic Zone. The Crown Minerals Act 1991 and its related regulations governs the allocation rights to oil resources.

**Telecoms infrastructure**

The telecommunications industry is essentially separated into network owners, who own the infrastructure (including fixed line and fibre), and retail service providers, who purchase wholesale broadband and voice services from network owners to on-sell to consumers. The wholesale price that network owners can charge to retail services providers is controlled by the Commerce Commission. Due to ‘unbundling’ of local loop infrastructure (cabling which connects an exchange to an end consumer), retail service providers are also able to install their own infrastructure in exchanges, giving them more control over the quality of their service.

There is some regulation in place to support new mobile service providers. However, retail service providers looking to enter the market face limited choices when looking for commercial agreements for roaming and co-location on mobile towers. Competition regulations do not impose price controls on owners of mobile infrastructure. The Commerce Commission undertook a mobile market study in 2019.

**Transport infrastructure**

Opportunities exist for investment in transport infrastructure through the government’s Public-Private Partnership (PPP) program. There are currently two major transport PPPs underway for the construction of major expressways. A PPP is one option for the light rail project proposed for Auckland and it is expected that further projects will be identified as the Infrastructure PlanCommission develops a 30 year infrastructure plan.

**What is the applicable procurement process?**

Private sector procurement is governed by the ordinary laws of New Zealand. As noted above, foreign investors may need to obtain consent from the Overseas Investment Office before entering into certain transactions. Foreign investment is otherwise generally not subject to any further restrictions.

Public sector entities must comply with good public sector procurement practices when contracting with private sector suppliers. The Government Rules of Sourcing (GRS), issued by the Ministry of Business Innovation and Employment, provide a broad framework of rules and best practice guidelines for government procurement. The GRS apply on a mandatory basis to almost all executive government organizations and a number of Crown entities. Other non-core public sector and local government organizations may also be obliged to take the GRS into account as guidance for good practice. In addition to the GRS, each public sector entity has its own procurement policy.

The GRS apply to government contracts when the maximum total estimated value meets or exceeds:

- in relation to contracts for goods and services, NZD100,000 or more; or
- in relation to contracts for construction works, NZD9 million or more.
The broad objective of the GRS is to ensure that procurement decisions are fair, transparent, lawful and provide value for tax payer money. A decision not to award a contract to tenderer cannot be made on the basis that they are a foreign-owned or controlled entity.

Government procurement opportunities are advertised on a web-based service called Government Electronic Tender Service (GETS). GETS is accessible to all interested suppliers, both domestic and international. It meets New Zealand's commitments under free trade agreements. Government agencies are also permitted to consider unsolicited proposals from the private sector, subject to certain restrictions.

Construction procurement guidelines have recently been developed which set out the standards of good practice for government agencies to apply to their construction projects.

What are the most common forms of funding / investing in energy and infrastructure?

The principal forms of sector funding in energy and infrastructure in New Zealand are:

- loans made on a corporate finance basis (balance sheet debt);
- loans made on a project-finance basis (to a special purpose project company) on medium- to long-term bases. Such loans may later be syndicated to other funders;
- bond finance;
- mezzanine debt (in some sectors);
- refinancing of the debt in operational projects; and
- asset financing.

Funding is often sourced from offshore.

The most common form of investment in energy and infrastructure is equity investment in joint ventures, special purpose vehicles or entities that may have a portfolio of interests (share capital and subordinated sponsor loans).

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

The Reserve Bank of New Zealand has the power to appoint any person to carry out an investigation of the affairs of a registered bank or an associated person of that registered bank when it is satisfied that it is:

- necessary or desirable to give directions when it has reasonable ground to believe that the registered bank or associated person is insolvent, likely to be insolvent, is about to suspend payment or is unable to meet obligations;
- the business of the bank is not being carried out in a prudent manner;
- the affairs or circumstances surrounding the bank or associated person are such as to be prejudicial to the soundness of the financial system; and
- the bank or associated person fails to comply with a requirement under the Financial Markets Conduct Act 2013 (FMCA) or has been convicted of an offence under the Reserve Bank of New Zealand Act 1989.

Similar powers exist under the Corporation (Investigation and Management) Act 1989 in relation to the statutory management of companies and other entities. Enforcement of a security may be suspended while a company or other entity is subject to statutory management.
The Financial Markets Authority (FMA) has extensive powers under the Financial Markets Authority Act 2011 to:

- obtain information, documents and evidence where FMA considers it necessary or desirable for the purposes of performing its functions, powers or duties under that Act or any financial markets legislation (including the FMCA);
- enter and search places, vehicles and other things for the purpose of ascertaining whether a person has engaged in or is engaging in conduct that constitutes or may constitute a contravention of any provision of financial markets legislation where there are reasonable grounds to suspect that there is a contravention and that the search will find evidential material; and
- share information and documents with other law enforcement agencies, regulators or overseas regulators that the FMA considers may assist those agencies' performance or exercise of their functions, powers or duties under an enactment or foreign law (but only where the overseas regulator can provide appropriate protections for the purpose of maintaining the confidentiality of anything provided).

FMA may also use any information, or copy of any documents, provided to it by a law enforcement or regulatory agency under any enactment, or by an overseas regulator, in the FMA's performance of its functions, powers or duties.

The FMA also has powers under the FMCA to intervene in debt securities offered under a regulated offer and in registered managed investment schemes. Auditors and other parties such as investment managers and custodians have a duty to report serious problems in respect of debt securities or managed investment schemes to the FMA (or the supervisor of a managed investment scheme). The FMA can direct the supervisor, issuer or manager to take action in respect of serious problems reported to it, or apply for court orders to remedy problems. There is a wide range of civil liability provisions in the FMCA relating to contraventions of the FMCA by issuers and managers. Criminal liability only applies where there has been a deliberate breach.

_Last modified 13 Dec 2019_

**What regulatory penalties may apply?**

The Reserve Bank of New Zealand has the discretion to take enforcement action and to decide what enforcement action to take. Registered banks could be subject to de-registration.

Examples of penalties in the Financial Markets Conduct Act 2013 are:

- fines of up to NZD50,000 for infringement offences;
- injunctions;
- banning orders;
- loss of license;
- pecuniary penalty orders (the maximum being the greater of the consideration for the transaction, three times the amount of the gain made or loss avoided, or NZD1 million for an individual and NZD5 million in any other case);
- compensatory orders; and
- other civil liability orders.

_Last modified 13 Dec 2019_

**What criminal penalties may apply?**

Criminal offences can apply under the Reserve Bank of New Zealand Act 1989 when the offences relate to:

- the supply of information;
- the registration of banks;
- disclosure statements; and
- the prudential supervision of registered banks (amongst other miscellaneous provisions).

The maximum term of imprisonment can be up to 18 months or a fine of NZD200,000 for an individual or in the case of a body corporate...
Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

There are no stamp duties, registration or transfer-type taxes currently imposed in New Zealand. In some circumstances a loan that comes within the Approved Issuer Levy ('AIL') regime will need to be registered with Inland Revenue.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

There are no stamp duties, registration or transfer-type taxes currently imposed in New Zealand. In some circumstances a mortgage, debenture or other security that comes within the Approved Issuer Levy ('AIL') regime will need to be registered with Inland Revenue.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?

There are no stamp duties, registration or transfer-type taxes currently imposed in New Zealand. In some circumstances debt securities that come within the Approved Issuer Levy ('AIL') regime will need to be registered with Inland Revenue.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?

Generally not, but whether or not the Inland Revenue has priority over secured lenders/secured debt security holders will depend on a number of factors (including whether and when the security interest has been perfected, the nature of the tax owed to the Inland Revenue and the status of the debtor (e.g. whether it is in liquidation)). On a liquidation, the Inland Revenue can have priority in some circumstances.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Yes, generally New Zealand imposes withholding tax on interest payments under a loan.

If so:
What is the rate of withholding?
The rate of withholding varies.

For interest paid to recipients resident for tax purposes in New Zealand, the rate of resident withholding tax (RWT) differs according to the type of recipient. For most corporates, the rate is 28% (or 33% if it chooses the higher rate), whereas individuals can elect a rate which reflects their marginal tax rate (10.5%, 17.5%, 30% or 33%). However, if the recipient (corporate or individual) has not provided its taxpayer identification (IRD) number to the payer, the rate defaults to 33%.

For interest paid to recipients not resident for tax purposes in New Zealand, the rate of non-resident withholding tax (NRWT) is 15% unless either:

- the approved issuer levy (AIL) regime has been applied to the loan and the requirements of the regime are met (including payment of a 2% or 0% levy), in which case NRWT is reduced to 0%; or
- a reduced rate applies under an applicable double tax treaty.

What are the key exemptions?

The key exemptions from the requirement to deduct withholding tax from interest payments to recipients resident for tax purposes in New Zealand apply where the recipient holds a certificate of exemption (or, from 1 April 2020, has RWT-exempt status) – persons who may apply for a RWT exemption certificate (or, from 1 April 2020, RWT-exempt status) include registered banks, those in the business of borrowing and lending money, portfolio investment entities (a tax status for certain collective investment vehicles), certain large taxpayers (gross income in excess of NZD2 million), and certain persons deriving exempt income (e.g. charities).

The key exemptions from the requirement to deduct withholding tax from interest payments to recipients not resident for tax purposes in New Zealand apply where:

- the loan is under the AIL regime and the requirements of the regime have been met (including payment of the 2% levy or the loan is NZD dominated listed debt that qualifies for AIL at a rate of 0%), then NRWT is reduced to 0% (note: this is a reduction as opposed to an exemption);
- the interest is paid by a transitional resident and other requirements are met;
- the Commissioner of Inland Revenue has relieved the person of the obligation to withhold NRWT (although it is unlikely that this power would be exercised); or
- an applicable double tax agreement provides an exemption, in whole or in part.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding tax (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both Norwegian and EU law, the latter of which is almost always incorporated into Norwegian law.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Norway or to request that they are admitted to trading on a regulated market operating in Norway unless an approved prospectus has been made available to the public.

What are common issuing methods and types of debt securities?

In Norway the most common debt securities are bullet bonds, where the interest is paid at regular intervals until the full amount is due, whereupon the entire par value is payable.

There are several types of debt securities in Norway. Some common forms include:

- different types of bonds with varying repayment and interest rates, such as coupon bonds, zero-coupon bonds, secured bonds, covered bonds, unsecured or senior bonds, government bonds, and convertible and contingent convertible bonds; and
- short-term loan certificates that are tradable debt securities.

What are the differences between offering debt securities to institutional/professional or other investors?

The Norwegian prospectus rules do not make a distinction between professional and other investors for the purposes of its disclosure requirements but do include different disclosure regimes by reference to the minimum denomination of a single security.

However, for more information, see Issuing and investing in debt securities – requirement for prospectus. Section 7-4 number 8 of the Securities Trading Act of 2007 states that the provision of section 7-2 does not apply where the offer is addressed to professional investors pursuant to further rules laid down by the ministry in regulations.
When is it necessary to prepare a prospectus?

Section 7-2 of the Securities Trading Act 2007 states that where an offer to subscribe for or purchase transferable securities is addressed to 150 or more persons in the Norwegian securities market, and involves an amount of at least €1 million calculated over a 12-month period, a prospectus shall be prepared in accordance with the rules of chapter 7 of the Securities Trading Act chapter 7. The same applies where an offeror residing in Norway makes an offer in another European Economic Area (EEA) state and the prospectus requires approval pursuant to section 7-7 of the Securities Trading Act. Chapter 7 implements the EEA directives (EF) 2003/71 and (EF) 2004/809.

It is also necessary to prepare a prospectus upon admission to trading of transferable securities in a Norwegian regulated market place, including increases of capital in companies with quoted shares. The same applies where an issuer residing in Norway seeks admission to trading on a regulated market in another EEA state and the prospectus requires approval pursuant to the provisions of section 7-7 of the Securities Trading Act of 2007.

Section 7-4 number 8 of the Securities Trading Act of 2007 states that the provision of section 7-2 does not apply where the offer is addressed to professional investors pursuant to further rules laid down by the ministry in regulations.

What are the main exchanges available?

There are two equity markets in Norway. Oslo Børs (Oslo Exchange Market) is the only regulated market for securities trading. For companies that do not meet the requirements of the Oslo Exchange Market, there are is another licensed and regulated market called Oslo Axess. There are also unregulated and multilateral trading facility (MTF) marketplaces such as Merkur Market, Oslo Connect and Nordic ABM.

Is there a private placement market?

There is a private placement market in Norway. Private placements are popular where the prospectus rules do not need to be complied with.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document may give rise to both civil and criminal liability under Norwegian law. Norway has various investor protection statutory provisions relevant to liability for an inaccurate offering memorandum. There are also general fraud statutes and liability may also arise under common law through a civil action for deceit, negligent misstatement or misrepresentation.

Investing in debt securities

Debt security terms and conditions typically confer significant discretions on the trustee. The trustee will represent the interests of the debt security holders, and will be the only party who can take legal action, whether against the issuer's board of directors or the issuer itself. The conditions also provide for meetings of investors to consider matters affecting the investors' interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

Establishing and investing in debt / hedge funds
Are there any restrictions on establishing a fund?

Yes.

Establishing a fund or the fund management and marketing of units in funds towards the public, among other things, are regulated activities under the Securities Fund Act of 2011 or the Alternative Investment Fund Managers Act of 2014 and therefore subject to supervision by the Norwegian Financial Supervision Authority.

What are common fund structures?

Common forms of funds include:

- Securities Funds (open-ended and closed-ended funds as well as fund-in-fund structures);
- National Funds (Norwegian fund structure according to chapter 6 in the Securities Fund Act of 2011);
- Special Funds (Norwegian fund structure according to chapter 7 in the Securities Fund Act of 2011);
- Undertakings for Collective Investments in Transferrable Securities (UCITS);
- Hedge funds, private equity funds, investment companies and real estate funds (Alternative Investment Funds (AIFs)); and
- Exchange-Traded Funds listed on the Oslo Stock Exchange.

What are the differences between offering fund securities to professional/institutional or other investors?

Retail funds

Retail funds, including Undertakings for Collective Investments in Transferrable Securities (UCITS), are subject to a strict regulatory regime, including obligations with regard to the fund management and the investments of the securities fund's assets (ie allocation and investment limits and requirements as to liquidity of the investments). Special investor protection rules apply and it is required to provide key investor information and meet language requirements.

The retail funds are offered to non-professional investors and are subject to strict investor protection rules. Note that certain categories of funds cannot be offered to non-professional investors. A non-professional investor means any investor not considered as a professional investor, or one who may upon request be treated as such.

Institutional/professional funds

Professional funds are offered to professional investors and a professional client who meets two of the following three criteria: a total balance sheet of €20 million, turnover of €40 million or own capital of €2 million. In practice, in Norway, this often refers to non-UCITS funds, being hedge funds, private equity funds, investment companies and real estate funds, which fall into the category of Alternative Investment Funds (AIFs) and are therefore subject to the Alternative Investment Funds Managers Act of 2014. The regulatory framework is better suited for professional investors and does not set the same restrictions on the investments made by the fund.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

In general, the legal framework for establishing fund structures is complex and there are many risks to be taken into account.
A new entrant to the fund market will need to obtain the necessary license(s) from the regulator and set up an organization (incl. control bodies) which fulfills various suitability requirements. It will also have to manage the fund in compliance with the applicable regulations. The marketing and distribution of fund products to the public are subject to particular rules (for more information, see Establishing and investing in debt and hedge funds – establishment). It is also important for the fund incorporator to select the optimal fund structure to fit the fund product(s) intended for sale and the targeted fund investors.

For investors there are a lot of risk factors to take into consideration and an investment fund can generally reduce the risk of being exposed to a single security as it allows them to invest in a portfolio of securities, meaning a drop in the value of a single investment will not necessarily cause the value of the whole investment to collapse. That being said, all investments carry a varying degree of risk and investing in funds involves many of the same risks as any other investment. The value of an investment may rise or fall and the previous performance of a fund is not a guarantee of its future performance. Further, return and risk almost always go hand in hand; generally, an investor must take a greater risk to achieve greater returns. The risks that apply will often be determined by the classes of assets that the fund invests in and the selection of investments that the manager makes. Other risk factors that may impact on the performance of a fund include market risk, regulatory, economic and political risks (especially if the fund invests in non-EU markets, emerging markets etc), counterparty risk (if a counterparty defaults, that may impact on the fund’s position), currency risk and gearing risks (if the fund borrows or utilizes derivatives to increase potential returns), diversification risk and liquidity risk. Liquidity risk is the risk that positions cannot be realized at a particular point in time both in relation to the manager’s ability to buy and sell positions for the fund and the investor’s ability to buy or sell units in the fund. The fund investor should carefully consider the fund’s risk profile and the policies employed by the fund. Note that all risk indicators are usually based on historical data or assumptions.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Yes.

The units of a fund can be marketed by investment firms, licensed alternative investment fund managers or securities funds as well as banks to a certain extent. Other regulated entities may also be entitled to market units in a fund in cooperation with the manager.

The Securities Fund Act of 2011 and the Alternative Investment Fund Managers Act of 2014 set out the marketing regimes applicable for funds. They also provide exemptions for some of these marketing requirements where marketing is aimed at professional investors. In addition, the laws differentiate between securities’ funds and alternative investment funds (AIF). AIFs are more suited for professional investors, therefore there are restrictions in relation to the marketing of such funds to non-professional investors. Where the AIF fund is marketed to professionals and it is below certain set fund thresholds, then a marketing permit from the Norwegian Financial Supervisory Authority is not needed. Where marketing is done towards non-professional investors, then the management is required to apply for a special marketing license.

The Undertakings for Collective Investments in Transferrable Securities (UCITS) directive has been incorporated into Norwegian legislation. This enables fund promoters to create a single product for marketing in all EU member states and on the completion of the appropriate notification procedure, a UCITS established in one member state can be sold in any other. A UCITS intending to market in another member state must complete and submit to its home regulator a notification which must include certain specified information, including copies of key investor documents. The home regulator then completes a notification file which is sent in a regulator-to-regulator transmission, following which the UCITS can be sold in the other member state.

Are there any restrictions on managing a fund?

The Securities Funds Act of 2011 and its related regulations set several requirements in relation to management of funds. The Norwegian Financial Supervisory Authority oversees and provides licensing for all securities fund management companies. To receive such authorization, certain statutory requirements must be met, and various restrictions arise on manager structuring, investment limits, organization of the activity, risk management etc. This Act also incorporates specific regulations regarding UCITS, incorporating the UCITS directive. Alternative Investment Fund Managers (AIFMs) are also subject to regulation under the Alternative Investment Fund Managers Directive (as implemented in Norway).
Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

Yes.

Investment services provided on a professional basis must be provided by undertakings authorized to do so by the Ministry of Finance. The authorization shall indicate which investment services and ancillary services the investment firm may provide. An investment firm shall apply to the Norwegian Financial Supervisory Authority for approval before it offers ancillary services beyond those indicated by the authorization. However, the following entities are exempted from the authorization requirement:

- the Central Bank of Norway;
- the National Insurance Scheme Fund;
- public authorities that manage public debt;
- management companies for securities funds;
- insurance companies;
- pension funds;
- depositories of securities funds, pension funds and alternative investment funds;
- undertakings authorized to operate as an options clearing house, clearing house or regulated market; and
- managers of alternative investment funds.

What are common types of derivatives?

Common types of derivatives include options, futures, swaps, forward rate agreements and any other derivative contracts relating to securities, currencies, interest rates or yields, or other derivative instruments, financial indices or financial measures which may be settled physically or in cash, commodity derivatives, credit derivatives and financial contracts for differences.

Are there any other notable risks or issues around entering into derivatives contracts?

In order to ensure close out netting, the derivatives agreements must be in writing and provide for valuations at market prices. In addition the derivatives must be of the kind described in the Norwegian Securities Trading Act 2007.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending
Lending is a regulated activity, and unless the available exemptions apply, a lender will need to be authorized by the Norwegian Financial Supervisory Authority (FSA) to conduct such business. There are particular restrictions around how:

- the loans are marketed, originated and sold;
- lenders administer the loans on an ongoing basis; and
- to deal with borrowers who fall behind with their payments.

Foreign lenders may conduct business in Norway by establishing Norwegian subsidiaries and having these apply for authorization from the FSA. Special rules apply for entities that are authorized and seated in another European Economic Area state. Such entities may conduct business in Norway by passporting their licenses to Norway or through a branch.

Norwegian company law contains restrictions as to financial assistance. Section 8-7 of both the Private Limited Liability Companies Act of 1997 and the Public Limited Liability Companies Act of 1997 limit a Norwegian limited liability company's ability to grant credit for the benefit of its shareholder or a party closely related to a shareholder, or for the benefit of a shareholder of another company in the same group or any of its closely related entities. Such credit may only be granted:

- within the limits of the assets which the company may legally use for distribution of dividends (free equity); and
- if adequate security is furnished for the claim for repayment or recovery or within companies in the same group of companies.

There are certain exceptions to the rule mentioned above. The following credit may be granted outside the limits of the assets which the company may legally use for dividends:

- credit of customary duration in connection with commercial agreements;
- credit or security for the benefit of the parent company or other group company; and
- credit or security in favor of a legal person that has a controlling interest as set out in section 1-3 over the company, or in favor of a subsidiary of such a legal person, provided that the credit or security serves the group's economic interests.

Note that the requirement concerning adequate security shall not apply if the legal person is a state, municipality or county municipality.

Section 8-10 of both the Private Limited Liability Companies Act and the Public Limited Liability Companies Act limit a Norwegian limited liability company's ability to provide financial assistance or security in connection with the acquisition of shares in that company or any of its holding companies.

**Borrowing**

Borrowing is generally not regulated in Norway.

*Last modified 20 Oct 2017*

**What are common lending structures?**

Lending in Norway can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

 Syndicated facilities by their nature involve more parties, are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one participant in the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities.

**Loan durations**
The duration of a loan can vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable, and often attracting a higher margin.

**Loan security**

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

**Loan commitment**

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

**Loan repayment**

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

**What are the differences between lending to institutional/professional or other borrowers?**

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective. The Financial Contracts Act of 1999 chapter 3 contains several provisions that aim to protect consumers.

**Do the laws recognize the principles of agency and trusts?**

The concept of a trust is not recognized under Norwegian law. However, the agency function is widely used and generally accepted under Norwegian law.

**Are there any other notable risks or issues around lending?**

**Generally**

Loan agreements and other finance documents are subject to general contractual principles under Norwegian law, such as principles of revision of unfair contract terms. Certain statutory rules applying to financial institutions may also have implications to a lender, such as the mandatory requirement to include a maximum liability for a security interest or guarantee in order to ensure its validity if that security interest or guarantee is given in favor of a financial institution (other than in respect of security provided for the borrower's own debt).

**Specific types of lending**

Norwegian law poses certain challenges in the context of project finance and certain other types of asset lending transactions as security...
cannot as a general rule be granted over contracts as such (only monetary claims arising under a contract), requiring careful structuring of these types of transactions.

**Standard form documentation**

Most Norwegian law syndicated finance transactions are governed by documentation based on recommended forms published by the Loan Market Association (LMA), but adapted for the Nordic market excluding or reducing the scope of a number of provisions in the standard template. Bilateral finance transactions are sometimes made using a simplified form of the LMA standard, but will most often be documented on bank standard form documentation prepared in-house.

*Last modified 20 Oct 2017*

**Are there any other notable risks or issues around borrowing?**

Borrowers should be aware of the potential implications of the EU's Bank Recovery and Resolution Directive (BRRD), which outlines certain measures for dealing with failing financial institutions.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to 'bail in' obligations of failed EEA financial institutions and to postpone the enforcement of early termination rights against the affected institution. 'Bail in' describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of English or other EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

The BRRD is under consideration by the Ministry of Finance, but has not yet been implemented into Norwegian law and no deadline has been set as of today. However, Norway already has rules with effects similar to BRRD.

*Last modified 20 Oct 2017*

**Giving and taking guarantees and security**

**Are there any restrictions on giving and taking guarantees and security?**

**Guarantees**

Guarantees are extensively used in Norway, and can be considered as a highly heterogeneous instrument. Guarantees may be issued by both private individuals/companies, credit institutions and public entities. They may guarantee both existing and future liabilities. The underlying claim may be a claim for money, contribution in kind or performance. Norwegian law recognizes the concept of on-demand guarantees. Recent court practice suggests, however, that careful structuring of on-demand instruments will be required to ensure their enforceability.

In the event that the guarantee is provided by a consumer in favor of a finance institution as the beneficiary, certain mandatory rules set out in the Financial Contracts Act of 1999 will apply. These rules contain:

- certain information requirements applicable to the beneficiary before entry into the guarantee;
- an obligation to dissuade the guarantor (if required);
- requirements in respect of the specific content of the guarantee document (eg information on the maximum guaranteed amount);
- certain notification requirements of the beneficiary (eg when security is not furnished as premised, in the event of default and deferral of payment); and
- restrictions in respect of when the guarantee may be enforced (The beneficiary may not make a claim against the guarantor until legal steps have been initiated to obtain a basis for enforcement against the principal. As a result of this, a consumer may not grant a traditional on-demand guarantee or an unconditional guarantee where the beneficiary is a financial institution.).
The same rules are applicable for non-consumer guarantees where the beneficiary is a financial institution (regardless of the type of guarantee provided). However, most of these rules are non-mandatory and routinely waived in guarantee agreements.

The guarantee must:

- be entered into in writing;
- contain details of the size of the maximum guaranteed amount; and
- contain information in respect of mortgages or other security for the beneficiary's claim, whether the guarantee shall encompass older debt, and, if so, whether the principal has defaulted on such debt, as well as other circumstances which the guarantor in accordance with honesty and good faith is entitled to be informed of.

General rules in respect of contractual invalidating factors also apply to guarantees and securities.

Note also that Norwegian company law contains financial assistance restrictions. Section 8-7 of both the Private Limited Liability Companies Act of 1997 and the Public Limited Liability Companies Act of 1997 (together the Limited Liability Companies Acts) limit a Norwegian limited liability company's right to grant credit and security (including guarantees) for the benefit of its shareholder or a party closely related to a shareholder or for the benefit of a shareholder of another company in the same group or any of its closely related entities. Such guarantees may only be granted:

- within the limits of the assets which the company may legally use for distribution of dividends (free equity); and
- only if adequate security is furnished for the claim for repayment or recovery.

The restrictions described above apply to a company's right to issue security for the benefit of a member of the board of directors, general manager or a member of the corporate assembly of the company or another company within the same group of companies, or any of their related parties, with certain exceptions in respect of issuing security for the benefit of employees.

There are, however, certain other important exceptions from the restrictions discussed above where:

- the security is of customary duration in connection with commercial agreements;
- the security is provided for the benefit of the parent company or another company within the same (Norwegian) company group;
- the security is granted in favor of a legal person that has controlling interest over the company, or in favor of a subsidiary of such legal person, provided that the credit or security shall serve the group's economic interests; or
- the security is granted for the benefit of a shareholder (owning less than 5% of the share capital in private companies and less than 1% in public companies) or related parties when the debtor is employed with the company or another company of the same group, such employment is his main occupation and the security is granted in accordance with customary rules for financial assistance to employees.

Pursuant to section 8-10 of the Limited Liability Companies Acts, a company may only provide security (hereunder provision of a guarantee) in connection with a third party's acquisition of shares or a right to shares in the company or the company's parent company within the scope of the funds that the company may use for distributing dividend and only if certain formal requirements are met, such as approval from the general meeting with 2/3 majority and satisfactory security for the recourse claim.

Exceptions to this restriction may be granted by regulations or individual decisions made by the King.

A transaction in violation of the financial assistance restriction is null and void, however, such invalidity may not be asserted against a counterparty in good faith. In extreme cases, a violation of the financial assistance restrictions may lead to criminal charges.

As guarantees are frequently granted from one company on behalf of other companies in the same group, the formal procedures set out in section 3-8 of the Limited Liability Companies Acts are of relevance. As a general rule, agreements between a company and its shareholders, the parent of the company's shareholders, or a person closely related to these, will not be binding upon the company unless the agreement is approved by a shareholders’ meeting of the company.

In addition to this, there are also further formalities which must be complied with, such as:

- the requirement of a formal statement from the board of directors containing, inter alia, a declaration that the compensation that the company receives by providing the guarantee corresponds reasonably with the value of providing the guarantee (and a confirmation...
from the company's auditor regarding the same); and

- registration of the transaction in the Norwegian Register of Business Enterprises.

There are certain important exceptions from the main rule, such as agreements that are entered into in the course of the ordinary business of the guarantor on customary terms and conditions (e.g., cash pooling arrangements), agreements where the guarantor's consideration has a real value below 1/10 of its share capital (1/20 for public companies) and guarantees issued by a guarantor which is a 100% owned subsidiary of the legal person in favor of whom the security is granted, provided, however, that the security is given to serve the group's financial interests.

The main risk of non-compliance with section 3-8 is that the agreement (i.e., the guarantee) may be deemed void and not binding on the company, and any performance according to such an agreement shall be returned.

Pursuant to section 3-9 of the Limited Liability Companies Acts, transactions between companies of the same group shall be based on customary business terms and principles. To the extent that the value of the benefit/payment received by a Norwegian limited liability company in providing a guarantee does not correspond with the value of contribution provided by the company, such transactions may also be considered illegal distribution of dividends pursuant to the Limited Liability Companies Acts section 3-6. The consequence of an illegal distribution is that the distribution must be reversed, i.e., the guarantee will be invalid (with a reservation for a receiving party in good faith). An illegal contribution may also be subject to claims for compensation for loss or criminal sanctions.

It should be noted that even though interest expenses, as a general rule, are tax deductible, certain limitations apply to interest relating to intra-group loans, and guarantees and security granted in favor of a closely related entity.

**Security**

By agreement, a mortgage may be validly created only where authorized by the Mortgage/Liens Act of 1980 or other statute. In addition, a mortgage may not be validly attached as a whole to all the present and future property of the mortgagee.

When a right cannot be assigned, or can be assigned only on certain conditions, the same limitation applies in respect of attaching a lien to the right. However, one may always pledge the shares in a limited liability company unless the contrary is stipulated in the company's articles of association.

If a person owns only parts of an asset, this part may be pledged, but only if it is pledged in its entirety (i.e., if the person owns 50% of a property, then the entire 50% must be pledged).

A mortgage must set out the maximum amount (in Norwegian Krone, or in foreign currency for which a stock exchange rate is normally quoted in Norway) secured by such mortgage and is perfected by registration in a register of real property or in the movable property register.

Please see the rest of this answer in respect of guarantee limitations for further restrictions that apply equally to taking security.

*Last modified 20 Oct 2017*

**What are common types of guarantees and security?**

**Common forms of guarantees**

Under Norwegian law, guarantees have traditionally been classified into three main categories;

- conditional guarantees (*simpl garanti*);
- unconditional guarantees or sureties (*selvskyldnerkausjon*); and
- on-demand guarantees (*påkravsgaranti*).

There are also other types of guarantee which lie between these guarantees and where the degree of independence between the guarantee and the underlying obligation varies. Each guarantee must be assessed and interpreted in accordance with its specific content/wording.

**Common forms of security**
In Norway, security may not be validly attached as a whole to all the present and future property of the mortgagee.

Norwegian law states that security may be established in *inter alia* these forms and objects:

- Ownership and special rights in real property or unspecified parts of real property (including property comprised of the mortgage on a lease of land and houses thereon, mortgage of an owner section and leases of dwelling) may be mortgaged.
- Possessory liens may be created by agreement on movables that cannot be entered in a real property register.
- Liens on movables that can be entered in a real property register and accessories of such movables acquiring legal protection by being entered in the proper register.
- Business enterprises may create non-possessory liens on operating assets (*driftstilbehør*) that are used in or are designed for their business operations (such liens are created together with liens on ownership of or a registered and assignable right to use the real property to which the business relates).
- Business enterprises may create non-possessory liens – combined or individual – on motor vehicles that are used or intended for use in the business operation, and mobile construction machines that are used or intended for use in the enterprise's contractor business.
- Movables that are used or intended for use in agriculture operations but which are not accessories to real property and goods that are produced in the operations, can be separately attached with non-possessory liens.
- Movables that are used or intended for use in commercial operations conducted from fishing, whaling or sealing vessels, but which are not accessories of a vessel, may be separately attached with non-possessory liens.
- Business enterprises may create non-possessory liens on their stocks of goods used in the business (*varelager*).
- In connection with the sale of movable objects, a lien may by agreement be imposed on said objects as security for the seller's claim on the purchase price with the addition of interests and costs, or loans which a third party has granted to the buyer for full or partial payment of claims and which the lender has paid out directly to the seller.
- Securities, such as negotiable promissory notes and similar documents, share certificates and life policies, may be attached with possessory liens.
- A claim or a right evidenced by a redemption paper which is not a security may be attached with liens.
- Shares that are not registered in a securities register may be pledged unless the contrary is stated in the company's articles of association.
- Non-negotiable monetary claims on a named debtor may be attached with liens, as may non-negotiable money claims that will arise against a named debtor in a specifically mentioned legal situation.
- A business enterprise may conclude an agreement to assign, assign for security purposes or attach the non-negotiable money claims which it has or acquires in its business or a specific part thereof. It is not necessary that the debtors are named.
- Some authorizations may be pledged (see for instance section 20 of the Aquaculture Act (*Akvakulturloven*) and section 6-2 of the Petroleum Act (*Petroleumsloven*)).
- Vessels and aircraft may be pledged.

*Are there any other notable risks or issues around giving and taking guarantees and security?*

**Giving or taking guarantees**

In a judgment from 2012 (Rt. 2012 s. 1267), the Norwegian Supreme Court concluded that a payment guarantee was not an on-demand guarantee, but a surety only, under which the guarantor could invoke debtor objections to the payment obligations, despite the fact that the guarantee included language customarily used in on-demand guarantees in the international business arena.

The case considered a guarantee that had been written in English. The dispute centered on the nature of the guarantee; the guarantor...
claimed it was an on-demand guarantee, whereas the debtor claimed it was meant to be seen as a surety only. The guarantee did not say explicitly what kind of guarantee it was but contained some wording often found in on-demand guarantees, ie ‘irrevocably and unconditionally guarantee’, ‘as their own debt’, ‘immediately due on first demand’, and ‘honored forthwith’. The Supreme Court held that it had to look at the guarantee as a whole and that, on this basis, the guarantee left doubt as to whether it was a surety or an on-demand guarantee, and that such doubt should dis-benefit the party who had drafted it. The effect of this judgment is that, under Norwegian law, there are stricter requirements as to the contents of an on-demand guarantee in order to obtain the intended legal effect of such a guarantee, compared to what seems to have been the general assumption among practitioners and legal authors. It is therefore important to ensure that on-demand guarantees are drafted using language which removes any doubt as to their classification and legal effects, ie by saying explicitly that it is in fact meant to be an on-demand guarantee.

Giving or taking security

Pursuant to section 3-1 of the Partnerships Act of 1985, a limited partnership may not acquire its own shares, and cannot by agreement establish a security in its own shares. A subsidiary may not obtain shares in the parent company or by agreement establish a security in such shares. Any agreement to the contrary will be void. In addition to this, section 3-5 of the Partnership Act of 1985 stipulates that the partnership’s right to receive capital cannot be assigned, nor can it be deposited as security for debt or subjected to distraint for the obligations of the partnership.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Financial Institution Act (*Finansforetaksloven*) 2015

Consumer credit

Financial Contracts Act (*Finansavtaleloven*) 1999

Corporations

Partnerships Act (*Selskapsloven*) 1985
Private Limited Liability Companies Act (*Aksjeloven*) 1997
Public Limited Liability Companies Act (*Allmennaksjeloven*) 1997

Funds and platforms

Alternative Investment Fund Managers Act (*AIF-loven*) 2014
Securities Fund Act (*Verdipapirfondloven*) 2011

Mortgages

Mortgage/Liens Act (*Panteloven*) 1980

Other key market legislation

Money Laundering Act (*Hvitvaskingsloven*) 2009
Securities Trading Act (*Verdipapirhandelven*) 2007

Last modified 20 Oct 2017
Stock Exchange Act (Børsloven) 2007
Financial Collateral Act (Lov om finansiell sikkerhetsstillelse) 2004
Enforcement Act (Tvangsfullbyrdelsesloven) 1992

Last modified 20 Oct 2017

Regulatory authorization

Who are the regulators?

The Norwegian Financial Supervisory Authority (Finanstilsynet) (the FSA) is responsible for the supervision and follow-up of banks, finance companies, mortgage companies, insurance companies, pension funds, investment firms, securities fund management and market conduct in the securities market, stock exchanges and authorized market places, settlement centers and securities registers, estate agencies, debt collection agencies, external accountants and auditors. Finanstilsynet is an independent government agency that builds on laws and decisions emanating from the Parliament (Stortinget), the Government and the Ministry of Finance (Finansdepartementet) and on international standards for financial supervision and regulation.

The Norwegian Ministry of Finance is responsible for planning and implementing Norwegian economic policy and for coordinating the work with the Fiscal Budget. The Ministry of Finance is the complaints body for the FSA.

Last modified 20 Oct 2017

What are the authorization requirements and process?

Depending on the type of firm, a firm must apply to the Norwegian Financial Supervisory Authority (Finanstilsynet) (FSA) or the Norwegian Ministry of Finance for authorization.

The regulators must assess whether the application meets the required threshold conditions within six months of the submission of the complete application.

The application fee depends on the type of the application.

The regulator will also approve key individuals in their roles.

Authorized firms and individuals are registered on the Authorization Register (Konsesjonsregisteret), which is provided by the FSA online on their home page.

Last modified 20 Oct 2017

What are the main ongoing compliance requirements?

The firm must have started its business within one year from the day the authorization was granted, and must still be active. Threshold conditions (such as fulfilling the governance and capital requirements as well as being compliant with the terms of the authorization) are an ongoing compliance requirement for authorized firms.

Failure to comply with the capital requirements and more detailed regulatory rules can result in sanctions for firms and regulated individuals, and loss of authorization.

Last modified 20 Oct 2017

What are the penalties for failure to be authorized?

A person undertaking a regulated activity without being authorized or exempt, commits a criminal offence and is liable to imprisonment.

Last modified 20 Oct 2017
Regulated activities

**What finance and investment activities require authorization?**

Financial activities may only be conducted by authorized banks, credit institutions and finance undertakings. When stipulated in the Financial Institution Act 2015 chapter 5, foreign credit institutions may also 'passport' their and/or conduct financial activities in/to Norway.

‘Financial Activities’ means the granting, intermediating or furnishing of guarantees for credit or otherwise participating in the financing of activity other than one's own, except for:

- business related to public institutions or a fund that is intended for special credit purposes;
- business conducted by a foundation that does not have as its purpose to conduct business activities, or the county administrator's management of financial assets pursuant to the act on custody (Vergemålsloven);
- credit or guarantees provided on behalf of the company's or the group's employees;
- credit provided by the seller of a good or service;
- business conducted as a financial agent or a financial advisor; or
- financial services that are conducted only in isolated cases.

Examples of finance and business activities that require authorization include banks, credit institutions, finance undertakings, payment institutions, electronic money institutions, insurance companies, life insurance companies, general insurance companies, credit insurance companies, pension funds and loan intermediaries.

*Last modified 20 Oct 2017*

**Are there any possible exemptions?**

Yes.

‘Financial Activities’ that are exempt include:

- business related to public institutions or a fund that is intended for special credit purposes;
- business conducted by a foundation that does not have as its purpose to conduct business activities, or the county administrator's management of financial assets pursuant to the act on custody (Vergemålsloven);
- credit or guarantees provided on behalf of the company's or the group's employees;
- credit provided by the seller of a good or service;
- business conducted as a financial agent or a financial advisor; or
- financial services that are conducted only in isolated cases.

*Last modified 20 Oct 2017*

**Do any exchange controls or other restrictions on payments apply?**

Norway does not operate any foreign currency controls.

For cases of money transferring from non-EU member states, imports of foreign currency may need to be declared in the custom declarations, but there is no legal restriction on moving money in and out of the country.

Note, however, that there may be anti-money laundering and tax considerations to take into account.

*Last modified 20 Oct 2017*
What are the rules around financial promotions?

The Marketing Control Act 2009

Where financial products or services are marketed to consumers in particular, but also to a small extent to businesses, the Marketing Control Act of 2009 will apply unless otherwise stated. This Act and related regulations contain rules aimed at protecting consumers, by ensuring for example that the total price of products or services are clear and unambiguous, and also that the seller does not use misleading communications or omit to inform of important details regarding the services or products.

The Financial Contracts Act of 1999 applies to contracts and assignments concerning financial services with financial institutions or similar institutions, unless otherwise provided by or pursuant to law. This Act regulates specifically what information must be provided to consumers when marketing loan and credit agreements.

In addition, the Consumer Ombudsman has provided extensive guidelines in relation to marketing of specific financial products aimed towards consumers, for example credit cards. There are also certain market standards or agreements established in Norway that set requirements for promotions of certain financial products, which can also secure fair comparisons of these.

Where transferable securities are being offered, a prospectus may be required, and these rules will provide more detailed information regarding how such securities can be promoted.

The Financial Institution Act 2015

The Financial Institution Act of 2015, chapter 2 part III says that banks need to use the word 'bank' in their company name. The same rule applies to sparebanker. No entities other than banks and sparebanks may use such wording. Similar rules apply in the case of insurance companies.

Rules relating to a financial institution's relationship to customers and related financial promotions are set out in chapter 16 of the Financial Institution Act 2015.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common types of legal entities that are used to undertake financial or investment activity (ie banks, pension funds, credit institutions etc) are limited liability companies (aksjeselskap) (denoted by the suffix AS), public limited liability companies (allmennaksjeselskap) (denoted by the suffix ASA) and Norwegian savings banks (sparebank).

Funds

Investment funds and fund managers are limited liability companies, public limited liability companies, or similar foreign companies.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

Foreign lenders may conduct business in Norway by establishing Norwegian representative offices (NUF) subsidiaries and have these apply for authorization from the Norwegian Financial Supervisory Authority. Credit institutions, insurance companies, pension funds,
payment institutions and electronic money institutions that are seated and authorized in another European Economic Area state may passport the licenses from their home jurisdiction to Norway and conduct business in Norway without getting a separate license here.

Last modified 20 Oct 2017

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform, rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is still in its early days in Norway and we only see a few platforms in the market. The main obstacle for growth in the Norwegian market is most likely to be the regulatory regime, which is quite demanding.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P) type structures, often operated through an electronic platform provider as well as crowdfunding. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds, as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain, in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust
to operate as a store of value (e.g. in the case of cryptocurrencies such as bitcoin) or providing an indisputable record, for example, relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

What is a cryptocurrency?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether, based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

What is an initial coin offering (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture. ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights; and
- compliance with law and all regulatory requirements.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.
Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet, rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Last modified 20 Oct 2017

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The Norwegian Financial Supervisory Authority (Finanstilsynet or FSA) is the conduct regulator for firms providing financial products and services in both retail and wholesale markets.

GENERAL

A person must not carry on a regulated activity in Norway unless authorized or exempt (known as the general prohibition). A financial activity requires regulatory authorization when: it is identified as a specified activity, it is carried on by way of business in Norway and it does not fall within any of the available exemptions. Where FinTech products and/or applications involve financial activity which requires regulatory authorization, the firms providing such products and/or applications must be authorized by the FSA.

POINT OF CONTACT AT THE FSA

The Norwegian Ministry of Finance has proposed to establish a contact point at the FSA for guidance of FinTech companies. The Ministry of Finance believes that the emergence of new players, new technologies and new business models creates the need for guidance and clarifications in areas where current rules are based on well-known business models and methods of production. The proposal is currently under assessment at the FSA.

Electronic payments platforms and regulation of peer-to-peer lenders

The emergence of new entrants, who are using technology to provide financial services in new ways can be seen in Norway. The rise of FinTech as a separate industry also reflects a change in the way that the supply-side is interfacing with customers in Norwegian markets. For example, in the payment services and financing segments, new players are entering the market and offering financial services outside the established financial system, at the same time as financial undertakings are developing competing services within the system.

ELECTRONIC PAYMENT PLATFORMS

A number of FinTech businesses are offering electronic payment platforms to rival the traditional payment systems and the introduction of new regulations recognizes the rise in such businesses, with the aim of creating a more level playing field for payment services providers, while addressing the need for enhanced security and customer protection.

All participants in a payment system will be regulated by the Norwegian Financial Institutions Act of 2015 (Finansforetaksloven or Financial Institutions Act), if the participant is deemed to perform payments services.

E-MONEY

The Financial Institutions Act regulates e-money institutions and issuance of e-money. E-money is defined as electronically (including magnetically) stored monetary value, represented by a claim on the issuer, which is issued on receipt of funds for the purpose of making payment transactions. E-money must be accepted by a person other than the electronic money issuer and include pre-paid cards and electronic pre-paid accounts for use online. Firms issuing e-money must be authorized with the FSA.

PEER-TO-PEER LENDERS
Lending is a regulated activity in Norway, and unless any exemptions apply, a lender will need to be authorized by the FSA to conduct such business.

Businesses conducting brokerage of loans must notify the FSA of their business. Loan brokers are subject to certain requirements in the Financial Institutions Act and is, among other things, obligated to give the lenders and borrowers information concerning the terms and conditions of the loans.

**Regulation of payment services**

Where a Norwegian business provides payment services, as a regular occupation or business activity in Norway, it will require authorization by the FSA to become an authorized payment institution under the Financial Institutions Act. Failure to obtain the required authorization is a criminal offence.

In order to become authorized by the FSA, a payment services business will need to meet certain criteria, including, in relation to its business plan, initial capital, processes and procedures in place for safeguarding client funds, sensitive data and money laundering and other financial crime controls.

There is ongoing legislative work in Norway with a new Financial Contracts Act (Finansavtalelov). The new law will among other European Union regulations, implement the European Union Payment Services Directive II.

**Application of data protection and consumer laws**

The Norwegian Data Protection Act 2000 (Personopplysningsloven or DPA) regulates the processing of personal data in Norway. The DPA implements the European Data Protection Directive of 1995. Where a business determines the purposes and manner in which any personal data is processed, it will be regulated by the DPA and have certain notification and compliance obligations.

The European General Data Protection Regulation (GDPR) is due to replace the DPA from 25 May 2018. It is proposed that a new data protection act will therefore replace the existing DPA. The GDPR introduces some new obligations and is more specific than the current DPA on certain issues, including mandatory notifications where a breach occurs and provide for severe monetary sanctions for breach.

The Norwegian Marketing Act 2009 (Markedsføringsloven or Marketing Act) regulates unsolicited direct marketing by electronic means and other special categories of marketing. The proposal for a new Regulation on Privacy and Electronic Communications by the European Commission is, however, expected to lead to amendments to the Marketing Act, if the regulation is implemented in Norway.

**Money laundering regulations**

The Norwegian Act on Money Laundering and Terrorist Financing (Hvitvaskingsloven) imposes certain obligations on financial institutions and others who perform services on their behalf, such as credit institutions, investment firms and payment service providers. The obligations generally include customer due diligence and a duty to report suspicious activities, and are intended to prevent money laundering and terrorist financing.

New anti-money laundering legislation, based on the European Union's Fourth Money Laundering Directive, is currently under development and a revised act is expected to be presented to the Norwegian parliament before the end of 2017. It is assumed that the new act will take greater account of the new service providers created through the development of FinTech. The FSA is responsible for supervising entities' adherence, under both current and future legislation.

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**

**SEED INVESTMENT**

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. An example is the FintechAngels at TheFactory. Such seed investment is often
used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING

Crowdfunding has also been introduced in the Norwegian market. This type of funding may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform.

The Norwegian market has primarily reward-based crowdfunding, which provides investors with a tangible benefit, such as early access to a platform or an application that the business is developing.

ACCELERATORS

There are various incubators or accelerators in the Norwegian market which offer support, facilities and funding for startups, often in return for an equity stake. For example, TheFactory operates as an accelerator, incubator and mentor for FinTech companies and offers an investment up to NOK 350,000 in return for 5%-to-12% equity.

GOVERNMENT PROGRAMS

Innovation Norway (Innovasjon Norge) is the Norwegian Government’s most important instrument for innovation and development of Norwegian enterprises and industry. Innovation Norway supports companies in developing their competitive advantage and encouraging innovation. The organization also provides services for startup companies, such as mentoring and startup grants. More information can be found here.

Venture capital and debt

Venture capital funding is a type of equity investment, usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed, to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically offered as a convertible bond or loan.

Peer-to-peer platform funding

An alternative form of funding is by way of peer-to-peer (P2P) lending platforms, which bring individual borrowers and lenders together without the involvement of traditional banks. P2P lending does not involve equity investments, and instead interest is paid on the money borrowed. This is relatively new in the Norwegian market, but is anticipated that we will see more and more of this type of funding in the future.

Senior bank debt and capital markets funding

SENIOR BANK DEBT

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

CAPITAL MARKETS FUNDING

Norway has both debt and equity capital markets which are accessible to businesses (usually of a certain size).

Raising finance by way of an Initial Public Offering (IPO) is a popular funding arrangement for FinTech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange, such as the Oslo Stock Exchange (Oslo Børs).
Oslo Axess and Merkur Market provide alternatives to the Oslo Stock Exchange. Oslo Axess is a regulated market, suitable for companies that have less than three years of history and who seek a quality stamp and other benefits associated with listing on a regulated market. Merkur Market is a multilateral trading facility and an option for all types of companies, ranging from newly incorporated growth companies, to savings banks or mature industry companies, that do not satisfy the listing requirements, or do not wish to be fully listed on a regulated market.

**CONVERTIBLE BONDS/LOAN NOTES**

A popular funding tool for startup companies, including FinTech businesses, is to issue convertible bonds or loan notes, which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

**Incentives and reliefs**

SkatteFUNN R&D tax incentive scheme is an initiative designed to stimulate research and development (R&D) in Norwegian trade and industry. Businesses and enterprises that are subject to taxation in Norway are eligible to apply for SkatteFUNN.

The incentive is a tax credit and comes in the form of a possible deduction from a company's payable corporate tax. Small and medium sized businesses that satisfy the relevant requirements can obtain tax relief in respect of up to 20% of their project costs, and larger businesses that satisfy the relevant requirements can obtain tax relief in respect of up to 18% of their project costs. More information about the SkatteFUNN R&D tax incentive scheme can be found [here](https://www.dlapiperintelligence.com/investmentrules).

*Last modified 20 Oct 2017*

**Portfolio sales**

**Loan transfers and portfolio sales**

*What are common ways of buying and selling loans?*

Buying and selling loans is very common.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

Loan transfers between professionals are commonly documented using standard form contracts made available by the Loan Market Association. For more complex transactions, a more bespoke form of sale and purchase agreement would tend to be used. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

Note also that lending is a strictly regulated activity in Norway and that in principle assuming a creditor position as part of a loan sale and purchase process can trigger an authorization requirement (subject to any applicable exemptions).

*Last modified 20 Oct 2017*

*What are the main considerations when transferring a loan and related security?*

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller's legal advisors. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

Generally speaking, Norway has been reluctant to open up to the privatization of core infrastructure; and most transport infrastructure, the electricity grid and large hydropower production assets are publicly owned. Telecoms infrastructure, apart from the emergency network is generally privately owned and operated. Whilst ownership may be private, owning and/or operating relevant infrastructure will in most cases be subject to authorizations and concessions.

Energy

There are no restrictions on private ownership of energy assets, apart from ‘large’ hydropower assets (above 10MW) that must be at least two thirds publicly owned and controlled. Whilst ownership may be private, owning and/or operating relevant energy infrastructure will in most cases be subject to special authorizations and government concessions.

Statnett SF is the state-owned enterprise responsible for building and operating the central grid. Statnett SF is the transmission system operator (TSO) for the central grid and owns more than 90% of it.

The Ministry of Petroleum and Energy (MPE) has the overall responsibility for managing the energy and water resources in Norway. The MPE’s job is to ensure that this management is carried out according to the guidelines provided by the Storting and the Government. The Ministry’s Energy and Water Resources Department has ownership responsibility for Statnett SF.

The Norwegian Water Resources and Energy Directorate (NVE), which reports to the MPE, is responsible for managing domestic energy resources, and is also the national regulatory authority for the electricity sector. The NVE is also responsible for managing Norway’s water resources.

The total length of the Norwegian gas pipeline network is about 8,300 kilometres. Most of the gas transport infrastructure is jointly owned through the partnership Gassled, while Gassco is the neutral and independent operator.

Gassled is a private joint venture that owns most of the gas infrastructure on and serving the Norwegian continental shelf (including pipelines, platforms, onshore processing plants and receiving terminals abroad).

The Norwegian gas transport infrastructure includes several receiving terminals in other countries. Norway and those countries where gas from the Norwegian shelf is landed have concluded agreements regulating their rights and obligations in this connection.

Telecoms infrastructure

Telecoms infrastructure, apart from the emergency network, is generally privately owned and operated.

The electronic communications sector in Norway is regulated through both sector-specific and general laws and regulations. Although not a EU member, Norway is required, as a member of the European Economic Area (EEA), to adhere to the EU’s regulatory framework to the extent that EU directives are adopted by the EEA pursuant to the Agreement on the European Economic Area. The Electronic Communication Act (the ECA) and regulations adopted pursuant to the ECA implement the EU regulatory framework for the electronic communications sector in Norway. The competent regulatory authority in Norway is the Norwegian Communications Authority.

Transport infrastructure
Transport infrastructure such as road and rail networks (and related infrastructure) are publicly owned.

Norway has approximately 98 airports. Of these, 45 are owned by the government through its airport operator, Avinor. Airports used only for general aviation (GA) are owned by a mix of municipalities, aviation clubs and private companies.

Public (sea) ports are generally municipally owned, with limited private ownership interests in isolated instances.

The main governing body in respect of transport infrastructure is the Norwegian Ministry of Transport and Communications, which performs operations through numerous subsidiaries. Tasks related to public transport and some roads have been delegated to the counties and municipalities.

**Are there special rules for investing in energy and infrastructure?**

**Generally**

No, but the ownership and/or operation (or related activities) is generally subject to special authorizations and Government concessions.

**Energy**

Special regulations and restrictions apply to investments into 'large' hydropower assets (above 10MW).

**What is the applicable procurement process?**

**Generally**

Public procurement in Norway is governed by a set of rules that are meant to ensure fair competition, integrity and predictability in the procurement process, and the equal treatment of providers.

Norwegian legislation distinguishes between tender invitations for contracts above and below the European Economic Area (EEA) Public Procurement Thresholds. Above the EEA thresholds, Norway is obliged to follow the relevant EU regulations through the Agreement on the European Economic Area. Tender invitations for contracts above these thresholds are advertised in the English language in the EU official journal and the TED database.

Below the EEA thresholds, national rules govern the procurement process. These are in general simplified versions of the implemented EU regulations. In Norway there is also a national threshold of NOK 1.1 million. Invitations to tender for contracts above the national threshold must be made public in the Norwegian official database, Doffin. Under the national threshold, the employer is allowed to choose a procedure which ensures a minimum level of competition.

**What are the most common forms of funding / investing in energy and infrastructure?**

**Funding**

The most common forms of funding for energy and infrastructure include balance sheet lending and project finance (including PPP).

**Investing**

The most common forms of investing in energy and infrastructure include direct equity investments.
Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

When the authorities consider that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

Last modified 20 Oct 2017

What regulatory penalties may apply?

Where a breach has taken place, the Norwegian Financial Supervisory Authority or the Norwegian Ministry of Finance may impose a financial penalty or censure, or withdraw regulated status against the firm and/or regulated individuals. The regulator will publicize these penalties.

In addition to this, ordinary penalties and sanctions may be imposed by the Norwegian police.

Last modified 20 Oct 2017

What criminal penalties may apply?

Following formal investigation, the regulators have powers to impose criminal penalties in certain cases, including:

- insider dealing and misleading statements and practices;
- breaches of the Money Laundering Act of 2009; and
- conducting regulated activities when not authorized.

Last modified 20 Oct 2017

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

No stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

Mortgages over Norwegian real estate must be registered at the Land Registry (Statens Kartverk) to ensure legal protection against third parties. The fee for such registration is NOK 525.

Mortgages granting security over moveable property (eg vehicles, capital assets, inventory) must be registered in the Register of Mortgaged Moveable Property (Løsøreregisteret) to ensure legal protection against third parties. The fee for such registration is NOK 1,051 when registered electronically and NOK 1,516 when registered on paper.
Mortgages granting security over aquaculture permits must be registered in the Register of Aquaculture (Akvakulturregisteret) to ensure legal protection against third parties. The fee for such registration is NOK 1,450.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

No stamp, registration, transfer or other similar taxes are payable on the issue, transfer or assignment of a debt security.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

No.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

No. There is no withholding tax on interest payments.

If so:
What is the rate of withholding?

N/A.

What are the key exemptions?

N/A.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

N/A.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are certain restrictions on offering and selling debt securities under Peruvian law if those securities will be offered under a public offering.

A public offering of marketable securities is a public invitation to one or more individuals or legal entities of the general public, or specific segments thereof, to carry out a legal placement, acquisition or disposal of marketable securities.

The Securities Registry is where securities, securities issue program documentation, mutual funds, investment funds and participants in the securities market are registered, with the purpose of making the information thereon publicly available, allowing decision-making by investors and ensuring the market's transparency. The legal entities entered in this registry and the issuer of registered securities are obliged to submit the information required by law and other regulation and are accountable for the truthfulness of such information.

The publicly offered securities and securities issue programs documentation are required to be entered in the Securities Registry and no previous administrative authorization is required (except for, in the case of financial companies the previous authorization to be obtained from the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS)). The registration of securities that will not be offered publicly is optional.

The holders of debt securities may request the registration of such securities in the Securities Registry in accordance with the provisions of the applicable law and the terms established in the issuance agreement or, as the case may be, the equivalent instrument. If no regulation has been set forth on this regard, the request must be backed up by the holders of such securities that represent the absolute majority of the outstanding amount issued.

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Peru are bonds or notes issued on a stand-alone basis or under a program. A debt security is any right of debt issued on a mass basis that is transferable to third parties.

Many different types of debt securities are offered in Peru. According to the Regulations on the Initial Public Offering of Marketable Securities (Reglamento de Oferta Pública Primaria y de Venta de Valores Mobiliarios) (Resolution Conasev 141-1998-EF/94.10) and SMV supplemented regulations (Normas Comunes para la Determinación del Contenido de los Documentos Informativos) (Resolution Conasev 211-98-EF/94.11), some common forms include:

- securities granted by common companies (commercial paper, issued for debt younger than a year, and corporative bonds, issued for debts older than a year); and
securities granted exclusively by authorized financial companies:

- negotiable corporative certificates of deposit (issued for debt younger than a year);
- corporative bonds (issued for debt older than a year);
- subordinate bonds (issued for subordinate debt that qualify as effective equity); and
- leasing bonds (issued for financing the purchase of goods for leasing).

Additionally, the securities listed above must have any of the following characteristics to qualify as typical securities:

- zero coupon securities that pay a fixed amount at its maturity;
- periodical fixed-rate securities, with amounts and maturity determined at its issue;
- securities with automatic adjustment of the principal according to the General Act of the Financial and Insurance Systems and Internal Organization Act of the SBS; and
- variable-rate securities, in which the interest rate cannot be a rate (such as LIBOR, PRIME, or others) plus a fixed differential.

Non-typical securities, which are the ones that are not listed above but have the characteristics of a debt security (which are not common in Peruvian securities), which may have any of the following characteristics, include:

- guaranteed securities, perpetual debt securities (i.e. debt securities that have no specified redemption date);
- asset-backed securities;
- derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- hybrid securities (securities with both debt and equity features);
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer);
- exchangeable bonds (debt securities convertible into the equity of a third party);
- depositary receipts (a security issued by a depositary conferring its holders beneficial ownership of certain underlying assets held by the depositary); and
- warrants (securities giving its holders the option to purchase the equity of the issuer or a related company).

**What are the differences between offering debt securities to institutional/professional or other investors?**

An offering that exclusively targets institutional investors is considered as a private offer and the regulations established in the Securities Act (Ley del Mercado de Valores) will not be applicable.

In that scenario, securities acquired by an institutional investor cannot be transferred to third parties, unless such third party is another institutional investor or the security is previously entered in the Securities Registry conducted by the Superintendence of Securities Market (SMV).

Nevertheless, institutional investors can decide whether to register before the Securities Registry under a special regime the following issues targeted to institutional investors: (i) the ones registered as such before the SMV; (ii) the ones registered before the U.S. Securities and Exchange Commission – SEC under Rule 144A or Regulation S of the U.S. Securities Act of 1933; (iii) the registered as such before other stock exchanges member of the Latin American Integrated Market (Mercado Integrado Latinoamericano – MILA).

**When is it necessary to prepare a prospectus?**
Unless an exemption applies, it is necessary to prepare, register and publish a prospectus before the Superintendence of Securities Market (SMV) where there is an initial public offering (IPO) of securities, i.e., the public offering of new securities.

Among other reasons, the prospectus is needed in order to have a security subject to the IPO entered in the Securities Registry. The basic requirements for the preparation of the prospectus are stated in the Regulations on the Initial Public Offering of Marketable Securities (Reglamento de Oferta Pública Primaria y de Venta de Valores Mobiliarios) (Resolution Conasev 141-1998-EF/94.10) and SMV supplemented regulations (Normas Comunes para la Determinación del Contenido de los Documentos Informativos) (Resolution Conasev 211-98-EF/94.1.1).

In addition, there are other special regimes that require lighter requirements.

An offer would not be deemed to have been made to the public if it is made solely to qualified investors or where the minimum denomination per unit is at least PEN499,908.28 in 2019 (equivalent to approximately US$147,770.70). The denomination per unit is annually adjusted.

The underwriting or acquisition of securities presupposes the acceptance by the underwriter of all terms and conditions of the offering, as they appear in the informative prospectus.

What are the main exchanges available?

The unique legal stock exchange in Peru is the Lima Stock Exchange (Bolsa de Valores de Lima S.A.), which is a corporation (sociedad anónima) that offers listed securities trading services and provides services, systems and mechanisms for the brokering of publicly offered securities and instruments. The company operates under the supervision of the Superintendence of Securities Market (SMV).

Since 30 May 2011, Lima Stock Exchange (Bolsa de Valores de Lima), Santiago Stock Exchange (Bolsa de Comercio de Santiago), Colombia Stock Exchange (Bolsa de Valores de Colombia) and the Mexican Stock Exchange (Bolsa Mexicana de Valores) (since June 2014) established an alliance namely the Latin American Integrated Market (Mercado Integrado Latinoamericano - MILA) in order to foster the trading activity in those markets by allowing the intervention and operation of investors and intermediaries in any of such stock markets.

Is there a private placement market?

Even though there are no official records, there is an active market for private placements. However, private pension funds – which are the principal investors in the Peruvian securities market – generally purchase securities that have information registered at the Superintendence of Securities Market (SMV).

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to administrative, civil and criminal liability under Peruvian law. Peru has various investor protection statutory provisions relevant to liability for inaccurate prospectus. There are also general fraud statutes and liability may also arise under common law through a civil action for deceit, negligent misstatement or misrepresentation.

Investing in debt securities

Debt security terms and conditions typically contain provisions which may permit their modification without the consent of all investors and confer significant discretion on the trustee, which may be exercised without the consent of investors and without regard to the individual interests of particular investors. The conditions also provide for meetings of investors to consider matters affecting the investors’ interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.
Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Establishing a fund, offering fund securities and operating a fund, among other things, are regulated activities under the following laws:

- **private pension funds** – regulated under the General Act of the Financial and Insurance Systems and Internal Organization Act of the Superintendence of Banking and Insurance (Ley General del Sistema Financiero y del Sistema de Seguros y Orgánica de la Superintendencia de Banca y Seguros) and its Regulations and therefore subject to the regulations of the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS);

- **investment funds** – regulated under the Investment Funds and their Management Companies Act and its Regulation and therefore subject to the regulation of the Superintendence of Securities Market (SMV);

- **mutual funds** – regulated under the Securities Market Act and its Regulations and therefore subject to the regulations of the SMV;

- **collective funds** – regulated under the Collective Fund Act (A las Empresas Administradoras de Fondos Colectivos contralará SMV) – Executive Order 21907 and its Regulations and therefore subject to the regulations of the SMV.

An investment fund may be established through a general regime or a simplified regime.

All funds are subject to the general regime unless offers are:

- exclusively directed to institutional investors;
- directed to investors that will pay certain minimum quotas before the funds can operate; or
- directed to the management company's shareholders, directors and members of the 'Investment Committee'.

The incorporation of an investment fund under the simplified regime is automatically approved upon the submission of the required documentation. On the other hand, the incorporation of a fund under the general regime is subject to the approval and authorization of the SMV.

What are common fund structures?

Common forms of private pension funds include:

- **capital protection** – minimum investment 100% in debt securities (maximum 100% short term and 75% long term);

- **capital preservation** – maximum 10% in equity securities, maximum 100% in long-term debt securities; maximum 40% in short-term debt securities and maximum 10% in derivatives;

- **mixed or balanced** – maximum 45% in equity securities; maximum 75% in long-term debt securities; maximum 30% in short-term debt securities and maximum 20% in derivatives; and

- **capital growth** – maximum 80% in equity securities, maximum 70% in long-term debt securities, maximum 30% in short-term debt securities and maximum 30% in derivatives.

Common forms of investment fund include:

- investments in any kind of securities, deposits, participation certificates on mutual funds, properties, leasing over properties, factoring and bills discounting;

- open-ended and closed-ended funds;

- retail and non-retail funds (including mixed investment funds);
• Undertakings for Collective Investments in Transferrable Securities (UCITS) and non-UCITS funds; and
• qualified investor structures that invest in, for example, corporate shares or bonds, real property, commodities (for example, precious metals) and derivatives.

Common forms of mutual funds include:

• **debt securities mutual funds** – 100% in debt securities minimum, sub-classified in very short term, short term, middle term and long term;
• **moderate mixed mutual funds** – 75% in debt securities minimum and 25% equity maximum;
• **balanced mixed mutual funds** – 50% in debt securities and 25% in equity securities as minimum investment;
• **growing mixed mutual funds** – 50% in debt securities and 50% in equity securities as minimum investment;
• **equity mutual fund** – 75% in equity as minimum investment;
• **partial secured mutual fund** – 75% of its capital is secured;
• **fixed income secured mutual fund** – 100% of its capital is secured and a minimum income;
• **secured mutual fund** – 100% of its capital is secured;
• **structured mutual fund**;
• **international mutual fund** – 51% in overseas securities;
• **mutual fund of mutual funds** – 75% in other mutual funds; and
• **flexible mutual fund** – any other criteria than above.

Common forms collective funds include different groups for purchasing:

• properties and mortgage payments;
• cars and trucks;
• machinery and equipment;
• motorcycles, moto-taxi and household appliances; and
• educational services.

**What are the differences between offering fund securities to professional / institutional or other investors?**

For investment funds, the main difference is that if the fund's securities will be exclusively offered to institutional investors, the registration procedure of the funds will be conducted through the simplified regime. In that sense, the management company will not be obliged to present an advance copy of the agreement to be executed with its clients (which is needed for funds incorporated under the general regime) or require to register in advance the information regarding the investment fund and its issue.

**Are there any other notable risks or issues around establishing and investing in funds?**

**Establishing funds**

There are no specific risks to reference here other than those referred to in [Establishing and investing in debt and hedge funds – establishment](https://www.dlapiperintelligence.com/investmentrules).
Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

No, there are no limits or restriction on marketing a fund, except for common law principles applicable to all services and products that are offered in the market. The marketing must be done directly by the Fund Management Company or an authorized promotor (such as a brokerage firm representative).

Are there any restrictions on managing a fund?

The Superintendence of Securities Market (SMV) is responsible for regulating and supervising funds. Fund managers, individuals and legal entities are prohibited from carrying out regulated activities, such as fund management, without authorization.

The SMV authorizes the organization and operation of a fund management company as a corporation (sociedad anónima) and supervises it as long as its purpose is to manage investment funds, mutual funds and collective funds. The Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS) authorizes the organization and operation of private pension funds.

All fund management companies need an authorization except for investment fund management companies whose funds only issue trust certificates not to be placed through public offerings, which are not supervised by the SMV, being obliged to inform such condition to their investors and clients.

The capital of management companies is prescribed by law and varies for:

- private pension fund management companies;
- investment fund management companies and mutual fund management companies; and
- collective fund management companies.

Additionally, the net equity of any management company must be at least than 0.75% of the sum of mutual fund and investment fund equities under its administration.

Management companies must obtain a business license either from the SMV or the SBS. The conditions applicable to the establishment of a management company remain throughout the company's existence.

Management companies are required to grant certain guarantees on behalf of the SMV in order to guarantee the compliance of the obligations assumed before their investors.

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

There are no restrictions on entering into derivatives contracts as all of them are executed on an 'over-the-counter' (OTC) basis, which means that contracts are negotiated and agreed between private parties without being regulated.

Without prejudice to the foregoing, the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS) establishes a limited amount of operations related to derivative contracts for financial entities in relation to their equity in order to regulate their total exposure and guarantee a diversified investment portfolio.
**What are common types of derivatives?**

Derivative contracts are executed in Peru for a range of reasons including hedging, trading and speculation.

All of the main types of derivative contracts are widely used in Peru:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contracts is based on the value of the underlying assets.

The main classes of underlying assets seen in Peru are:

- equity;
- fixed income instruments;
- commodities;
- foreign exchange; and
- credit events.

**Are there any other notable risks or issues around entering into derivatives contracts?**

Considering that the market for derivative contracts in Peru is limited and that there is no regulation applicable to that type of operation, no notable risks are apparent other than the limitations established by the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS) in relation to the level of exposure from authorized financial companies.

**Debt finance**

**Lending and borrowing**

**Are there any restrictions on lending and borrowing?**

**Lending**

Lending is only a regulated activity if it is conducted using public money (defined as deposits obtained from individuals). Under these circumstances, a lender will need to be authorized by the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS) to conduct such business.

Financial operations conducted using public money are subject to a range of regulatory requirements that do not apply to unregulated loans. For example, for regulated mortgage contracts, there are particular regulations relating to the provisions of corresponding loan agreements, including the amount to be lent and the total exposure that banks and financial entities should have for these types of loans.

Additionally, regulated credit agreements have specific requirements regarding drafting and forms and the information to be included therein.

In relation to the interest rates, through Circular Letter 018-2019-BCRP, the Central Reserve Bank of Peru established that financial system operations are determined by free competition in the financial market.
On the other hand, for individuals and companies that are not part of the financial system, the maximum conventional compensatory interest rate is mandatory as set forth in the Peruvian Civil Code and the Central Reserve Bank of Peru. The maximum conventional compensatory interest rate is established on a daily basis by reference to the average rate of the financial system for credits to be granted to small-companies (microempresas).

There are no additional restrictions applying to foreign lenders making loans to Peruvian borrowers.

**Borrowing**

While borrowers are generally not regulated, it is advisable for borrowers to consider whether either the mortgage or consumer lending regimes apply to their activities, in which case they will benefit from the above-mentioned protections.

**What are common lending structures?**

Lending in Peru may be structured in a number of different ways to include a variety of features and conditions depending on the commercial needs of the parties.

A loan may either be provided on a bilateral basis (a single lender providing the entire facility) or a syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents and trustees which fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities.

**Loan durations**

The duration of a loan may also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid; or
- an overdraft, provided on a short-term basis to solve short-term cash flow issues.

**Loan security**

A loan may either be secured, unsecured or guaranteed. These conditions depend on the risk profile of the borrower and the total amount to be lent, and the exposure of the effective equity of the lender, among others.

**Loan commitment**

A loan may also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

**Loan repayment**

A loan may also be repayable on demand, on an amortizing basis (in instalments over the loan life) or scheduled (usually meaning the loan is repayable in full at maturity).
What are the differences between lending to institutional/professional or other borrowers?

Lending to institutional/professional borrowers is subject to less regulatory supervision and so less burdensome from a compliance perspective.

By contrast, lending in the context of mortgages and to consumers is a regulated activity. Standard contracts and loan documents forms must be previously approved by the SBS.

Do the laws recognize the principles of agency and trusts?

Peruvian law does not have any specific provisions about agency. Thus, any agency undertaken with Peruvian entities is governed by the provisions of any contract entered into between the parties.

Trust principles are recognized as a matter of Peruvian law and have specific regulations. For instance, it is possible to appoint a trustee (which must be subject to the supervision of the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS)) to hold rights and other assets on trust for lenders or secured parties.

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual principles. In addition, regulated companies are obliged to provide their clients, specially when they qualify as consumers, full and easy-to-understand information regarding the main conditions of the loans and credit facilities to be granted, being subject to penalties if those obligations are not fulfilled.

The administrative authorities in charge of attending consumers' complaints are the National Institute for the Defense of Free Competition and the Protection of Intellectual Property Rights (INDECOPI) and the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS).

Specific types of lending

There are different types of lending available depending on the purpose for which the money is borrowed and the characteristics of the debtor. According to prudential regulations, specifically the Regulations for the Assessment and Rating of the Debtor and the Requirement of Provisions (Reglamento para la Evaluación y Clasificación del Deudor y la Exigencia de Provisiones), Resolution SBS 11356-2008, the types of credit granted by financial companies are:

- corporate credit;
- credit to large, medium, small and micro companies;
- revolving consumer credit;
- non-revolving consumer credit; and
- mortgage credit.

Standard form documentation

Standard form contracts for users of the financial system who qualify as consumers must be approved by the SBS and must comply with the requirements provided for under the Consumer Protection and Defense Code (Código de Protección y Defensa del Consumidor) – Law 29571 and the Regulations on Market Conduct Assessment of the Financial System (Reglamento de Gestión de Conducta de Mercado del
Are there any other notable risks or issues around borrowing?

As mentioned before, it is advisable for borrowers to consider if the lending regimes apply to their activities in order to determine if certain benefits of protection are applicable to them.

In addition, borrowers, before entering into loan agreements, should be aware of the potential implications of the occurrence of events of default and the consequences expressly established in the loan agreement (such as prepayment of all amounts that were lent and penalties to be applied).

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the giving of guarantees and security are as follows.

Capacity

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors’ or attorneys’-in-fact powers that would be preventative. Under Peruvian law, directors have a general duty to promote the success of the company for the benefit of its members as whole. Directors will need to be able to show that adequate corporate benefit is derived from the company giving the guarantee or security. A safe approach is often to have the shareholders or authorized members of the company approve the giving of the guarantee or security by resolution.

Insolvency

Guarantees and security may be at risk of being set aside under Peruvian insolvency and bankruptcy laws if the guarantee or security was granted by a company within a certain period of time prior to the onset of insolvency. This would be the case if the company giving the guarantee or security received considerably less consideration, and as such, the transaction was at an undervalue. For such a transaction to be set aside, certain statutory criteria would have to be met, including that the guarantee or security was given within one year of the onset of insolvency of the affected party. Guarantees and security may also be challenged on other grounds relating to insolvency.

What are common types of guarantees and security?

Common forms of guarantees

Guarantees can take a number of forms under the Peruvian law with a majority of them having a payment guarantee nature, covering the payment of money (compensation, penalties, and reimbursement) and other contractual obligations.

Common forms of securities

There are four basic types of security interests that can be created under Peruvian law:

- a pledge (garantía mobiliaria);
- a charge;
• a mortgage; and
• a guarantee trust.

Different types of securities are suitable for securing different types of assets.

Under Peruvian law it is possible to grant security over all the assets of a Peruvian company or individual assets. Granting security over all of a company’s assets will tend to be achieved by way of a debenture which will include:

• a mortgage over real estate;
• a fixed charge over assets which are identifiable and can be controlled by the creditors (such as equipment);
• a floating charge over fluctuating and less identifiable assets (such as stock); and
• an assignment by way of charge over receivables and contracts.

Are there any other notable risks or issues around giving and taking guarantees and security?

Granting or taking guarantees

To be valid, a guarantee needs to be in writing, signed by the guarantor and provided for good consideration.

Consideration for a guarantee is subject to general contractual principles. In the case of a guarantee, the underlying obligations are usually the consideration for the guarantee and so it is advisable to execute the guarantee at the same time as executing the underlying obligations to avoid any suggestion of past consideration. Often the guarantee is included in the loan agreement and so this should not be an issue. Also, it can be difficult to establish consideration for a guarantee as the primary obligations are between the underlying obligor and beneficiary, for example between the borrower and lender. As a result, guarantees are often executed as deeds to avoid any argument about whether good consideration was provided. Deeds have particular execution requirements under Peruvian law which need to be observed.

Additionally, there is a risk that a guarantee may be set aside if it was procured by undue influence by a borrower or lender. A party being provided with a guarantee should be aware of this issue and take all necessary actions to avoid claims of undue influence by, for example, requiring the guarantor to take separate legal advice.

Granting or taking security

A security instrument may need to be executed as a public deed (escritura pública) if it:

• contains a mortgage over land or any other assets specified as fixed assets under the Peruvian Civil Code;
• confers a statutory power of sale and power to appoint a receiver; or
• contains a power of attorney.

Once granted, security needs to be properly perfected before it is valid against third parties. Perfection formalities can include having the secured asset delivered to the security holder and registration of the security in the Peruvian Public Registry Office, depending on the type of security granted.

Mortgages are required to be notarized and registered in the Peruvian Public Registry Office to be valid and enforceable.

Like guarantees, for a period after a new security interest has been granted (known as the hardening period), it is at risk of being set aside in certain circumstances under insolvency laws.

Financial regulation
Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

The General Act of the Financial and Insurance Systems and Internal Organization Act of the Superintendence of Banking and Insurance (Ley General del Sistema Financiero y del Sistema de Seguros y Orgánica de la Superintendencia de Banca y Seguros) – Law 26702

The Securities Act (Ley del Mercado de Valores) – Supreme Decree 093-2002-EF

Regulations on the Initial Public Offering of Marketable Securities (Reglamento de Oferta Pública Primaria y de Venta de Valores Mobiliarios) – Resolution SMV 141-1998-EF/94.10

Consumer credit

The Consumer Protection and Defense Code (Código de Protección y Defensa del Consumidor) – Law 29571

Regulations on Market Conduct Assessment of the Financial System (Reglamento de Gestión de Conducta de Mercado del Sistema Financiero) – Resolution SBS 3274-2017

The Supplemented Act on Consumer Protection in Financial Service Matters (Ley Complementaria a la Ley de Protección al Consumidor en Materia de Servicios Financieros) – Law 28587

Mortgages

The Peruvian Civil Code (Código Civil Peruano) – Legislative Decree 295

The General Security Interest Act (Ley de la Garantía Mobiliaria) – Law 28677

Corporations

The General Business Corporations’ Act (Ley General de Sociedades) – Law 26887

Regulations of the Registry of Companies (Reglamento del Registro de Sociedades) – Resolution 200-2001-SUNARP-SN

Funds and platforms

The Investment Funds and their Management Companies Act (Ley de Fondos de Inversión y sus Sociedades Administradoras) – Legislative Decree 862

Regulations on Investment Funds and their Management Companies Act (Reglamento de Fondos de Inversión y sus Sociedades Administradoras) – Resolution SMV 029-2014-SMV-01

Regulations on Mutual Funds and their Management Companies Act (Reglamento de Fondos Mutuos de Inversión de Valores y sus Sociedades Administradoras) – Resolution Conasev 068-2010-SMV/01

The Collective Fund Act (A las Empresas Administradoras de Fondos Colectivos contralará SMV) – Executive Order 21907

Regulations on the Collective Funds System and their Management Companies (Reglamento del Sistema de Fondos Colectivas y de sus Sociedades Administradoras) – Resolution SMV 020-2014-SMV/01

Other key market legislation

The General Bankruptcy System Act (Ley General del Sistema Concursal) – Law 27809

Last modified 5 Dec 2019 | Authored by DLA Piper Pizarro Botto Escobar
Regulatory authorization

Who are the regulators?

The Superintendence of Banking, Insurance and Private Pension Fund Management Companies (Superintendencia de Banca, Seguros y AFP, or SBS) is a constitutionally autonomous institution in charge of the regulation and supervision of the financial, insurance and private pension fund system in Peru and the companies that are part of it, being the conduct regulator for firms and companies providing banking and financial services. It enjoys functional, administrative and economic independence.

The Superintendence of Securities Market (Superintendencia del Mercado de Valores, or SMV) is a specialized technical entity attached to the Ministry of Economy and Finance whose purpose is to protect investors, ensuring the efficiency and transparency of the markets under its supervision, as well as of the correct firm pricing and the dissemination of the necessary information for such purposes, through its regulatory, supervisory and promotional functions. It enjoys functional, administrative, economic, technical and budgetary independence.

Both Peruvian institutions are entitled to initiate administrative and sanctioning procedures against entities that are under their supervision and, when applicable, apply sanctions that include warnings, economic fines and revocation of licenses.

What are the authorization requirements and process?

Any company which intends to provide banking and/or financial services must apply to the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS) for:

- authorization for the organization of the company; and
- authorization for the operation of the company.

The procedure and requirements are regulated by the General Act of the Financial and Insurance Systems and Internal Organization Act of the Superintendence of Banking and Insurance (Ley General del Sistema Financiero y del Sistema de Seguros y Orgánica de la Superintendencia de Banca y Seguros) and the Regulations for the Incorporation, Reorganization and Establishment of Companies and Representatives of the Financial and Insurance Systems (Reglamento para la Constitución, Reorganización y Establecimiento de Empresas y Representantes de los Sistemas Financiero y de Seguros), enacted by Resolution SBS 10440-2008.

The SBS will assess whether the application meets the required threshold conditions within:

- 180 calendar days from the submission of the complete application for the establishment, authorization; and
- 220 calendar days from the submission of the complete application for the operating permit.

For authorizations requested by banks or financial firms or investment banks, the opinion of the Central Reserve Bank of Peru is required.

On the other hand, any company with the intention of participating in operations conducted and executed in the securities market, such as brokerage firms, stock exchanges, securities clearing, securitization companies, mutual fund management companies, investment fund management companies or collective fund management companies must apply to Superintendence of Securities Market (Superintendencia del Mercado de Valores, or SMV) for:

- authorization for the organization of the company, and
- authorization for the operation of the company.

The procedure and requirements are established based on the type of entity to be incorporated or the services to be provided.

In both cases, individuals and legal companies applying as organizers must demonstrate moral integrity and financial capacity. Board and management members must demonstrate the required technical ability for the running of the company.

There are no application fees for the submission and assessment of the applications submitted before the SBS. For any authorization to be granted by the SMV, an application fee of PEN 3,850 (equivalent to approximately US$1,140) must be paid for each procedure.
Authorized firms and individuals are listed on the SBS' and SMV's websites.

What are the main ongoing compliance requirements?

Many threshold conditions (such as having adequate financial resources, a minimum capital stock and compliance arrangements in place) are also ongoing compliance requirements for authorized firms.

These include:

- minimum capital and equity capital (basic equity and supplementary capital) requirements;
- risk concentration limits, which are based on a firm's equity capital global limits (these limits are overall limits, global limits for operations, individual limits, related individuals exposures and foreign companies and corporate group exposures);
- general and specific provisions for loans granted according to a firm's level of risk; and
- functions (companies must have at least an audit unit, a risk unit, an anti-money laundering system, a market conduct officer and a law compliance officer).

Failure to comply with the threshold conditions and more detailed regulatory rules allow the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS), in addition to imposing the applicable sanctions, to directly supervise the operation of the relevant firm and to request financial and internal information in order to determine if the failure to comply will be resolved. If the situation has not been resolved within the period of time given to the relevant entity, the SBS is entitled to intervene in the administration of the company and, when necessary, to initiate its dissolution and liquidation.

What are the penalties for failure to be authorized?

An individual or company undertaking a regulated activity without being authorized is a criminal offence, punishable with imprisonment and further monetary penalties.

Regulated activities

What finance and investment activities require authorization?

Generally

An individual or company must not carry on any regulated activity in Peru unless authorized or exempted (known as the general prohibition).

A financial or banking activity requires regulatory authorization to carry out specific activities in Peru where such activities do not fall within any of the available exemptions.

- Specific activities include activities such as accepting deposits; dealing in, managing, arranging and advising on investments; and establishing collective investment schemes.
- Specific investments include deposits, shares, debt instruments, options, futures, units in collective investment schemes, and government and public securities.

Are there any possible exemptions?
In accordance with Article 87 of the Political Constitution of Peru, the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS) authorizes, supervises and controls the activities of all banks, financial firms, insurance companies and any other firms that receive money from the public.

Credit Unions (cooperativas de ahorro y crédito no autorizadas para captar recursos del público) which can receive deposits and grant loans from/to their members do not need for a business license; nevertheless, they must register in the National Credit Unions Registry conducted by the SBS.

Without prejudice to the foregoing, unless otherwise expressly provided for by a special law, agreements relating to private financial and investment activities that do not involve public money can be executed without permit or authorization, in addition to other activities that may be excepted for having a different nature, such as making introductions (that is, making arrangements under which clients can, under certain circumstances, be introduced to another person).

Do any exchange controls or other restrictions on payments apply?

Peru has implemented no foreign exchange controls. The exchange rate policy in Peru may be defined as a floating rate with the possibility of Central Reserve Bank of Peru intervening in the market in order to preserve monetary stability. Consequently, the exchange rate between currencies is free and can be established by any private entity for any purpose without the Central Reserve Bank of Peru or other institution intervening in it.

The Political Constitution of Peru guarantees the free possession and disposal of foreign currency.

In case of money transferring from non-Peruvian firms, imports of foreign currency may need to be declared in the customs declarations for their transfer in and out of the country.

There may also be anti-money laundering, anti-terrorism financing and tax considerations to be taken into account.

What are the rules around financial promotions?

According to the Stock Market Promotion Act – Law 30050, every advertisement or offer made in Peru, to buy or sell or subscribe securities through mass media such as newspapers, magazines, radio, television, mail, meetings, social networking, internet servers located in Peru or other media or technology platforms, may only be done by companies authorized by the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS) or the Superintendence of Securities Market (SMV).

There are specific promotion rules for specific financial products such as:

- consumer credit as provided for in the Regulations on Regulations on Market Conduct Assessment of the Financial System (Reglamento de Gestión de Conducta de Mercado del Sistema Financiero) – Resolution SBS 3274-2017;
- mutual funds referred to in Resolution Conasev 068-2010-EF/91.10 (Reglamento de Fondos Mutuos y sus Sociedades Administradoras);
- investments funds as referred to in Resolution SMV 029-2014-SMV/01 (Reglamento de Fondos de Inversión y sus Sociedades Administradoras), and
- collective funds as referred to in Resolution SMV 20-2014-SMV/01 (Reglamento del Sistema de Fondos Colectivos y de sus Empresas Administradoras).

Promotion rules broadly relate to the obligation of including or not including certain information in the promotion materials relating to financial products.

Additionally, any promotion – including financial promotions – must follow publicity rules that are set out in the Unfair Competition Act (Ley de Represión de la Competencia Desleal) – Legislative Decree 1044. Any promotion infraction may be punished by the National Institute for the Defense of Free Competition and the Protection of Intellectual Property Rights (Instituto Nacional de Defensa de la Competencia y de la Protección de la Propiedad Intelectual) - INDECOPI, which is the national promotion and consumer protection authority.
Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The applicable law establishes that, unless express exceptions apply, banks and financial entities must be established as corporations (sociedades anónimas) with separate legal existence and limited liability for their members.

Corporations may either be privately held (denoted by the suffix sociedad anónima or SA) or publicly held (denoted by the suffix sociedad anónima abierta or SAA) depending on whether their shares are listed in the stock exchange.

Shareholders' liability may be limited by shares, in which case they are liable to pay for their shares but not for the company's debts, or by guarantee, where they are also liable to pay a certain amount if the company is wound up.

Funds

An investment fund is an independent autonomous entity made up by the contributions of individuals and legal entities to be invested in instruments, financial operations and other assets depending on the type of fund under management by a fund manager for the account of and at the risk of the fund shareholders.

The four types of types of funds commonly established in Peru are:

- private pension funds administrated by private pension fund management companies (contributions of individuals are made for investments in authorized securities for the individuals' retirement pension);
- investment funds administrated by investment fund management companies (contributions are made by a closed group for making investments in anything of their interest – investment fund management companies whose funds only issue trust certificates which are not to be placed through public offerings are not supervised by the Superintendence of Securities Market (SMV) and consequently are not subject to heavy regulation);
- mutual funds administrated by mutual fund management companies (contributions are made by an open group for making investments in securities); and
- collective funds administrated by collective fund management companies (periodical contributions of individuals or companies are made for acquiring goods or services of the interests of a group).

Fund Management Companies, on the other hand, tend to be set up as corporations (generally limited by shares) and must be authorized by the SMV or, in case of the Private Pension Fund Management Companies, by the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS).

Is it possible to conduct lending or investment business through a branch or establishment?

Yes, it is.

Legally, a company can conduct lending or investment business in Peru through an establishment (also known as a ‘branch’). The procedure for a company to request a license to operate a branch in Peru is regulated in Section 18 of Resolution SBS 10440-2008.

Foreign companies having a Peruvian establishment need to comply with the procedures for establishing a banking or financial entity, and are obliged to request an authorization from the SBS and, when applicable, the Central Reserve Bank of Peru. However, the supervision model of the SBS has been primarily developed to control and supervise subsidiaries but not branches. To date, there are no branches of...
foreign banking or financial institutions operating in Peru.

Unless otherwise expressly provided for by specific laws or an international convention, foreign companies carrying on a trade in Peru through a ‘permanent establishment’ will be subject to Peru’s corporation tax.

---

**FinTech**

**FinTech products and uses**

*What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?*

**Peer-to-peer funding platforms and marketplace lending**

There is no strict definition for marketplace lending, given that specific regulations on this matter do not exist in Peru. Usual market practice includes companies lending money with their own capital and companies connecting investors and borrowers through a platform (either with or without knowing the identity of the applicant requiring financing). Marketplace lending is available to address mainly personal loans and is becoming available for small companies. Additionally, citizens may employ FinTech lending products available worldwide that accept Peruvian citizens.

As marketplace lending is just starting its development in the country and many projects are being developed, it is likely that the volume of lending in personal loans as well as further and additional product areas will significantly increase over the coming years.

**Blockchain, smart contracts and cryptocurrencies**

*WHAT IS BLOCKCHAIN?*

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a peer-to-peer mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third-party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that, once authorized can validate, observe
and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an 'address'). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

At the time of writing, there is only one Peruvian company that operates using the blockchain platform to exchange cryptocurrencies, specifically bitcoins, from dollars or soles; however, Peruvian citizens can operate cryptocurrencies through platforms that accept them. Therefore, it is not common for commercial establishments to accept cryptocurrencies as payment method.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called 'smart contracts'. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced more-complex interactions with the outside world using so called 'Oracles'. With Oracles the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

There is no legal definition of cryptocurrencies in Peru. The exchange of cryptocurrencies is not regulated by Peruvian laws but it may be considered as a foreign currency that may not be limited since the free possession and disposal of foreign currency is guaranteed by the Peruvian Political Constitution. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:
• availability and limitations on the total amount of the tokens;
• decision-making process in relation to the rules or ability to change the rules of the scheme;
• nature of the project to which the tokens relate;
• technical milestones applicable to the project;
• basis and security of underlying technology;
• amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
• quality and experience of management; and
• compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

To our knowledge, there have not been any ICOs led out of Peru at the time of writing.

Electronic money

Law 29985 regulates a range of matters, including the issuance of e-money. Electronic money is a monetary value represented through an enforceable credit to its issuer for the same amount of the money received, which is stored in an electronic medium, allowing the user to carry out payments without using cash or credit cards. According to Law 29985, issuers may rely on financial institutions, such as banks or other financial companies authorized by the Superintendence of Banking, Insurance and Private Pension Fund Management Companies to carry out such activity or use specialized companies for issuing money. The purpose of this product is to be an instrument for financial inclusion for people who would not otherwise have access to alternative financial products, so that they may pay by means other than cash (which is the most common payment method in Peru).

Artificial intelligence, robo advisory systems and auction systems

Recommender systems include software tools that provide information published and provided by traditional financial institutions (such as banks, financial entities and fund management companies) to users in order for them to make a decision to acquire financial products that fit their needs. The recommender systems available do not analyze personal data; therefore, they are not suitable for financial products that consider those parameters to advise in areas such as lending but they are functional for deposit and investment products.

Robo advisory systems which analyze personal data and other values are being developed for acquiring loans and are beginning to operate in the finance marketplace. These systems utilize algorithms relating to a person's historical information and the characteristics of financial products in order to rate the risk profile and display the best offers or products available according to the person's appetite for risk.

Auction systems for financial products such as deposits and loans based on recommender systems and robo advisory systems for deposits and loans also exist in Peru. Through auction systems, the developer of the FinTech application makes alliances with different financial companies so that the latter may give a specific offer to the client suitable to their requirements.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

In Peru, the main applicable regulations are the General Act of the Financial and Insurance Systems and Internal Organization Act of the Superintendence of Banking and Insurance – Law 26702 and the Securities Act – Executive Order 861 which regulate lending and public offering of securities. There is not a specific regulatory regime for FinTech products.

Lending will be considered to be a regulated activity if it is conducted using public money which is defined as funds obtained from individuals. Under these circumstances, a lender will need to be authorized by the Superintendence of Banking, Insurance and Private
Pension Fund Management Companies to conduct such business.

A public offering of securities is, on the other hand, a public invitation to one or more individuals or legal entities of the general public, or specific segments thereof, to carry out a legal placement, acquisition or disposal of marketable securities. It is important to highlight that it is not necessary to state that the activity is employing securities; the Superintendence of Securities Market considers that it is enough that the characteristics of the financing fit in the definition of public offering of securities.

**Regulations on crowdfunding and peer-to-peer lending**

**CURRENT SITUATION**

There is no specific regulation on crowdfunding and peer-to-peer (P2P) lending. However, this activity may fall within the definition of a public offering of securities making it subject to the general financial regulatory regime.

**WARNING FROM THE REGULATOR**

The position of the Superintendence of Securities Market is that financing by crowdfunding through securities issuing is a non-authorized activity. Moreover, the Superintendence of Securities Market warns the public against investing through entities that promote crowdfunding through securities as they may not have the required license. The statement extends and applies to initial coin offerings as they follow a similar purpose.

**REGULATION PROJECTS**

Both public and private sectors recognize the need to enact specific regulation on crowdfunding and P2P lending. Consequently, there have been some initiatives, particularly from the private sector, for implementing an act issued by Congress, appointing the Superintendence of Securities Market as the natural supervisor of these activities. However, it is been discussed if there is a need to have a FinTech regulation in Peru instead of applying the general rules.

Moreover, there is consensus on the fact that FinTech regulations must be flexible enough for promoting FinTech development in Peru.

**Regulations on payment services**

There are no specific regulations for payment services. It is therefore not in scope of the general financial regulatory regime, and currently no specific authorization from the regulator is required to carry on this activity.

**Application of data protection and consumer laws**

The Data Protection Act, Law 29733, regulates the processing of personal data within Peru which aims to guarantee the fundamental right to protection of personal data and must be applied by public entities and private companies. Whenever any personal data is processed, it will be regulated by the Data Protection Act and be subject to certain registration and compliance obligations such as:

- registration requirements with the National Registry of Data Protection;
- obtaining consent for processing and treatment of personal data from clients, providers and employees; and
- restrictions on using data for purposes other than those for which personal data was given, amongst others.

**Anti-money laundering regulations**

The Anti-Money Laundering Act, Law 27693, establishes the obligation for companies, depending on the business activity they perform, to implement an anti-money laundering system which allows them to satisfy certain registration and compliance obligations. Among others included in the list prepared by the Financial Intelligence Unit (which itself is part of the Superintendence of Banking, Insurance and Private Pension Fund Management Companies), companies subject to the anti-money laundering regulations are:

- financial companies;
- credit unions;
- credit and debit card issuers;
individuals or legal entities engaged in foreign exchange activities;

- brokerage firms, stock exchanges, securities clearing, mutual fund management companies, investment fund management companies, collective fund management companies.

The main obligations within the framework of the anti-money laundering regulations include:

- appointment of an employee as the anti-money laundering compliance officer;
- adoption of internal regulations such as employee manuals;
- implementation of policies in relation to know-your-clients-and-workers requirements;
- implementation of an operations log; and
- reporting of suspicious operations.

However, the specific regulations applicable to a company depends on the entity type; therefore, obligations may vary between different types of companies.

What type of funding arrangements and incentives are available to FinTech businesses?

**Seed investment**

Initial investment in FinTech business may be provided by families and friends of the founders through their own capital and other high-net-worth individuals that invest in the FinTech business in return for an equity stake (often known as business angels). Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers. There are some private initiatives in Peru that aim to link business angels with FinTech businesses.

**Venture capital**

Venture capital funding is a type of equity investment usually targeted at early-stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), which is secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest in companies that have already received investment through venture capital. Local investment funds, whose target is venture capital investment, are being developed to fund FinTech businesses that are already developed and need to grow. In addition, overseas funds and other entities are starting to invest in Peruvian FinTech initiatives.

**State investment**

The Peruvian state has initiatives which provide lending to encourage seed investment for starting businesses and venture capital for business that need to grow through the Production Ministry. Additionally, the National Council of Science, Technology and Technological Innovation (Concytec), which is the government entity engaged in promoting the development of technology, has different funds for financing science and technology.

**Bank debt and capital markets funding**

Currently, FinTech is considered to be a potentially risky business at an early stage of development. Consequently, banks are not promoting this type of debt in the market. Moreover, as the FinTech sector is not yet advanced in Peru, FinTech companies are unlikely to
obtain financing through the capital markets. Nevertheless, as the FinTech business consolidates in the country, it is expected that its funding would diversify.

**Portfolio sales**

**Loan transfers and portfolio sales**

*What are common ways of buying and selling loans?*

Buying and selling loans is very common in Peru. A loan may be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms. The most common ways of selling loans are through assignment, which may be either a transfer of rights only and not obligations, or a complete transfer of a contractual position (including rights and obligations). Subject to any contractual restrictions, assignment of rights can be executed without the consent of the debtor, while assignment of a contractual position requires the consent of the debtor.

Loan transfers are commonly documented using standard form contracts proposed and negotiated by and between the financial entities. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

*What are the main considerations when transferring a loan and related security?*

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller's legal advisors. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and
- **consent** – whether a transfer requires the consent or notification of any other parties or, if applicable, authorization of the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS).

**Projects**

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

Generally
Private entities are entitled to invest in Peruvian energy and infrastructure projects. Based on the location and the regulatory framework, these projects may be:

- national projects;
- regional projects; and
- local projects.

Furthermore, these projects may be part of different sectors such as energy, aviation, rail, telecommunications, water, roads, waste, transport, education, health and justice/prisons.

**Energy**

Part of the electricity industries in Peru are privatized, with the generation, transmission, distribution and supply services provided by a number of companies of the private sector. Thus, all transmission activities in Peru are developed by private companies and the generation and distribution assets are owned by different public and private companies.

Regarding the transmission system, the National Interconnected Electrical System (Sistema Eléctrico Interconectado Nacional, or SEIN), is in charge of the operation of the transmission network in Peru. This system interconnects most of the transmission lines in three geographical areas (north, central, and southern regions). However, there are also 'isolated' systems, not linked to the SEIN, which cover the rest of the country and are owned by private sector companies.

The private sector finances and delivers most of the required infrastructure but there are a number of government policy mechanisms (adopted through legislation) which are used to promote investment in eligible energy generation technologies. In certain instances, including on major energy infrastructure, projects may be procured by the public sector and depending on the terms of the procurement, the asset may either be publicly or privately owned.

The Ministry of Energy and Mines is the main body with responsibility for regulation of the energy sector in Peru. The relevant regulatory authority responsible for ensuring the quality and efficiency of service provided by private companies in the energy market is the Supervisory Agency for Private Investment in Energy and Mining (Organismo Supervisor de la Inversión en Energía y Minería, or OSINERGMIN).

**Telecoms infrastructure**

The telecommunications networks in Peru have been privatized to a number of private companies which provide telecommunications services. All the companies that provide telecommunications services are heavily regulated by government.

The Ministry of Transport and Communications (MTC) is the main authority of the Peruvian telecommunications sector. It also has responsibility for wireless communications services. Further, the Supervisory Agency for Private Investment in Telecommunications (Organismo Supervisor de la Inversión Privada en Telecomunicaciones or OSIPTEL), is the regulatory authority created to ensure the quality and efficiency of service provided in the telecommunications market.

**Transport infrastructure**

**LIGHT RAIL**

The only light rail system in Peru is located in Lima. Typically, rail assets (such as trams and associated track) are owned by the national public sector. However, the first light rail system project in Peru has been outsourced to a private sector company which is currently running a concession. The Ministry of Transport and Communications (as the main authority in the sector) has projected the development of more lines in Lima and in other cities thereafter.

**HEAVY RAIL**

The rail market in Peru involves both public and private entities. The rail assets are owned by local and national public sector but certain elements of rail projects have been outsourced to the private sector, for example, the private sector may operate and maintain rail systems on behalf of the Directorate of Railways. The assets will continue, however, to be owned by the public sector.

The rail sector is regulated by the Directorate of Railways (Dirección de Ferrocarriles) which is part of the Ministry of Transport and Communications.
ROADS, BRIDGES AND TUNNELS

A government entity, the General Directorate for Land Transport (Dirección General de Transporte Terrestre) is a nationwide agency that operates, maintains and improves the motorways and major roads in Peru and is part of the Ministry of Transport and Communications. The General Directorate for Land Transport receives funding from the government for investment in the strategic road network (including additional road capacity). Local roads in Peru are the responsibility of local authorities. The public sector may outsource the construction, operation and maintenance (sometimes on a project financed basis) of such assets to the private sector. In the case of tolled roads, the private sector has taken on roads/crossings on a full concession basis. It is responsible for the design, build, financing, operation, maintenance and collection of tolls for a number of years with the main revenue stream being the collection of toll revenues from users (rather than any service payments from the public sector). In some cases, the private sector provides toll collection services for a service fee rather than relying on those tolls as its main source of revenue.

AVIATION

Airport infrastructure involves both public and private entities in the Peruvian market, national government ownership and some forms of public-private ownership. All models are regulated by government. The Civil Aeronautical Authority in Peru (Autoridad Aeronáutica Civil en el Perú) is the aviation regulator in Peru and is part of the Ministry of Transport and Communications.

PORTS

The ports sector also involves both public and private entities, including local and national government ownership and some forms of public-private ownership. This sector is regulated by government and the National Port Authority in Peru (Autoridad Nacional Portuaria), part of the Ministry of Transport and Communications, is the port regulator in Peru.

Other infrastructure

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS/PRISONS)

Typically, these are owned by the public sector with the private sector’s responsibility being for any or all of the design, build, financing, operation and maintenance of the infrastructure. The majority of social infrastructure assets in Peru are directly financed by the government. Subject to value-for-money considerations, private finance may also be used in the procurement of social infrastructure assets. In relation to some of these specific sectors:

Education

The ownership of a school’s infrastructure is owned by the Ministry of Education. The current program for new schools is through the ‘National Program of Educational Infrastructure’ (Programa Nacional de Infraestructura Educativa), delivering schools either through a traditional construction procurement or on a project-financed basis. This program seeks to develop infrastructure on three fronts: (i) high-performance schools (Escuelas de Alto Rendimiento), (ii) schools in risk areas (Escuelas en Riesgo) and (iii) Institutes of High Technical Education (Institutos Superiores Técnicos).

Hospitals

Ownership of hospitals is vested in various public sector bodies that are part of the national government (such as the Ministry of Health of Peru and Social Security System (ESSALUD), or local authorities (such as Hospitales de la Solidaridad or Regional Hospitals).

DEFENSE

All defense assets are owned by the public sector.

WASTE

The public sector procures new waste treatment or collection facilities and these are owned by the public sector even if the private sector is responsible for design, build, operation or maintenance of any given facility. Those waste treatments and collection facilities are owned by local authorities, which have competence to regulate all of the activities connected to such facilities. In the past few years, some private initiatives have been proposed to public authorities with regard to waste systems. However, such systems have not been successful due to the lack of clear regulation in connection with waste activities.
WATER

Water and wastewater (sewerage) services in Peru are delivered mostly by public sector companies (water companies) which own the relevant infrastructure assets and are located in each region of the country. For example, Servicio de Agua Potable y Alcantarillado de Lima (SEDAPAL) is a public company that provides water and wastewater services in Lima. Nonetheless, the public sector may outsource the construction, operation and maintenance (sometimes on a project financed basis) of such assets to the private sector. The National Sanitation Services Supervisory (SUNASS) is the regulator of the water sector in Peru and its functions are to establish norms, supervise providers, approve tariffs and resolve controversies and complaints, among other responsibilities.

Are there special rules for investing in energy and infrastructure?

Generally

There is no specific regime governing or restricting investment in energy or infrastructure projects in Peru over and above existing regulation for investors and funders, but a particular proposed investment may be subject to legislative or regulatory control (eg merger control rules in case of energy investments). As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory position relevant to that project must be considered. For example, a project involving development on land will require planning permission or a development consent order, and a project may require environmental authorizations/permits and/or sector specific regulatory consents or licenses. If a public body (eg a government department, a local authority or a competent ministry of the corresponding sector) is procuring a project using private finance, and the public body is to benefit from central government funding towards the cost, the project will be subject to central government approval. Key sector-specific issues are flagged in the sections below.

Whether an investor can invest will depend on the terms of the procurement of that project if it is a public-sector project and, in respect of an existing/operational project, that will depend on whether there are any contractual restrictions on ‘change of control’. This is less of a concern on private sector infrastructure projects although investors would need to consider whether the validity of any licenses/consents/permits would be affected by their acquisition of an interest.

Energy

The energy markets in Peru have a complex system of arrangements between suppliers, generators, transmission and distribution in place, and are heavily regulated. In particular, there are complex arrangements in respect of licensing, subsidies and demand/charging mechanism with suppliers, customers, the Ministry of Energy and Mines, and OSINERGMIN. These arrangements are subject to change/regular updates meaning that investors will need to have a good understanding of the current framework and the potential directions in which the market may move. Investors need to understand how technology changes may impact on the overarching regulatory framework and vice versa.

Investors should also consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with any license conditions or the granting of specific subsidies, particularly, if a breach of those conditions could lead to the revocation of a license/subsidy that might make the potential target less attractive or viable.

Further, investors should consider that obtaining licenses is not enough to guarantee the development of energy projects in certain areas. One major issue is to guarantee the ‘Rights of Way’ for the projects without generating a social problem by affecting property rights of third parties. In most of the cases getting along with the communities located around the project is as important as obtaining the relevant licenses and permits.

Telecoms infrastructure

There is a complex regulatory environment for this sector including how access and interconnectors (between networks) are regulated under the Legislative Decree 1019 – Law of Access to Infrastructure of Public Telecommunications Services and Access to Infrastructure regulations (Decreto Legislativo 1019 – Ley de Acceso a la Infraestructura de los Proveedores Importantes de Servicios Públicos de Telecomunicaciones) regarding access to infrastructure and how the Ministry of Transportation and Communications grants rights to access private or public land in order to install and maintain essential equipment in, over or under that land. This equipment might be cables sunk beneath the ground or a mobile mast sited on the ground. The Supervisory Authority for Private Investment in Telecommunications (OSIPTEL) is the regulator of the telecommunications sector in Peru and it is responsible for the following: rates
applicable to users; competition in the sector; interconnection; quality of the service; settlement of disputes between operators and application of the corresponding penalties; and dealing with complaints from users.

The industry is largely privatized; therefore, investors should consider if any permits/consents/licenses will be affected by their interest.

**Transport infrastructure**

**RAIL**

There is a framework to consider in respect of parties' practical and operational involvement in this sector. Key issues for parties seeking to become involved in rail infrastructure include developing an understanding of the regulatory regime for certification for train use and acceptance and user fare regulation. Depending on how an investor wishes to invest in a project (specifically, depending on the type of entity or asset involved), there are varying degrees of difficulty for investors to contend with, particularly when entering into existing projects.

**ROADS**

In order for a private sector partner to carry out its duties on certain types of roads projects, the procuring public sector authority (Ministry of Transport and Communications or a local authority) may delegate certain of its statutory duties to the private sector partner. This will be dependent on the project and the specific contractual requirements. Any investor will, therefore, need to understand those duties and whether it is able to subcontract those duties to an appropriate person. There is usually a restriction on the change of control of the private sector partner during the construction period. Following the construction period, the relevant private sector partner may be allowed a change of control only with the prior approval of the Ministry of Transport and Communications or local authority. The precise scope of the restrictions will depend on the contractual terms of the project.

**Other infrastructure**

On publicly procured infrastructure, it is quite common for long-term projects to have a 'change of control' clause which restricts change in ownership structures of the private sector. For example, in most sectors there is a restriction on change in control during the construction period but this is often relaxed post-construction. How strict these restrictions are will often depend on the sector. For example, the defense sector usually gives the Ministry of Defense a strong degree of discretion (particularly on the grounds of national security) as to whether to accept a change in control over its private sector partner.

**What is the applicable procurement process?**

Public procurement in Peru is, for the time being, in most instances governed by the Law for Public Procurement and State Contracting. There are some sector-specific regulations such as Legislative Decree 1224 Public-private partnerships Law (Decreto Legislativo N° 1224 Ley Marco de Promoción de la Inversión Privada mediante Asociaciones Público Privadas y Proyectos en Activos), applicable to any sector and the Law of Electric Concessions (Decreto Ley 25844 Ley de Concesiones Eléctricas), among others.

The key principles are that contracts procured by the public sector are awarded fairly, transparently and without discrimination on the grounds of nationality and that all potential bidders are treated equally.

**Investing in energy and infrastructure**

Public procurement is relevant where the Peruvian government, or a branch of it, is seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset. The relevant procurement legislation applies to certain public bodies including central government departments, local authorities, police and fire authorities, among others. A regulated procurement is required where certain financial thresholds are met and on most major infrastructure projects (where limited exclusions do not apply), it is likely that those thresholds will be met so a regulated procurement would need to be run.

The general rule is that the public sector needs to follow a public tender. However, it could happen that some projects are generated under unsolicited proposals, which means that a private sector company may propose the development of a project to a public entity. Regarding public tenders, there are different regulations that may be applicable depending on the sector, for example the regulation...
applicable to electric projects are regulated by different rules to those regulating transportation infrastructure projects.

An investor may choose, however, to seek to invest in a project (by acquiring an interest in a private sector partner) that has already been procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the original awarded contract rather than procurement regulations themselves.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement-related considerations that need to be borne in mind.

**Financing energy and infrastructure**

On a publicly procured contract, the public sector may have prescribed requirements regarding the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector.

**What are the most common forms of funding / investing in energy and infrastructure?**

The principal forms of private sector funding/investment in energy and infrastructure in Peru (including in relation to public-private partnerships) include the following.

**Funding**

- Loans made on a corporate finance basis (balance sheet debt)
- Loans made on a project-finance basis (to a special purpose project company) on medium- to long-term bases – such loans may later be syndicated to other funders (for publicly procured project finance deals, this often means using private finance)
- Bond finance
- Mezzanine debt (in some sectors)
- Refinancing of the debt in operational projects
- Asset financing (this is particularly relevant in the rail sector)

In order to promote private investment in these activities, the Peruvian government has tried to expand the funding base and increase liquidity in the market (particularly by encouraging institutional investors) by various means. These include the Ministry of Economy and Finance of Peru offering financial and non-financial guarantees to assure certain types of debt on infrastructure projects (for example, guaranteeing bond finance debt so as to lower debt pricing to near gilt levels and offering a ‘minimum guaranteed income’).

**Investing**

- ‘Equity’ investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans
- Secondary market investment in operational projects (acquisition of ‘equity’)

**Restructuring**

**Enforcement and sanctions**

**When can there be regulatory investigations?**

When the Superintendence of Banking, Insurance and Private Pension Fund Management Companies (SBS) or the Superintendence of
Securities Market (SMV) as applicable, considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation.

This may result in regulatory and monetary sanctions, in addition to criminal liability for the individuals involved if any criminal offence was committed.

Last modified 5 Dec 2019 | Authored by DLA Piper Pizarro Botto Escobar

**What regulatory penalties may apply?**

When a rule breach has taken place, the authorities may impose a financial penalty or censure, or withdraw regulated status of the firm and/or regulated individuals.

Last modified 5 Dec 2019 | Authored by DLA Piper Pizarro Botto Escobar

**What criminal penalties may apply?**

Following formal investigation, the regulators have powers to impose criminal penalties in certain cases, including:

- insider dealing and misleading statements and practices;
- breaches of the Anti-Money Laundering and Terrorism Financing Regulations;
- conducting regulated activities when not authorized; and
- bribery practices with public officials and private persons.

**Tax**

**Tax issues**

*Are stamp, registration, transfer or other similar taxes applicable?*

*Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?*

In general, no stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan.

However, a tax on financial transactions would be applicable in the event that funds are transferred via local bank accounts. The tax is equal to 0.005% of the amount transferred.

*Are the stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?*

No stamp, registration, transfer or other similar taxes are payable on the taking, transfer or assignment of a mortgage, debenture or other security.

It is advisable to register at the Real Estate Registry the taking, transfer or assignment of mortgages in order to make it enforceable against third parties. An administrative fee is required to be paid when registration of the taking, transfer or assignment of such mortgage takes place. The amount of the fee will depend on the amount of the mortgage.

*Are the stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?*
In general, no stamp, registration or other similar taxes are payable on the issue, transfer or assignment of a debt security.

However, in the case of bonds or other debt securities issued in the context of a public offering, a registration fee on the issue of such bonds/debt securities is required to be paid before the Superintendence of Securities Market (SMV).

**Do tax authorities take priority on enforcement?**

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

Tax authorities take priority on enforcement over secured lenders or secured debt security holders.

However, in the context of a bankruptcy proceeding, lenders or debt security holders may take priority over the tax authorities when the loans or the debt securities are supported under a warranty before the entry date of the debtor to such a proceeding.

**Is withholding tax on interest payments applicable?**

Is there withholding tax on interest payments under a loan?

Yes. Withholding tax is generally applicable to Peruvian-source interest payments paid by a borrower resident in Peru to a lender which is a legal person not resident in Peru or an individual who is not domiciled in Peru. Such withholding tax applies not just to interest payments but also extends to commissions and any additional amount to the interest agreed in loans, credits or any capital placed or economically used in Peru.

**If so:**

What is the rate of withholding?

**LENDERS AS LEGAL PERSONS**

In the case of interest payments to legal persons (ie not individuals) not resident in Peru, the general withholding tax rate is 30%.

However, the rate of withholding may be reduced to a rate of 4.99%, if all of the following requirements are met:

- the interest rate is not higher than LIBOR + 7 points (the excess would be subject to a withholding rate of 30%);
- the entry of the loan capital into Peru is attested in documentation; and
- the financing operation is not performed between related parties (including by way of back-to-back transactions).

In addition, in the case of interest payments to financial institutions a rate of 4.99% will be applied.

**LENDERS AS NON-DOMICILED INDIVIDUALS**

In the case of interests to individuals not domiciled in Peru, the general withholding tax rate applicable is also 30%.

However, the rate of withholding may also be reduced to 4.99%, if all of the following requirements are met:

- the financing operation is not performed between related parties (including by way of back-to-back transactions); and
- the interest payments are not derived from transactions made from or through tax havens.

**What are the key exemptions?**

The main exemptions from withholding tax in Peru apply to interest and related payments made on:

- development loans granted directly or indirectly by international organizations or foreign government institutions; and
• government bonds.

An exemption from the application of withholding tax on interest or related payments may be applicable in part, under the terms of a double tax treaty entered into by Peru, provided that the requisite conditions are met.

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes, the analysis described above is applicable to both interest payments under a loan or other form of debt security.

Last modified 5 Dec 2019 | Authored by DLA Piper Pizarro Botto Escobar

**Are foreign lenders and debt security holders subject to tax on interest payments?**

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes.

Poland

**Capital markets and structured investments**

**Issuing and investing in debt securities**

*Are there any restrictions on issuing debt securities?*

There are restrictions on offering and selling debt securities under both Polish and EU law.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Poland or to request that they are admitted to trading on a regulated market operating in Poland, unless an approved prospectus has been made available to the public.

The Prospectus Directive sets a standard for selling restrictions on offers of debt securities. These restrictions are aimed at preventing breaches of:

- the rules on financial promotion; and
- the rules on accepting deposits.

*What are common issuing methods and types of debt securities?*

The most common types of debt securities issued in Poland are bonds issued on a stand-alone basis or under a program.

Many different types of debt securities are offered in Poland. Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating/variable-rate securities, and zero-coupon securities;
- bonds;
- mortgage bonds;
- public securities;
- bank securities; and
- subscription warrants.

*What are the differences between offering debt securities to institutional / professional or other investors?*
The **Prospectus Directive** does not make a distinction between professional and other investors for the purposes of its disclosure requirements, but it does include different disclosure regimes by reference to the minimum denomination of a single security.

If the denomination of the securities is equal to or above €100,000 (or the equivalent in another currency), the ‘wholesale’ rules apply. If the denomination is under €100,000, the ‘retail’ rules apply. Additional disclosure requirements apply for retail securities.

**When is it necessary to prepare a prospectus?**

Under the **Prospectus Directive**, unless an exemption applies, it is necessary to publish a prospectus where there is an offer of securities to the public or an application for the securities to be admitted to trading on a regulated market.

An offer would not be deemed to have been made to the public if it is made solely to qualified investors, addressed to fewer than 150 persons (other than qualified investors) per European Economic Area state, or where the minimum denomination per unit is at least €100,000.

If the offer is deemed not to be made to the public, a Prospectus Directive compliant prospectus may still be required if an application is made for the securities to be admitted to trading on a regulated market. An exemption from both the offer to the public and the admission to trading on a regulated market is needed to avoid having to publish a prospectus.

**What are the main exchanges available?**

The Polish debt capital market includes:

- the main stock exchange market organized by the Warsaw Stock Exchange (WSE);
- NewConnect – an alternative stock exchange market organized by the WSE; and
- Catalyst – a bonds market.

The Main Market of the WSE is a regulated market for the purposes of the **Markets in Financial Instruments Directive** (MiFiD), so issuers on the Main Market are subject to the requirements of a number of EU Directives, including the Market Abuse Regulation, **Market Abuse Directive** and the **Transparency Directive**. Securities listed on the Main Market can be passported to other European Economic Area markets in order to access international investors.

NewConnect is an alternative stock exchange operated by the WSE, allowing smaller companies to float shares. The exchange is conducted outside the regulated market as a multilateral trading facility. Compared to the main market of the WSE, NewConnect offers lower costs for floated companies, simplified entrance criteria, and limited reporting requirements. It is also characterized by higher risk and in turn a higher rate of return.

The bond market operates on transaction platforms of the WSE and BondSpot, jointly organized by Catalyst, which comprises four trading platforms:

- two platforms operated by the WSE (a regulated market and an alternative trading system) are dedicated to retail investors; and
- two platforms operated by BondSpot (regulated market and ATS) are dedicated to wholesale investors.

All platforms support trading in non-treasury debt instruments: municipal bonds, corporate bonds, and mortgage bonds. The Catalyst’s architecture ensures that the market can accommodate issues of different sizes and parameters and serve the needs of different investor groups: wholesale and retail investors, institutions, and individuals.

The rules of trading on the regulated markets and in the alternative trading systems are identical and the only differences apply to block trades. Execution of transactions on all Catalyst markets is guaranteed by the National Depository for Securities. Issuers are bound by reporting requirements, including current and periodic reports.
Is there a private placement market?

Poland has an active private placement market. There is no dominant standard for documentation.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil and criminal liability under Polish law. Poland has various statutory investor protection provisions relevant to liability for an inaccurate offering memorandum. There are also general fraud statutes and liability may also arise for deceit, negligent misstatement or misrepresentation.

Investing in debt securities

With respect to changes of the terms and conditions of issue, there are various requirements with respect to consent that aim at protecting investors. For instance, a change of the terms of conditions of issue requires a resolution of the bondholders' meeting and consent of the issuer. Resolutions of a bondholders' meeting concerning amending the qualified provisions of the terms and conditions of issue have to be adopted by a majority of three-fourths of votes, and in the case of bonds admitted to trading on the regulated market or introduced to the alternative trading system, resolutions concerning amending the qualified provisions of the terms and conditions of issue require the consent of all the bondholders present during the bondholders' meeting. Moreover, resolutions of the bondholders' meeting concerning the reduction of the nominal value of bonds require the consent of all the bondholders present during the bondholders' meeting.

MIFID II Directive

Poland has implemented the MIFID II Directive, thus forcing the investment firms offering securities to disclose whom they represent while offering securities and limiting their possibility to charge commission and receive remuneration from the securities issuers.

Enhanced oversight of non-public securities trading

Following the Act of 9 November 2018 on amendment of certain acts in connection with strengthening the supervision over the financial market and protection of investors. all bonds (corporate bonds, bonds of security and closed-end investment fund certificates) offered by the Polish issuers or in Poland need to be dematerialized, meaning that bonds cannot be in the form of a printed document, but need to be registered with the National Securities Depository (Krajowy Depozyt Papierów Wartociowych or KDPW). They will exist only as an entry in the KDPW computer system, as is the case of securities traded on the Warsaw Stock Exchange.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally

Establishing a fund, offering fund securities, and operating a fund are regulated activities under the Investment Funds and Alternative Investment Fund Managers Act.

Under Polish law, funds can be established in the form of an open-ended investment fund, a special investment fund, a closed-ended investment fund, or an alternative investment company. Open-ended investment funds are compliant with the Undertakings for Collective Investment in Transferable Securities (UCITS) Directive. Closed investment funds and alternative investment companies are Alternative
Investment Funds (AIFs). An investment fund is formed by the Investment Fund Company (Towarzystwo Funduszy Inwestycyjnych), which manages and represents the fund in its relations with third parties. The establishment of a public fund requires the consent of the Polish Financial Supervisory Authority.

Investment funds are subject to registration in the Investment Funds Register.

**Collective investment schemes**

Collective investment schemes are regulated under the UCITS Directive, which has been implemented in Poland. UCITS operate in Poland in the form of open-end investment funds.

**What are common fund structures?**

Common forms of funds include open-ended funds, closed-ended funds, special open-ended investment funds, and alternative investment companies, Undertakings for Collective Investments in Transferrable Securities (UCITS) and non-UCITS funds.

**What are the differences between offering fund securities to professional / institutional or other investors?**

**Retail funds**

Open-ended retail funds must be either authorized by the Polish Financial Supervisory Authority (PFSA) (if domiciled in Poland), or recognized by the PFSA (if domiciled in another jurisdiction). Funds that are ‘recognized’ by the PFSA in this context mostly comprise Undertakings for Collective Investments in Transferrable Securities (UCITS) funds established in other jurisdictions.

Retail funds, including UCITS, are subject to substantial regulatory oversight and restrictions, including obligations with regard to independent custodian/depositary arrangements for assets, investment and borrowing power specifications (for open-ended retail funds), concentration requirements, and other matters.

**Institutional/professional funds**

Closed-ended funds are generally established as Polish closed-ended investment funds or Polish/offshore limited partnerships.

Non-retail funds that are offered in Poland generally fall into the category of Alternative Investment Funds and are therefore subject to the Alternative Investment Fund Managers Directive regime in relation to authorization of the manager/fund, marketing arrangements, reporting, governance etc.

**Are there any other notable risks or issues around establishing and investing in funds?**

**Establishing funds**

Managing investment funds is a regulated activity under the Act on Investment Funds and is therefore subject to authorization by the Polish Financial Supervisory Authority.

**Managing and marketing debt / hedge funds**

**Are there any restrictions on marketing a fund?**
Selling restrictions

Generally, offering securities or units of funds in Poland is covered under the Act on Public Offerings and the Act on Investment Funds.

Undertakings for Collective Investments in Transferable Securities (UCITS)

UCITS, including those established in Poland, have an EU passport which enables fund promoters to create a single product for marketing in all EU member states. Upon the completion of the appropriate notification procedure, a UCITS established in one member state can be sold in any other member state of the EU.

A UCITS intending to market in another member state must complete and submit to its home regulator a notification including certain specified information, including copies of key investor documents. The home regulator then completes a notification file which is sent in a regulator-to-regulator transmission, following which the UCITS can be sold in the other member state.

Alternative Investment Funds (AIFs)

Under the Alternative Investment Fund Managers Directive, marketing is defined as: a direct or indirect offering to or placement with investors domiciled or with a registered office in the EU of units or shares in an Alternative Investment Fund (AIF) at the initiative of the Alternative Investment Fund Manager (AIFM) or on behalf of the AIFM that manages the AIF.

An AIFM may only market an AIF to EU investors if it is authorized to do so by a relevant EU regulator. Subject to certain conditions, registration with one EU regulator allows marketing to professional investors across the EU under an EU passport or if it complies with national private placement regimes (where available).

Reverse solicitation and the regulation of ‘marketing’

Applicable in the context of professional investors, this is a sensitive area in Poland and Europe generally. The Alternative Investment Fund Managers Directive generally continues to permit professional investors to invest in Alternative Investment Funds based on their own initiative (reverse solicitation); however, the EU is currently reviewing this area and may impose tighter requirements.

In Poland, the Polish Financial Supervisory Authority (PFSA) has provided general guidelines on marketing for investment funds. The guidelines are not binding but they provide a framework for operating within the law. According to the Investment Funds Act, the PFSA can impose financial sanctions on a fund that is operating contrary to fair marketing rules.

Are there any restrictions on managing a fund?

Fund management in Poland is regulated under the Act on Investment Funds and Alternative Investment Fund Managers and is supervised by the Polish Financial Supervisory Authority (PFSA). The PFSA is responsible for supervising funds, fund managers and those marketing funds. It is prohibited for any legal or natural person to perform regulated activities, such as fund management, without authorization.

Under the regulations there are various restrictions on manager structure компенсация и profit-sharing arrangements and any manager that is subject to the remuneration rules must apply those rules proportionate to its size, internal organization and scope and complexity of activities.

Under EU law, Alternative Investment Fund Managers (AIFMs) are also subject to regulation under the Alternative Investment Fund Managers Directive and managers of Undertakings for Collective Investments in Transferable Securities (UCITS) are subject to certain requirements under the Undertakings for Collective Investment in Transferable Securities Directive.

The registration of such entities involves a significant authorization process. The application must include:

- for the manager – information on senior personnel (must be suitable persons etc), organizational structure, policies and procedures, remuneration practices; and
- for each fund – investment strategy, constitutional documents, depositary information and disclosure requirements.
However, AIFMs can be exempted from full regulation on certain grounds, including managing assets under €500 million where the assets are not leveraged and investors have no redemption rights for five years, and managing assets under €100 million including assets acquired through leverage. Exempted managers do not need a permit from the PFSA to operate but they still have to register in the Alternative Investment Company Register.

**Entering into derivatives contracts**

*Are there any restrictions on entering into derivatives contracts?*

Unless an exemption or exclusion applies, a person entering into a derivatives contract by way of doing business in Poland (such as a dealer) will ordinarily have to be authorized under the Trading in Financial Instruments Act, if the transaction is one of the specified activities, such as:

- options;
- futures;
- contracts for difference; or
- rights to or interests in investments.

One of the key exclusions to the requirements above applies to persons that deal in derivatives for risk management purposes.

The European Market Infrastructure Regulation applies to all derivatives transactions and requires that transactions be reported to regulators and that transactions between dealers be cleared or subject to other risk mitigation techniques such as initial margin and variation margin requirements.

Last modified 6 Dec 2019

**What are common types of derivatives?**

Derivatives contracts are entered into in Poland for various reasons, including hedging, trading and speculation.

Derivatives may be traded over-the-counter or on an organized exchange.

The main types of derivatives contracts are:

- forwards;
- futures;
- swaps; and
- options (call options and put options).

The Polish market for financial derivatives, although still fairly young, is high on the list of European markets. This is mainly due to the turnover on futures contracts, the most important derivative instrument listed on the Warsaw Stock Exchange, on the WIG 20 index.

Globally, the biggest influence on the financial market is attributed to instruments related to interest rates, which account for around 85% of the overall turnover. In Poland, this market is still very small and undeveloped. The largest turnover is generated on the over-the-counter (OTC) market in forward rate agreements and swaps.

Individual investors are not interested in speculation related to interest rates, and institutional investors conduct transactions on the OTC market. The situation is similar with respect to the currency derivatives market, where transactions, most commonly futures and options, are based on Polish currency.

Last modified 6 Dec 2019
Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007-to-2008, derivatives – and particularly over-the-counter derivatives – have attracted significant regulatory attention. The European Commission has sought to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative positions;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen and continues to see the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

The grant of loans is not a regulated activity. However, lenders that grant loans must comply with civil law provisions relating to loans and collateral.

Consumer loans are subject to a range of regulatory requirements that do not apply to unregulated loans. For example, there are particular restrictions around how:

- the loans are marketed, originated and sold;
- lenders administer the loans on an ongoing basis; and
- to deal with borrowers who fall behind with their payments.

There is a set of regulations which defines caps on interest and non-interest costs that may be charged by lenders in connection with consumer loan agreements.

The EU Mortgage Credit Directive (2014/17/EU) is being implemented into Polish law through adoption of the Act on Mortgage Credit (Ustawa o kredycie hipotecznym). The Act on Mortgage Credit will apply the above-mentioned restrictions to mortgage credits.

In addition, regulated credit agreements have specific requirements around how the agreement is drafted and formatted and what information must be included.

Borrowing

While borrowers are generally not regulated, it is advisable for borrowers to consider whether they are subject to consumer credit regulations.

What are common lending structures?

Lending in Poland can be structured in a number of different ways to include a variety of features, depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or on a syndicated basis (multiple lenders
each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents and trustees that fulfil certain roles for the financing parties), are more highly structured, and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one member of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities.

**Loan durations**

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to the maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

**Loan security**

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

**Loan commitment**

A loan can be committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled.

**Loan repayment**

A loan can be repayable on an amortizing basis (in instalments over the life of the loan), or scheduled (usually meaning the loan is repayable in full at maturity).

*Last modified 6 Dec 2019*

**What are the differences between lending to institutional / professional or other borrowers?**

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

*Last modified 6 Dec 2019*

**Do the laws recognize the principles of agency and trusts?**

Trusts are not recognized under Polish law.

Polish law provides for certain types of agencies that may be used in financing transactions, eg pledge administrator (administrator zastawu) or mortgage administrator (administrator hipoteki), who will act on behalf of the secured parties.

In addition, the concept of the parallel debt is recognized by the Polish courts.

*Last modified 6 Dec 2019*

**Are there any other notable risks or issues around lending?**
Generally

Loan agreements and other finance documents are subject to general contractual principles.

Specific types of lending

Polish law regulates consumer credit activities. For more information, see Regulated activities – authorization.

STANDARD FORM DOCUMENTATION

Most Polish law syndicated finance transactions are governed by documentation based on recommended forms published by the Loan Market Association (LMA).

Are there any other notable risks or issues around borrowing?

Borrowers face a number of systemic risks such as regional or national recessions, regional or national house price declines or national increases in interest rates. In response to the recent foreign currency loan crisis (the Swiss franc mortgage loans), i.e. mortgages which are denominated or indexed in a currency other than PLN the Act on the Borrowers Support was changed in 2019 by forming a separate Restructuring Fund, which will be used for voluntary restructuring of loans in foreign currency.

Borrowers should be aware of the potential implications of the EU's Bank Recovery and Resolution Directive (BRRD) (implemented in Poland by the Act of 10 June 2016 on the Bank Guarantee Fund, Guaranteed Deposit Scheme and Mandatory Restructuring), which outlines certain measures for dealing with failing financial institutions.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to ‘bail in’ the obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. ‘Bail in’ describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of EEA law contracts, including Poland, such powers override what the contracts say. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into these contracts.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the giving of guarantees and security are:

Capacity

It is important to check the constitutional documents of a company giving a guarantee or security, as they often provide that corporate authorization is required in connection with granting a guarantee or security.

Actio pauliana

If a third party has gained a benefit as a result of a legal transaction effected by a debtor to the detriment of its creditors (ie where the debtor became insolvent or became insolvent to a greater extent as a result of the transaction), each of the creditors may demand that the transaction be recognized as ineffective, if the debtor consciously acted to the creditors’ detriment and the third party knew or with due diligence could have known about it (and it is alleged that the third party knew that the debtor acted to the creditors’ detriment, if the third party remains in a permanent or close economic relationship with the debtor) or the third party obtained the benefit free of charge.
Insolvency and restructuring

Guarantees and security may be at risk of being set aside under Polish insolvency and restructuring laws if the guarantee or security was granted by a company a certain period of time prior to the onset of insolvency or restructuring proceedings.

Financial assistance

A joint-stock company may, directly or indirectly, finance the acquisition of or subscription for the shares that it issues, in particular by making loans, providing advance payments, or creating security, provided that the financing is granted on market terms and after the solvency of the debtor has been checked, the acquisition or subscription is for a fair price, the financing is made from the reserve capital created by the company for that purpose, and the financing is based on and is within the limits set out in an earlier resolution of the general assembly of the company. In the case of a limited liability company, the shareholders may not receive, under any title, any payments from the company's assets needed to fully finance the share capital.

What are common types of guarantees and security?

Common forms of guarantees

Guarantees can take a number of forms.

A particular distinction worth remembering is between a performance guarantee and a payment guarantee:

- Performance guarantee is a term used to describe both performance bonds (in the context of trade finance) and 'see to it' guarantees (in other contexts):
  - A performance bond describes a financial undertaking used to protect a buyer against the failure of a supplier to deliver goods or perform services in accordance with the terms of a contract. The issuer of the bond undertakes to pay to the buyer a sum of money if the seller fails to deliver the goods or perform the contracted services on time or in accordance with the terms of the contract.
  - A 'see to it' guarantee is a promise by the guarantor to see to it that the primary obligor fulfils its obligations under the primary contract. If the primary obligor fails to fulfil its obligations under the primary contract, the guarantor will be in breach of its obligations under the guarantee.
  - A payment guarantee is narrower in scope than a performance guarantee as it only covers the payment of money rather than other contractual obligations.

Common forms of security

Polish law provides for real and personal security interests.

Personal security interests include:

- suretyship;
- guarantee; and
- statement on submission to enforcement.

The following types of security interest *in rem* can be created under Polish law:

- a pledge (under Polish law a distinction can be made between a registered pledge, a civil pledge and a financial pledge);
- a mortgage;
- a security assignment of receivables; and
- a security transfer of assets.

Different types of security are suitable for securing different types of assets.
Under Polish law, it is possible to grant security over all of the moveable assets and rights of a Polish company or over individual assets. Granting security over all of a company's assets may be achieved by the establishment of a registered pledge. However, real property cannot be encumbered with a pledge. The only security interest that can be established over the real property is a mortgage.

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking security

Some documents creating security interest have to be executed in a special form, for instance:

- Statement on granting a mortgage has to be executed in the form of a notarial deed (there are certain statutory exceptions to this rule).
- Agreement for the establishment of a civil pledge over shares has to be executed in writing with signatures certified by a notary.
- Security assignment agreement and security transfer of assets have to be executed with a certified date.

Once granted, security often needs to be properly perfected before it is valid against third parties. Perfection formalities range from having the secured asset delivered to the security holder, registration of the security, and notice being given to third parties. For instance, registered pledges and mortgages have to be registered in the relevant registers.

Like guarantees, for a certain period after a new security interest has been granted (known as the hardening period), it is at risk of being set aside in certain circumstances under insolvency and restructuring laws.

In the case of a guarantor that is a limited liability company, the shareholders may not receive, under any title, any payments from the company's assets needed to fully finance the share capital.

For more information, see Tax issues – stamp taxes.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Act of 23 April 1964 – Civil Code (Ustawa z dnia 23 kwietnia 1964 r. – Kodeks cywilny) (civil code)

Act of 29 August 1997 – Banking Law (Ustawa z dnia 29 sierpnia 1997 r. – Prawo Bankowe) (banking law)

Act of 29 July 2005 on Public Offering, the Conditions Governing the Introduction of Financial Instruments to Organized Trading, and on Public Companies (Ustawa z dnia 29 lipca 2005 r. o ofercie publicznej i warunkach wprowadzania instrumentów finansowych do zorganizowanego systemu obrotu oraz o spółkach publicznych) (public offering and public companies)

Act of 29 July 2005 on Trading in Financial Instruments (Ustawa z dnia 29 lipca 2005 r. o obrocie instrumentami finansowymi) (financial instruments trading)

Act of 15 January 2015 on Bonds (Ustawa z dnia 15 stycznia 2015 r. o obligacjach) (bond issue and trading)

Act of 21 July 2006 on Financial Markets Supervision (Ustawa z dnia 21 lipca 2006 r. o nadzorze nad rynkiem finansowym) (financial markets
supervision)

Act of 29 July 2005 on Capital Markets Supervision (Ustawa z dnia 29 lipca 2005 r. o nadzorze nad rynkiem kapitałowym) (capital markets supervision)

Act of 27 July 2002 – Foreign Exchange Law (Ustawa z dnia 27 lipca 2002 r. – Prawo dewizowe) (foreign exchange)

**Consumer credit**

Act of 12 May 2011 on consumer credit (Ustawa z dnia 12 maja 2011 r. o kredycie konsumenckim) (consumer credit)

**Mortgages and mortgage credit**

Act of 6 July 1982 on Land and Mortgage Registers and on Mortgage (Ustawa z dnia 6 lipca 1982 r. o księgach wieczystych i hipotece) (land and mortgage registers and mortgage)

Act of 23 March 2017 on Mortgage Credit and Supervision of Mortgage Credit Brokers and Agents (Ustawa z dnia 23 marca 2017 r. o kredycie hipotecznym oraz o nadzorze nad porednikami kredytu hipotecznego i agentami) (mortgage credit) (NB The act enters into force on 22 July 2017.)

**Corporations**

Act of 15 September 2000 – Code of Commercial Companies (Ustawa z dnia 15 sierpnia 2000 r. – Kodeks spół handlowych) (company law)

**Funds and platforms**

Act of 27 May 2004 on Investment Funds and Alternative Investment Funds Management (Ustawa z dnia 27 maja 2004 r. o funduszach inwestycyjnych i zarzdzaniu alternatywnymi funduszami inwestycyjnymi) (general investment funds law)

**Other key market legislation**

Act of 10 June 2016 on Bank Guarantee Fund, Guaranteed Deposit Scheme and Mandatory Restructuring (Ustawa z dnia 10 czerwca 2016 r. o Bankowym Funduszu Gwarancyjnym, systemie gwarantowania depozytów i przymusowej restrukturyzacji) (guaranteed deposit scheme)

Bank Recovery and Resolution Directive (2014/59/EU) (recovery and resolution)

Capital Requirements Regulation (Regulation (EU) 575/2013) (capital requirements)

European Market Infrastructure Regulation (Regulation (EU) 648/2012) (derivatives)

Market Abuse Regulation (Regulation (EU) 596/2014) (market abuse)

REGULATION (EU) 2019/452 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 19 March 2019 establishing a framework for the screening of foreign direct investments into the Union (the screening of investments from non-EU countries (foreign direct investment) that may affect security or public order).

*Last modified 6 Dec 2019*

**Regulatory authorization**
Who are the regulators?

The Polish Financial Supervision Authority (Komisja Nadzoru Finansowego) supervises financial markets, including banking, capital markets, insurance market, pension market, financial conglomerates, electronic money institutions, payment institutions and payment service bureaus, as well as cooperative savings and credit unions.

The Polish Financial Supervision Authority carries out the licensing, regulatory, control and disciplinary function. The PFSA issues licenses for banks, cooperative banks, domestic payment institutions, insurance and reinsurance undertakings, open pension funds, investment funds or investment companies. The PFSA may impose financial penalties provided for by the law and withdraw license held by a financial institution. It may also issue individual recommendations for a specific entity or recommendations or guidelines aimed to affect the entire financial market sector. The PFSA analyses reports submitted by financial institutions on running basis and assesses whether they satisfy legally defined capital requirements. The scope of competence of the PFSA also includes carrying out control procedures in supervised entities.

Last modified 6 Dec 2019

What are the authorization requirements and process?

In relation to performing banking activities, the PFSA has to be informed by the competent supervisory authorities of a home Member State about the types of operations to be performed by a credit institution.

Brokerage activities may be commenced by a foreign investment firm in Poland after the PFSA has been notified by the competent supervisory authority that has granted the investment firm license to perform brokerage activities, of the planned commencement of such activities.

EU payment institution or EMI (electronic money institutions) may commence cross-border activities in Poland after the PFSA has been informed by the competent supervisory authorities of a home Member State about a name, a registered seat, an address and types of payment services to be performed by such institution.

A firm must apply to the Polish Financial Supervision Authority for the relevant type of regulatory authorization.

The application fee depends on the type of application and ranges from PLN600 (approx. €140) to PLN13,000 (approx. €3,000). The application fee for the authorization of banking activity is equal to 1% of the share capital of the bank.

Authorized firms and individuals are listed in registers maintained by the Polish Financial Supervision Authority (eg register of investment firms or register of foreign investment funds).

Last modified 6 Dec 2019

What are the main ongoing compliance requirements?

Threshold conditions (such as having adequate financial resources and compliance arrangements in place) are an ongoing compliance requirement for authorized firms.

Failure to comply with the threshold conditions and more detailed regulatory rules can result in sanctions being imposed on firms and regulated individuals, as well as the loss of regulated status.

Last modified 6 Dec 2019

What are the penalties for failure to be authorized?

In principle, a person who performs a regulated activity without being authorized, or without having an exemption from the duty to be authorized, commits a criminal offence and may be fined or imprisoned.

Last modified 6 Dec 2019

Regulated activities
What finance and investment activities require authorization?

Generally

A person must not carry on a regulated activity in Poland unless authorized or exempt from the duty of authorization (known as the general prohibition).

Regulated finance and investment activities include:

- banking;
- insurance;
- payment services;
- securities brokerage and trading;
- investment funds; and
- pension funds.

Consumer credit

Consumer credit activities are subject to certain statutory requirements in Poland. Loan companies which are not banks or credit institutions are not required to be authorized in order to grant consumer credits. However, it is a prerequisite for such loan companies and for loan intermediaries to obtain an entry in the register of loan institutions or, respectively, the register of loan intermediaries maintained by the Polish Financial Supervision Authority.

According to the Act of 12 May 2011 on Consumer Credit, a consumer loan is a loan granted to a consumer which is not exceeding PLN255,550 (approx. €59,000).

Are there any possible exemptions?

There are two types of exclusions permitting the performance of regulated activities without authorization:

General exclusions

Certain persons may carry on a regulated activity without being authorized, for instance EU-based payment institutions do not require authorization to conduct business activity within the scope of authorization granted by their domestic regulator.

Specific exclusions

For each type of regulated activity there are a number of specific exemptions that could also apply, for instance banks may conduct certain securities trading activities without securities trader license.

Do any exchange controls or other restrictions on payments apply?

Foreign exchange regulations are included in the Act of 27 July 2002 – Foreign Exchange Law and secondary legislations issued on the basis thereof.

There are certain restrictions on payments that apply in the case of non-Bilateral Investment Treaties (non-BIT) countries or countries that do not have agreements on partnership and cooperation, association agreements or other similar agreements, which would oblige Poland to enable the free flow of capital.
In addition:

- Importing or exporting domestic or foreign currency must be declared in writing to customs officials if the value of the currency exceeds the equivalent of €10,000 (this restriction does not apply in the Schengen area). Customs officials can also demand the presentation of imported or exported currency regardless of its value.

- International money transfers and domestic settlements relating to foreign exchange dealings shall be made with the intermediation of authorized banks or payment institutions or electronic money institutions authorized to provide payment services. In the case of making settlements within the country, they may also use payment services bureaus if the amount of transfer or settlement exceeds the equivalent of €15,000. This obligation does not apply to cases in which a party to the settlement is an authorized bank, a domestic payment institution, a branch of a EU payment institution, a domestic electronic money institution, or a branch of an EU electronic money institution.

Compliance with EU rules on payments (EU Payments Regulation and the Transfer of Funds Regulations) must be ensured.

Anti-money laundering and tax considerations may also need to be taken into account.

**What are the rules around financial promotions?**

A financial promotion is a communication of an invitation or inducement to engage in investment activity made by a person in the course of business. Only authorized persons are allowed to offer investment products and advise on engagement in investment activities.

It is a criminal offence for an unauthorized person to communicate a financial promotion.

**Exemptions**

Exemptions include intra-group financial promotions or free-of-charge financial advice given in the ordinary course of business.

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

**Generally**

The most common types of legal entities are limited companies and limited partnerships.

Limited companies take the form of limited liability companies and joint-stock companies, both of which are corporate bodies with separate legal personality.

Joint-stock companies can be either private or public, depending on whether their shares are offered to the public.

Limited partnerships are similar to limited companies in many ways, with the main difference being that they are formed by partners whose relationship is governed by a private agreement rather than having shareholders and directors.

**Funds**

Investment funds are legal persons which may take the form of open-ended investment funds, special open-ended investment funds, or closed-ended investment funds. Alternative investment companies (Alternatywna Spółka Inwestycyjna) may take the form of limited companies or limited partnerships, provided that the sole general partner is a limited company.

Fund managers (Towarzystwa Funduszy Inwestycyjnych) take the form of joint-stock companies.
Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

A foreign company can conduct lending or investment business in Poland through a branch office (oddzia), but this does not create a separate legal entity.

The branch office's scope of activity must be exactly the same as that of the foreign company's.

Opening a branch office through which a regulated activity will be carried out requires regulatory authorization, as in the case of a branch office of a bank. A credit institution with its registered office in the EU is exempted from this requirement and may start operating through a branch office or on cross-border basis following a notification to the Polish Financial Supervision Authority.

Another possibility for a financial institution to conduct business in Poland involves setting up a representative office (przedstawicielstwo). As with a branch office, a representative office is not a separate legal entity. However, the only activities that may be carried out by a representative office are the promotion and marketing of a foreign company.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- consumer loans;
- student lending products; and
- small and medium-sized enterprises (SME) lending.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P) type structures often operated through an electronic platform provider as well as crowdfunding and also direct to retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

Blockchain, smart contracts and cryptocurrencies
WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a 'proof of work' process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open ('permissionless' or 'unpermissioned') or structured within a private group ('permissioned'). Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that, once authorized can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an 'address'). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

In Poland, a Polish accelerator of blockchain technology is working on the potential use of blockchain to support sectors such as:

- public administration (controlling the circulation of documents, digital identity and traceability of public assets);
- the health service; and
- the oil and gas sector.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called 'smart contracts'. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called 'Oracles'. With Oracles the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

Smart contracts have not been formally classified as a manner of executing an agreement and therefore they are not regulated under Polish law. However, a declaration of will which constitutes an agreement may be expressed by any behavior which manifests the intent of a party to the agreement in a sufficient manner, including a disclosure of such intent by electronic means. Accordingly, agreements executed based on smart contracts technology are allowed, as long as they clearly demonstrate the intent of the parties.

It should be noted that certain types of agreements need to be entered into in a specific form (for instance in a written form or in a form
of a notarial deed). In such a case, application of smart contracts technology will not be possible.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

**WHAT IS A CRYPTOocurrency?**

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency). A Polish cryptocurrency – polcoin (PLC) – was created in 2004.

**Initial coin offerings and token-based products**

**WHAT IS AN INITIAL COIN OFFERING (ICO)?**

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

**Artificial intelligence and robo advisory systems**

Automated financial advice tools, also known as 'robo advisors' are software tools driven by artificial intelligence (AI) that provide a variety
of investment advice services from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

The cloud computing market is developing rapidly in Poland.

Last modified 6 Dec 2019

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

Due to the variety of products and legal constructions used in the FinTech industry, there is no one legal act in Polish law that comprehensively regulates this area. Depending on the specific product, the main pieces of legislation that need to be taken into consideration are:

- the Payment Services Act, which constitutes the legal framework for all types of payment services, including the issuance of payment instruments, e-money, and payment transactions;
- the Civil Code, which constitutes the main source of regulations referring to contracts in general, but also to certain specific agreements (eg loan agreements) – it also covers consumer law issues;
- the Consumer Credit Act, relevant for credit facilities and loans granted to consumers;
- the Consumer Rights Act, relevant if services are provided to consumers remotely;
- the Act on Anti-Money Laundering and Combatting the Financing of Terrorism; and
- the Foreign Currencies Act, which should be taken into account where currency conversion is involved in a given service.

Other pieces of legislation that may be of importance to providers of FinTech products include the Act on Personal Data Protection, the Act on the Provision of Services Online and the Act on Trade in Financial Instruments.

Furthermore, as FinTech products may be offered by regulated entities, certain legislation regarding the provision of services by such entities should also be taken into consideration, eg the Banking Law, the Act on Insurance and Reinsurance Activity, and the Act on Investment Funds and Alternative Investment Funds Management.

The recommendations of the Polish Financial Supervision Authority (Komisia Nadzoru Finansowego) constitute an important soft law complement to Polish legal regulations and in many cases will be applicable to the providers of FinTech products.

Electronic payments platforms and regulation of peer-to-peer lenders

Electronic payment platforms

The main piece of legislation that regulates electronic payment platforms is the Payment Services Act. The act lays down rules governing the provision of payment services, including the acquisition of payments carried out over the Internet using electronic payment platforms. The scope of the act encompasses:

- the conditions for the provision of payment services, in particular regarding the transparency of contractual provisions and
information obligations with respect to the payment services;

- the rights and obligations of the parties resulting from the contracts on performance of payment services as well as the liability of providers of payment services;
- the principles governing the operation of payment institutions; and
- the basis of operation of the market of domestic payment transactions via payment cards and payment schemes.

PEER-TO-PEER LENDERS

Despite the fact that peer-to-peer lending systems exist in Poland, no specific legal regulations covering this type of business have been implemented. Accordingly, provisions of the Civil Code relating to loan agreement and contracts in general will be applicable to these types of services.

Regulation of payment services

The Payment Services Act is also the main piece of legislation regulating the provision of payment services. As noted above the provisions of the act include:

- the conditions for the provision of payment services, in particular regarding the transparency of contractual provisions and information obligations with respect to the payment services;
- the rights and obligations of the parties resulting from the contracts on performance of payment services as well as the liability of providers of payment services;
- the principles governing the operation of payment institutions; and
- the basis of operation of the market of domestic payment transactions via payment cards and payment schemes.

It should also be mentioned that a draft amendment to the Payment Services Act is currently in the legislative process. It is aimed at implementing Directive (EU) 2015/2366 (the Second Payment Services Directive). The purpose of the Second Payment Services Directive is to create uniform legal provisions in European Union member states concerning:

- reinforcement of consumer rights in the payment services area;
- reinforcement of the supervisory role of the European Banking Authority;
- promotion of the newest mobile and internet payment services; and
- enhancement of the security of payment services.

In addition, the role of Regulation (EU) 2015/751 of the European Parliament and of the Council of 29 April 2015 on interchange fees for card-based payment transactions should also be mentioned. Together with the Second Payment Services Directive, it includes provisions that limit fees in relation to consumer credit and debit cards and it also forbids retailers from imposing extra charges for the use of cards.

Application of data protection and consumer laws

The REGULATION (EU) 2016/679 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC (General Data Protection Regulation) and Act on the Protection of Personal Data of 10 May 2018 is the generally applicable act in Poland, which has to be observed by FinTech businesses. It regulates the principles of data processing, the security of personal data, the registration of data files, and the transfer of personal data to a third country.

The Consumer Rights Act of 30 May 2014 regulates the obligations of the trader when contracting with the consumer, the procedure for the consumer to exercise his/her consumer rights, and the rules for concluding remote contracts with consumers (e-commerce).

The Consumer Credit Act of 12 May 2011 includes regulations and procedures for concluding consumer loan agreements, the lender’s and credit intermediary’s obligations in relation to pre-contractual information and the obligations of the consumer, lender and credit intermediary in connection with the executed consumer loan agreement as well as the sanctions for the failure to meet the lender’s obligations.
The Polish Civil Code includes general principles for executing agreements with consumers, which are also applicable to FinTech businesses.

**Money laundering regulations**

The money laundering regulations which are applicable to FinTech businesses are included in the Act on Anti-Money Laundering and Counter Terrorism Financing; it lays down principles and procedures for counteracting money laundering and the financing of terrorism. It provides for the application of specific restrictive measures against natural and legal persons, as well as the obligations of entities involved in financial transactions connected to the collection and transmission of information related to such transactions.

Last modified 6 Dec 2019

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**

The FinTech industry is developing very well in Poland; however, some barriers still remain. Polish law does not include specific provisions which would facilitate provision of FinTech services or development of FinTech businesses at the early stage of their operation. Moreover, there remain certain difficulties in obtaining financing of FinTech startups.

**SEED INVESTMENT**

Seed investment is mostly used in the establishment of and early investments in a business. The vast majority of Polish FinTech startups indicate that the main source of funding at the early stage of their business activity comes from their founders' budget.

So-called business angels are an increasingly popular solution to finance FinTech startups. A business angel is a person who has his/her own capital and who wants to use it to finance new companies and new ideas. In exchange for their capital, business angels receive a minority stake in the company. In Poland there are a number of associations of business angels, including Lewiatan Business Angels or the Network of the Business Angels, ‘Amber’. Many FinTech startups cooperate with these associations.

**CROWDFUNDING**

Crowdfunding is a type of social financing and is one of the most popular solutions to finance startups in Poland. There are many crowdfunding platforms which provide an opportunity to present new projects and raise funds, including beesfund.com, odpalprojekt.pl, findfunds.pl.

**ACCELERATORS**

In Poland there are many incubators or accelerators that offer financial support for startups. The most popular is the ‘Start in Poland’ program, financed by European Union funds, which offers PLN 3 billion for initial investments in startups. The program is under the auspices of the Polish Ministry of Development.

**Venture capital and debt**

The financing of FinTech startups by venture capital funds, being investment funds that acquire private equity stakes in such startups using the money of investors (mainly Polish banks) is one of the most important sources of financing for FinTech startups in Poland. It should be noted however that it is targeted primarily at early-stage FinTech businesses.

**Warehouse and platform funding**

At this time there are no public examples of Polish FinTech companies using warehouse or platform funding as a source of financing for the purpose of developing their business.

**Senior bank debt and capital markets funding**

**SENIOR BANK DEBT FUNDING**

As a general rule, senior bank debt is available to FinTech businesses. In practice however, at the early stage of their activity, obtaining
senior debt funding may prove to be difficult. It stems from the high risk encumbering FinTech startups as well as lack of property which might secure the repayment of credit facility or loan.

CAPITAL MARKETS FUNDING

Raising funds through the capital markets, in particular listing shares on the Warsaw Stock Exchange, is available to FinTech businesses. In practice, only companies that are well established in the Polish market (such as eCard S.A.) have been able to raise capital via this method of funding.

Incentives and reliefs

The FinTech market in Poland is developing rapidly, but at the same time the legal and financial regulations are not supportive of new developments. Moreover, the government is not providing sufficient support for startups, which is needed due to the risk-averse approach of investors and entrepreneurs. There are no special incentives or reliefs directed solely at FinTech startups.

However, in 2017 the so-called Small Act on Innovation came into force. The act introduces a new tax relief for startups connected with the research and development sector.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Buying and selling loans is very common in Poland.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are as follows:

- **assignment** – the transfer of rights only, not obligations (subject to any contractual or statutory restrictions, assignment can be done without the consent of the debtor); and

- **sub-participation** – the transfer of the economic interest in a loan without changing the legal relationship between the existing parties (sub-participation involves the buyer taking on a double credit risk, both on the seller as well as the borrower).

The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller’s legal advisors. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;

- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;

- **lender eligibility** – whether there are any restrictions concerning the type of entity to which the loan can be transferred;

- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall upon the transferee or reduce claims made by the transferee;

- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and
Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

Most of the energy and infrastructure assets are publicly owned by local government bodies, government bodies, or state-owned companies.

Key sectors are considered below.

Energy

The gas and electricity industries in Poland are generally run by state-owned companies. Most of the generation, distribution and supply services are provided by six main companies, the biggest five of which are publicly listed but controlled by the State Treasury. All transmission assets are state-owned and cannot be purchased by private investors.

The oil industry is mainly run by two publicly listed companies that are controlled by the State Treasury. In the field of selling oil to consumers there are many private companies, including international groups.

The Energy Regulatory Office is the principal body with responsibility for regulating the energy sector in Poland.

Other infrastructure

TELECOMS

Telecommunications networks in Poland are privately owned by a number of companies, including service providers.

Postal services are mainly run by the state-owned company Poczta Polska, but there are also private companies operating in this sector.

The Office of Electronic Communications is the regulator of the Polish post and telecommunications sectors.

RAIL

Typically, light rail assets (such as trams and associated track) are owned by local public transport authorities. Certain elements of light rail projects may be outsourced to the private sector. Heavy rail infrastructure in Poland is mostly owned by the state-owned Polskie Koleje Pastwowe (PKP) Group. The exceptions are the railway electrification grid and railway sidings, which are owned by private entities.

The rail sector is regulated by the Office of Rail Transport.

ROADS

Roads, bridges and tunnels are owned by the state or by local authorities. The public sector may outsource the construction, operation and maintenance of some assets to the private sector.

Some motorways are privately owned and their functioning is heavily regulated.

AVIATION

The main aviation infrastructure in Poland is mostly indirectly owned by the state or by local authorities. Services connected with the functioning of airports are partly provided by private entities. Air carriers are both state-owned and private. All aviation activities are heavily regulated. The Civil Aviation Authority is the aviation regulator in Poland.
PORTS

The main port infrastructure is mostly indirectly owned by the state or by local authorities. Additional infrastructure such as warehouses is also owned by private entities.

HOSPITALS

Most hospital infrastructure is owned by public bodies. Some hospitals are private and their activities are heavily regulated.

EDUCATION

Most schools are owned by local authorities, but there are also private schools. Higher education in Poland is generally provided by the state but there are many private entities.

WAREHOUSES

Warehouses are mostly owned by private entities and operate on a commercial basis.

DEFENSE

Typically, defense assets are owned by the Polish Armed Forces. Some manufacturers of defense-related products are state-owned and some are private.

WASTE

The waste sector (waste services and waste infrastructure) is indirectly owned by local authorities and by private companies.

WATER

Rivers are treated as public property, not as commercial goods, and are maintained by the state and local authorities. Water services (including sewerage), depending on the town, are provided by private sector companies or local authorities.

Are there special rules for investing in energy and infrastructure?

Generally

There is a specific regime governing and restricting investment in energy or infrastructure projects in Poland. In some cases, the relevant minister can block the buying or selling of some class of assets or companies on the grounds of an overriding public interest such as public security. Some companies that own infrastructure assets are also obligated to perform some activities connected with public security, such as preparing emergency plans.

Energy and infrastructure investments may be subject to legislative or regulatory control, such as merger control rules.

As regards the planning and implementation of the underlying energy or infrastructure project (in which an investment is to be made), the legal or regulatory position relevant to the project must be considered. For example, a project involving development on land will require planning permission or a development consent order. Additionally, a project may require environmental authorizations, permits and/or sector-specific regulatory consent decisions or licenses. Environmental impact assessments may also be required.

Energy

The energy market in Poland has a complex and heavily regulated system of arrangements between suppliers, generators, transmitters and distributors. In particular, there are complex arrangements in respect of licencing, subsidies, and demand/charging mechanisms with suppliers, customers and the grid operator. These are subject to change and regular updates, which means that investors need to have a good understanding of the current framework and the potential directions in which the market may move. Investors need to understand how changes in technology may impact the overarching regulatory framework and vice versa.
Investors should also consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with any license conditions or the granting of specific subsidies. In particular, if a breach of those conditions could lead to the revocation of a license that might make the potential target less attractive or viable. In Poland, unbundling and Third Party Access (TPA) principles are in force.

There are public policy mechanisms (adopted through legislation) which are used to incentivize investment in distribution and generation, especially in renewable energy sources.

**Other infrastructure**

There are specific sectoral provisions concerning other infrastructure. The relevant provisions depend on the specific project.

Telecommunications and transport infrastructure are especially heavily regulated, mostly by sectoral acts like the Telecommunications Law and the Rail Transport Act. For example, there is a complex regulatory environment in the telecommunications sector including issues such as access and interconnectors. The industry is largely in private hands, therefore investors should consider if any permits, consent decisions or licenses will be affected by their interest. The rail sector also has an extensive and complex regulatory framework with respect to practical and operational issues. Key areas include certification for train use and fare regulation. Depending on how an investor wishes to invest in a project (specifically, what type of entity or asset), there is a varying degree of difficulty in entering into an existing project.

**What is the applicable procurement process?**

Public procurement in Poland is, for the time being, in most instances governed by the Public Procurement Law Act, which is based on EU Directives.

The key principles are that contracts procured by the public sector must be awarded fairly, transparently and without discrimination on the grounds of nationality, and that all potential bidders must be treated equally.

**Investing in energy and infrastructure**

Public procurement is relevant where the Polish government, or a branch thereof, is seeking to outsource the delivery of a new project. On an infrastructure project, a potential investor would have to bid on its own or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance, and financing of the relevant energy or infrastructure asset. The relevant procurement legislation applies to certain public bodies, including central government departments, local authorities, the police and fire authorities, and the National Health Fund. A regulated procurement is required where certain financial thresholds are met. On most major infrastructure projects (where limited exclusions do not apply), it is likely that those thresholds will be met, therefore a regulated procurement would be necessary.

In most cases, the public sector will need to publish a contract notice in the Office Journal of the European Union (OJEU) and typically run one of the following procedures:

- **Open procedure** – This is suitable for easy-to-evaluate projects and bidders simply submit an offer in response to the OJEU notice. Changes to the tender and negotiations are not permitted.

- **Restricted procedure** – There is a shortlisting of at least five bidders following an expression of interest stage and then the bidders submit their offers. Again, no negotiation is permitted (other than to clarify and finalize the contract terms).

- **Competitive dialogue** – This is the most common procedure for complex infrastructure projects and involves a shortlisting of at least three bidders who are invited to enter dialogue with the public sector contracting party to develop detailed solutions which are acceptable for the public sector. Clarifications and further negotiations are allowed following the final tender, but only to confirm the financial and other commitments in a bidder’s offer.

- **Competitive procedure with negotiation** – This is sometimes described as a hybrid procedure because it allows dialogue with bidders but also allows the public sector contracting party to award a contract on the basis of an initial tender (or further stages), but clarifications and negotiations are not allowed after the final tender.

However, an investor may choose to seek to invest in a project (by acquiring an interest in a private sector partner) that has already been procured and is already operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly
procured projects) within the original awarded contract rather than by procurement regulations themselves.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement-related considerations that need to be borne in mind.

Financing energy and infrastructure

On a publicly procured contract, the public sector contracting party may have prescribed requirements concerning the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector contracting party.

Last modified 6 Dec 2019

What are the most common forms of funding / investing in energy and infrastructure?

The principal forms of private sector funding/investment in energy and infrastructure in Poland (including in relation to public-private partnerships) are as follows.

Funding

Common forms of funding in energy and infrastructure include:

- loans made on a corporate finance basis (balance sheet debt);
- loans made on a project-finance basis (to a special purpose project company) on medium- to long-term bases – such loans may later be syndicated to other funders;
- bond finance;
- mezzanine debt (in some sectors);
- refinancing of the debt in operational projects; and
- asset financing (this is particular relevant in the rail sector).

Funding/funding products can also, sometimes, be provided by the European Investment Bank and export credit agencies.

Investing

Common forms of investing in energy and infrastructure include:

- ‘equity’ investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of ‘equity’).

Last modified 6 Dec 2019

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

When the Polish Financial Supervision Authority considers that an authorized firm or regulated individual may have breached compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

Last modified 6 Dec 2019
What regulatory penalties may apply?

The Polish Financial Supervision Authority may, among others, impose a financial penalty or withdraw the regulated status of the firm and/or regulated individuals. The regulator will publicize these penalties.

Last modified 6 Dec 2019

What criminal penalties may apply?

Following a formal investigation, the regulators have the power to impose administrative and criminal sanctions for the following unlawful acts:

- insider dealing and misleading statements and practices;
- breaches of the Money Laundering Regulations; and
- conducting regulated activities when not authorized.

Last modified 6 Dec 2019

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

Grant (advance) of a loan

Yes, loan agreements (and amendments to such agreements, if they result in an increase of the principal) may be subject to the tax on civil law transactions (TCLT) at 0.5%. As a rule, loans granted by financial institutions and entities whose business activities are to provide finance are not subject to TCLT (as they are exempt from value added tax in relation to such transactions).

A loan agreement is subject to TCLT, if:

- the rights arising out of the loan agreement are exercised in the territory of Poland (where the loan is granted by a company not resident in Poland this condition is not fulfilled); or
- the rights arising out of the loan agreement are exercised outside of the territory of Poland but the borrower has its place of residence or registered office in Poland, and the loan agreement was executed in Poland.

Loans granted by a shareholder to a company (limited liability company or joint-stock company) are exempt from TCLT.

The TCLT obligation arises when the loan agreement is executed. Generally, the tax base is the amount or value of the loan (principal). If the principal is to be paid in tranches and the total amount of tranches is not known (eg because the agreement does not specify the total principal amount), the tax is due in relation to a given tranche once it is paid out. The borrower is obliged to calculate and pay TCLT within 14 days from executing the loan or receiving the tranche of the loan.

Transfer (assignment) of a loan

A transfer (assignment) of a loan may be subject to TCLT; where this is the case, the tax rate is 1%. The acquirer of the debt is liable to pay the TCLT.

There is no TCLT in the case of the subrogation of loans.
TCLT does not apply to the assignment of a loan agreement if at least one of the parties is subject to or exempt from value added tax in relation to the assignment.

**Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?**

There are court fees involved in the registration of registered pledges and mortgages in the relevant registers. Stamp duty is payable if the application to register a security is filed by an attorney-in-fact. Additional court fees are payable if any amendments to the registered pledges or mortgages are registered. In each case, the fees are not significant.

Notarial fees are involved when any security interest is executed in a form of notarial deed (eg mortgage) or with signatures certified by the notary (eg civil pledge over shares in a limited liability company) or with date certified by the notary (eg security assignment or security transfer of assets). In any case, the notarial fees are capped at PLN 10,000 (approx. €2,350).

The establishment of a mortgage is subject to TCLT. The tax rate is 0.1% of the amount of the secured debt if it is possible to determine the amount of such debt or PLN 19 (approximately €5), if the debt is of an amount which is not capable of being determined.

The TCLT obligation arises upon submission of a declaration on the establishment of a mortgage or conclusion of an agreement for the establishment of a mortgage. The tax base is the value of debt secured. The person submitting a declaration of intent concerning the establishment of a mortgage is liable to pay the TCLT.

**Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?**

Generally, this depends on the type of debt securities and entities involved.

As a rule, a sale agreement relating to shares and stocks in a Polish company is subject to TCLT, as these stocks and shares are considered as rights exercised in the territory of Poland.

Sales of bonds will be subject to TCLT if they constitute rights exercised in Poland or if the acquirer is resident in Poland and the transaction is concluded in Poland. Usually, it is accepted that bonds are exercised where the creditor (ie the seller) is resident, but bond documentation should be analyzed in this respect on a case-by-case basis.

The TCLT is calculated as 1% of the market value of the shares/stocks/bonds. The tax is to be paid by the acquirer.

The following sales are exempt from TCLT:

- sales to investment companies and foreign investment companies;
- sales via investment companies or foreign investment companies (eg brokerage houses);  
- sales as part of an organized trading; and
- sales outside organized trading by investment companies and foreign investment companies, if those rights were acquired by those companies under organized trading.

No stamp, registration, transfer or other similar taxes payable are payable on the issue of bonds.

**Do tax authorities take priority on enforcement?**

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

There is no general rule of priority entitling the tax authorities to take priority over secured lenders or secured debt security holders during enforcement proceedings. Any priority is determined on the basis of general rules provided by law. For example, in the case of a compulsory mortgage established in favor of the State Treasury and a mortgage securing the rights of secured bond holders, it is the relative position of the mortgages which determines which mortgage is executed in the first place and therefore takes priority. If the
mortgage securing the bonds was determined as the mortgage with first position, then this mortgage will be treated as executed before the compulsory mortgage of the State Treasury and will take priority.

Notwithstanding the above, in the case of bankruptcy of a debtor, the law distinguishes certain categories of liabilities that should be paid by the bankrupt entity in a given order. In this respect, liabilities owed to tax authorities may be privileged – that is they are paid just after liabilities owed to employees and before liabilities owed to other unsecured creditors.

**Is withholding tax on interest payments applicable?**

**Is there withholding tax on interest payments under a loan?**

In principle interest paid under a loan to an entity which is not resident in Poland is subject to withholding tax.

Payments of interest to entities resident in Poland (but not individuals) are not subject to withholding tax.

**If so:**

**What is the rate of withholding?**

The general withholding tax rate on interest paid to entities which are not resident in Poland is 20%.

**What are the key exemptions?**

Interest payments to entities not resident in Poland may be exempt from withholding tax under the EU Interest and Royalties Directive as implemented under Polish law, provided that certain conditions are met. The withholding tax rate may be also reduced or eliminated based on relevant double tax treaty (DTT) concluded between Poland and the recipient's country of residence under certain conditions. Under most DTTs the withholding tax rate is limited to 10% or 5%. Some DTTs provide for a 0% withholding tax rate. Moreover, a number of DTTs provide for exemption applicable to interest payable to banks.

However, the Polish withholding tax (WHT) regime has been substantially amended with the 2019 corporate income tax reform. Under the new rules, WHT becomes obligatory for certain cross-border payments (including interest). Even when a lower rate or an exemption is available, for example under a bilateral tax treaty entered into by Poland, the WHT has to be withheld in full by the withholding agent based on Polish domestic law and remitted to the relevant tax authority. The tax authority may provide a refund after it has verified the right of the non-resident taxpayer to benefit from a reduced rate or an exemption. There are also alternative procedures which may allow to mitigate WHT (a description of these procedures can be found here).

In principle, the changes affect cross-border payments exceeding PLN2 million annually paid to a non-resident taxpayer.

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes, the comments outlined above are applicable to interest payments under a debt security (like bond). However, with respect to new obligatory WHT, such WHT regime is excluded in case of receivables received by non-residents due to interest or discount on bonds issued by the State Treasury/BGK and offered on foreign markets.

**Are foreign lenders and debt security holders subject to tax on interest payments?**

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.
Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both Portuguese and EU law.

Unless certain exclusions or exemptions apply, the offering of debt securities to the public in Portugal and the request for admission to trade debt securities on a regulated market operating in Portugal requires disclosure to the public by way of an approved prospectus.

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Portugal are bonds, notes and commercial paper issued on a stand-alone basis or under a programme. Many different types of debt securities are offered in Portugal. Some common forms include:

- debt securities characterized by a fixed rate of interest plus the right to a supplementary interest rate or a reimbursement premium, either fixed or dependent on the profits of the issuer;
- debt securities with an interest rate and repayment plan dependent on profits;
- debt securities convertible into shares or other securities;
- debt securities giving the right to subscribe one or more shares;
- debt securities giving subordinated credit rights over the issuer;
- debt securities convertible into other credits of shareholders or third parties over the issuer;
- debt securities providing special guarantees over assets or profits of the issuer or a third party;
- debt securities issued at a premium;
- cash bonds;
- equity securities;
- mortgage securities; and
- perpetual securities.
What are the differences between offering debt securities to institutional/professional or other investors?

According to Portuguese law the offer of debt securities to qualified investors (credit institutions, investment firms, insurance firms, pension funds and managing firms etc.) is classified as a private offer. On the other hand, the offer of debt securities to an undetermined pool of investors is a public offer, provided the offer is not addressed to qualified investors only. Portuguese law only imposes requirements for disclosure by way of an approved prospectus for public offers.

When is it necessary to prepare a prospectus?

According to Portuguese law, unless an exemption applies, it is necessary to publish a prospectus where there is an offer of securities to the public or an application for securities to be admitted to trading on a regulated market.

An offer is deemed to have been made to the public if:

- it is made solely to an undetermined pool of investors or to the generality of the shareholders of a listed company, even if the share capital is represented by nominal shares;
- the offer is preceded or followed by a solicitation addressed to an undetermined pool of investors or general advertising promotion; or
- it is offered to more than 150 persons (other than qualified investors) per European Economic Area state.

If the offer is deemed not to be made to the public, a prospectus may still be required if an application is made for the securities to be admitted to trading on a regulated market. An exemption from both the offer to the public and the admission to trading on a regulated market is needed to avoid having to publish a prospectus.

What are the main exchanges available?

Regulated markets

The regulated markets in Portugal, for the purposes of the Markets in Financial Instruments Directive II (MiFID II) are:

- Euronext Lisbon (Sociedade Gestora de Mercados Regulamentados, S.A.);
- futures and options markets, managed by Euronext Lisbon (Sociedade Gestora de Mercados Regulamentados, S.A.); and
- OMIP Derivatives market, managed by OMIP - Operador do Mercado Ibérico de Energia.

These markets are subject to the requirements of several EU directives, including the Market Abuse Directive and the Transparency Directive.

Multilateral trading facilities

In Portugal there are the following multilateral trading facilities:

- Euronext Lisbon (Sociedade Gestora de Mercados Regulamentados, S.A.); and
- Alternext, managed by Euronext Lisbon (Sociedade Gestora de Mercados Regulamentados, S.A.).

Is there a private placement market?

Portugal has an active private placement market.
There is no dominant standard for documentation but it is usual to adopt internationally accepted models.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to administrative liability under Portuguese law and additional public sanctions.

Investing in debt securities

Debt security terms and conditions typically contain provisions which allow for modification without the consent of all investors and without regard to the individual interests of particular investors. The conditions also provide for meetings of investors to consider matters affecting the investors. These provisions typically allow defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally

The establishment of investment funds and commercialization of investment funds' units is supervised by the Portuguese Securities Market Commission and the Bank of Portugal, under the terms of the Legal Regime on Undertakings for Collective Investment in Transferable Securities.

Funds are one form of collective investment undertaking (which may be structured as a public limited company which are subject to further regulation). The conditional documents and proposed activities of funds require prior authorization from the Portuguese Securities Market Commission.

Collective investment schemes

In Portugal, there are two types of collective investment schemes.

INVESTMENT COMPANIES (SOCIEDADES DE INVESTIMENTO)

Investment companies are typically structured as public limited companies and are generally governed by the Commercial Companies Code and the Legal Regime on Undertakings for Collective Investment in Transferable Securities (except for certain activities that may conflict with typical activities of a collective investment scheme such as mergers, demergers or transformation regimes). Investment companies may be self-managed.

INVESTMENT FUNDS

Investment funds consist of an autonomous pool of assets. They do not have any legal personality and must be managed by a management entity. Investments funds are comprised of participation units and governed by the Legal Regime on Undertakings for Collective Investment in Transferable Securities. Unlike investment companies, investments funds may not be self-managed.

What are common fund structures?
Funds may be established as open-ended funds (with a variable number of units that may be redeemed at any time at the request of the unit holder) or closed-ended funds (with a fixed number of units).

There is a prescribed list of types of investment funds. The qualification of each fund is determined by the type of assets the fund holds, management of the fund and the characteristics of the units comprising the fund. Examples of funds include money-market funds which invest in money-market instruments and guaranteed funds in which an investor’s income is guaranteed.

What are the differences between offering fund securities to professional / institutional or other investors?

An offer of fund securities to qualified investors such as credit institutions, investment firms, insurance firms, pension funds and fund managers is considered a private offer. Conversely, an offer of fund securities to undetermined investors is considered a public offer, provided the offer is not addressed to qualified investors. Disclosure of an approved prospectus is only required for public offers.

Are there any other notable risks or issues around establishing and investing in funds?

There are no other notable risks or issues to reference here for the purposes of this site. Possible additional risks would better be assessed on a case by case basis.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

An offer of securities is generally governed by the Securities Act and Legal Regime on Undertakings for Collective Investment in Transferable Securities.

Under the Securities Act, a firm is considered to market securities when an offer of securities:

- is directed at undetermined addressees;
- is preceded or accompanied by the gathering of investment intentions of undetermined addressees or marketing campaigns;
- is directed at a minimum of 150 investors; or
- is not exclusively directed to qualified investors.

Four types of entity are permitted to market funds:

- management entities;
- depositaries;
- financial intermediaries registered or authorized by the Portuguese Securities Market Commission to conduct the relevant activities, the placement, reception and transmission of orders on behalf of third parties; and
- other entities as authorized by Portuguese Securities Market Commission regulations.

Foreign funds may also be marketed in Portugal if duly authorized. Management entities authorized by another EU member state and which are subject to regulation by the relevant authority of that member state may, in principle, freely market funds under the principle of the free movement of services. Management entities not authorized by a EU member state are subject to a previous tight authorization process from Portuguese Securities Market Commission to market funds in Portugal.
Are there any restrictions on managing a fund?

Investment fund managing companies are considered financial intermediaries under the Securities Act. They must be registered with the Portuguese Securities Market Commission and are subject to rules regarding financial intermediaries.

Apart from self-managed funds (which is a possible management structure for investment companies):

- open-ended funds must be managed by investment fund managing companies (sociedades gestoras de fundos de investimento); and
- closed-ended funds must be managed by investment fund managing companies or certain credit institutions.

Investment fund managing companies must have a minimum share capital of EUR1250,000 and comply with the legal requirements governing their own funds. Credit and financial institutions that want to manage a closed-ended investment fund must hold at least €7.5 million in own funds.

Foreign management companies authorized by another EU member state and which are subject to supervision by the regulator of another member state may, in principle, freely operate in Portugal under the principle of the freedom of movement of services.

Foreign management companies from non-EU member states that wish to manage investment funds in Portugal must apply for prior authorization from Portuguese Securities Market Commission.

Investment fund managing companies are prohibited from conducting certain types of activity such as granting loans and credit, including granting guarantees, on their own account.

All investment fund management companies must act exclusively in their investors' best interests and, observe the principle of risk sharing and act according to high standards of professional competence and special diligence.

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

Derivatives may be traded over the counter or on an organized exchange.

Derivatives traded on an organized market are regulated according to general contractual clauses imposed by the respective fund managers. However, such contractual clauses must be subject to prior communication to the Portuguese Securities Market Commission and the prior approval of Bank of Portugal if the underlying asset of the transaction is an instrument of the money markets or foreign exchange market.

Last modified 6 Dec 2019

What are common types of derivatives?

The main types of derivatives traded in Portugal are:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps);
- options (call options and put options);
- credit derivatives;
- contracts for differences; and
- caps, floors and collars.
The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying asset seen in Portugal are:

- transferable securities;
- monetary instruments (eg savings certificates, commercial paper and cash bonds);
- interest rates (eg Euribor, Libor, Ester – applicable in 2020);
- foreign currency (eg euro/dollar and dollar/yen);
- financial ratios (eg PSI 20 and S&P 500);
- economic factors (eg inflation rates, unemployment rates and national product); and
- other derivatives.

**Are there any other notable risks or issues around entering into derivatives contracts?**

Since the global financial crisis in 2007-to-2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. The European Commission has sought in particular to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative position;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen and continues to see the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

Portuguese courts have reviewed several cases relating to derivatives since the financial crisis of 2007-to-2008. In general, Portuguese courts tend to uphold these types of agreements. However, where derivatives are traded with non-qualified investors, certain issues should be considered carefully, namely the provision of pre-contractual information, contracts subject to foreign law and usage of standard form documentation as these are issues that are considered by the courts in order to nullify or uphold such agreements.

**Debt finance**

**Lending and borrowing**

**Are there any restrictions on lending and borrowing?**

**Lending**

Under Portuguese law, home mortgage loans and consumer lending are regulated activities. Only credit institutions and financial companies can carry out such credit operations and therefore the lender (credit institution or financial company) will need to be authorized by the Bank of Portugal to conduct such business.

Home mortgage loans are subject to specific rules (eg early repayment rules). Credit institutions have the obligation to inform consumers about the calculation of the effective interest rate (TAE), any promotional conditions and early repayment conditions.

Regulated credit agreements are subject to specific requirements regarding the terms of the agreement. Prior to the execution of a regulated credit agreement, the lender must assess the solvency of the consumer borrower.

**Borrowing**
While borrowers are generally not regulated, it is advisable for borrowers to consider whether either the mortgage or consumer lending regimes apply to them, as they may benefit from the protections mentioned above.

Last modified 6 Dec 2019

**What are common lending structures?**

Lending in Portugal can be structured in several different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents and trustees which fulfill certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicates taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities.

**Loan durations**

The duration of a loan also varies between:

- a short-term loan, with a maturity date not exceeding one year;
- a medium-term loan with a maturity date exceeding one year but not exceeding five years; or
- a long-term loan, with a maturity date exceeding five years.

**Loan security**

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

**Loan commitment**

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

A breach of a loan commitment will only create a contractual liability by the breaching party, which gives the innocent party the right to call for a contractual remedy or to be indemnified.

**Loan repayment**

A loan can also be repayable upon demand, on an amortizing basis (in installments during the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

Last modified 6 Dec 2019

**What are the differences between lending to institutional / professional or other borrowers?**

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

By contrast, lending in the context of mortgages and to consumers is a regulated activity. For more information, see Lending and...
Do the laws recognize the principles of agency and trusts?

Portuguese law recognizes the principles under which one person or entity may act on behalf of another as attorney.

The Portuguese legal system does not recognize the concept of a trust.

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual principles. However, it is important to note that interest rates are capped by law and therefore, loans provided to institutional/professional entities are subject to the limit established for commercial interest rates which is updated every six months and is currently set at 7%.

The Legal Regime on Credit Agreements for Consumers establishes a number of requirements on lenders when dealing with consumers, including the need to:

- conduct affordability tests before lending; and
- provide standard information about a mortgage to enable borrowers to compare products.

Standard form documentation

Bilateral finance transactions are more likely to be documented on bank standard form documentation prepared in-house but which usually tend to follow the form of the Loan Market Association (LMA) adapted to Portuguese standards and legal requirements.

Are there any other notable risks or issues around borrowing?

Borrowers should be aware of the potential implications of the Banking Act, which outlines certain measures for dealing with failing financial institutions.

The Banking Act gives the Bank of Portugal the power to ‘bail in’ obligations of failed Portuguese financial institutions. ‘Bail in’ describes a variety of write-down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of Portuguese contracts, such powers override what the parties have agreed at a contractual level.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the giving of guarantees and security are as follows.

Capacity

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors’ powers that would be preventative. Under Portuguese law, directors have a general duty to promote the success of the company for the benefit of its members as whole; as such, they will need to be able to show
that adequate corporate benefit is derived from the company giving the guarantee or security. This is often more difficult in the case of upstream or cross-stream guarantees or security provided by a subsidiary to its parent or sister company. The safe approach is often to have the members of the company approve the giving of the guarantee or security by resolution.

**Insolvency**

Guarantees and security with a determined term prior to the onset of insolvency may be at risk of being set aside under Portuguese insolvency laws. Guarantees and security might also be challenged on other grounds relating to insolvency.

**Purchase of own shares**

It is unlawful for a public company to grant loans or issue guarantees or to provide financial assistance for the purchase of its own shares (however the law expressly provides for limited exceptions).

Last modified 6 Dec 2019

**What are common types of guarantees and security?**

**Common forms of guarantees**

Guarantees can take different forms, as follows.

**PERFORMANCE GUARANTEE**

A third party (guarantor) personally undertakes the obligation of the debtor if the debtor fails to fulfill its obligations.

**PROMISSORY NOTE (FIANÇA)**

The guarantor promises in writing to pay a determinate sum of money to the creditor if the debtor fails to fulfill its obligations.

**Common forms of security**

There are two basic types of security interest that can be created under Portuguese law:

- a pledge; and
- a mortgage.

Different types of security are suitable for securing different types of assets (eg, financial pledge and a fiduciary alienation/transfer of collateral).

Last modified 6 Dec 2019

**Are there any other notable risks or issues around giving and taking guarantees and security?**

**Giving or taking guarantees**

Depending on the type of guarantee provided, specific requirements may apply. For instance, personal guarantees (fiança) need to be in writing and signed by the guarantor and the obligation guaranteed must be determined or determinable.

**Giving or taking security**

A security document may need to be executed as a deed if it contains a mortgage over land or other assets subject to registration (eg, cars, airplanes and boats).

There are no notarization requirements for security documents under Portuguese law.
Like guarantees, security granted during a period of time prior to the onset of insolvency may be at risk of being set aside under Portuguese insolvency laws and may also be challenged on other grounds relating to insolvency.

Last modified 6 Dec 2019

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Banking Act (Regime Geral das Instituições de Crédito e Sociedades Financeiras) (establishes the general regulatory framework for banks and other financial entities)

Legal Regime on Payment Institutions and Electronic Currency (DL n.º 91/2018, de 12 de novembro) (regulates the activity of payment institutions and the provision of payment services)

Securities Act (Código dos Valores Mobiliários) (establishes the general legal framework applicable to securities and to the activity of financial intermediation)

Legal Regime on the Taking-Up and Pursuit of the Business of Insurance and Reinsurance (Lei 147/2015, de 9 de setembro) (regulates access to the insurance and reinsurance business, the procedures applicable to special crimes involving the insurance sector and pension funds, as well as the administrative offences supervised by the Portuguese insurance authority Autoridade de Supervisão de Seguros e Fundos de Pensões (ASF))

Legal Regime on the Taking-Up and Pursuit of the Activity on Insurance and Reinsurance Mediation (DL n.º 144/2006, de 31 de julho) (regulates the regime applicable to insurance and reinsurance brokerage activities in the EU territory, by natural or legal persons resident or having their registered office in Portugal)

Legal Regime on Insurance Contracts (DL n.º 72/2008, de 16 de abril) (that sets out the legal framework applicable to insurance contracts)

Consumer credit

Mortgages

Legal Regime on Housing Credit (DL n.º 74-A/2017, de 23 de junho) approves the legal framework of housing credit agreements and sets out the applicable rules for consumer credit when secured by mortgage or by other types of security over real estate – partially transposes Directive 2014/17/UE relating to housing consumer credit)

Legal Regime on Mortgage Obligations and Mortgage Credit Institutions (DL n.º 59/2006, de 20 de março) (sets out the legal regime on mortgage obligations and mortgage credit institutions)

Corporations

Companies Act (Código das Sociedades Comerciais) (establishes the general legal framework applicable to the incorporation and organization of commercial companies)

Funds and platforms

Legal Regime on Undertakings for Collective Investment in Transferable Securities (Lei n.º 16/2015, de 24 de fevereiro) (partially transposes
European Directives 2011/61/EU and 2013/14/EU on collective investment undertakings and establishes framework applicable to collective investment undertakings

Legal Regime on the Setting Up and Operation of Pension Funds and Managing Entities of Pension Funds (DL n.º 12/2006, de 20 de janeiro) (regulates the setting up and operation of pension funds and the managing entities of pension funds)

Other key market legislation

Legal Regime on Prevention of Money Laundering and Terrorism Financing (Lei n.º 83/2017, de 18 de agosto)

Legal Regime on the Central Register of the Beneficial Owner (Lei n.º 89/2017, de 21 de agosto)

Bank Recovery and Resolution Directive (2014/59/EU) (recovery and resolution)

Capital Requirements Regulation (Regulation (EU) 575/2013) (capital requirements)

European Market Infrastructure Regulation (Regulation (EU) 648/2012) (derivatives)

Market Abuse Regulation (Regulation (EU) 596/2014) (market abuse)

Markets in Financial Instruments Regulation – MiFIR- (Regulation (EU) No 600/2014) (financial instruments)

Legal Regime on Securitisation (Lei n.º 69/2019, de 21 de agosto)

Regulatory authorization

Who are the regulators?

The Bank of Portugal is responsible, among other functions, for ensuring the stability of the national financial system. To this end, it performs its functions as lender of last resort and the national macro-prudential authority. The Bank of Portugal also enacts general regulations and specific recommendations applicable to entities subject to its supervision. It also has powers to conduct investigations and apply penalties for infringement.

The Portuguese Securities Market Commission “CMVM” oversees the securities and derivatives market and is responsible for the supervision of investment services activities (known as conduct of business supervision) and the establishment of investment funds and the commercialization of units in investment funds. The Portuguese Securities Market Commission also issues general regulations and specific recommendations. It also has powers to conduct investigations and apply penalties for infringement.

The Portuguese Insurance and Pensions Funds Supervising Authority is the official body that controls and supervises the business of insurance and reinsurance, pension funds and brokerage activities.

What are the authorization requirements and process?

Depending on the type of activity, a firm must apply to the Bank of Portugal, Portuguese Securities Market Commission or Portuguese Insurance and Pensions Funds Supervising Authority for authorization.

Bank of Portugal

The incorporation of a credit institution, financial firm (including a firm involved in the management of investment funds), payment
institution and e-money institution is subject to prior authorization by the Bank of Portugal.

The Bank of Portugal must assess whether an authorization request meets the required threshold conditions within six months (in the case of applications for credit institutional or financial firms) or three months (in the case of payment institutions and electronic currency institutions) of submission of a completed application or submission of additional information requested (if later), provided that an assessment must be made not later than 12 months from the date of the submission of the completed application in any event.

Once authorized, the shareholders have 12 months to register the firm with the Commercial Registry.

The Bank of Portugal is also responsible for the approval of the appointment of key individuals (eg senior management, audit committee) for the supervised entities.

**Portuguese Securities Market Commission**

The Portuguese Securities Market Commission is responsible for authorizing the creation and termination of regulated markets, including multilateral trading facilities, in Portugal. The activity of fund management is also subject to registration with the Portuguese Securities Market Commission.

Credit institutions which intend to carry on investment services and financial investment activities must, following authorization by the Bank of Portugal, register with the Portuguese Securities Market Commission. The Portuguese Securities Market Commission must assess whether an application for registration meets required threshold conditions within 30 days of the date of receipt of a complete application or the submission of complementary information requested (if later). An application for registration is deemed rejected if not accepted by the Portuguese Securities Market Commission within the applicable timeframe.

Appointment of key individuals (eg senior management, audit committee) in such entities is also subject to the approval of Portuguese Securities Market Commission.

The registration fee depends on the type of application.

**Portuguese Insurance and Pensions Funds Supervising Authority**

**INSURANCE AND REINSURANCE ACTIVITY**

The incorporation of an insurance or reinsurance firm is subject to prior authorization by the Portuguese Insurance and Pensions Funds Supervising Authority. The Portuguese Insurance and Pensions Funds Supervising Authority must assess whether an application meets required threshold conditions within six months of the submission of a completed application or the submission of complementary information requested (if later), provided that such assessment must be made not more than 12 months from the date of the submission of the completed application in any event.

Once authorized, the shareholders must incorporate the firm within six months and initiate the activity for which the firm is authorized within 12 months.

**PENSION FUNDS MANAGEMENT ACTIVITY**

The activity of managing pension funds is subject to the supervision of the Portuguese Insurance and Pensions Funds Supervising Authority, who must approve the constitution of pension funds.

The Portuguese Insurance and Pensions Funds Supervising Authority must assess whether an application for approval meets the required threshold conditions within 90 days of the submission of the complete application or the submission of complementary information requested (if later).

Following authorization of a firm carrying on the activity of managing pension funds, the shareholders must incorporate such firm within six months and initiate the activity for which they have been authorized within 12 months.

**INSURANCE AND REINSURANCE MEDIATION ACTIVITY**

Both natural and legal persons domiciled in Portugal can operate the activity of insurance and reinsurance mediation provided they are registered as mediators at Portuguese Insurance and Pensions Funds Supervising Authority.

The Portuguese Insurance and Pensions Funds Supervising Authority must approve the appointment of key individuals (eg senior
What are the main ongoing compliance requirements?

Threshold conditions (including solvency requirements) are ongoing compliance requirements for authorized firms. Failure to comply with the threshold conditions and more detailed regulatory rules can result in sanctions for firms and regulated individuals, and loss of regulated status.

What are the penalties for failure to be authorized?

A person undertaking banking activity or financial investment activity without being authorized commits a very serious administrative offense and is liable for the payment of penalties, and might be subject to additional material sanctions relating to the entity or to the carrying out of the activity.

A person undertaking insurance and reinsurance activity, reinsurance mediation activity or pension fund management activity without being authorized commits a very serious administrative and/or criminal offense and may be liable for the payment of penalties and/or imprisonment, as applicable.

Regulated activities

What finance and investment activities require authorization?

Generally

Regulatory authorization is necessary for the carrying out of financial, investment and insurance and reinsurance activities in Portugal.

- Investment activities include activities such as receiving and transmitting orders regarding financial instruments, executing orders in the name of third parties, portfolio management, registering and depositing transferable securities and investment advice.
- Banking activities include activities such as accepting deposits and other repayable funds, lending, financial leasing and money broking.
- Insurance and reinsurance activities include dealing in life insurance.

Generally, financial and investment activities may only be professionally rendered by authorized credit and financial institutions. However, certain consulting activities might also be provided by other authorized individuals.

Consumer credit

Activities involving consumer credit are considered as a regulated activity. Only credit institutions and financial companies can carry out credit operations and therefore they must obtain regulatory authorization.

Issuance of means of payment and e-money

The issuance of payment instruments and e-money are regulated activities and only firms authorized by the Bank of Portugal as payment and electronic money institutions are allowed to carry out such activities.

Are there any possible exemptions?
Some financial and investment activities ordinarily requiring authorization by the applicable regulator may not be subject to authorization if certain exemptions apply. For example, financial activities carried out on a professional basis may be exempt from authorization and certain investment activities, such as companies providing investment services exclusively to their subsidiary or controlling parent entity may be exempt from authorization.

Also, activities that are merely accessory to the main activity of the entity might in some cases be provided without previous authorization.

**Do any exchange controls or other restrictions on payments apply?**

There are no legal restrictions on moving money in and out of the country. However, where money is being transferred to or from non-EU member states, in some instances sums of foreign currency above EUR10,000 must be declared to customs authorities.

Compliance with the EU rules on payments (EU Payments Regulation and the Transfer of Funds Regulations) must be ensured.

There may also be anti-money laundering and tax considerations to take into account.

**What are the rules around financial promotions?**

**Rules**

The promotion and advertising of investment and financial services is a regulated activity, unless they fall within one of the exemptions.

Promotion of investment services is considered a complementary activity to the investment service being carried out and therefore subject to the same regulatory regime applicable to such activities.

Promotion of other financial services that do not qualify as investment services may only be carried out by authorized persons/promoters, who can only carry out promotional activity provided that they do not enter into or execute agreements on behalf of the financial institution. The financial institution must draft and submit a code of conduct applicable to such promoters.

Unauthorized or unfit promotions of investment and financial services are offences punishable by fine.

**Exemptions**

Exemptions include certain promotions to certified high-net worth individuals or overseas recipients, provided certain criteria are fulfilled.

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

**Generally**

The most common type of legal entity are limited companies. A limited company is a corpoarte body with separate legal personality.

A limited company can either be a public company (denoted by the suffix SA) or a private company (denoted by the suffix Lda. or Limitada), depending on whether the identity of the shareholders is publicly known or not and on other legal aspects eg, amount and form of share capital required for constitution. Some activities require a legal entity to be used. For example, banking activity and insurance and reinsurance activity may only be carried out by public limited companies.

Members of a limited company have limited liability.
Funds

Undertakings for collective investment in transferable securities are structured as a fund or corporate body. Undertakings for collective investment structured as corporate bodies corp include (public) real estate investment companies and (public) securities investment companies and might be open or closed (to participation).

Fund managers are typically financial institutions constituted for such effect.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes, a firm can conduct lending or investment business in Portugal through an establishment or a branch. A firm operating through an establishment or a branch will not have separate legal personality.

EU firms must notify the relevant regulator prior to establishing a branch while non-EU firms require prior authorization from the relevant regulator.

In relation to some specific activities as follows.

Credit institution, financial firm, payment institution and e-money institution

The establishment of a branch in Portugal of an EU firm is subject to prior notification by the competent regulation in the firm's home member state to the Bank of Portugal. The branches of such firms may only carry on activities in Portugal for which they have been authorized in their home member state. The establishment of a branch in Portugal of non-EU firms is subject to prior authorization by the Bank of Portugal.

Insurance and reinsurance activities

The establishment of a branch in Portugal of an EU insurance firm requires prior communication between the supervising authority in the firm's home member state and the Portuguese Insurance and Pensions Funds Supervising Authority. Non-EU insurance and reinsurance firms must obtain the prior authorization of the Portuguese Insurance and Pensions Funds Supervising Authority before establishing a branch in Portugal.

Insurance and reinsurance mediation activities

An insurance or reinsurance mediator registered in another EU member state can operate in Portugal one month after confirmation from the competent authority of its home country that it has notified the Portuguese Insurance and Pensions Funds Supervising Authority of the mediator's intention to operate in Portugal. Non-EU insurance or reinsurance mediators must obtain the prior authorization the Portuguese Insurance and Pensions Funds Supervising Authority.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal
characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Although there is still not a very active market in Portugal, marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
- consumer loans;
- student lending products;
- small and medium-sized enterprises (SME) lending; and
- residential property and commercial property mortgage lending.

**Blockchain, smart contracts and cryptocurrencies**

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a peer-to-peer mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features, such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by several nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example, relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

**WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?**

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as
blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to decide. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

**WHAT IS A CRYPTOCURRENCY?**

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

**Initial coin offerings (ICOs) and token-based products**

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal and may result in criminal sanctions in several jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.
Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are several applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The Portuguese Securities Market Commission (Comissão do Mercado de Valores Mobiliários or CMVM) and the Bank of Portugal (Banco de Portugal or BdP) are the regulatory authorities for firms providing financial and banking products and services, respectively.

GENERAL

Regulated activities must not be carried out in Portugal without a previous authorization.

Electronic payments platforms and regulation of peer-to-peer lenders

ELECTRONIC PAYMENT PLATFORMS

The Bank of Portugal promotes the compliant operation of payment systems through the operation, regulation, oversight and development of payment systems and instruments. It currently operates four payment systems in Portugal:

- **SICOI** – the retail payment system that processes day-to-day payments by checks, bills of exchange, direct debits, credit transfers and bank cards;
- **TARGET2-PT** – the Portuguese component of TARGET2 (which is the Eurosystem's large value payment system);
- **AGIL** – which is the Bank of Portugal's deposit account management system and allows institutions not participating in TARGET2 to conduct specific transactions with Bank of Portugal, namely cash deposits and withdrawals; and
- **TARGET2-Securities** – which links the Portuguese community to the Eurosystem's securities settlement system where securities transactions are settled, notably shares and bonds against the central bank's money.

Decree Law no. 317/2009, of 30 October and Decree-Law no 298/92, of 31 December (as amended) contain the rules applicable to payment and e-money institutions. Payment institutions and e-money institutions must obtain the Bank of Portugal's authorization prior to incorporation.

PEER-TO-PEER LENDERS

According to the Portuguese Banking Act only institutions authorized by the Bank of Portugal may carry out lending activities as a regulated activity. Peer-to-peer (P2P) lending would only be permitted if not carried out on a professional basis. Although P2P lending implies that a platform provides lending on behalf of others (investors) it is not clear if the Bank of Portugal accepts that this should not be
a lending activity on the basis that P2P lenders are not carrying out such activity by themselves, but on behalf of such investors.

**Regulation of payment services**

Where a Portuguese business provides payment services as a regular occupation or business activity in Portugal, it will require authorization by the Bank of Portugal to become an authorized payment institution under Decree-Law No 91/2018 of 12 November 2018. Failure to obtain such authorization is a criminal offence. This Decree-Law implements Payment Services Directive II.

In order to become authorized by the Bank of Portugal, a payment services business will need to meet certain criteria, including, in relation to initial capital, processes and procedures in place for safeguarding relevant funds, sensitive payment data and money laundering and other financial crime controls.

**Application of data protection and consumer laws**

The General Data Protection Regulation (GDPR) is the legal regime applicable to the protection of individuals with regard to the processing of personal data and the free movement of such data. The GDPR implements Regulation (EU) 2016/679 (General Data Protection Regulation). Whenever a business is required to process personal data in order to operate, a significant set of rules pertaining to notification and compliance obligations must be complied with.

Law no. 41/2004, of 18 August (as amended) regulates the processing of personal data and the protection of privacy in the electronic communications sector, including unsolicited direct marketing by electronic means.

The Portuguese Consumer Protection Act (CPA) was approved by Law no. 24/96, of 31 July (as amended) and provides for wide ranging protections in respect of consumers' rights, notably information rights.

**Money laundering regulations**

Law no. 83/2017, of 18 August gives the Bank of Portugal responsibility for supervising the anti-money laundering controls of businesses that offer certain services, such as lending, providing payment services and issuing other means of payment. This Law implements the European Union's Fourth Money Laundering Directive.

Where a firm is authorized and supervised by the Bank of Portugal, it will generally also be supervised for compliance with anti-money laundering requirements, particularly since electronic currencies tend to represent a higher money-laundering risk.

_Last modified 6 Dec 2019_

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**

**SEED INVESTMENT**

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

**CROWDFUNDING**

The crowdfunding sector is well established and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform, such as PPL.

There are four types of crowdfunding in Portugal:

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Donation-based crowdfunding involves investing through a donation that may or may not have a non-monetary return.
• Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

• Loan-based crowdfunding involves the financed entity repaying the obtained financing through the payment of interest determined on the moment of the funding.

Crowdfunding offers many private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

The legal framework regarding crowdfunding has been recently approved:

CMVM Regulation on Crowdfunding (loan based and equity based) (Regulamento da CMVM n.º 1/2016)

Legal Framework on Crowdfunding (Lei n.º 102/2015, de 24 de agosto)

Sanctioning regime applicable to crowdfunding Activities (Lei n.º 3/2018, de 9 de fevereiro)

ACCELERATORS

There are various incubators or accelerators in the Portuguese market which offer support, facilities and funding for startups. Dedicated to FinTech, the most relevant accelerator in Portugal is SIBSPAYFORWARD.

Venture capital and debt

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending, given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund. The benefit of having a CVC as an investor for a FinTech startup is that the fund can share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

In Portugal, venture capital is the main source of funding for technological firms and startups of all sizes.

Warehouse and platform funding

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

Senior bank debt and capital markets funding

SENIOR BANK DEBT

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding, which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

CAPITAL MARKETS FUNDING

In Portugal, the most popular way for funding arrangements in the capital markets is by way of Initial Public Offering (Oferta Pública de Venda), when a company or an investor proposes to the general public to buy certain transferable securities and wishes to trade the stocks in the stock market. However, this is not a common form of funding arrangement for growing FinTech businesses.

Incentives and reliefs

There are a number of investment incentive programs in Portugal in co-partnership with the European Commission, their applicability depending on the size and dimension of the applicant company, focused on stimulating economic development and competitiveness. The
most relevant investment incentive program in Portugal is Portugal 2020, and although not specifically directed to FinTech, these types of companies may be eligible, if they meet the requirements.

The Seed Initiative is designed to help small, early-stage companies raise equity finance by offering individuals who invest in the shares of qualifying startups an income tax relief of 25% of the eligible amount invested, up to 40% of the investor's Individual Income Tax, up to a maximum investment of €100,000 per year.

In addition, according to the Investment Tax Code, the activities of research and development (R&D), high-tech and information and communication technology are eligible for tax credits as an incentive designed to encourage companies to invest in those fields. Investment projects in such fields may benefit from a certain amount of tax credit (10% to 25% of the relevant applications of the investment project) in Corporate Income Tax, an exemption or reduction in Municipal Tax on Real Property and Municipal Tax on Real Estate Transfer, as well as an exemption in Stamp Tax regarding all contracts necessary for the investment project.

The Enterprise Investment and Development Tax Incentives Scheme (SIFIDE) offers a Corporate Income Tax deduction of 32.5% of the expenses incurred on research or development (and additionally the possibility to deduct 50% of the increase of expenses in R&D). In the case of micro, small and medium-sized enterprises the deduction rate applicable, in certain circumstances, is 47.5%.

Finally, the Patent Box Scheme enables companies to exclude 50% of the profits earned from its patented inventions from Corporate Income Tax, within certain limits and provided certain conditions are met.

**Portfolio sales**

**Loan transfers and portfolio sales**

*What are common ways of buying and selling loans?*

A loan can be sold on an individual basis or as a portfolio. The most common ways of selling loans are as follows.

**Credits Assignment**

Credits assignment is a transfer of rights only and of not obligations. Subject to any contractual restrictions, credit assignments can be done without the consent of the debtor, but the contractual relationship between the debtor and the lender will continue.

**Assignment of the contractual position**

An assignment of the contractual position will transfer both the rights and obligations of the lender. Although consent of the debtor is required, such an assignment terminates the contractual relationship between the debtor and the former lender.

**What are the main considerations when transferring a loan and related security?**

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller's legal advisors. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan can disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

The ownership of energy and infrastructure assets in Portugal varies according to the asset class. The main asset classes are usually considered to be:

- economic infrastructure (energy, aviation, rail, telecommunications, water, roads and waste); and
- social infrastructure (education, health and justice/prisons and housing).

Key sectors are considered below.

Energy

The gas and electricity industries in Portugal are privatized, with the generation, transmission, distribution and supply services provided by a number of private sector companies. The relevant private sector companies own the generation, transmission and distribution assets.

The energy sector has been a liberalized sector in Portugal since 2012, although the law has provided for a temporary transitional regulated regime. According to official data, the liberalized electricity market covered more than 4.7 million clients at the end of 2016 and both the liberalized electricity and gas tariffs amounted to approximately 91% of total electricity and gas consumption in Portugal. The transitional regulated tariffs have been decreasing over the years. Entidade Reguladora dos Serviços Energéticos (ERSE), the Portuguese regulator for the energy sector now only determines energy tariffs for the system tariffs (eg use of grids and infrastructures) and the transitional regulated consumer tariffs. This liberalization of consumer energy tariffs boosted free competition and the emergence of various retail energy sellers which has in turn provided a greater choice for consumers.

Telecoms infrastructure

The telecommunications networks (fixed and mobile) in Portugal are privately owned by a number of service providers. Autoridade Nacional de Comunicações (ANACOM) performs a dual role, as:

- the regulator of the Portuguese communications sector, regulating all electronic and postal communications; and
- as an independent administrative body of the Portuguese government.

Transport infrastructure

Autoridade da Mobilidade e dos Transportes (AMT) performs a dual role as:

- the regulator of the Portuguese transportation sector, supervising inland, fluvial transportation and railways, also the economic activity of trading ports and maritime transports; and
- an independent administrative body of the Portuguese government.

Light rail

Typically, light rail assets (such as trams and associated tracks) are owned by local public sector promoting bodies. For example, Carris owns and operates the trams and supporting infrastructure in Lisbon. Metro de Lisboa owns and operates the metropolitan transport...
network in the Lisbon area. Outside of Lisbon there are a number of private companies operating supporting bus lines.

HEAVY RAIL

The heavy rail market in Portugal is operated by both private and public companies. Most of the Portuguese railway lines are operated by publicly owned companies, although there are some significant lines operated by private companies.

ROADS, BRIDGES AND TUNNELS

A state-owned company is responsible for designing, building, financing, exploring, preserving, requalifying and modernizing the motorways and railways across Portugal. It is supervised by the Ministry of Housing and Infrastructure and the Ministry of Finance.

PORTS AND AIRPORTS

Ports are operated by private companies.

The aviation sector is regulated by Autoridade Nacional da Aviação Civil (ANAC) and it is composed of both privately and publicly owned companies. Portuguese airports are operated by private companies, some under a concession scheme.

Other infrastructure

The majority of social infrastructure assets (schools, hospitals, defense) in Portugal are directly financed by the State of Portugal. Subject to value-for-money considerations, private finance may also be used in the procurement of social infrastructure assets.

In relation to some of these specific sectors:

EDUCATION

Education establishments may be owned by public or private entities or a mixture of the two.

HOSPITALS

Ownership of hospitals may be both public or private (or public-private partnerships). The regulatory authority for the health sector in Portugal is Entidade Reguladora da Saúde (ERS).

DEFENSE

Typically, defense assets are owned by the public sector.

Last modified 6 Dec 2019

Are there special rules for investing in energy and infrastructure?

Generally

There is no specific regime governing or restricting investment in energy or infrastructure projects in Portugal over and above existing regulation for investors and funders more generally but a particular proposed investment may be subject to legislative or regulatory control (eg merger control rules). With regard to the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory position relevant to that project must be considered.

Energy

The energy markets in Portugal have a complex system of arrangements between suppliers, generators, transmission and distribution which are heavily regulated. In particular, there are complex arrangements in respect of licensing, subsidies and demand/charging mechanism with suppliers and customer and these are subject to change/regular updates meaning that investors will need to have a good understanding of the current framework and the potential directions in which the market may move. Investors need to understand how technology changes may impact on the overarching regulatory framework and vice versa.
Investors should also consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with any license conditions or the granting of specific subsidies. In particular, if a breach of those conditions could lead to the revocation of a license/subsidy that might make the potential target less attractive or viable.

**Telecoms infrastructure**

The industry is largely privatized; therefore investors should consider if any permits/consents/licenses will be affected by their interest.

**Transport and other infrastructure**

Depending on the business activity, the investors should consider if any permits/consents/licenses will be affected by their interest.

---

**What is the applicable procurement process?**

In Portugal, public procurement is governed by the Portuguese Public Contracts Code which transposes EU directives into Portuguese law. The award of contracts by public entities must comply with the principles of the Treaty on the Functioning of the EU and in particular the free movement of goods, freedom of establishment and the freedom to provide services, as well as principles deriving therefrom, such as equal treatment, non-discrimination, mutual recognition, proportionality and transparency. In particular, for public contracts above a certain value, regulated procurement procedures with an element of competition are mandatory to ensure that those principles are given practical effect.

**Investing in energy and infrastructure**

Public procurement is relevant where the Portuguese government or a public body is seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset.

A regulated procurement procedure is required where certain financial thresholds are met and on most major infrastructure projects (where limited exclusions do not apply), it is likely that those thresholds will be met so a regulated procurement would need to be run. In most cases, the awarding entity will need to publish a contract notice in the Office Journal of the European Union (OJEU) and typically run one of the following procedures:

- **Public Tender (Concurso Público)** – a procurement procedure open to any bidders; or

- **Restricted Tender by Prequalification (Concurso Limitado por Qualificação Prévia)** – a procurement procedure open to all bidders that meet requirements of technical capacity and/or financial capacity defined in the tender documents.

An investor may choose, however, to seek to invest in a project (by acquiring an interest in a private-sector partner) that has already been procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the original awarded contract rather than procurement regulations themselves.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement-related considerations that need to be borne in mind.

**Financing energy and infrastructure**

On a publicly procured contract, the awarding entity may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project-finance deals, a refinancing of the senior debt will require the consent of the public sector.

---

**What are the most common forms of funding / investing in energy and infrastructure?**

**Funding**
Common forms of funding in energy and infrastructure include:

- loans made on a corporate-finance basis;
- loans made on a project-finance basis (to a special purpose project company) on medium- to long-term bases – such loans may later be syndicated to other funders;
- bond finance;
- mezzanine debt (in some sectors);
- refinancing of the debt in operational projects; and
- asset financing (this is particularly relevant in the railway sector).

**Investing**

Common forms of investing in energy and infrastructure include:

- ‘equity’ investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of ‘equity’).

**Restructuring**

**Enforcement and sanctions**

**When can there be regulatory investigations?**

Under their respective supervision powers, the Bank of Portugal, the Portuguese Securities Market Commission or the Portuguese Insurance and Pensions Funds Supervising Authority may perform the necessary inspections and investigations to the entities subject to their supervision. Such investigations may result in regulatory sanctions.

**What regulatory penalties may apply?**

When a firm has committed a breach of regulation, the Bank of Portugal, the Portuguese Securities Market Commission or the Portuguese Insurance and Pensions Funds Supervising Authority may impose regulatory penalties and ancillary penalties. Penalties may include a temporary ban on a firm’s operations and a publication of any penalties imposed.

**What criminal penalties may apply?**

Regulators will co-operate with competent authorities to conduct criminal investigations where appropriate. The decision of a competent authority in respect of an investigation is subsequently communicated to the relevant regulator. When an entity commits a criminal offence, it may be liable to penalties including fines or the imprisonment of responsible persons.

**Tax**
Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

No stamp, registration, transfer or other similar taxes are payable on the advance of a loan.

The transfer or assignment of a loan triggers stamp duty only when the loan is transferred or assigned with recourse against the assignor (in the case of the borrower's default). This is on the basis that such transfer or assignment is an effective grant of credit to the assignee since the assignor retains exposure to the relevant default risk. Stamp duty is calculated on the amount of the credit and, depending on the maturity, the applicable rates are as follows:

- credit with maturity of less than one year – for each month or period – 0.04%;
- credit with maturity of one year or more – 0.50%; and
- credits used as a current account, bank overdraft or any other form of credit the period of use of which is not, or cannot be, determined – 0.04% on the monthly average balance (obtained from the sum of the balances owed calculated on a daily basis throughout the month, divided by 30).

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

Portuguese stamp duty is payable on the taking of security. The applicable stamp duty is calculated based on the secured amount at the applicable rates, depending on the security's maturity, as follows:

- up to one year (for each month or period) – 0.04%;
- one year or more – 0.5%; and
- five years or more – 0.6%.

In any event, stamp duty does not apply to a security interest that is materially ancillary to a contract already subject to stamp duty and which is granted simultaneously (eg loan contracts).

Specific registration requirements may apply depending on the type of security interest (eg mortgages will only be valid if duly registered) and/or asset over which the security is taken and on the specific effects which are to be achieved (eg effects on third parties). Thus security interests may be subject to registration at Companies House (Registro Comercial), eg a pledge over shares, or at the Land Registry (Registo Predial), eg real estate mortgages. Registration fees apply in such cases although they are generally not material in amount.

The transfer or assignment of a security interest is not subject to stamp duty.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

The issuance, transfer or assignment of a debt security does not trigger stamp duty, registration, transfer or any other similar tax.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

Last modified 6 Dec 2019
Portuguese civil law and tax procedural legislation establishes the rules for ranking creditors competing over the same asset, alongside the State Revenue, as follows:

- General preferential rights do not prevail over secured rights.
- Special preferential rights only prevail over secured rights if constituted first.
- General immovable preferential rights do not prevail over secured rights.
- Special immovable preferential rights prevail over secured rights, regardless of being constituted after those secured rights.

The State Revenue benefits from the general preferential right, and particular taxes benefit from preferential rights. Stamp duty (where the operation for which it would be levied involves real estate) and real estate transfer tax grant the State Revenue an immovable preferential right, and for that reason, tax authorities take priority on enforcement in such cases. As regards municipal property taxes, the State Revenue benefits from a special preferential right in its enforcement, only prevailing over secured rights if constituted first.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

In general, interest payments with a Portuguese source are subject to withholding tax in Portugal.

If so:

What is the rate of withholding?

The general rate of withholding tax applicable to interest payments by corporate taxpayers is 25%.

What are the key exemptions?

The most commonly relied on exemptions to ensure that interest payments made by Portuguese companies can be made free of Portuguese withholding tax (in whole or in part) include:

- the exemption applicable to interest received by banks and financial institutions that are resident in Portugal and subject to corporate income tax;
- the exemption applicable to interest on shareholders' loans when the lender holds, directly or indirectly, more than 10% of the share capital with voting rights in the debtor company, provided the shareholding has been held continuously during the year preceding the interest payment;
- the reliance on a double tax treaty entered into by Portugal and the country of residence of the lender to obtain an exemption (in whole or in part) provided that the requisite conditions are met; and
- the reliance on the EU Interest and Royalties Directive as implemented by Portuguese domestic law, provided that the requisite conditions are met.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes, the analysis described above is applicable to both interest payments under a loan or other form of debt security.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?
No.

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes.

*Last modified 6 Dec 2019*

Puerto Rico

Issuing and investing in debt securities

**Are there any restrictions on issuing debt securities?**

There are restrictions on offering and selling debt securities under both Puerto Rican and US federal laws.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Puerto Rico unless an approved prospectus has been made available to the public. This prospectus needs to be approved by the Office of the Commissioner of Financial Institutions of Puerto Rico or the US Securities and Exchange Commission.

**What are common issuing methods and types of debt securities?**

The most common types of debt securities issued in Puerto Rico are bonds or notes issued on a stand-alone basis or under a program. Many different types of debt securities are offered in Puerto Rico. Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities and high-yield bonds;
- guaranteed securities or subordinated securities;
- commercial paper (either stand-alone or as part of a program);
- asset-backed securities;
- derivative securities such as securities linked to the value of one or more reference asset including interest rate or index, and credit-linked notes;
- hybrid securities (securities with both debt and equity features); and
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer).

**What are the differences between offering debt securities to institutional/professional or other investors?**

The main difference is that if the institutional/professional investor qualifies for an exemption of registration (for example, a private
placement exemption) registration of a prospectus is not required. However, a disclosure document, such as a private placement memorandum, should be used to comply with the anti-fraud provisions of the Uniform Securities Act and US securities laws.

Last modified 11 Dec 2019

**When is it necessary to prepare a prospectus?**

Unless an exemption applies, it is necessary to register a prospectus with the Office of the Commissioner of Financial Institutions of Puerto Rico or the US Securities and Exchange Commission where there is an offer of securities to the public.

Last modified 11 Dec 2019

**What are the main exchanges available?**

Puerto Rico does not have organized exchanges to trade securities. Securities issued in Puerto Rico or issued by Puerto Rican issuers are traded in organized exchanges in the United States such as the New York Stock Exchange and NASDAQ.

Last modified 11 Dec 2019

**Is there a private placement market?**

Yes there is, but a very limited one.

Last modified 11 Dec 2019

**Are there any other notable risks or issues around issuing or investing in debt securities?**

**Issuing debt securities**

All issuances of debt securities are subject to the anti-fraud provisions of the Uniform Securities Act and US securities laws.

**Investing in debt securities**

Debt security terms and conditions typically contain provisions which may permit their modification without the consent of all investors and confer significant discretions on the trustee, which may be exercised without the consent of investors and without regard to the individual interests of particular investors. The conditions also provide for meetings of investors to consider matters affecting the investors interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

Last modified 11 Dec 2019

**Establishing and investing in debt / hedge funds**

**Are there any restrictions on establishing a fund?**

The principal restriction in establishing a fund in Puerto Rico is the applicability of the Puerto Rico Investment Companies Act of 2013 or the US Investment Company Act of 1940. In addition, there are laws that regulate the establishment of certain investment funds and grant special tax treatment to the fund and investors in the fund. One such example is Act 185 that authorizes the establishment of private equity funds that do not invest in publicly traded securities and in investments in Puerto Rico.

Last modified 11 Dec 2019

**What are common fund structures?**
Common forms of funds include:

- open-ended investment companies (mutual funds);
- closed-ended investment companies (mutual funds);
- private equity funds (Act 185 Funds);
- family investment funds; and
- exempt investment companies (less than 100 securities holders or all qualified purchasers under the US Investment Company Act of 1940).

What are the differences between offering fund securities to professional / institutional or other investors?

Retail funds

Retail funds require the registration of a prospectus and are subject to investment requirements, prohibitions regarding leverage, limitation on transactions with affiliates and other requirements applicable to investment managers of the fund, which may not be applicable in the case of institutional funds.

Institutional/professional funds

If the institutional/professional investor qualifies for an exemption of registration (for example, a private placement exemption) registration of a prospectus is not required. However, a disclosure document, such as a private placement memorandum, should be used to comply with the anti-fraud provisions of the Uniform Securities Act and US securities laws.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

Separately managed accounts are also commonly used in Puerto Rico as an investment management structure. This is where investor funds are generally held in a separate account subject to the discretionary investment authority of a manager who can acquire and dispose of assets using the investor funds in line with a pre-determined strategy and parameters set out in an Investment Management Agreement. These are often structured as common trust funds, variable annuities and individual retirement accounts.

Managing investments is a regulated activity under the Uniform Securities Act and the US Investment Advisors Act of 1940 and therefore subject to authorization.

Investing in funds

Most investment funds established in Puerto Rico are created for tax reasons, and therefore the investor in the fund should be aware that the tax treatment of the investment and of the fund itself is in tune with the investor's objectives.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

There are restrictions on offering and selling securities of a fund under both Puerto Rican and US federal laws.
Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Puerto Rico unless an approved prospectus has been made available to the public. This prospectus needs to be approved by the Office of the Commissioner of Financial Institutions of Puerto Rico (OCFI) or the US Securities and Exchange Commission. In the case of investment companies under the Investment Companies Act of 2013 the prospectus needs to be approved by the OCFI pursuant to the disclosure requirements under such act and its accompanying regulation. The same is applicable to investment companies under the US Investment Company Act of 1940, where the prospectus needs to be approved by the SEC pursuant to the disclosure requirements under such act and its accompanying regulations.

**Are there any restrictions on managing a fund?**

Fund management in Puerto Rico is regulated under the Uniform Securities Act (PRUSA), the Investment Companies Act (Act No.6) and the Investment Companies Act of 2013. The Office of the Commissioner of Financial Institutions of Puerto Rico (OCFI) is responsible for regulating investment companies, investment company managers, investment advisors and those marketing funds (securities broker-dealers) and any legal or natural person is prohibited from carrying on regulated activities, such as fund management, without authorization. The same is true with the US Securities and Exchange Commission (SEC) for investment advisors with USD100 million or more in assets under management. In that case SEC regulations supersede the PRUSA and OCFI regulations.

Various restrictions arise on manager structuring/compensation and profit-sharing arrangements as a result of the regulations and any manager that is subject to the remuneration rules must apply those rules proportionate to its size, internal organization and scope and complexity of its activities. The rules impact on, among other things, reporting and compensation arrangements.

**Entering into derivatives contracts**

**Are there any restrictions on entering into derivatives contracts?**

The principal issue here is whether entering into derivative contracts are transactions involving securities under the Uniform Securities Act (PRUSA). The issue of whether a commodities instrument or derivative product is a security or not is not settled in Puerto Rico and depending on the instrument they may be securities and in other cases they may not. If they are securities, the marketing or solicitation of such is regulated under the PRUSA.

Section 101 of the PRUSA states the following in this respect:

'It shall be unlawful for any person, relative to the offer, sale or purchase of any securities, directly or indirectly:

(1) to employ any device, scheme, or artifice to defraud;

(2) to make any untrue statement of a material fact or to omit to state a material fact necessary in order to make the statements made, in the light of the circumstances under which they are made, not misleading;

(3) to engage in any act, practice, or course of business which operates or would operate as a fraud or deceit upon any person;

(4) to issue, circulate, or publish any material, printed or through electronic means, containing false representation of a material fact, or omitting information concerning a necessary material fact, so that the information which is issued, circulated or published, in the light of the circumstances in which it was issued, circulated or published, leads to an error; or

(5) to issue, circulate, or publish any material, or make any written statement, unless the name of the person who issues, circulates or publishes or makes the aforesaid, and the fact that it is that person who issues, circulates, publishes or makes the statement, is clearly indicated in that same communication.'
Section 101 of the PRUSA is applicable to any person, not just broker-dealers. Therefore it is applicable to parties to a securities transaction whether you are a broker-dealer or not. What makes section 101 of the PRUSA relevant is that the transaction is a securities transaction.

The Office of the Commissioner of Financial Institutions of Puerto Rico (OCFI) has not interpreted whether the described commodities transactions are within the definition of securities under the PRUSA. Therefore, there is a possibility that the OCFI determines that the described commodities transactions are securities within the PRUSA and thus subject to the PRUSA including its licensing or registration requirements.

Notwithstanding the above, an entity would be not be considered a broker-dealer under the PRUSA if the person is deemed not to have a place of business in Puerto Rico and thus exempt from the licensing and registration requirements of the PRUSA. An entity does not have a place of business in Puerto Rico if:

- the person carries out transactions in Puerto Rico exclusively with or through:
  - the issuers of the securities involved in the transaction;
  - other broker-dealers;
  - banks, savings institutions, trust companies, insurance companies, investment companies as such are defined in the Investment Companies Act of Puerto Rico, pension trusts or shares in the benefit of other financial institutions or institutional buyers acting on their own account or as trustees; or
  - during any other period of 12 consecutive months does not in any way make more than 15 sale or purchase offers in Puerto Rico to persons other than those specified in (A) above, whether the person making the offer or the persons to whom the offer is made are in Puerto Rico.

In addition to these issues under Puerto Rican law, the commodities market in Puerto Rico is regulated under the US Commodity Exchange Act.

**What are common types of derivatives?**

The derivative market in Puerto Rico is very limited and are generally traded over-the-counter.

The following types of derivative contract are used in Puerto Rico:

- forwards;
- futures;
- strips (interests only strips and principal only strips);
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contracts is based on the value of the underlying assets.

**Are there any other notable risks or issues around entering into derivatives contracts?**

Since the global financial crisis in 2007-to-2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. In 2010, the US adopted the Dodd-Frank Wall Street Reform and Consumer Protection Act. As a result the derivatives market has seen, and continues to see, the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.
Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

With the exception of lending under the Financial Intermediary Act, lending is only a regulated activity in relation to mortgages and consumer lending (e.g. small loans, credit cards and financial leasing). In these circumstances, and assuming none of the available exemptions apply, a lender will need to be authorized by the Office of the Commissioner of Financial Institutions of Puerto Rico (OCFI) to conduct such business.

Mortgage and consumer loans are subject to a range of regulatory requirements that do not apply to unregulated loans. For example, for regulated mortgage contracts, there are particular restrictions around how:

- the loans are marketed, originated and sold;
- lenders administer the loans on an ongoing basis;
- to deal with borrowers who fall behind with their payments; and
- foreclosure procedures.

Regulated credit agreements on the other hand have specific requirements around how the agreement is drafted and formatted and what information must be included.

Borrowing

While borrowers are generally not regulated, it is advisable for borrowers to consider whether the mortgage or consumer lending regimes apply to their activities, in which case they will benefit from the protections mentioned above.

What are common lending structures?

Lending in Puerto Rico can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties. Puerto Rico is a 'freedom to contract' jurisdiction where the parties can agree to any terms to a contract as long as such terms are not against the law and the public policy of the Commonwealth of Puerto Rico (la moral y el orden público).

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents and trustees which fulfils certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, e.g. term loans, bullet loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities.

Loan durations

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
• an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
• a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Loan security

A loan can either be secured, unsecured or guaranteed.

Loan commitment

A loan can also be:

• committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
• uncommitted, meaning that the lender has discretion whether or not to provide the loan.

Loan repayment

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity). There are regulations regarding prepayment penalty clauses that may be applicable to certain loans (for example, mortgage loans).

What are the differences between lending to institutional / professional or other borrowers?

The main difference may be that consumer credit lending is more regulated than institutional lending. However, institutional lending may be subject to specific regulations that are not applicable to consumer credit (for example, commercial property appraisals).

Do the laws recognize the principles of agency and trusts?

Although generally there is no fiduciary duty between the lender and the borrower, there are certain circumstances where the lender may be subject to liability against the borrower (for example, the exercise of unreasonable control and environmental liabilities).

Agency and trust structures are recognized under Puerto Rican law and therefore can be included in lending structures. For instance, it is possible to appoint an agent to act on behalf of other parties and a trustee to hold rights and other assets on trust for the lenders or secured parties.

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual principles. In Puerto Rico, a civil law jurisdiction, such contractual principles are found in the Puerto Rican Civil Code.

In addition, most lending is subject to credit and bankruptcy risk. In the case of insolvency, borrowers can ask for protection under the US Bankruptcy Code.

Specific types of lending

Mortgage lending is also subject to the US Real Estate Settlement Procedures Act and regulations which establishes specific requirements...
in the process of granting mortgage loans.

Standard form documentation

In the case of conforming mortgage loans there are standard forms for loans that can be acquired by the Federal Home Loan Mortgage Corporation and the Federal National Mortgage Association.

Are there any other notable risks or issues around borrowing?

Lending in Puerto Rico is subject to US federal consumer protection laws such as the Truth in Lending Act and subject to the regulations of the Consumer Financial Protection Bureau.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the giving of guarantees and security are as follows.

Capacity

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors’ powers that would be preventative. The safe approach is often to have the members of the company approve the giving of the guarantee or security by resolution.

Insolvency

Guarantees and security may be at risk of being set aside under Federal bankruptcy laws if the guarantee or security was granted by a company with a certain period of time prior to the onset of insolvency. Insolvency proceedings in Puerto Rico are of the exclusive jurisdiction of the United States Bankruptcy Court.

Security interest

Puerto Rico and US states apply statutes derived from Article 9 of the Uniform Commercial Code (UCC) for constituting a security interest over personal property. Article 9 of the UCC governs security interests in personal property as collateral to secure a debt. While Article 9 does not govern security interests in real property, it does cover fixtures to real property. Security interests in real property are secured by a mortgage and governed by the Real Property Act. In order to create a security interest a security agreement must be executed. In order to perfect a security interest, generally a financing statement has to be filed at the Puerto Rico Department of State, unless it is a fixture filing, which is filed at the corresponding Real Property Registry, or a security over titled automobiles which are filed with the Puerto Rico Department of Transportation and Public Works.

What are common types of guarantees and security?

Common forms of guarantees

Guarantees can take a number of forms.

A particular distinction worth remembering is between a performance guarantee and a payment guarantee:

- A performance bond describes a financial undertaking used to protect a buyer against the failure of a supplier to deliver goods or
perform services in accordance with the terms of a contract. The issuer of the bond undertakes to pay to the buyer a sum of money if the seller fails to deliver the goods or perform the contracted services on time or in accordance with the terms of the contract.

- A payment guarantee is narrower in scope than a performance guarantee as it only covers the payment of money rather than other contractual obligations.

**Common forms of security**

Security interests are mostly governed by Article 9 of the Puerto Rico Uniform Commercial Code (UCC). A security interest is created by a security agreement under which the debtor grants a security interest in the debtor's property as collateral for a loan or other obligation. Depending on collateral, security interests are perfected by possession, or filing of a UCC-1 financing statement with the Puerto Rico Department of State. Security agreements may take various forms depending on the collateral.

Mortgages are perfected by filing a Deed of Mortgage with the corresponding Registry of Property. Different types of security are suitable for securing different types of assets. Fixture filings may also be filed with the relevant Registry of Property, if applicable.

Different types of security are suitable for securing different types of assets.

Under Puerto Rican law it is possible to grant security over all of the assets of a Puerto Rican company or individual assets through a combination of:

- a security interest on movable property of all types, including inventory, receivables, equipment, intellectual property etc; and
- mortgage(s) over real property(ies).

Last modified 11 Dec 2019

**Are there any other notable risks or issues around giving and taking guarantees and security?**

**Giving or taking guarantees**

A guarantee is a secondary obligation. In order to be valid, the primary obligation must be valid and enforceable. The guarantee itself is also subject to general contractual principles. Therefore, it must have a cause, an object and the consent of the parties.

**Giving or taking security**

A security document will need to be executed as a deed if it contains a mortgage over land.

Once granted, security needs to be properly perfected before it is valid against third parties. Perfection formalities can range from having the secured asset delivered to the security holder, filing of a Uniform Commercial Code-1 (UCC-1) financing statement and notice being given to third parties. Please note, however, that perfection of a mortgage right must be made by filing a deed with the relevant Registry of Property.

Assignment of contracts, rents and leases require notarization in order to be valid against third parties under Puerto Rican law.

Last modified 11 Dec 2019

**Financial regulation**

**Law and regulation**

*What are the main laws and regulations that apply to entities that are involved in finance and investments generally?*

**Generally**
Puerto Rico Banking Act (regulation of commercial banks)

Uniform Securities Act (regulation of securities broker-dealers and investment advisors) (PRUSA)

Financial Intermediary Act (regulation of lenders and financial advisors that are not regulated by special laws)

Small Loan Concessionaires Act (regulation of lenders of loans of US$5,000 or less)

Mortgage Concessionaires Act (regulation of mortgage banks)

International Financial Center Act (regulation of international financial entities)

International Banking Center Act (regulation of international banking entities)

General Credit Unions Act of 2004, as amended (regulation of Puerto Rico credit unions)

Puerto Rico Incentives Code, act 60-2019 (regulation on general tax incentives)

**Consumer credit**

Personal Property Leasing Act

Retail Instalment Sales Act (Act 68)

Small Loan Concessionaires Act (regulation of lenders of loans of US$5,000 or less)

Puerto Rico Civil Code

Puerto Rico Registry of the Property Act (regulating mortgages over real property)

Act to Regulate Mortgage Loan Industry

Act to Regulate Monetary Services Industry

**Mortgages**

Mortgage Concessionaires Act and the Puerto Rico Mortgage Law

Puerto Rico Civil Code

Puerto Rico Registry of the Property Act (regulating mortgages over real property)

**Corporations**

The General Corporations Act of 2009, as amended

**Funds and platforms**

The Investment Companies Act (Act No. 6), Investment Companies Act of 2013, as amended

**Other key market legislation**

Most, if not all, of the US federal laws regulating entities that are involved in finance and investments apply in Puerto Rico as well.

_Last modified 11 Dec 2019_
Who are the regulators?

The main financial regulator in Puerto Rico is the Office of the Commissioner of Financial Institutions of Puerto Rico. However, other financial institutions are regulated by:

- the Office of the Commissioner of Insurance (e.g. insurance companies, brokers and agencies);
- the Public Corporation for the Regulation and insurance of Cooperatives (COSSEC) (e.g. cooperatives and credit unions); and
- the Secretary of the Treasury (the main tax authority in Puerto Rico).

What are the authorization requirements and process?

Commercial banks

The entity must file with the office of the Secretary of State, a duly authenticated copy of its corporate charter or articles of incorporation and a certificate sworn to by the president, manager, agent or cashier or other authorized official of such bank, and attested to by a majority of its board of directors, stating:

- the name of said bank;
- the location of its existing or proposed main office or place of business in Puerto Rico;
- the purpose or purposes of its business;
- the amount of its paid-in capital;
- the amount of capital in cash;
- the amount of the bank's assets, including what they consist of and their cash value;
- an itemized statement of its liabilities and whether any of its debts are secured, and how they are secured; and
- the names and mailing addresses of all the directors and officials of the bank and the dates when their terms of office expire.

Foreign banks must additionally file at the same time, with the office of the Secretary of State of Puerto Rico, a certificate with the official seal of the bank and signed by the president, vice president or other acting head, and its cashier, if there is one, stating that the bank has consented to be sued in the courts of Puerto Rico in any and all causes of action originated against it in Puerto Rico and that the service of notice on the bank as defendant as well as any other judicial proceeding may be made on a given person, resident of Puerto Rico, whose name and place of residence shall be stated on the certificate; and service thus made upon the agent, shall be valid service on the bank.

The written consent of the person designated to act as agent shall also be filed, and such designation shall remain in force until a written revocation of the same is filed in said office, executed in the same manner, in which case some other person shall be designated to act as agent.

A certified copy of a designation so filed, together with a certificate stating that it has not been revoked, shall constitute presumptive evidence that the designation has been made and shall be conclusive evidence of the authority of the official making it. An investigative fee of at least USD2,500 may be applicable in the event of the establishment of a branch of a foreign bank in Puerto Rico. If the applicable fee is more than USD2,500, such excess will be notified to the applicant.

Both domestic and foreign domestic banks must have been issued a license by OCFI allowing for registration with the State Department prior to taking any of the steps set forth above.

Securities broker-dealers

The license under the Uniform Securities Act (PRUSA) is a license as a securities broker-dealer if the entity does not qualify for an exemption from registration.

A broker-dealer may register or notify its registration statement initially, or renew its registration or notice of registration statement, by
filing an application or notice before the Office of the Commissioner of Financial Institutions of Puerto Rico (OCFI), and also giving consent to be summoned pursuant to the provisions of the PRUSA. The application or notice shall contain any information regarding the matter required by the OCFI, such as:

- the manner and place in which the applicant was organized;
- the manner in which the applicant intends to conduct business;
- the qualifications and business history of the applicant; in the case of a broker-dealer, the qualifications and history of any partner, official or director or of any person occupying a similar position or performing similar functions, or any person directly or indirectly controlling the broker-dealer;
- any injunction or administrative order or conviction for a crime involving securities or any aspect of the securities business, or any dishonest activity unrelated to the securities business; and
- the financial condition and history of the applicant.

The OCFI may, through regulation or order, require that the applicant of an initial registration publish notices relative to their application in one or more of the newspapers published in Puerto Rico, designated by the OCFI. If no denial order is in effect concerning the registration and no proceedings are pending pursuant to the PRUSA, the registration shall be effective at noon of the thirtieth day after the application has been filed. The OCFI may, through regulation or order, specify an earlier effective date and may, through an order, defer the effective date until noon of the thirtieth day after any amendment has been filed.

- Any applicant for an initial registration or renewal shall pay a filing fee of USD500 in the case of a broker-dealer or USD150 in the case of an agent. When the application is denied or withdrawn, the OCFI shall retain the total filing fee.
- The OCFI, by regulations to such effect, may require the broker-dealers to have a minimum capital or prescribe the ratio between the net capital and the total debt, subject to the limitations as established in §15 of the Securities Exchange Act of 1934.

Subject to the limitations imposed by §15 of the Securities Exchange Act of 1934, with regard to broker-dealers, the OCFI may require the broker-dealer, through regulations to such effects, to post bonds up to the sum of USD50,000, and may establish conditions. Any appropriate deposit whether in cash or securities shall be accepted in lieu of the required bond. Registered persons whose net capital, which can be defined by regulations, exceed USD100,000, or who can offer such other securities that are acceptable to the OCFI, shall not be required to post a bond. Every bond shall provide for any action under §410 of the PRUSA (Civil Liabilities), and if the OCFI thus orders it by regulation or order, by any person who may have a cause of action that does not arise from the PRUSA. Every bond shall provide that no lawsuit shall be filed to enforce any liability contracted by virtue of the bond unless the suit is filed within two years after the sale or any other act that gives rise to the suit.

- It shall be required that the broker-dealers who wish to register in Puerto Rico shall be members of the Financial Industry Regulatory Authority (FINRA), or its successor.
- The OCFI may use the services of the Central Registration Depository or any successor or similar system operated by FINRA or its affiliates, to accept registration requests, the filing of documents and the collection of fees in the name of the OCFI.

Other financial institutions

Financial institutions under the jurisdiction of the OCFI need to obtain a license under the appropriate statute that usually requires the filing of an application, information about its directors, officers and shareholders, filing fees and, in some cases, a fidelity bond.

Last modified 11 Dec 2019

**What are the main ongoing compliance requirements?**

**Commercial banks**

All commercial banks in Puerto Rico are regulated by the Office of the Commissioner of Financial Institutions of Puerto Rico (OCFI) and also have their deposits insured by the US Federal Deposit Insurance Corporation (FDIC) and as such are required to comply with the regulations of the FDIC. These essentially regulate capital, asset quality, management, earnings, liquidity and interest rate sensitivity management. In addition, special attention is given to anti-money laundering regulation and bank secrecy. Some commercial banks are also members of the US Federal Reserve System (Fed) and are subject to the Fed regulations as well.
Securities broker-dealers

Securities broker-dealers in Puerto Rico are required to become members of self-regulatory organizations such as the Financial Industry Regulatory Authority (FINRA). Most, if not all, securities broker-dealers in Puerto Rico are members of FINRA and are required to comply with its regulations. These regulations pertain to net capital requirements, communications with clients, disclosures to clients, licensing and supervision of personnel and claims, among others.

Last modified 11 Dec 2019

What are the penalties for failure to be authorized?

There are civil and criminal penalties for the entity and officers and directors involved. Depending on the violation, the individuals can be barred from the industry and disqualified from obtaining licenses and authorizations in Puerto Rico.

Last modified 11 Dec 2019

Regulated activities

What finance and investment activities require authorization?

Generally

The following require authorization:

- commercial banks;
- securities broker-dealers;
- investment advisors;
- financial advisors;
- lenders;
- small loan lenders;
- mortgage banks;
- credit card issuers;
- investment companies (mutual funds);
- cooperatives (credit unions);
- financial intermediaries;
- insurance companies;
- insurance brokers;
- insurance agencies;
- international insurers;
- international banking entities; and
- international financial entities.

Consumer credit

The following require authorization:
• commercial banks;
• financial intermediaries;
• lenders;
• credit unions;
• small loan lenders;
• mortgage banks; and
• credit card issuers.

Are there any possible exemptions?

Yes.

For each type of non-depository regulated activity there are a number of specific exemptions that could apply, such as de minimis transactions being registered under other statutes or engaging in certain transactions.

Do any exchange controls or other restrictions on payments apply?

There are no exchange controls under Puerto Rican laws as the currency in Puerto Rico is the US dollar, which is exclusively regulated at the US federal level.

What are the rules around financial promotions?

A financial promotion is a communication of an invitation or inducement to engage in investment activity (offer to sell or buy). Any such marketing of financial products, especially securities, are heavily regulated under the Uniform Securities Act (PRUSA). Pursuant to such regulation, marketing material needs to be registered and all written materials to sell securities are subject to anti-fraud protections.

Exemptions

There are a number of exemptions applicable to the registration of written marketing material to be used in the sale of securities, but there is no exemption from the anti-fraud provisions of the PRUSA and other US federal securities laws.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common types of legal entities are corporations and limited liability companies (LLCs), both of which are legal entities with separate legal personality and limited liability with respect to their shareholders or members, as applicable.

Corporations can be private or public, depending on whether their shares are offered to the public. Corporations are usually denoted by the suffix Inc. or Corp. LLCs can also be private or public and are denoted by the suffix LLC.
The liability of a corporation's shareholders or LLC's members can be limited by shares or membership interests, in which case they are liable up to the capital contributed to the entity, but not the entity's liabilities or by guarantee, where they are also liable to pay a certain amount if the company is wound up.

LLCs are similar to corporations in many ways, with the main differences being that they are:

- not required to file public annual reports with the Puerto Rican State Department;
- not required to publicly disclose names of members;
- are allowed more flexible corporate governance structures; and
- may be taxed as partnerships or corporations.

**Funds**

Investment funds tend to take the form of limited liability companies, trusts or corporations.

Fund managers tend to be set up as limited liability companies or corporations.

*Last modified 11 Dec 2019*

**Is it possible to conduct lending or investment business through a branch or establishment?**

Yes.

However, the branch or establishment will need the appropriate licenses to conduct business in Puerto Rico.

*Last modified 11 Dec 2019*

**FinTech**

**FinTech products and uses**

**What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?**

**Peer-to-peer funding platforms and marketplace lending**

The FinTech marketplace in Puerto Rico is in its early stages of development. Due to the political and economic relationship between Puerto Rico and the United States (US), it is expected that developments in FinTech solutions will come as a result of evolving trends in this area from the US. As a result, Puerto Rico has not seen any local trends in financing mechanisms for marketplace lending platforms or other similar structures; the only type of emerging funding platform we are aware of is reward-based crowdfunding.

One of Puerto Rico's economic development strategies, however, is based on transforming Puerto Rico into an attractive and successful services export hub. To this end, several tax incentive laws have been approved which provide attractive tax benefits to companies that establish their operations in Puerto Rico in order to export their services abroad. It is expected that these tax benefits will attract FinTech companies from all over the world to Puerto Rico, and these will play an active role in the development of the local marketplace in the near future.

Although commercial banks do provide limited internet banking and are starting to offer peer-to-peer payment products, financial services and products are still, generally, delivered by traditional means. Thus, generally speaking, in Puerto Rico, financial services and products continue to be provided by traditional market players, namely commercial banks, credit unions and other non-depository lending companies.
Blockchain, smart contracts and cryptocurrencies

The financial system in Puerto Rico continues to offer banking services under traditional security technology. No major developments have been observed in blockchain, smart contracts or cryptocurrencies. However, it is expected that commercial banks operating in Puerto Rico will need to enhance their offering in this area, as new technologies develop in the US and Europe.

Notwithstanding the above, the formation of International Financial Entities with cryptocurrency and digital exchange markets have been approved by the Office of the Commissioner of Financial Institutions.

Initial coin offerings (ICOs) and token-based products

There have been no ICO products introduced into Puerto Rico; however, due to its close relationship with the US markets, it is conceivable that this type of funding mechanism will be developed in Puerto Rico in the near future.

Artificial intelligence and robo advisory systems

Puerto Rico has not yet seen any developments in connection with artificial intelligence or robo advisory systems. It is anticipated that these will be introduced, as these software tools continue to develop in the US.

Data analysis and cloud computing

Cloud computing is available in Puerto Rico to support future FinTech applications that may be developed in Puerto Rico.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

As the FinTech sector in Puerto Rico is still in its early stages, there are no specific laws, regulations or procedures applicable to these products or sectors.

The Office of the Commissioner of Financial Institutions is the main regulator of the financial sector in Puerto Rico. Other financial institutions, such as insurance companies, are regulated by the Office of the Commissioner of Insurance. The credit unions are regulated by the Public Corporation for the Regulation and Insurance of Cooperatives.

Commercial banks in Puerto Rico are also part of the US banking regulatory system inasmuch as the deposits of all such institutions are insured by the Federal Deposit Insurance Corporation. As a result, commercial banks in Puerto Rico are subject to laws and regulations applicable to banks in the US and are supervised by the applicable US supervisory agency, as well as by the local regulator. Therefore, it is anticipated that the local regulatory environment in Puerto Rico will be developed in line with the US regulatory system as financial innovation continues its dynamic growth.

FinTech companies looking to conduct business in Puerto Rico, must ensure compliance with the applicable local laws including licensing requirements for the conduct of banking business, as well as with any consumer lending, securities and insurance laws and regulations applicable to any such activities.

Electronic payments platforms and regulation of peer-to-peer lenders

There are no specific laws or regulations in Puerto Rico that regulate electronic payment platforms or peer-to-peer lending.

Regulation of payment services

Payment services in Puerto Rico are generally controlled by commercial banks and credit unions. There are other important players in this market such as the money services businesses. Under the Money Services Business Regulatory Act (MSBRA) any entity that proposes to conduct a money services business in Puerto Rico must obtain a license from the Office of the Commissioner of Financial Institutions. The MSBRA covers entities that provide money transfer services, check cashing services and money order services, as a regular business in
Puerto Rico. The MSBRA provides certain minimum capital and liquid assets requirements and incorporates by reference all US federal anti-money laundering laws and regulations.

**Application of data protection and consumer laws**

There is no single law in Puerto Rico that provides a comprehensive treatment of data protection or privacy issues. There are, however, several applicable local and US federal laws and regulations related to the protection of consumer information, including privacy and security, most of which are focused on the protection of non-public information about consumers by financial institutions.

The Citizens Information of Data Banks Security Act (DBSA) makes it mandatory to notify the Puerto Rico Consumers Affairs Department (DACO) in the event of a data breach within ten days of detection. Upon receiving notice, DACO may make the breach public within 24 hours.

A data breach is defined in the DBSA as any incident in which personal information is accessed in such a way that the security or confidentiality of the data is compromised, regardless of whether the personal information is accessed with or without permission, or under false pretenses. If a breach is suspected to involve criminal activity, the DBSA recognizes the need to delay notification and allow for enforcement agencies to conduct an investigation and prevent evidence from being destroyed, lost or altered.

There are two exceptions for providing a data breach notification under the DBSA. The first is where the data is protected by encrypted or other technical controls (in that case, the incident might not be considered a data breach). Second, if the breached entity already provides for a data breach notification procedure as a part of its own information security policies, that affords individuals equal or greater protection. The DBSA provides various options for the notification and also sets forth certain basic information that must be included.

The Consumer Personal Information Destruction Act (CPIDA) requires commercial entities to securely destroy any data or records that contain personally identifying information. All documents must be shredded, or the information must be suppressed or modified so as to render it illegible or unidentifiable. The CPIDA does not address or specify what reasonable safeguards or appropriate security measures should be employed in order to properly dispose of electronic material. The destruction of information must be documented via a notarial act and preserved for a period of ten years.

Title V of the federal Gramm-Leach Bliley Act and regulations issued thereunder, require financial institutions, generally defined as companies that offer consumer financial products or services, to:

- explain to their customers their information sharing practices;
- safeguard customers’ sensitive data; and
- give consumers the option to opt-out of some sharing of personal financial institutions (in this respect, customers must be notified, on a periodic basis, of the financial institution’s Privacy Policy and must be given the option to opt-out of the customer’s personal information sharing).

The Notification of Privacy Policies Act (NPPA) imposes on every website operator and any person who collects personal information, the duty to notify its users of its information sharing policies and practices in a clear, concise and conspicuous manner. Furthermore, the NPPA requires that website operators inform individuals of their rights, if any, to access or rectify their personal information and the procedures for obtaining notice when the privacy notice is revised.

**Money laundering regulations**

The US federal anti-money laundering (AML) laws and regulations are applicable in Puerto Rico to the same extent as they apply to any state of the US. Specifically, the Bank Secrecy Act (BSA) provides a comprehensive set of rules that must be complied with by financial institutions that conduct business in the US and its territories (such as Puerto Rico), designed to assist the US government agencies in detecting and preventing money laundering. Generally, the BSA and its implementing regulations require, among others, the establishment by covered financial institutions of specific AML programs as well as know-your-customer programs. Under such programs, covered financial institutions are generally required to identify and report transactions of a suspicious nature to the Financial Institutions Crime Enforcement Network and the Office of Foreign Asset Control, agencies of the US Treasury Department. Further, financial institutions are required to verify customer identity and understand the kinds of transactions in which the customer is likely to engage. Moreover, there are reporting obligations regarding cash transactions in excess of USD10,000 received by covered transactions.

In addition to the BSA, Section 60501(a) of Title 26 of the US Internal Revenue Code (the Code) generally provides that any person engaged in trade or business who receives more than USD10,000 in cash in a single transaction or in related transactions must file a
report with the US Internal Revenue Service. The Code provides certain exceptions to the general rule stated above, such as:

- cash received by a financial institution; and
- transactions occurring outside of the US (which includes Puerto Rico).

Finally, Act No. 131 of July 23, 1974, as amended (Act 131) is the most relevant locally enacted AML statute. Act 131 requires domestic financial institutions covered to report to the local Treasury Department any wire transfer of funds in excess of USD5,000 that is initiated to or received from a foreign country.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Since FinTech has yet to develop in Puerto Rico, we are not aware of any funding arrangements or incentives specifically targeted at this sector. There are, however, funding mechanisms available for startups or innovative businesses more generally, addressed below. Initial investment in startup businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

Grupo Guayacan, a non-profit dedicated to promoting entrepreneurship, has recently launched a fund to invest seed capital in startups.

CROWDFUNDING

Crowdfunding may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform, such as Kickstarter.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

To our knowledge, there is no equity crowdfunding platform specifically geared to Puerto Rico businesses; however, as Puerto Rico is part of the US, US-based platforms are available and have been used by local businesses. We know of one local reward-based crowdfunding platform, Antrocket, although it appears to be currently inactive. As with equity crowdfunding platforms, reward-based crowdfunding platforms based in the US are available for local businesses.

ACCELERATORS

There are various incubators or accelerators in Puerto Rico which offer support, facilities and funding for startups, sometimes in return for an equity stake. The most well-known is Parallel18, which is a program of the Puerto Rico Science, Technology and Research Trust which offers cash grants, together with mentoring from industry experts. Several municipalities, including Caguas and Mayaguez, also operate incubators/accelerators. In addition, there are several business plan competitions in Puerto Rico which also provide cash grants and mentoring. The best-known is called EnterPRize and is run by Grupo Guayacan.

Venture capital and debt

Venture capital (VC) funding is a type of equity investment usually targeted at early stage companies with an established business and some trading history. VC provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset
base or long track record needed to attract traditional debt funding from financial institutions.

There are a few VC funds in Puerto Rico. The best-known is Advent-Morro.

To our knowledge, venture debt is not available in Puerto Rico.

**Warehouse and platform funding**

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator. Warehouse financing is unusual in Puerto Rico, except in the context of commercial and residential mortgages. It is sometimes seen in subsidiaries of large companies, as part of a broader US or global financing. Asset based loan financing by banks is somewhat more common.

Another alternative form of funding is by way of peer-to-peer (P2P) lending platforms, which bring individual borrowers and lenders together without the involvement of traditional banks. P2P lending does not involve equity investments, and instead interest is paid on the money borrowed. We are not aware of any local P2P lending platforms, but local businesses have access to US P2P lending platforms.

**Senior bank debt and capital markets funding**

**SENIOR BANK DEBT**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes. Bank debt is the most common financing method in Puerto Rico, as the local banking sector is robust and sophisticated.

**CAPITAL MARKETS FUNDING**

Puerto Rico has no equity capital markets. The US equity capital markets are accessible to Puerto Rican businesses, but most Puerto Rican businesses are too small to make this a viable financing alternative. Currently, there are only a handful of publicly listed Puerto Rico-based companies (principally banks and insurance companies).

Puerto Rico has private debt markets (mainly bonds and notes), although these have been significantly reduced as a result of the current financial crisis. In the past, companies issued industrial revenue bonds (known as AFICAs) and banks issued preferred debt. There have also been private placements of debt by hotel and resort companies, a private toll road, the operator of the airport and certain conduit offerings, all of which are sizeable businesses.

**Convertible bonds/loan notes**

Convertible bonds or loan notes are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances. Convertible bonds are not all that common in Puerto Rico.

**Incentives and reliefs**

Puerto Rico's new Incentives Code became law on 1 July 2019. The Incentives Code effectively consolidates all tax incentives available for different economic activities into a single legislative measure, including export services businesses (“ESBs”) previously covered under Act No. 20-2012, the Act to Promote the Exportation of Services (APES), as well as private equity funds (“PEFs”) previously covered under Act No. 185-2014, the Private Equity Funds Act (PEFA).

The Incentives Code promotes the establishment of ESBs in Puerto Rico by granting tax incentives for exporting services from Puerto Rico to persons outside of Puerto Rico with no nexus to Puerto Rico. Among the export services covered by the Incentives Code are (collectively, “ESB Eligible Activities”):

- blockchain and cloud-computing services;
• research and development;
• advertisement and public relations;
• consulting;
• investment banking, asset management and other financial services; and
• professional services such as legal, accounting, architectural and engineering services, among others.

In general, qualifying ESBs must file an application with and obtain a tax decree from the Department of Economic Development and Commerce (DDEC, for its Spanish acronym) (“ESB Decree”) to receive the following tax benefits:

• a 15-year binding contract with the government of Puerto Rico, which means that the constitutional prohibition against the impairment of contracts should protect the awarded tax benefits from any potential revocation or amendment by subsequent legislation;
• a 4% income tax rate on the net income derived from the ESB Eligible Activities covered by the ESB Decree;
• no income tax on dividend distributions the ESB makes out of its earnings and profits derived from the APES Eligible Activities;
• a 50% exemption from municipal license taxes on the volume of business derived from the ESB Eligible Activities; and
• a 75% exemption from real and personal property taxes with respect to property used in the ESB Eligible Activities.

The Incentives Code has two aims with respect to PEFs: to promote investment in entities that do not have access to public capital markets and to attract capital investments in Puerto Rico.

In general, the Incentives Code provides that any limited liability company or partnerships (domestic or foreign) engaged in the business of investing in such instruments or notes, bonds, or stock (not traded or quoted in public markets when acquired) may file an application with the DDEC to be treated as a PEFs, subject to certain conditions. Among other requirements, this limited liability company or partnership must have an office in Puerto Rico and must enter into a contract with a registered investment advisor who is engaged in trade or business in Puerto Rico, which may subcontract another investment advisor that is located outside Puerto Rico. In addition, the Incentives Code provides that a series limited liability company (LLC) may elect to be treated as a single “private equity fund,” regardless of the number of series. The Incentives Code also provides that securities issued by the government of Puerto Rico are eligible investments for purposes of the minimum investment in Puerto Rico securities requirements. Finally, the diversification threshold for investing in a single business is 50%.

Under the Incentives Code, a qualifying PEF must file an application with and obtain a tax exemption grant from the DDEC, the content and specifications of this application of which are not yet available, to receive the following tax incentives:

• The PEF is treated as a partnership for Puerto Rico income tax purposes. Accordingly, a PEF is not subject to Puerto Rico income tax; instead, the investors are subject to Puerto Rico income tax with respect to their distributive share of the income of the PEF.
• The share of an accredited investor of dividends and interest derived by the PEF is subject to a Puerto Rico fixed income tax rate of 10%. Nevertheless, interest or dividend income derived by the PEF and that is exempt from Puerto Rico income tax is also exempt for the accredited investors.
• An accredited investor’s share of capital gains derived by a PEF is exempt from Puerto Rico income tax.
• Capital gains from the sale of the private equity fund interest are subject to a Puerto Rico fixed income tax rate of 5%. However, if total gross proceeds are reinvested in a Puerto Rico private equity fund within 90 days from the date of the sale, such capital gains are not subject to Puerto Rico income tax.
• In the case of registered investment advisors, general partners and private equity firms, interest and dividend income is subject to a Puerto Rico income tax rate of 5% and capital gains are subject to a 2.5% tax rate.
• A 30% or 60% deduction with respect to the initial investment in the PEF, provided certain rules are met and a 75% exemption on real and personal property taxes and 100% exemption on municipal license taxes; however, property such as stock, bonds, notes, promissory notes and other securities or debt instruments in which a PEF invests in is exempt property under the Municipal Property Tax Act of 1991, as amended, and is not otherwise subject to Puerto Rico personal property taxes.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Buying and selling loans is very common.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are through the purchase of asset and liabilities agreements and servicing agreements. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

Last modified 11 Dec 2019

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller's legal advisors. Some of the key considerations include:

- confidentiality – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- data protection – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- lender eligibility – whether there are any restrictions around the type of entity to which the loan can be transferred;
- undrawn commitments – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- servicing obligations and fees – a sale of a pool of loans is usually subject to servicing and servicing fees;
- transfer mechanics – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and
- consent – whether a transfer requires the consent or notification of any other parties.

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

The ownership of energy and infrastructure assets in Puerto Rico varies according to the asset class. The main asset classes are usually considered to be:

- economic infrastructure (e.g. energy, aviation, rail, telecommunications, water, roads and waste); and
- social infrastructure (e.g. education, health and justice/prisons, and housing).

Key sectors are considered below.

Energy
Energy in Puerto Rico is principally generated by the Puerto Rico Electric Power Authority (PREPA), a government instrumentality of the Commonwealth of Puerto Rico. PREPA is the largest public utility in the US. Given the financial challenges facing PREPA, including the looming default of its debt obligations and its restructuring, the government has issued a request for proposals (RFPs) for the privatization of the transmission of energy and is scheduled to issue and RFP for generation of electricity in the first quarter of 2020.

**Telecoms infrastructure**

Currently, the Puerto Rico Telephone Company (PRTC), the principal provider of telephone services in Puerto Rico, is privately owned by America Movil from Mexico (a company owned by Carlos Slim). At one moment in time, the Commonwealth of Puerto Rico owned and controlled the PRTC but later sold it to GTE/Verizon, who later sold it to America Movil. There are other telephone services providers in Puerto Rico, but all are currently private. There are plans for a subsidiary of PREPA to offer telephone and internet services through PREPA Net, but that service is not up and running in the public market yet.

**Transport infrastructure**

The main airport in Puerto Rico, the Luis Muñoz Marín International Airport (LMM Airport), was leased for a term of 40 years to Aerostar Airport Holdings, LLC through a public-private partnership (P3) on 26 February 2013. Aerostar is a private operator of the airport and is a venture from Mexico (60% ASUR) and Canada (40% Public Pensions Plans of Canada). All other port facilities, including other regional airports and maritime ports are government owned. The Commonwealth of Puerto Rico has indicated that they will be issuing RFPs for P3 projects related to the regional airports and the maritime ports.

Similarly to what happened to the LMM Airport, the Puerto Rico Highways and Transportation Authority entered into an Operation and Maintenance Agreement with Metropistas de Puerto Rico related to the PR-22 and PR-5 highways in the north of Puerto Rico. Metropistas is a joint venture between Goldman Sachs & Co. and Abertis from Spain. In addition to this P3, the Teodoro Moscosso Bridge is also operated by an affiliate of Abertis. The rest of the highway and transportation network in Puerto Rico is publicly owned and operated. The Commonwealth of Puerto Rico has indicated that they will be issuing RFPs for P3 projects related to the highways and transportation infrastructure.

**Other infrastructure**

All other economic infrastructure is owned and operated by the government government (subject to ongoing negotiations with private parties to operate (i) Puerto Rico's regional airports and ferry systems and (ii) the San Juan Cruise Terminal). Social infrastructure is a mixture of government and privately owned and operated projects.

**Are there special rules for investing in energy and infrastructure?**

Since the Commonwealth of Puerto Rico no longer has access to the world capital markets, the government is relying on public-private partnerships (P3) to put forward energy and infrastructure projects. Therefore investing in these projects is through the procurement of P3 projects. That procurement is pursuant to the Puerto Rico Public-Private Partnership Act of 2009, as amended (P3 Act). The P3 Act expressly states that it is the public policy of the Commonwealth of Puerto Rico to favor and promote the establishment of P3s and further authorizes all departments, agencies, public corporations, and instrumentalities, as well as municipalities and the legislative and judicial branches of the Commonwealth of Puerto Rico, to use the establishment of P3s in accordance with the process specified therein. The P3 Act also establishes that the Commonwealth of Puerto Rico shall not legislate to limit the powers or rights granted to the Puerto Rico Public-Private Partnership Authority (Authority) and partnering government entities under the P3 Act until the obligations under an executed P3 contract are satisfied. The P3 Act also sets out the areas where P3s are expressly authorized as a matter of policy. These are defined as ‘Priority Projects.’

The Priority Projects are:

- the development, construction or operation of sanitary landfill systems, including methane recovery operations, as well as facilities for the management and disposal of non-hazardous and hazardous solid waste, such as plants for recycling, composting and converting waste into energy;

- the construction, operation or maintenance of reservoirs and dams, including any infrastructure necessary for their operation to produce, treat, and distribute water and any infrastructure for the production of hydroelectric energy and for sewage and potable
water treatment plants;

- the construction, operation or maintenance of existing or new plants for the production of energy;
- the construction operation or maintenance of transportation systems of any kind, thorough a fare system or related infrastructure;
- the construction, operation or maintenance of educational, health, security, correctional and rehabilitation facilities. It is worth noting that when operating educational facilities, a P3 may only be established if the contract is executed with a worker-owned cooperative, a special employee-owned corporation or a nonprofit entity;
- the construction, operation or maintenance of affordable housing projects;
- the construction, operation or maintenance of sports, recreational, tourist and cultural entertainment facilities;
- the construction, operation or maintenance of wired or wireless communication networks for communications infrastructure of any kind;
- the design, construction, operation or maintenance of high technology, computer and automation systems; and
- the construction, operation or maintenance of any kind of activity or facility or service as may be identified from time to time as a Priority Project through legislation.

**Legal framework**

The existence of the P3 Act and its regulation provide clarity, uniformity, and boundaries to the P3 selection process and contracting, underscoring the strength of Puerto Rico as a jurisdiction with certainty with respect to the legal framework for the development of P3s. Of particular significance are the following aspects of the P3 Act and Puerto Rico's legal system.

**P3 CONTRACTS**

The P3 Act broadly allows for creation of P3s, providing that P3 contracts may be design-build; design-build-operate; design-build-finance-operate; design-build-transfer-operate; design-build-operate-transfer; turnkey; long-term lease; surface right; administrative grant; joint venture; long-term administration and operation; and/or any other kind of agreement that separates or combines the design, building, financing, operation or maintenance phases of the so called Priority Projects. Furthermore, the P3 Act is clear about certain required clauses in a P3 contract, possible clauses to be negotiated between the parties and boundaries with respect to other clauses. The P3 Act even discusses the issue of the possible transfer of public employees to the P3 entity when the government partner benefitting from the P3 is in a precarious fiscal condition. The P3 contracts may have an initial maximum term of 50 years and may be extended for an additional 25 years (75 years total) provided certain conditions are met.

**CONFIDENTIALITY**

The P3 Act establishes a balance between information that has to be disclosed publicly and confidential information. It provides for ways of protecting certain privileged or protected information disclosed by proponents to the Authority as a part of the P3 procurement process. The proponents shall have the duty of identifying the information that the proponent considers confidential and, when presenting the proposal, request confidential treatment. The Authority will evaluate the requested confidential treatment in accordance with the procedure established in the P3 Act and in the Regulation and then make a determination regarding the same; if it constitutes a trade secret, proprietary information or privileged/confidential information, all such information shall be protected. Also, Act 80 of 2011, known as the Trade Secrets Act of Puerto Rico, follows the Uniform Trade Secrets Act which classifies a trade secret as any confidential information that has economic value or that provides commercial advantage and is under reasonable security measures.

**TAXES**

The P3 Act provides property tax exemptions for facilities subject to a P3 contract and any property used exclusively in, or for, the facility subject to the P3 contract if it is acquired, built or owned by the partnering government entity and is made available to the operator. The private partner may enter into agreements with municipalities to establish exemptions from municipal license fees, excise taxes or municipal taxes. In addition, the private partner, whether classified as a corporation or as flow-through entity for PR income tax purposes, is subject to a fixed preferential income tax rate of 1020% over the net income derived from the operations provided in the P3 contract, in lieu of any other income taxes imposed by the PR Internal Revenue Code of 2011, as amended (“PR-IRC”). Distributions of the net profits derived from the operations provided in the P3 contract to the shareholders, members or partners, as the case may be, of the private partner are not subject to further taxation in Puerto Rico.
What is the applicable procurement process?

Once the Puerto Rico Public-Private Partnership Authority (Authority) has determined that the project meets the public policy requirements of the P3 Act and it is advisable to pursue the establishment of a public-private partnership (P3), then the P3 Act provides for two kinds of procurement procedures:

- competitive negotiated procurement; and
- negotiations without a request for proposal.

The P3 Act also provides for unsolicited proposals. The first procurement procedure involves request for qualifications (RFQ) issued by the Authority to identify the persons that satisfy the minimum standards to enter into a P3 contract. The P3 Act describes the qualifications to be a proponent. Among these qualifications, a proponent must:

- be authorized to do business in the Commonwealth of Puerto Rico;
- have available corporate or equity capital or securities or other financial resources that are necessary for the construction and proper operation, as applicable, of the P3;
- have a good reputation;
- have technical capacity and experience; and
- certify that neither it nor any of its directors or officers have formally been convicted for acts of corruption in Puerto Rico, the US or any foreign country.

Proponents may present proposals jointly under consortia. After the RFQ process, requests for proposals (RFPs) will be issued. Proponents who submit proposals for P3 contracts shall assume the risk of paying for all expenses related to the RFQ and RFP processes.

The second procedure is initiated by the Authority and allows the negotiation of a partnership contract without abiding by the RFQ and RFP procedure only when:

- there is only one source capable of providing the service required; and
- an RFP was issued and received no responses or the proposals submitted failed to meet the indicated requirements, and, in the Authority's opinion, issuing a new RFQ and RFP would cause such delay that a partnership contract may not be executed in the time required.

Prior to executing a contract with proponents chosen pursuant to this second procurement alternative, the Authority must notify the legislature Public-Private Partnership Joint Commission. Unsolicited proposals are also provided for under the P3 Act.

Unsolicited proposals may be received by the Authority provided they include, at a minimum:

- a summary of the proposed project;
- a description of how the proposed project satisfies a government need;
- how the proposal differs from other traditional or proposed approaches to develop the project;
- the amount of public resources needed to complete the project and indirect and direct costs involved, including capital costs;
- financial viability and financing mechanisms available;
- commercial aspects of the project;
- possible public benefit;
- proposed method of execution; and
- unique intellectual property involved, if any.

If the Authority considers the unsolicited proposal to be favorable to the public interest, it may either enter into talks directly with the
unsolicited proponent or commence a process of open RFP, depending on various conditions indicated in the P3 Act.

**What are the most common forms of funding / investing in energy and infrastructure?**

**Funding**

In the past the principal source of funding for energy and infrastructure projects was through the issuance of municipal bonds by instrumentalities of the Commonwealth of Puerto Rico such as the Puerto Rico Electric Power Authority. Given the financial challenges of the government sector in Puerto Rico and the lack of access to the world capital markets, the shift has been to financing projects through public-private partnerships (P3s) (brownfields and greenfields).

**Investing**

Since the government is relying almost exclusively on P3s, there are investment opportunities for infrastructure funds and similar investors and lenders to such investors.

**Restructuring**

**Enforcement and sanctions**

**When can there be regulatory investigations?**

When the Office of the Commissioner of Financial Institutions considers that a regulated company or individual may have breached the ongoing compliance requirements or that an unregulated person carries out regulated activities, it can launch an investigation which may result in fines or penalties.

**What regulatory penalties may apply?**

When a regulatory breach has taken place, the Office of the Commissioner of Financial Institutions of Puerto Rico may impose a fine or penalty, or revoke the license to operate in Puerto Rico. These penalties are published in the applicable regulations.

**What criminal penalties may apply?**

Criminal penalties may apply to the extent that the Puerto Rican Criminal Code is violated or if US federal laws are violated. Generally, this occurs in cases of insider trading, material misstatements, money laundering, and when carrying out regulated activities without authorization.

**Tax**

**Tax issues**

**Are stamp, registration, transfer or other similar taxes applicable?**
Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer of assignment of a loan?

No.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture of other security?

No.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?

No.

*Do tax authorities take priority on enforcement?*

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?

With respect to real property taxes, the Puerto Rico Municipal Revenue Collection Center (known as CRIM for its Spanish acronym) has a preferential lien, which has priority over any other lien. The lien is limited to real property taxes owed for the current fiscal year and the previous five fiscal years.

*Is withholding tax on interest payments applicable?*

Is there withholding tax on interest payments under a loan?

Generally, there is no income tax withholding on interest payments made to any Puerto Rico entity. Similarly, there is no income tax withholding on interest payments made to a foreign entity, unless:

- the creditor is a foreign entity not engaged in a trade or business in Puerto Rico; and
- the debtor and creditor are ‘related persons’ under the Puerto Rico Internal Revenue Code of 2011, as amended.

If so:

What is the rate of withholding?

Where applicable, the rate of withholding is 29%.

What are the key exemptions?

As indicated above, interest payments made to any Puerto Rico entity are not subject to income tax withholding and interest payments made to a foreign entity are not subject to income tax withholding if the foreign entity is not a ‘related person’ with respect to the debtor. Other exemptions exist for interest paid to foreign entities that are otherwise ‘related persons’ for interest paid on bank deposits and interest paid by international banking entities. There are no tax treaties between Puerto Rico and other jurisdictions.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.
Are foreign lenders and debt security holders subject to tax on interest payments?

In general, foreign lenders and foreign debt security holders not engaged in a trade or business in Puerto Rico are not subject to Puerto Rico income tax on interest payments, unless they fall within the definition of 'related persons' of the Puerto Rico Internal Revenue Code of 2011, as amended.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both Romanian and EU law. Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Romania or to request that they are admitted to trading on a regulated market operating in Romania unless a prospectus approved by the Financial Supervisory Authority has been made available to the public.

Last modified 20 Oct 2017

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Romania are bonds or notes issued on a stand-alone basis or under a program. Common forms of debt securities offered in Romania include:

- government bonds and treasury certificates;
- municipal bonds;
- corporate bonds;
- exchangeable bonds (debt securities convertible into the equity of a third party); and
- warrants (securities giving the holders the option to purchase the equity of the issuer or a related company).

In addition, following the enactment of Law No 304/2015 which entered into force on March 2016, a new legislative framework was established in order to facilitate the issuance of mortgage covered bonds by credit institutions.

Last modified 20 Oct 2017

What are the differences between offering debt securities to institutional / professional or other investors?

The preparation and publishing of a prospectus are not mandatory for an offer of securities addressed solely to professional investors. Professional investors are defined as clients who have the experience, knowledge and ability required to take investment decisions and assess the risks involved, and include, *inter alios*, the following:
• credit institutions;
• investment firms;
• other financial institutions authorized or regulated;
• insurance companies;
• Undertakings for Collective Investments In Transferable Securities (UCITS) and their management firms;
• pension funds and their management firms;
• traders; and
• firms which meet two of the following requirements:
  • aggregate balance sheet – €20 million;
  • net turnover – €40 million; and
  • equity – €2 million.

When is it necessary to prepare a prospectus?

Under Romanian law, unless an exemption applies, it is necessary to publish a prospectus approved by the Financial Supervisory Authority where there is an offer of securities to the public.

Certain exemptions where the preparation and publishing of a prospectus are not mandatory apply, such as, inter alios, the following:

• an offer of securities addressed solely to qualified investors;
• an offer of securities addressed to less than 150 investors, natural or legal persons, other than qualified investors, per member state of the EU;
• an offer of securities addressed to investors who each acquire securities of at least the equivalent in RON of €100,000 for each separate offer;
• an offer of securities whose nominal value per unit amounts to at least the RON equivalent of €100,000; and
• an offer of securities whose total value in the EU is less than the equivalent in RON of €100,000, calculated over a period of 12 months.

Even if the offer is exempted from the prospectus requirement, as a general rule a prospectus is still required if an application is made for the securities to be admitted to trading on a regulated market.

What are the main exchanges available?

The Bucharest Stock Exchange

The Bucharest Stock Exchange is authorized by the Financial Supervisory Authority (FSA) as a market operator and, as such, it manages a spot regulated market.

The Bucharest Stock Exchange is also authorized by the FSA as a system operator. In this capacity, it operates an Alternative Trading System (Multilateral Trading Facility).

Is there a private placement market?
Romania has a low-volume private placement market.

Last modified 20 Oct 2017

**Are there any other notable risks or issues around issuing or investing in debt securities?**

**Issuing debt securities**

Making a public offer without the Financial Supervisory Authority's approval of the prospectus, when no exemption applies, constitutes an administrative offense.

Issuers are required to take responsibility for prospectuses for debt securities.

Misleading statements in, or omissions from, any applicable offering document may give rise to civil and, under certain circumstances and mainly in case of willful misconduct, criminal liability.

Last modified 20 Oct 2017

**Establishing and investing in debt / hedge funds**

**Are there any restrictions on establishing a fund?**

In order to comply with the Romanian legislation, investment vehicles must be established in accordance with the following conditions.

**Undertakings for Collective Investments In Transferable Securities (UCITS)**

UCITS for which Romania is home member state, may only operate based on the authorization issued by the Financial Supervisory Authority (FSA).

The FSA authorization shall not be issued in case:

- the persons who effectively manage the fund do not have the reputation or necessary experience to perform activities which are specific to a certain type of UCITS; or
- the UCITS is restricted by law (including by inserting a provision in the rules of the fund or in the articles of association of the company) to distribute all the participation titles on the territory of Romania.

**Open-ended investment funds**

The initiative for setting up an open-ended investment fund belongs exclusively to the investment management company, in accordance with the decision of the board.

Open-ended investment funds are managed by an investment management company. Therefore, a prerequisite for obtaining a license from the FSA is to have a license for the investment management company or the consent of the FSA with regards to an investment management company's request from a member state to manage the respective investment fund.

**Open-ended investment companies**

Open-ended investment companies must be licensed by the FSA (the licensing requirements for open-ended investment funds are also applicable to open-ended investment companies). Such companies may be managed either by their board of directors or by a separate investment management company.

Open-ended investment companies may not perform other activities than:

- operating collective investments by placing financial resources in financial instruments (as provided by law) based on the risk diversification and prudent administration principle; and
ensuring that the value of the titles for participation on a market does not vary significantly in relation to the value of the net unit asset.

The initial capital of investment companies managed by their board of directors must amount to at least the RON equivalent of €300,000.

Open-ended investment companies must request the trading admission on a regulated market within 90 days from the issuance of the FSA authorization.

**Alternative Investment Funds (AIFs)**

Each AIF is administered by an AIF manager (AIFM) which may be an external manager. In case the AIF is self-administered, the provisions related to AIFMs are also applicable.

The AIFM must fulfil the following requirements:

- it must be authorized by the FSA; and
- in order to be authorized:
  - the AIFM must have initial share capital and sufficient own funds in accordance with the law;
  - the persons who effectively manage the AIFM must have the reputation or necessary experience as required by the FSA;
  - the day-to-day management must be ensured by at least two persons meeting such conditions;
  - the AIFM shareholders that have qualifying holdings must meet the requirements of the need to ensure sound and prudent management of the AIFM; and
  - the head office and registered office of the AIFM must be located in Romania.

**What are common fund structures?**

Common forms of funds include:

- Undertakings for Collective Investments In Transferable Securities;
- Alternative Investment Funds; and
- financial investment companies.

**What are the differences between offering fund securities to professional / institutional or other investors?**

Participative titles issued by Alternative Investment Funds (AIFs) which are authorized in other member states can be offered to retail investors in Romania only if those AIFs observe the conditions of the investment limits and reporting, transparency and publicity requirements currently applicable to Other Collective Investment Undertakings (OCIU) which attract financial resources publicly.

In addition to such conditions, participative titles which are issued by AIFs authorized in other member states and which may be offered to Romanian professional investors, may be distributed to Romanian retail investors only if the entities which perform the distribution are authorized to provide investment advisory services.

**Are there any other notable risks or issues around establishing and investing in funds?**

There are no specific risks except for the inherent risks corresponding to each type of fund.
Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Undertakings for Collective Investments In Transferable Securities (UCITS)

In the case of UCITs, marketing materials addressed to investors can only be made public following the approval by the Financial Supervisory Authority (FSA) of the prospectus and its publication.

UCITS authorized in an EU member state intending to market in Romania must complete and submit to its home regulator a notification including certain specified documents. The home regulator then completes a notification file which is sent in a regulator-to-regulator transmission, following which the UCITS can be sold in Romania.

Alternative Investment Funds (AIFs)

AIFs which are closed-ended investment funds attracting financial resources publicly can be marketed to the public following their registration with the FSA and following the FSA's approval.

Closed-ended investment funds which attract financial resources privately and are managed by an AIFM are not allowed to distribute any promotional materials to the public.

An AIFM authorized in an EU member state may distribute and market AIFs from an EU member state in Romania to professional investors on the basis of its authorization by the relevant EU member state regulator, under an EU passport. The distribution of participative titles in AIFs, as well as the marketing of those AIFs in Romania are subject to the passporting formalities which mainly require that the FSA is notified by the AIFM home member state regulator of the intention of the AIFM to distribute in Romania participative titles of AIFs from an EU member state.

As regards distribution and marketing to retail investors, in addition to the passporting formalities above, it is required that AIFs which are marketed in Romania comply with the Romanian legislation which sets up investment limits, reporting, transparency and marketing obligations applicable to Romanian AIFs which attract financial resources publicly.

Are there any restrictions on managing a fund?

The management of Undertakings for Collective Investments In Transferable Securities (UCITS) and Alternative Investment Funds (AIFs) is a regulated activity subject to authorization by the Financial Supervisory Authority (FSA).

Authorization of both investment management companies and AIF managers (AIFMs) is subject to a significant authorization process which may take up to six months starting from the completion of the application. Authorization requirements mainly refer to initial capital minimum levels, shareholders' financial soundness, expertise and integrity of management bodies, senior personnel requirements (must be suitable persons with adequate expertise and reputation), business plan and organization structure, policies and procedures.

AIFMs which were previously authorized by the FSA as investment management companies, are not required to refile the documents already submitted upon authorization as an investment management company.

The FSA authorization of an AIFM or an investment management company is valid for all EU member states based on the European passport. They may perform the financial services for which they are authorized by the FSA in another member state either by establishment of a branch or directly, under the direct provision of services.

Following authorization, investment management companies and AIFMs are subject to various regulatory requirements, including in relation to own funds, conflicts of interest, risk management policies and remuneration policies.
Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

In order to trade, as a business, in their name and on their own account, in derivative financial instruments, such as futures contracts and options, a legal person must be authorized by the Financial Supervisory Authority (FSA) and registered with the FSA’s Registry.

The European Market Infrastructure Regulation applies to all derivative transactions and requires transactions to be reported to regulators, transactions between dealers to be cleared or subject to other risk mitigation techniques such as initial margin and variation margin requirements.

Last modified 20 Oct 2017

What are common types of derivatives?

Derivative contracts are entered into in Romania for a range of reasons including hedging, trading and speculation.

Derivatives may be traded over-the-counter or on an organized exchange.

All of the main types of derivative contracts are used in Romania:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying assets seen in Romania are:

- equity;
- indices;
- commodities; and
- foreign currency.

Last modified 20 Oct 2017

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007-to-2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. The European Commission has sought in particular, to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative position;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen and continues to see the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

Debt finance
Lending and borrowing

*Are there any restrictions on lending and borrowing?*

**Lending**

Professional lending is a regulated activity, which may exclusively be undertaken by regulated entities. Depending on the type of loans being granted, various specific requirements or limitations should be considered.

By way of example, mortgage loans for real estate investments (*credite ipotecare pentru investitii imobiliare*) can be granted only by certain regulated entities (eg universal banks or mortgage loan banks). Moreover, the credit agreement for such type of loans must include certain information expressly required by law. There are also particular requirements on how to deal with borrowers that fall behind with their payments.

Specific rules are also provided under the law on consumer loans.

**Borrowing**

While borrowers are generally not regulated, it is advisable for borrowers to consider whether either the mortgage or consumer-lending regimes apply to their activities, in which case they will benefit from the protections mentioned above.

*Last modified 20 Oct 2017*

**What are common lending structures?**

Lending in Romania can be structured in a number of different ways, mainly depending on the complexity and the value of the transaction and, generally, the overall commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders, each providing parts of the overall facility).

Syndicated facilities, by their nature, involve more parties (such as agents and security agents which fulfil certain roles for the finance parties), as well as more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicates taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, project loans, acquisition loans, real estate loans or letter of credit facilities.

**Loan durations**

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

**Loan security**

A loan can be either secured or unsecured. For more information, see *Giving and taking guarantees and security*.

**Loan commitment**
In practice, a loan can also be:
- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan (although in this case there may be certain legal issues to be considered).

**What are the differences between lending to institutional / professional or other borrowers?**

In principle, lending to institutional or professional borrowers is more flexible, while lending in the context of mortgages and to consumers is subject to more regulatory oversight and is more cumbersome from a compliance perspective.

For more information, see Lending and borrowing – restrictions.

**Do the laws recognize the principles of agency and trusts?**

The Romanian Civil Code expressly recognizes the possibility to create a movable mortgage in favor of a third party (agent) designated by the secured creditor. Such agent shall exercise all rights of the secured creditor which appointed it. This concept is, however, provided by law only in case of movable mortgages (immovable mortgages are therefore excluded). In practice, however, such an agency mechanism is not that frequently used, due to its limited regulation.

Furthermore, Romanian law does not recognize the common law concepts of ‘trusts’ and ‘trustee’. However, since October 2011, the Romanian Civil Code has introduced a concept similar to a trust, namely the ‘fiducia’. However, given the legal requirements related to the creation and registration of a fiducia (including tax related requirements), the fiducia is not commonly used in practice, particularly for taking security. Thus, in syndicated facilities security agents structures are commonly used.

**Are there any other notable risks or issues around lending?**

Romanian law prohibits a Romanian company from making, directly or indirectly, loans to its directors or officers, or to spouses, certain relatives or in laws of such directors or officers, or to any companies in which such a person is director or manager, or holds 20% or more of the share capital. Transactions may be invalidated for this reason and there may also be criminal sanctions.

Insolvency-related limitations should also be taken into consideration. By way of example, Romanian insolvency law prohibits the acceleration of loans due to reasons related to the opening of insolvency proceedings against the borrower.

As a general note, Romanian law governed loan agreements and other finance documents are subject to general contractual lending principles. Depending on the lending transaction’s size and type, loan agreements used on the Romanian market are usually based on the bank’s standard form documentation (particularly in the case of bilateral loans and small transactions) or Loan Market Association (LMA)-style facility agreements (eg for syndicated loans).

**Are there any other notable risks or issues around borrowing?**

Borrowing by Romanian residents from non-residents for a period exceeding one year is subject to notification to the National Bank of Romania for statistical purposes.
Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the giving of guarantees and security are as follows.

Corporate benefit and misuse of corporate assets

Upstream or cross-stream guarantees or security usually raise corporate benefit issues under Romanian law. Each guarantor or security provider must receive a real and adequate corporate benefit from assuming such guarantee obligations. Additionally, the absence of any corporate benefit may be construed as a lack of cause for the guarantee or security, with the risk of the respective guarantee or security agreement being invalidated on these grounds. Corporate benefit is, however, a matter of fact assessed on a case-by-case basis by the courts.

Furthermore, the directors or officers and the (founding) shareholders of a Romanian company are criminally liable if they intentionally misuse the assets (including moneys or loans) of the company for a purpose contrary to the company's interest or in its own interest or in order to favor another company in which such persons have a direct or indirect interest. As a consequence, if there is a misuse of corporate assets, the related transactions may also be invalidated.

Prohibition from securing loans granted to directors

Romanian law prohibits a (joint-stock) company to conduct credit activities to the benefit of its directors through various operations, including through the creation of security aimed at securing, totally or partially, any loans granted to the respective director(s). The same prohibition applies to operations in which the respective directors’ spouses, certain relatives or in-laws are interested, as well as in case the security is granted to another company with which it shares one (or more) directors (or the directors which are relatives) or to any companies in which such a person is director or manager, or holds 20% or more of the share capital. Transactions may be invalidated for this reason and there may be also criminal sanctions. There are certain exemptions from this prohibition provided by Law No 31/1990 on companies.

Insolvency

Insolvency proceedings may have various impacts on receivables which are preferred by law and rank above any other receivables (e.g., privileges, mortgages, pledge over assets of the insolvent debtor) and the creditors which have such type of receivables. By way of example, following the commencement of insolvency proceedings, all court and out-of-court actions or enforcement measures for the settlement of claims over the debtor are suspended by operation of law. Also, security created for a prior, existing, but unsecured receivable, within the six month period prior to the opening of insolvency proceedings may be invalidated. Similarly, fraudulent acts committed by a debtor during the two years preceding the commencement of insolvency proceedings may also be invalidated.

Financial assistance

According to Law No 31/1990 on companies, a (joint-stock) company cannot create any security in favor of another party in order for such other party to acquire that company’s own shares. Breach of this rule renders the guarantee null. Such prohibition is not applicable to transactions carried out in the ordinary course of business of credit institutions or any other financial institutions or to transactions carried out with a view to acquiring shares by or for that company’s employees, provided that such transactions do not trigger the reduction of the net assets of the company below the aggregated value of the subscribed share capital and the reserves that cannot be distributed according to law or constitutive act.

Corporate approvals

The borrower should ensure that it has in place all necessary corporate approvals taken at the approval level required by its articles of association and other applicable corporate decisions setting forth the competences of its corporate bodies. In practice, these are either a shareholders’ resolution or a board decision. In case of a joint-stock company, a shareholders’ resolution is mandatory if the facility exceeds 50% of the book value of the assets of the respective joint-stock company.

Last modified 20 Oct 2017
What are common types of guarantees and security?

Romanian law regulates two main types of guarantees/security: personal guarantees and in rem security.

Personal guarantees

The most common ones are:

- suretyship (*fidieiusiune*); and
- autonomous guarantees (which, in their turn, may take the form of:
  - letters of guarantee; and
  - letters of comfort).

In rem security

The most commonly available in rem security are (conventional) mortgages, which do not entail the dispossession of the security provider. Depending on the type of assets taken as security, mortgages can be either:

- movable mortgages – covering various tangible or intangible, present and future movable assets (by way of example, a movable mortgage may be created over bank accounts, shares, receivables, intellectual property rights, insurance policies rights, machinery, inventory, universalities of movable assets which are assigned to the activity of an enterprise etc); or
- immovable mortgages – covering immovable assets together with their accessories, superficies rights etc (the Romanian Civil Code expressly recognizes the possibility to create an immovable mortgage over future buildings).

Romanian law also regulates privileges, which are claims preferred by law and which have in principle the highest rank. Privileges can be either general (over all movable and immovable assets of the debtor) or special (eg the privilege of the seller's claim for the unpaid price of a movable asset sold to a natural person, save for the case when the buyer acquires the asset for the service or exploitation of an enterprise). There are special priority rules provided by the law with respect to privileges and mortgages.

Furthermore, quasi-security may also be used in practice, such as assignment of receivables for security purposes (*cesiune de creanta in scop de garantie*), retention of title (*clauzele de rezerva a proprietatii*). They are subject to the same priority and enforcement rules as those provided by law for mortgages.

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking personal guarantees

Suretyship is fairly common in lending transactions in Romania. It is an agreement whereby the guarantor undertakes to the creditor to fulfil the obligations of the debtor (either on a free-of-charge basis or against a consideration) in case the latter fails to comply with such obligations. The suretyship cannot be presumed, it must be specifically undertaken by way of a written agreement concluded either as an authentic deed (in front of a notary public) or as a private deed or, in certain cases, even included in the facility agreements. There are specific legal conditions that need to be observed by the guarantor (eg to have and maintain sufficient assets in Romania to cover the secured liabilities, to be domiciled in Romania), however, these rules do not apply in case a certain provider of the suretyship was specifically requested by the creditor.

There are no registration formalities provided by the law for suretyships.

Giving or taking in rem security

Immovable mortgages are subject to certain formal requirements which render them valid and enforceable against third parties. Specifically, immovable mortgages can only be created through an agreement authenticated by a notary public, subject to payment of
notarial fees. Immovable mortgages must be registered with the land book where the mortgaged real estate is registered, subject to payment of registration fees.

As concerns movable mortgages, they are validly created through movable mortgage agreements concluded either as private deeds or as authenticated deeds. The ranking of a movable mortgage is generally given by the registration with the so-called Electronic Archive for Movable Security (Arhiva Electronica de Garantii Reale Mobiliare). Such registration is valid for a five-year period and may be renewed before its expiry. Depending on the specific type of mortgaged assets, other registration formalities may apply (eg registration with the shareholders’ registry in case of mortgages over shares, the creation of ‘control’ over the mortgaged bank accounts etc).

As a general requirement, a mortgage agreement (either movable or immovable) is not valid unless the amount for which the mortgage is created can reasonably be determined on the basis of the mortgage agreement. Also, under the sanction of nullity, the mortgage agreement must include a sufficiently precise description of the mortgaged asset, reasonably allowing its identification. The mortgaged assets may be described by drafting a list of the mortgaged movable assets, by determining the category to which they belong, by indicating their quantity, by providing a formula for their determination or by any other method which reasonably allows their identification. In the particular case of mortgages over bank accounts, for validity purposes the respective bank accounts must be expressly set out under the movable mortgage agreement.

Last modified 20 Oct 2017

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Credit institutions

Government Emergency Ordinance No 99/2006 on credit institutions and capital adequacy (Ordonanta de urgenta nr. 99/2006 privind institutiile de credit si adecvarea capitalului) (taking up and pursuit of the business of credit institutions)

National Bank of Romania (NBR) Regulation No 5/2013 on prudential requirements for credit institutions (Regulamentul nr. 5/2013 privind cerinte prudentiale pentru institutiile de credit) (prudential requirements for credit institutions)

Law No 312/2015 regarding the recovery and resolution of credit institutions and investment firms, as well as for amending and completing certain regulations in the financial field (Legea nr. 32/2015 privind redarea si rezolutia institutiilor de credit si a firmelor de investitii, precum si pentru modificarea si completarea unei acte normative in domeniul financiar) (recovery and resolution of credit institutions and investment firms)

NBR Regulation No 4/2014 on reporting statistic data and information to the National Bank of Romania (Regulamentul nr. 4/2014 privind raportarea de date si informatii statistice la Banca Nationala a Romaniei) (reporting for statistic purpose of financial data and information to the National Bank of Romania by credit institutions, non-banking financial institutions, investment firms or other reporting entities)

NBR Regulation No 4/2005 on the foreign exchange regime (Regulamentul nr. 4/2005 privind regulul valutar) (foreign exchange regime)

Non-banking financial institutions

Law No 93/2009 regarding non-banking financial institutions (Legea nr. 93/2009 privind institutiile financiare nebancare) (taking up and pursuit of the business of non-banking financial institutions)

Regulation No 20/2009 regarding non-banking financial institutions (Regulament nr. 20/2009 privind institutiile financiare nebancare) (registration, communication of changes occurred in the status of non-banking financial institutions and prudential requirements applicable to non-banking financial institutions)

Consumer credit
Government Emergency Ordinance No 52/2016 on credit agreements for consumers relating to immovable property, as well as for amending and supplementing the Government Emergency Ordinance No 50/2010 on credit agreements for consumers (Ordonanta de urgența nr. 52/2016 privind contractele de credit oferite consumatorilor pentru bunuri imobile, precum și pentru modificarea și completarea Ordonantei de urgența a Guvernului nr. 50/2010 privind contractele de credit pentru consumatori) (credit agreements for consumers relating to immovable property, prudential and supervisory requirements (including for the establishment and supervision of credit intermediaries and debt recovery entities), aspects regarding the provision of ancillary services)

Government Emergency Ordinance No 50/2010 on credit agreements for consumers (Ordonanta de urgența a Guvernului nr. 50/2010 privind contractele de credit pentru consumatori) (credit agreements for consumers)

Government Ordinance No 21/1992 on consumer protection (Ordonanta nr. 21/1992 privind protectia consumatorilor) (consumer protection)

Mortgages

Law No 287/2009 regarding the Civil Code (Legea nr. 287/2009 privind Codul Civil) (Civil Code of Romania)

Law No 77/2016 on giving in payment of real estate assets for discharging loan debts (Legea nr. 77/2016 privind darea in plata a unor bunuri imobile in vederea stingerii obligatiilor asumate prin credite) (giving in payment of real estate assets for discharging loan debts – datio in solutum)

Law No 190/1999 regarding mortgage loans for real estate investments (Legea nr. 190/1999 privind creditul ipotecar pentru investitii imobiliare) (mortgage credits for real estate investments)

Corporations

Companies Law No 31/1990 (Legea societatilor comerciale) (legal regime of companies)

Funds and platforms

Law No 297/2004 on the capital market (Legea nr. 297/2004 privind piaa de capital) (capital market)

Law No 74/2015 on alternative investment fund managers (Legea nr. 74/ 2015 privind administratorii de fonduri de investii alternative) (alternative investment fund managers)

Government Emergency Ordinance No 32/2012 on undertakings for collective investment in transferable securities and investment management companies and for amending and supplementing Law No 297/2004 on the capital market (Ordonanta de urgen nr. 32/2012 privind organismele de plasament colectiv in valori mobiliare i societile de administrare a investiitiilor, precum i pentru modificarea i completarea Legii nr. 297/2004 privind piaa de capital) (undertakings for collective investment in transferable securities and investment management companies)

Financial Supervisory Authority (FSA) Regulation No 9/2014 on the authorization and operation of investment management companies, undertakings for collective investment in transferable securities and depositaries of undertakings for collective investment in transferable securities (Regulamentul ASF nr. 9/2014 privind autorizarea i funcionarea societilor de administrare a investiitiilor, a organismelor de plasament colectiv în valori mobiliare i a depozitarilor) (authorization and operation of investment management companies, undertakings for collective investment in transferable securities and of the depositaries of undertakings for collective investment in transferable securities)

National Securities Commission (NSC) Regulation No 15/2004 on the licensing and functioning of investment management firms, collective investment undertakings and depositaries (Regulamentul CNVM nr. 15/2004 privind autorizarea i funcionarea societilor de administrare a investiitiilor, a organismelor de plasament colectiv i a depozitarilor) (licensing and functioning of investment management firms, collective investment undertakings and depositaries)

FSA Regulation No 10/2015 on alternative investment funds management (Regulamentul ASF nr. 10/2015 privind administrarea fondurilor de investitii alternative) (alternative investment funds management)

Other key market legislation

Government Ordinance No 9/2004 on financial collateral agreements (Ordonana nr. 9/2004 privind unele contracte de garanie financiar)
Regulatory authorization

Who are the regulators?

The main regulator in the banking sector is the National Bank of Romania (NBR) which is the Romanian central bank. The NBR has, *inter alia*, authorization, prudential supervising and regulatory competences in relation to credit institutions.

The Financial Supervisory Authority (FSA) is the regulatory and supervisory body responsible for capital markets. The FSA's role includes authorizing investment firms, management companies and investment funds, providing the general listing requirements for issuers, regulating the securities exchange and enforcing the market abuse regulations.

What are the authorization requirements and process?

Depending on its type, an entity must apply to the National Bank of Romania (NBR) or the Financial Supervisory Authority (FSA) for authorization.

Credit institutions and non-banking financial institutions

Romanian credit institutions (as well as the branches of credit institutions from third (non-EU/ European Economic Area) states must be authorized by the NBR when performing a regulated activity in Romania. The authorization process comprises two stages, namely the:

- approval of the establishment of the respective credit institution; and
- authorization of the functioning of such credit institution.

The NBR will also approve key individuals (e.g., senior management) in their roles at the level of the respective credit institution.

The NBR must approve or reject a request for authorization within four months of the application. Such term may be suspended in certain cases provided by law. Authorized credit institutions are registered with a special register maintained by the NBR.

Also, Romanian non-banking financial institutions (NFIs) (as well as subsidiaries established in Romania by foreign NFIs) may perform lending activities in Romania only after registration with the NFI General Registry or, as applicable, the NBR Special Registry, maintained by the NBR. Such registration is performed by the NBR upon notification of the establishment of the respective NFI (which must be performed within 30 days of the NFI registration with the Romanian Trade Register) and submission of the required documentation.

Investment firms and investment vehicles

Both investment firms and investment vehicles must apply to the FSA for authorization.

In order to be licensed by the FSA, investment firms must satisfy the required conditions including:
• the initial capital must amount to at least the RON equivalent of €730,000; and
• the day-to-day management must be carried out by at least two persons, who are also empowered to represent the investment firm.

What are the main ongoing compliance requirements?

Threshold conditions (such as having adequate own funds and compliance arrangements in place) are an ongoing compliance requirement for credit institutions, non-banking financial institutions, investment firms, investment vehicles and fund managers.

Failure to comply with the threshold conditions and more detailed regulatory rules can result in sanctions for regulated entities, such as written warning, fines, temporary suspension of the respective entity's authorization or even prohibition from performing the authorized activity.

What are the penalties for failure to be authorized?

A person undertaking a regulated activity consisting of lending activities, investment services or other activities specific to credit institutions, investment firms and/or investment vehicles, without being authorized, commits a criminal offence and may be liable to imprisonment.

Regulated activities

What finance and investment activities require authorization?

As a general rule, the performance without authorization of any activities or operations for which the laws regulating the financial sector require authorization is prohibited and, in most cases, gives rise to criminal liability.

Under Romanian law, it is generally prohibited for any individual or legal entity (other than a credit institution) to pursue activities such as attracting deposits or other repayable funds from the public.

Furthermore, professional lending is a regulated activity, which may exclusively be undertaken by regulated entities, such as credit institutions, non-banking financial institutions or payment services providers which perform lending activities in relation to payment services.

Offering investment services and managing investment vehicles are also comprehensively regulated activities, and require authorization by the Financial Supervisory Authority.

Are there any possible exemptions?

Individuals or legal entities that are not credit institutions are not permitted to carry on activities such as taking deposits or other repayable funds from the public. This prohibition is not applicable to taking of deposits or other funds repayable by a member state of the EU, or by a member state's regional or local authorities, or by public international bodies provided that one or more member states are members to the public international body. The prohibition also does not apply to cases expressly covered by national or EU legislation, provided that those activities are subject to regulations and controls intended to protect depositors and investors, and applicable to those cases.

To the extent that lending activities are performed incidentally and not on a professional basis, they may be freely undertaken by any individual or entity (not necessarily by regulated entities). The National Bank of Romania has a monopoly in determining, on a case-by-case basis, whether a determined activity constitutes professional lending, by applying the criteria provided by Law No 93/2009 regarding...
Do any exchange controls or other restrictions on payments apply?

There are certain general foreign exchange rules provided by Romanian law. By way of example, making or receiving payments, transfers and any other similar operations arising out of the sale of assets, or the provision of services between Romanian residents must be made only in Romanian currency (ie RON), except for certain specific operations, as provided by law, which may also be performed in other currencies. Operations between residents and non-residents can be performed either in Romanian currency or in a foreign currency.

In addition, there are certain threshold limitations for monetary transactions provided under the anti-money laundering law which may trigger various reporting obligations (eg for cash transactions involving amounts of at least the RON equivalent of €15,000, or for external transfers made in or from accounts and amounting to at least the RON equivalent of €15,000).

Statutory blacklists operate to prohibit, or restrict funds being sent to, or received from, persons in certain countries.

Also, certain reporting requirements apply to loans received by Romanian residents from non-residents.

Compliance with the EU rules on payments (EU Payments Regulation and the Transfer of Funds Regulations) must also be ensured. Furthermore, there are specific rules provided by the law for cash transactions between legal entities and other persons.

What are the rules around financial promotions?

There are various legal requirements applying to financial promotions and marketing.

For example:

- Any advertising concerning credit agreements for consumers must include certain standard information and be presented in a certain way.
- There are specific rules on credit agreements for consumers relating to residential immovable property.
- Long distance contracts regarding financial services (eg banking services, credit-related services, financial investments services, etc) are subject to various rules regarding the information to be provided to consumers who are entering into such contracts.

There are also specific rules around marketing materials for Undertakings for Collective Investments In Transferable Securities (UCITS).

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common types of legal entities in the financial sector are joint-stock companies and limited liability companies. They are subject to relatively straightforward rules and their shareholders benefit, in general, from limited liability (up to the amount of the subscribed capital). Unlike limited liability companies, joint-stock companies may be listed on regulated markets and have a more complex organization.

Certain financial activities can only be performed by entities set up in a particular type of legal entity (eg credit institutions and NFIs can only take the form of a joint-stock company).

Investment firms and investment vehicles
Investment firms are set up in Romania as joint-stock companies whose object of activity is to perform investment services. Open-ended investment funds are created on the basis of a simple partnership contract, they have no legal personality and are managed by an investment management company, which must be incorporated as a joint-stock company. Open-ended investment companies are set up as joint-stock companies and may be managed either by their board of directors or by a separate investment management company.

Closed-ended investment funds are established on the basis of a simple partnership contract and are managed by an investment management company. Closed-ended investment companies are established as joint-stock companies. The management of the closed-ended investment company is ensured either by its own board of directors or by a separate investment management company. Financial investment companies are a special type of closed-ended investment companies. They are joint-stock companies the shares of which are then traded on the Bucharest Stock Exchange and are subject to the same rules as the closed-ended investment companies.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes. Lending and/or financial investment services may be performed in Romania on a professional basis by, \textit{inter alios}:

- credit institutions (or payment services providers) and investment firms, respectively, which are licensed in an European Economic Area member state to perform lending/financial investment services and which carry out such services in Romania either:
  - directly (under the freedom to provide services); or
  - by way of establishment of a Romanian branch (under the freedom of establishment) based on a (banking) license obtained in their home member state, without the need to obtain a (banking) license in Romania (they are, however, subject to performing certain administrative formalities (the so called `passporting' formalities)); and
- Romanian branches of non-European Economic Area member states licensed (credit) institutions (to the extent the Romanian branches were licensed in Romania by the National Bank of Romania or the Financial Supervisory Authority, respectively).

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer to peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through an electronic bank lending platform established as a specialist corporate or special purpose vehicle based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
• connecting borrowers and lenders through the platform.

In Romania, peer-to-peer (P2P) funding platforms are not popular. However, there is one intermediary platform which operates as an internet-based intermediary between natural persons who can offer and request loans; a couple of similar platforms are being developed and we anticipate evolution in the field (alongside the currently more popular crowdfunding platforms).

Blockchain, smart contracts and cryptocurrencies

The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

While the use of both of bitcoin and blockchain technology is expected to become mainstream, Romania has yet to embrace this global trend. According to data released in March by Netopia mobilPay, Romanians made payments in bitcoin equivalent to €300,000 in 2016. The average payment value per was €400.

Currently, there are no specific regulations concerning bitcoin in Romania. The National Bank of Romania has taken a reserved attitude towards blockchain technology and bitcoin; reflecting the perspective of the European Central Bank. In March 2015, the National Bank of Romania issued a statement in relation to cryptocurrencies confirming that they are considered neither national, nor foreign currency and may not be considered e-currency either, which leads to an argument that bitcoin falls under the category of movable goods and, as a result, any transaction which applies a bitcoin ‘payment’ may qualify as barter trading, in accordance with article 1763 of the Romanian Civil Code.

Initial coin offerings and token based products

Issuing digital tokens by way of an initial coin offering (ICO) is not common practice in Romania. However, there are startup projects, including in the video gaming market sector, which have raised financing by means of an ICO. Issuance of tokens to fundraise in the video gaming market (where such tokens may be used for purchases within the game as well as being exchangeable in other cryptocurrency markets) is expected to grow and may be copied by issuance of so-called utility (discount) tokens in other market sectors.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Based on a recent study in Romania, 60% of the financial intermediaries interviewed mentioned that the main reason for using AI interfaces was data collection. On the other hand, the study also highlighted that concerns about the privacy of data are one of the main challenges to further development, as well as a preference for human interactions. The survey also found that although the number of human interactions at banks or telephone offices is decreasing and is likely to continue in line with this trend, the quality and importance of human contact will increase.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Cloud computing is most commonly used in the financial sector for the following services:

• internet banking platforms; and

• outsourcing activities with respect to services previously carried out by the financial institution (eg electronic archiving, e-mailing services etc).
Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

As a general rule, performing any activities or operations for which the laws regulating the financial sector require authorization, is prohibited without the appropriate authorization and, in most cases, doing so gives rise to criminal liability.

Under Romanian law, it is generally prohibited for any individual or legal entity (other than an appropriately licensed credit institution) to pursue activities such as deposit-taking (or holding other repayable funds from the public). Furthermore, professional lending is a regulated activity, which may only be undertaken by regulated entities, such as licensed credit institutions, non-banking financial institutions or payment services providers that perform lending activities in relation to payment services.

Payment services can only be performed either by an authorized payment institution (together with credit institutions, e-money institutions) or authorized agents of one of the above.

Money remittance services are similarly regulated and all such credit institutions, payments services institutions and e-money institutions must be authorized by and registered with the National Bank of Romania.

The offering of investment services and managing investment vehicles are also comprehensively regulated activities, and require authorization by the regulator.

Electronic payments platforms and regulation of peer to peer lenders

ELECTRONIC PAYMENT PLATFORMS

A number of FinTech businesses are offering electronic payment platforms to rival the traditional payment systems. These are mostly payment services institutions authorized in another European Union member state which provide payment services in Romania by passporting their home license (either directly or via local branches).

PEER TO PEER LENDERS

Peer-to-peer (P2P) lending is not yet regulated in Romania. The local market remains undeveloped, however, lending via crowdfunding platforms has begun to develop in recent years and draft legislation has been produced but is not yet implemented. It is expected that P2P lending platforms will grow alongside this sector.

Regulation of payment services

Where an entity provides payment services on a professional basis in Romania, it will require authorization by the National Bank of Romania to become an authorized payment institution under the Payment Services Ordinance No 113/2009 implementing the European Union Payment Services Directive I. Failure to obtain the required authorization is a criminal offence. Furthermore, payment services may also be performed by authorized credit institutions as well as by other authorized institutions, such as credit institutions or e-money institutions.

In order to become authorized by the National Bank of Romania, a payment services business will need to meet certain criteria, including in relation to its business plan, regulatory capital, requirements, processes and procedures in place for safeguarding relevant funds and money laundering controls.

Application of data protection and consumer laws

Law No. 677/2001 ‘on the Protection of Individuals with Regard to the Processing of Personal Data and the Free Movement of Such Data’ (Law 677/2001) regulates the processing of personal data in Romania. Law 677/2001 implements the European Data Protection Directive. Where a business determines the purposes and manner in which any personal data is processed, it will be regulated by Law 677/2001 and have certain notification and compliance obligations.
In addition, the European General Data Protection Regulation (GDPR) will replace the existing law with effect from 25 May 2018. The GDPR is more prescriptive and restrictive and includes mandatory notification requirements where a breach occurs, together with severe monetary sanctions for breach.

**Money laundering regulations**

Law No 656/2002 ‘on the Prevention and Sanctioning of Money Laundering and Countering the Financing of Terrorism’ gives the National Bank of Romania responsibility for supervising the anti-money laundering obligations of entities that offer certain services, such as lending, providing payment services and issuing and administering other means of payment.

Generally, where a legal entity is supervised by the National Bank of Romania, it will also be supervised by the same authority for compliance with anti-money laundering requirements. The same is provided in the draft law for the implementation of the European Union’s Fourth Money Laundering Directive, not yet implemented in Romania.

Last modified 20 Oct 2017

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**

**SEED INVESTMENT**

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

**CROWDFUNDING**

Crowdfunding may be appropriate for a FinTech business in the early stages. This involves members of the public investing in a business by pooling their resources through an intermediary platform, such as Crowdcube or Crowdfunder.

There are two main types of crowdfunding: equity and reward-based.

- Equity-based crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

Lending via crowdfunding platforms has begun to develop in recent years, but the local market remains immature. Most of the platform providers are organized as foundations and the fundraisers are usually non-profit organizations or natural persons. Generally, they are structured to function on the basis of donations received by the fundraiser and rewards (in the form of services or products) provided at a later date to the donors. The types of projects which have successfully raised the proposed financing are usually arts and technology orientated.

A legislative initiative for the enactment of a law on crowdfunding was launched during 2015. The draft has been approved by the Romanian parliament first chamber and it is currently under discussion in front of the second chamber (the Deputies House). Once implemented, the draft law will regulate both equity-based crowdfunding as well as credit-based crowdfunding. Donation-based crowdfunding structures are expressly excluded from the scope of the draft law and it is expected that these types of platforms will continue to function as they currently do. Reward-based crowdfunding is not mentioned expressly.

**ACCELERATORS**

There are various tech events or accelerators in the Romanian market which offer support, facilities and funding for startups, often in return for an equity stake. In 2016 there were almost 200 startups financed in this way in Romania. These ‘angel advisors’ help startups
not only with funding but also with mentoring and guidance.

**Venture capital**

Venture capital (VC) funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. VC provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

VC funding is being used more frequently by FinTech companies in the first years of their existence, with 20 startups in Romania raising €11.3 million in total in 2016. For example, Vector Watch (owned by Romanian entrepreneurs and recently acquired by the global wearable giant Fitbit) raised €5 million in 2015. Also, a Romanian robotic form-scanning software company, UiPath has raised $30 million in venture funding, marking one of the largest early-stage tech investments in Central Europe.

**Warehouse and platform funding**

Another alternative form of funding is by way of peer-to-peer (P2P) lending platforms, which bring individual borrowers and lenders together without the involvement of traditional banks. P2P lending does not involve equity investments, and instead interest is paid on the money borrowed. In the Romanian market, some foreign P2P lending platforms are used by both Romanian investors and borrowers and a leading non-bank mortgage loan originator in Romania (Extra Finance) recently joined the Mintos marketplace. Domestic P2P lending platforms are also being developed.

**Senior bank debt and capital markets funding**

**Senior Bank Debt**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding, which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**Capital Markets Funding**

While more common in other jurisdictions, FinTech fundraising by way of an Initial Public Offering or loan securitization have not, to our knowledge, been used as yet in Romania.

*Last modified 20 Oct 2017*

**Portfolio sales**

**Loan transfers and portfolio sales**

*What are common ways of buying and selling loans?*

Romanian law provides for various legal mechanisms for transferring rights and obligations, including those under loan agreements. The most common methods for transferring loans are as follows.

**Assignment of receivables**

The assignment occurs by the mere convention between the owner of certain receivables (assignor) and the buyer of those receivables (assignee), following which the assignee acquires:

- the receivables and all rights held by the assignor in relation to the assigned receivables, as well as
- all (assignable) security/guarantees and other rights accessory to the assigned receivables.

In principle, the consent of the assigned debtor is not required, except for cases when, depending on circumstances, the respective receivables are ‘essentially linked to the creditor (assignor)’, ie it can be enforced by the creditor only. The enforceability of the assignment
Assignment of receivables against third parties, including the assigned debtor is achieved upon fulfilment of certain formalities, such as:

- written notice of the assignment to the assigned debtor(s), or written acknowledgement of the assignment signed by the assigned debtors, bearing a certain date; and
- registration of the assignment with the Romanian Electronic Archive for Movable Security (Arhiva Electronica de Garantii Reale Mobiliare).

**Assignment of contract**

This is a mechanism introduced by the Romanian Civil Code (in force as of 1 October 2011). It allows a party to a contract to be replaced by a third party in that contract provided that the initial contractual parties have not yet fulfilled all their obligations under the respective contract and the counterparty agrees to such replacement. The assignment agreement and the acceptance of the assignment by the counterparty must be concluded in the form prescribed by law for the validity of the assigned contract.

**Novation**

The novation option implies the extinguishment of the existing contractual relationship and the creation of a new one. The novation may be achieved in three different ways, namely:

- The debtor undertakes a new obligation towards the creditor, which replaces and extinguishes the initial obligation.
- A new debtor replaces the initial debtor, the latter being released from its obligations towards the creditor.
- A new creditor replaces the initial one, the debtor being released from its obligations towards the initial creditor.

As a general principle, the security or guarantees securing the initial receivable are not maintained unless expressly agreed by the parties.

**Subrogation**

This mechanism operates when a third party pays instead of the debtor (eg borrower) and is subrogated to the creditor’s rights against the debtor.

*Last modified 20 Oct 2017*

**What are the main considerations when transferring a loan and related security?**

Recent legislative developments brought some changes to the legal regime applied to the transfer of loans, including on the consumer-lending side. Before 30 September 2016, the rule provided by law was that portfolios of loans originated by financial institutions could be acquired only by regulated entities (eg credit institutions, non-banking financial institutions and payment services providers (granting loans related to the payment services)). However, such rule did not apply if the loans were deemed as 'losses' within the meaning of Romanian regulations regarding credit classification.

After 30 September 2016, such legal provisions were expressly repealed and we are currently lacking an express legal provision dealing with acquisition of loans in general. However, the National Bank of Romania has recently issued a communication stating that, to the extent the activity to be performed by the acquirer of loans in relation to the acquired loans represents crediting activities performed on a professional basis, the acquirer must be a regulated entity. Further, the National Bank of Romania concluded that the acquisition of loans granted to individuals and legal entities, which are deemed as 'losses' within the meaning of Romanian regulations regarding credit classification, does not represent a crediting activity performed on a professional basis and, therefore, can also be performed by other persons than regulated entities.

Further, specific rules regarding the acquisition of consumer loans (including non-performing loans) are provided by law.

In addition, various other issues may need to be considered in the context of transferring a loan or a portfolio of loans, the potential limitations being usually revealed in the course of the due diligence process conducted in such loans acquisition deals. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a
potential purchaser or whether additional measures might need to be implemented in order to ensure compliance with data privacy limitations;

- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee;

- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms;

- **consent** – whether a transfer requires the consent or notification of any other parties; and

- **formalities in relation to the security** – in case of secured loans, additional formalities regarding security interests and personal guarantees securing the transferred loan(s), may be applicable depending on the relevant security package (in general, the new secured creditor must be registered with the relevant public registers – eg the Land Book in case of immovable mortgages, or the Electronic Archive for Movable Security in case of movable mortgages – for opposability purposes).

Projects

Financing / investing in energy / infrastructure

*To what extent are energy and infrastructure assets publicly or privately owned?*

**Generally**

The ownership of energy and infrastructure assets in Romania varies as follows:

**Oil and gas**

The oil and gas industry is privatized especially in the sectors of oil and gas downstream and upstream. Most of the assets in the oil industry are privately owned, except those which are included in the public domain such as: underground resources, energy transmission assets, oil and gas pipelines, water storages and dikes.

The gas midstream is owned by the Romanian state through the national company Transgaz.

**Electricity**

Most of the companies involved in the generation, transmission and distribution of electricity are state owned (as either majority or full owner) and some of them are listed on the Bucharest Stock Exchange. However, the regional electricity companies which supply electricity to the off takers are privatized.

ANRE (National Authority for Regulation in the Energy Field) is the regulatory and supervision authority in the electrical energy and gas field and OPCOM is the administrator of the electrical energy market.

**Telecoms infrastructure**

The telecommunications networks (fixed and mobile) in Romania are mostly privately owned by a number of international and local service providers. Certain assets – such as frequency spectrums and the telecommunication transportation and distribution networks – are in the public domain.

ANCOM (National Authority for Administration and Regulation in Communication) is the administration authority of the communication market.

**Transport infrastructure**

LIGHT RAIL
Typically, light rail assets (such as trams) are owned by local public sector. The Bucharest underground infrastructure, network and trains are owned by the Romanian state through the Ministry of Transport.

**HEAVY RAIL**

The rail network and infrastructure in Romania is owned by the Romanian state. There are only few small companies which operate trains on some rail routes, especially commercial trains.

The rail sector is regulated by the Office of Rail and Road (ORR).

**AVIATION**

While the operators are both publicly or private owned, the airports infrastructure is owned by the Romanian state.

**Other infrastructure**

**SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS/PRISONS)**

Typically, these are owned by the public sector with the exception of few hospitals and schools which are in the private sector.

**DEFENSE**

Defense assets are owned by the public sector.

**WASTE**

While in few municipalities facilities such as landfills, collection and transportation of the waste are in the private sector, the local public entities are still operating such facilities in most of the cities.

Are there special rules for investing in energy and infrastructure?

In Romania there are no specific regulations permitting or restricting investments in energy or infrastructure. Depending on the type of investment and the area in which such is envisaged to be made, various legal provisions may be applicable throughout the various stages of the investment, for example:

- corporate and civil law provisions applicable with respect to the setting-up of the investment vehicle, acquisition/sale of control in the investment vehicle, joint ventures etc;
- public procurement regulations in case of investments undertaken by public authorities or certain types of companies (such as energy-producing companies), which regulate aspects such as initiation of the investment, procurement of works, products and services related to the investment etc;
- legislation regarding European funds or state aid schemes, to the extent these are used for the funding of the investment; and
- general regulatory provisions related to design, construction, commissioning and operation of an investment project, including construction provisions, environmental provisions etc.

Special regulatory provisions are applicable for each category of project in energy (e.g. electricity, nuclear and thermal energy production investment projects) or infrastructure (telecommunications, railway and road infrastructure investment projects).

What is the applicable procurement process?

Public procurement in Romania is, for the time being, regulated by several laws enacted in 2016 aimed to transpose into Romanian legislation the EU public procurement reform, as follows:

- Law on Public Procurement transposing Directive 2014/24/EU on public procurement;
• Law on Sectorial Acquisitions, transposing Directive 2014/25/EU on procurement by entities operating in the water, energy, transport and postal services sectors;

• Law on Concessions of Works and Concessions of Services, transposing Directive 2014/23/EU on the award of concession contracts; and

• Law on Remedies and Appeals Related to Awarding of Public Procurement Contracts, Sectorial Contracts and Works Concession Contracts and Services Concession Contracts, as well as regarding the organization and functioning of the National Council for Solving Complaints, transposing Directive 89/665/EEC on application of review procedures to the award of public supply and public works contracts and Directive 92/13/EEC on application of Community rules on the procurement procedures of entities operating in the water, energy, transport and telecommunications sectors.

The key principles are that contracts procured by the public sector are awarded fairly, transparently and without discrimination on the grounds of nationality and that all potential bidders are treated equally. They also set out the principle of proportionality and assumption of responsibility.

The award of the contract is determined on a more complex basis, with the sole awarding criterion being the ‘most economically advantageous tender’, which is determined by reference to price or cost, price-quality and/or cost-quality ratio.

Public procurement is relevant where the central authorities, public institutions, local public authorities, local public institutions or State-owned companies, are seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset.

The thresholds triggering application of public procurement rules are as follows:

• RON 23,227,215 (approximately €5.186 million) for public works contracts;

• RON 600,129 (approximately €134,000) for public service contracts; and

• RON 3,334,050 (approximately €750,000) for public service contracts for social and other specific services.

A contracting authority is entitled to purchase directly products or services with an estimated value (excluding VAT) of RON 132,519 (approximately €33,129), or works with an estimated value (excluding VAT) of RON 441,730 (approximately €110,432).

The existing procurement methods are: open tender procedure, restricted tender procedure, competitive dialogue, negotiated procedure without prior publication, design contest, simplified procedure, competitive procedure with negotiation, innovation partnership, awarding procedure for social services and other specific services.

Prior to launching a procurement procedure, contracting authorities may conduct market consultations for preparing the procurement and in this context they may involve independent experts, public authorities or commercial entities, including representative organizations thereof. The advice received may be used in the planning and conduct of the procurement procedure, provided that it does not distort competition and/or results in violation of the principles of non-discrimination and transparency.

To simplify the procedure, the contracting authorities shall accept the European Single Procurement Document (ESPD), consisting of an updated sworn statement of the tenderer/candidate, as preliminary evidence in replacement of certificates issued by public authorities or third parties confirming that the relevant economic operator fulfills the qualification conditions such as not being in the exclusion situations provided by law, meeting the capacity criteria and, as the case may be, meeting the selection criteria. Nevertheless, the contracting authority may ask tenderers/candidates at any moment during the procedure to submit all or part of the supporting documents where this is necessary to ensure the proper conduct of the procedure. The tenderers/candidates are not obliged to provide such supporting documents if the authority has the possibility to obtain them directly by accessing a free national database.

Last modified 20 Oct 2017

**What are the most common forms of funding / investing in energy and infrastructure?**

The principal forms of private sector funding/investment in energy and infrastructure in Romania (including in relation to public-private partnerships) are:

**Funding**
Common forms of funding in energy and infrastructure include:

- loans made on a corporate-finance basis (balance sheet debt); and
- loans made on a project-finance basis.

Funding/funding products can also, sometimes, be provided by the European Bank for Reconstruction and Development.

**Investing**

Common form of investing in energy and infrastructure is ‘equity’ investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans.

*Last modified 20 Oct 2017*

**Restructuring**

**Enforcement and sanctions**

*When can there be regulatory investigations?*

The National Bank of Romania, in exercising its supervisory competences, is entitled by law to control and to check, on the basis of various reporting it receives and by investigations at the premises of the controlled entities, the accounts and any documents of the regulated entities that it authorized. Breaches of the applicable regulations may result in various measures and sanctions being applied by the National Bank of Romania, in accordance with the law.

As part of its supervisory competences, the Financial Supervisory Authority is entitled by law to perform on site verifications and, if the case, to order measures and impose sanctions.

*Last modified 20 Oct 2017*

*What regulatory penalties may apply?*

Depending on the breach, the National Bank of Romania may apply various sanctions, varying from written warning, public warning (in which the relevant guilty individual or entity, as well as the breach that has taken place are identified), fines applied to a legal entity (up to 10% of the aggregate net value of the turnover in the preceding financial year), fines applied to individuals (up to the RON equivalent of €5 million). Furthermore, the National Bank of Romania may also impose various measures aimed specifically at ending the observed breaches, such as withdrawal of the authorization granted to the credit institution. The National Bank of Romania makes public on its official website, the sanctions applied, in accordance with the law.

When a rule breach has taken place, the Financial Supervisory Authority (FSA) may issue a warning, impose a financial penalty, suspend or withdraw the authorization against the firm and/or regulated individuals. The FSA will publicize these penalties.

*Last modified 20 Oct 2017*

*What criminal penalties may apply?*

The breach of various legal provisions in the banking and financial investment services fields (such as performing credit activities or financial intermediation on a professional basis without being authorized) may constitute criminal offences punished with imprisonment or otherwise in accordance with the Romanian Criminal Code. The competent courts of law are involved in the actual application of the criminal sanctions.

*Last modified 20 Oct 2017*
Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

No stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

In principle, no stamp, registration or similar charges are payable on the granting or registration of security, other than, inter alia:

- fees payable for the authentication by a notary public of an immovable property mortgage agreement (such fees are calculated by applying a certain percentage to the value of the secured amount and, therefore, can be significant);
- fees payable to the Electronic Archive of Movable Security (Arhiva Electronica de Garantii Reale Mobiliare) or any other relevant public registers for the registration of mortgage agreements; and
- fees payable for the registration of an immovable property mortgage agreement with the relevant land registry.

Depending on the nature of the assets over which security is taken, other forms of registration may also be required (or be advisable), which may also require the payment of fees. Similarly, various registration fees may be payable in the context of the transfer of registered security interests (made with a view to reflecting the change in secured creditor).

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

No stamp, registration, transfer or other similar taxes are payable on the issue, transfer or assignment of a debt security (eg a bond).

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

As a general rule, tax authorities take priority over other types of creditors in the case of enforcement of security interests. However, in situations where loans are secured over real estate properties or other assets and certain notification procedures have been complied with, secured creditors may take priority over the tax authorities on enforcement.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

As a general rule, interest paid by a Romanian resident to a beneficiary who is not a Romanian resident, is subject to withholding tax.

If so:
What is the rate of withholding?
The current rate of Romanian withholding tax is 16%.

**What are the key exemptions?**

There are specific exemptions from the application of withholding tax for the following types of interest payments:

- interest related to public debt instruments, in Romanian and foreign currency, as well as interest related to instruments issued by the National Bank of Romania for the purpose of achieving the objectives of monetary policies and revenues derived from trading of titles issued by the National Bank of Romania;

- interest related to instruments/titles issued by certain Romanian companies, if such instruments/titles are issued based on a prospectus approved by the relevant regulatory authority and the interest is paid to a person that is not an affiliated person of the issuer;

- interest paid to a related party resident in a member state of the EU, provided that the conditions of the EU Interest and Royalty Directive, as implemented in Romanian domestic legislation, are met; and

- interest paid to certain pension funds, provided that between Romania and the country of residence of the income beneficiaries there is a legal instrument based on which information exchange can be performed.

A reduction or elimination of applicable withholding tax may also be available under the provisions of a double tax treaty concluded between Romania and the country of residence of the recipient/beneficiary, provided that certain requirements are met.

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes, both withholding taxes and the applicable exemptions (if the debt security can be classified within the exemptions) are applicable.

Last modified 20 Oct 2017

**Are foreign lenders and debt security holders subject to tax on interest payments?**

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding tax (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

*Are there any restrictions on issuing debt securities?*

There are restrictions on issuing debt securities in Russia which differ for Russian and foreign securities.

For Russian debt securities issued by Russian issuers, the general regulation for securities offerings must apply with special requirements established for each type of debt securities (bonds, depository receipts and etc.).

Foreign financial instruments may only be placed (sold for a first time to the first holder) in Russia if the following conditions are met:

- an international securities identification number (ICIN) and a Classification of Financial Instruments (CFI) are assigned to the instrument; and
- the instrument is qualified as security in accordance with the procedure established by the CBR,

provided that in each case the financial instrument is issued by a foreign issuer that complies with the requirements stated in the law (such as foreign organizations established in states that are members of the Organization for Economic Cooperation and Development (OECD), foreign organizations established in states whose relevant regulators (other authorized institutions) have entered into cooperation agreements with the CBR, and foreign organizations whose securities are listed on foreign exchanges included in the special list approved by the CBR).

Generally, in addition to the conditions set out above, foreign securities will be admitted for placement (initial sale to initial investors) in Russia provided that the prospectus describing such securities is registered by the CBR and such securities are registered with (held through) a depositary established in accordance with Russian law. A filing of a notice to the CBR with the results of the initial placement in the Russian territory and disclosure of this information are required, without which any subsequent trading/transacting in Russia is prohibited.

In certain cases, a decision to admit foreign securities to public circulation in Russia may be made by the Russian exchange if a listing procedure is started or finished by the foreign exchange and which is included in the list specified by the CBR.

*What are common issuing methods and types of debt securities?*

It should be noted that Russian regulation of the securities market is rather conservative. Russian issuers can only issue the types of securities that are directly specified in the law and in accordance with the requirements stated in the law.

The most common types of Russian debt securities are bonds issued on a stand-alone basis. Recently, it also became possible to issue bonds under a program.
The various types of Russian debt securities include:

- bonds characterized by the type of interest or payment such as fixed-rate bonds, floating-rate bonds and discount bonds;
- secured bonds such as bonds secured by the pledge, bonds secured by surety and bonds secured by bank or state guarantee;
- subordinated bonds and perpetual bonds (ie bonds that have no specified redemption date);
- exchange-traded bonds;
- commercial bonds;
- structural bonds;
- Russian depository receipts (securities issued by a Russian depository evidencing the right of its holder to a certain amount of securities of a foreign issuer);
- warrants (securities giving its holder the option to purchase equity of the issuer under the terms specified in it); and
- convertible securities (securities convertible into other types of securities such as shares or bonds).

Foreign financial instruments can only be admitted to public placement/circulation if, among other requirements, they are qualified as securities under the procedure established by the Central Bank of the Russian Federation (CBR). Thus, the types of such securities are limited to those recognized by the CBR.

**What are the differences between offering debt securities to institutional / professional or other investors?**

In some cases, securities can only be offered to qualified investors. Such offerings are possible without a prospectus and disclosure of information (but it is still required for listing by an exchange).

Securities for qualified investors can only be acquired or sold through a broker in some cases.

**When is it necessary to prepare a prospectus?**

Under Russian law, a prospectus must be prepared in all cases, unless one of the following exemptions apply:

- securities are placed with qualified investors or the persons that can exercise a preemptive right in respect of such shares or securities (convertible into shares);
- shares or securities convertible into shares are placed with persons that, as on a certain date, are or were shareholders of the issuer;
- securities are offered to a maximum of 150 persons (qualified investors and persons that can exercise a preemptive right in respect of such securities not counted);
- funds raised by the securities offerings during a year do not exceed RUB 4 billion for a credit organization or RUB 1 billion for all other issuers;
- funds paid by each potential purchaser (apart from the persons exercising their preemptive right) are not less than RUB 1 million 400 thousand; or
- registration of separate terms and conditions of bonds under a program where a prospectus has been registered simultaneously with registration of the program within one year from the date of registration of the prospectus.

**What are the main exchanges available?**
The Moscow Exchange has two principle markets on which debt securities are traded subject to its rules:

- the Equity Capital Market which offers trading in shares, depository receipts, fund shares, mortgage participation certificates and exchange traded funds; and
- the Debt Capital Market which offers trading in state bonds, corporate bonds, and corporate and sovereign Eurobonds.

Another active exchange in Russia is the Saint-Petersburg Exchange where shares, options and commodities are traded. It is notable that, for the first time on the Russian market, the Saint-Petersburg Exchange has introduced an opportunity to trade foreign securities within the Russian jurisdiction.

**Is there a private placement market?**

Russia has a moderately active private placement market.

As a matter of Russian law, securities cannot be placed (including private placements through private offering to specified potential buyers) until:

- the securities offering and (in relevant cases) the prospectus are registered with the Central Bank of the Russian Federation; or
- issuing of the securities (at the time of incorporation of the issuer or through private offering) is registered by a licensed registrar, an exchange or a depository.

**Are there any other notable risks or issues around issuing or investing in debt securities?**

Generally, it should be noted that issuing or investing in securities in emerging markets such as the Russian Federation is subject to greater economic, political and legal risks when compared with more mature markets.

Potential legal risks are connected with the fact that regulation of the securities market in Russia is rather new and undeveloped in some spheres. The relevant laws tend to change rapidly and their practical implementation may be inconsistent or unclear. Some important areas of the securities market are not regulated in Russia, while in other areas the law imposes obligations on the Russian issuers which are not common in other markets. The approach of the Russian regulator and interpretations of the applicable legislation are unstable, not well developed and, at times, can be unpredictable and selective.

**Issuing debt securities**

Failure to comply with the stated requirements of proper information disclosure including misleading statements in, or omissions from, a prospectus can lead to civil, administrative or criminal liability. Federal Law ‘On Protection of Rights and Legitimate Interest of Investors on Securities Market’ provides various measures for the protection of investors.

**Investing in debt securities**

The concept of a bonds trustee (which is not a trustee in common law terms but a representative that acts on behalf of, and in the interests of, the bond holders) was recently introduced to the Russian securities market. The law provides the bonds trustee with significant discretion, while being in some parts vague and not widely tested in practice. Some bonds trustees on the market may interpret the law differently leading to uncertainty among investors.

The law also introduced a concept of investors meetings which consider matters affecting the investors interests. The decision of any such meeting is binding upon all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the decision.
Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally, under Russian law, a fund may be established in one of the following ways:

- as an investment fund in the form of a Russian joint-stock company (JSC Investment Fund); or
- as a mutual fund being a separate portfolio of assets which does not hold the status of a legal entity (Mutual Fund).

To perform its investment activities, a JSC Investment Fund must obtain a special license from the Central Bank of the Russian Federation (CBR) and meet certain other criteria established by Russian law, such as keeping a certain level of its own funds, holding a separate bank account for all its operations connected with trust management or meeting specific corporate governance requirements. Furthermore, it is worth noting that the JSC Investment Fund is not allowed to place any securities, except for its ordinary shares.

Although a Mutual Fund itself is not a legal entity, the law requires that its assets portfolio be managed under a trust management agreement by a special management company holding a CBR license. The law contains specific rules that apply to such management companies and trust management agreements, for instance a management company is required to register the rules of trust property management with the CBR or maintain certain financial levels.

What are common fund structures?

Russian law recognizes the following categories of mutual funds:

- opened mutual funds (investment units may be purchased or sold at any time);
- exchange traded mutual funds (investment units can be sold at an exchange or to the person authorized by the fund itself);
- interval mutual funds (investors may sell their investment units only in specified time periods); and
- closed mutual funds (investors cannot sell their investment units until the time period for which a fund was established expires).

An investment declaration of a joint-stock investment fund, an interval mutual fund or a closed mutual fund may also provide (or must provide in cases established by the Central Bank of the Russian Federation) that the shares/ investment units of such fund are designated for qualified investors.

Furthermore, depending on the type of investment, common fund structures also include share funds, bond funds, commingled funds, index funds and real estate funds.

What are the differences between offering fund securities to professional / institutional or other investors?

Russian law establishes that certain types of securities may be offered to qualified investors only. There is also a general prohibition on offering foreign securities and foreign financial instruments that are not admitted for public placement/circulation in Russia by the exchange, or, in certain cases – the CBR to an unlimited group of persons, or to persons who are not qualified investors.

The term ‘offering/offer’ is understood very broadly. According to informal opinions of the predecessor of the current regulator (the Federal Service for Financial Markets which is the predecessor of the Central Bank of the Russian Federation in the sphere of financial market regulation), an ‘offer’ is in essence ‘advertising or proposing’ and ‘it is not allowed to disseminate within the Russian Federation in any way, in any form and by any means, information that (i) is addressed to an unlimited number of persons or to persons that are not qualified investors and (ii) is aimed at (a) drawing attention to foreign financial instruments that are not admitted for public placement and/or public circulation in Russia, (b) creating and supporting interest in such securities and (c) promoting them in the market’.

Considering the above, active marketing/distribution of foreign financial products is possible only if such financial instruments have obtained appropriate authorization for public placement/circulation in Russia by the exchange, or, in certain cases – the CBR. If a financial
Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

Establishing a fund requires a special license (for the fund itself in case of a joint-stock company investment fund or its management company in case of a mutual fund), meeting license rules and complying with certain reporting and public disclosure requirements throughout the operation of the fund. For more information, see Establishing and investing in debt and hedge funds – establishment.

Investing in funds

Before investing in a fund, it is essential to check for specific requirements which may apply to investment in the fund by virtue of law or in accordance with rules of the specific fund, for instance to verify whether investment units are designated for qualified investors only or may be offered to general public.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Federal Law 'On Advertising' sets requirements for the advertising (that is, the distribution of information addressed to the general public and intended to draw attention to an object of advertising, to form or keep up an interest to it or to market it in any form) of financial services or financial activities of a fund or the advertising of securities, such as a prohibition on the inclusion of information about the assets management that is not supported with documentary evidence, as well as the guarantees of future stability and/or profitability of the investments, unless it can be clearly defined at the time of agreement for using such financial services.

Russian law also prohibits offering foreign securities and foreign financial instruments that are not admitted for public placement/circulation in Russia to an unlimited group of persons, or to persons who are not qualified investors.

Are there any restrictions on managing a fund?

Activities of joint-stock investment funds, and management of joint-stock investment funds or mutual funds, require a license issued by the Central Bank of the Russian Federation.

Since the activities of funds are heavily regulated in Russia, there are various restrictions on the management of funds. For example, a management company cannot acquire assets which are not listed in the law and the investment declaration of an investment fund. Compensation of the management company cannot exceed 10% average annual net asset value of the investment fund.

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

A person entering into a derivative contract by way of business must have a license for banking operations or a license of a professional participant on the securities market (in particular, for brokerage or forex dealer activities) whereas entering into derivatives contract intended for qualified investors is possible only through such persons. Entering into such contracts on an organized exchange is possible where the other party to the agreement is a central counterparty.
The Civil Code of the Russian Federation also regulates deals where there is an obligation on a party to pay monetary amounts depending on the changing price of:

- goods;
- securities;
- exchange rates;
- interest rates;
- inflation rates;
- parameters calculated as an aggregate of the indicators specified above; or
- an occurrence of any other event provided by the law where it is not known whether such event will happen or not.

The claims in respect of such deals are only subject to court protection if at least one of the parties is a legal entity with a license for the banking operations or professional activities on the securities market or, if the deal is made on an authorized exchange, at least one party is a legal entity with a license authorizing it to make deals on an organized exchange. If an individual is a party to such deal, court protection will only be provided if such deal has been made on an organized exchange or in other cases directly stated in the law.

**What are common types of derivatives?**

Derivatives may be traded over-the-counter or on an organized exchange.

All of the main types of derivative contract are used in Russia:

- forwards;
- futures (most wide-spread and popular);
- swaps; and
- options (call options and put options).

The value of the derivative contract is based on the value of the underlying assets which, among others, may be:

- securities;
- commodities;
- foreign currency;
- interest rates;
- inflation rate; or
- credit events.

**Are there any other notable risks or issues around entering into derivatives contracts?**

Over-the-counter derivative contracts, unlike those made on an organized exchange, do not have any system of centralized control, guarantees of performance, risk-management system or requirements on the participants. This risk analysis is carried out by the market player itself.

However, at the moment the Central Bank of the Russian Federation is developing amendments to the relevant laws in order to mitigate the mentioned risks and improve the infrastructure of the over-the-counter derivatives market, including centralized clearing.
accreditation of price centers and repository activities. In particular, in 2019 the CBR introduced its new approach to further enactment of the new rules for variation margin for non-exchange traded derivatives that should be put into effect in several stages. This area of law is therefore subject to possible changes.

Debt finance

Lending and borrowing

*Are there any restrictions on lending and borrowing?*

**Lending**

A credit agreement in Russia can take two forms:

- a credit facility agreement (the creditor can only be a bank or other credit organization, and the subject matter of such agreement can only be monies); or
- a loan agreement (the creditor can be any other non-credit organizations, including individuals, and the subject matter of such agreement can be monies or other things of general description or securities).

A loan agreement where a creditor is an individual is considered concluded only after monies or other things of general description are transferred to the other party, not after its execution. In other cases such contracts shall be deemed to be concluded on their execution date.

Not all forms of lending activities are regulated, such as loans between individuals.

However, in order to perform operations related to lending activities, the banks and non-banking credit organizations are required to obtain a license from the Central Bank of the Russian Federation (CBR).

Professional consumer lending is only allowed for credit organizations and a number of non-credit financial organizations specified in the law (microfinance organizations, credit cooperatives and pawnshops) and included in a relevant list by the CBR. There are also regulatory requirements stated in the Federal Law 'On Consumer Credit (Loan)' that apply to such professional consumer lenders.

Federal Law 'On Consumer Credit (Loan)' sets out restrictions on credit agreements secured by mortgage which are entered into by a borrower with a non-business related purpose, such as restrictions on the maximum amount of penalties and the amount of the total charges for the credit agreement.

**Borrowing**

While borrowing is generally not regulated, it is advisable for borrowers to consider whether either the consumer lending or mortgage regimes apply to their activities, in which case they will benefit from the protections mentioned above.

However, the law states some specific restrictions in respect of borrowing, such as:

- an individual declared bankrupt cannot borrow without indicating this fact to the counterparty for five years; and
- there is a general prohibition on borrowing for management companies of investment funds.

**What are common lending structures?**

A credit agreement in Russia can take the form of a credit facility agreement or a loan agreement. For more information, see Lending and borrowing – restrictions.

A credit facility agreement, being the most common lending instrument in Russia, may be structured in a number of ways to include a
variety of features depending on the commercial needs of the parties. A loan agreement is used between individuals or non-credit organizations that only occasionally (not on a regular basis) lend their funds to other parties.

A credit facility agreement is usually provided on a bilateral basis (a single lender providing the entire facility); however, syndicated facility agreements with multiple lenders providing parts of an overall facility are also used on the basis of Federal Law 'On Syndicated Credit (Loan) and Amendments to Certain Legislative Acts of the Russian Federation'. It should be noted that Russian law does not recognize the concept of a trust, thus alternative structures, such as a credit agent (kreditnyj upravlyayushiy), are used in syndicated secured transactions.

**Loan durations**

There are no particular requirements as to the duration of credit agreements.

Depending on the commercial needs of the parties, the credit agreements may take the form of a term agreement (provided for an agreed period of time), revolving agreement (provided for an agreed period of time with an availability period to extend nearer to maturity of the agreement and which may be redrawn if repaid), etc.

**Loan security**

A credit agreement can be either secured or unsecured. For more information, see Giving and taking guarantees and security.

**Loan commitment**

In the case of a credit facility agreement a lender cannot refuse to provide the loan unless there are circumstances evidencing that the loan will not be repaid in the due time. However, in accordance with the long-standing position of Russian courts, a breach of the respective obligation by a creditor will not give rise to the remedy of specific performance; ie a debtor will not have an enforceable right against the creditor to demand the provision of a loan but will have to resort to the remedies of rescission and damages. It is also possible to formulate conditions precedent for such refusal in the credit facility agreement itself.

A lender under the loan agreement is obliged to provide the loan unless there are circumstances evidencing that the loan will not be repaid in the due time with the exception of cases where a lender is an individual (please see Lending and borrowing – restrictions).

**Loan repayment**

A credit facility or a loan can be repayable on demand, on an amortizing basis (in installments over the life of the loan) or scheduled (usually meaning the facility or loan is repayable in full at maturity).

*Last modified 5 Dec 2019*

**What are the differences between lending to institutional / professional or other borrowers?**

Lending to individuals for non-business related purposes, including mortgage lending, is subject to regulatory restrictions under Federal Law 'On Consumer Credit (Loan)', which are not applicable to institutional and professional borrowers. For more information, see Lending and borrowing – restrictions.

*Last modified 5 Dec 2019*

**Do the laws recognize the principles of agency and trusts?**

The principles of agency are recognized in Russia. For instance, it is possible to appoint an agent to act on behalf of other parties.

The concept of trust, on the other hand, is not recognized under the Russian law, thus alternative structures (such as a credit agent (kreditnyj upravlyayushiy)) are used in syndicated secured transactions.

*Last modified 5 Dec 2019*
Are there any other notable risks or issues around lending?

Generally

Credit agreements are subject to general contractual principles. For example, parties must agree on all the essential terms of the relevant type of agreement specified in the law, otherwise the agreement will be deemed unenforced.

It should be noted that a penalty stated in the agreement may be lowered by the court where it is evidently disproportionate to the consequences of the breach.

Under Russian law a pledge cannot be enforced if the breach of the secured obligation is insignificant and the amount of the claim as a result of this is evidently disproportionate to the value of the pledged property. It is presumed that the breach is insignificant if (i) the overdue amount is less than 5% of the value of the pledged property and (ii) the late payment period is less than three months. In addition, in some cases the court may postpone the enforcement of the pledge.

In case of the pledgor's bankruptcy the pledgee receives only 70% (or 80% for claims under the credit facility agreement) of the funds derived from the enforcement of the pledge in priority. Any remaining claims will be satisfied in the general order.

Specific types of lending

In respect of credits for non-business related purposes, there is more legal protection for the borrower than in the case of corporate credits. The law includes some restrictions specific to consumer lending and mortgage lending to individuals for non-business related purposes. For example, the maximum amount of total charges for credit and the maximum amount of penalties for non-performance or breach of the borrower's obligations are regulated by law, while some services are provided to individuals free of charge.

Standard form documentation

In 2015 the Association of Russian Banks has developed and published a standard Russian-law governed syndicated credit facility agreement which does not include the newer requirements of Federal Law 'On Syndicated Credit (Loan) and Amendments to Certain Legislative Acts of the Russian Federation', however in any case such syndicated facilities are rare. For transactions with a foreign counterparty it is common to choose English law as the governing law and to use Loan Market Association standard forms.

Bilateral finance transactions are more likely to be documented on bank standard form documentation.

Are there any other notable risks or issues around borrowing?

No other notable risks.

It should be noted that there are special types of crimes in respect of borrowing stated in the Criminal Code of the Russian Federation, such as:

- fraud in the sphere of lending;
- unlawful receiving of a credit; and
- malicious avoidance of credit repayment.

The type of punishment varies in respect of each crime. The maximum prison sentence is ten years.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?
As a matter of Russian law, a guarantee is not regulated separately – it is one form of security which shares common features with other forms of security.

Some of the key areas affecting the giving of security are as follows.

**Form of a contract**

Granting security that breaches certain mandatory form requirements specified by the law will lead to its invalidity. The requirements differ depending on the type of the security. For example, a pledge of a participation interest must be notarized, while agreement on penalty must be in writing regardless the form of the primary obligation.

**Insolvency**

For a period after a new security interest has been granted (known as the hardening period), security may be at risk of being set aside under Russian insolvency laws if the security was granted within a certain time period prior to the insolvency of a company and a company received considerably less consideration for it or if a deal was made with the purpose of prejudicing the property rights of the creditors. Another ground for setting security aside is where the court qualifies the deal as leading to preference of one creditor over the other creditors.

**Subsequent pledge**

Pursuant to recent changes to the law, a subsequent pledge cannot be prohibited by the first ranking pledge agreement. However, if a first ranking pledge agreement specifies the terms on which a subsequent pledge is to be concluded, the breach of such terms entitles the first ranking pledgee to claim from the pledgor compensation of any losses incurred by such breach.

**What are common types of guarantees and security?**

There are various methods of securing performance of obligations under the Russian law.

The common types of security interest include:

- pledge (including mortgage);
- surety (note that the surety and the debtor shall be jointly liable to the creditor unless the surety agreement or law provides for secondary liability);
- independent guarantee (a written guarantee issued by a bank or other legal entity to pay the creditor a certain amount of money irrespective of the validity of the obligation secured by this guarantee);
- security payment (a sum of money paid by one party to another party to secure a monetary obligation, including the obligation to pay a penalty for breach of contract and certain other specific types of obligations);
- penalty (a sum of money which the debtor is obliged to pay to the creditor in the event of its failure to discharge its obligations); and
- retention (a creditor has the right to retain tangible property in its custody in the event that the debtor fails to discharge its payment obligations relating to the property).

**Are there any other notable risks or issues around giving and taking guarantees and security?**

To be valid, security shall comply with the following form requirements:

- An agreement on a penalty must be in writing regardless the form of the primary obligation.
- A pledge can be created by a written agreement or by operation of law (in this case the parties may conclude a written agreement
The pledge of participation interest must also be notarized.

- A surety agreement must be in writing (in some cases it can be created by operation of law).
- An independent guarantee must be granted in a written form that allows for the identification of the terms of a guarantee and to ascertain its authenticity.

The law also states compulsory registration requirements for certain types of pledge that are not created until such registration is made:

- A pledge of participation interest must be registered in the official single register of the legal entities.
- A mortgage (pledge of immovable property) as an encumbrance over the real estate must be registered in the unified state register of real estate.
- For a share pledge, a transfer record must be made on the account on which the rights of the shares owner are recorded.

Moreover, regardless of the time the pledge was created, priority will be given to the claim under a pledge which has been registered first.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Civil Code of the Russian Federation, Part I (1) (general provisions of civil law)

Civil Code of the Russian Federation, Part II (2) (distinct types of obligations)

Civil Code of the Russian Federation, Part III (3) (succession law and international private law)

Federal Law 'On Securities Market' (securities market)

Federal law 'On Banks and Banking Activities' (banks and banking activities)

Federal Law 'On Foreign Investments in the Russian Federation' (foreign investments)

Consumer credit

Federal Law 'On Consumer Credit (Loan)' (consumer lending)

Federal Law 'On Microfinance Activities and Microfinance Organizations' (micro financing)

Federal Law 'On Credit Histories' (credit histories)

Federal Law 'On Protection of Rights and Legitimate Interests of Individuals In Activities of Collection of Overdue Repayment of Debts and
Amendments to Federal Law ‘On Microfinance Activities and Microfinance Organizations’ (collection activities)

Mortgages

Federal Law ‘On the Mortgage (Pledge of Immovable Property)’ (mortgages)

Corporations

Federal Law ‘On Joint-Stock Companies’ (joint-stock companies)

Federal Law ‘On Limited Liability Companies’ (limited liability companies)

Federal Law ‘On International Companies and International Funds’ (redomiciliation opportunities)

Funds and platforms

Federal Law ‘On Investment Funds’ (investment funds)

Federal Law ‘On Investment Partnership’ (investment partnerships)

Other key market legislation

Federal Law ‘On Currency Regulation and Currency Control’ (currency regulation and control)

Federal Law ‘On Concession Agreements’ (concession agreements)

Federal Law ‘On Anti-money Laundering and Counter-Terrorism Financing Measures’ (AML and CTF rules)

Federal Law ‘On the Non-governmental Pension Funds’ (non-governmental pension funds)

Federal Law ‘On Syndicated Credit (Loan) and Amendments to Certain Legislative Acts of the Russian Federation’ (syndicated loans)

Last modified 5 Dec 2019

Regulatory authorization

Who are the regulators?

The Central Bank of the Russian Federation is the main regulator of the financial and investment market. Its functions, among others, include:

- banking supervision;
- regulating activities of non-banking credit organizations;
- supervision of corporate relations by joint-stock companies;
- regulation and supervision of the securities market and activities of the professional participants on the securities market;
- organization and performance of currency regulation and control;
• organization and methodological support of official statistical recording of direct investments;
• control of compliance with the requirements of the insider trading regulation;
• protection of rights and legitimate interests of shareholders and investors on the financial markets; and
• regulation, control and supervision of insurance activities;
• control over the activities of investment platforms operators.

What are the authorization requirements and process?

There are several types of authorization. Depending on the nature of the business a person may be required:

• to obtain a license from the Central Bank of the Russian Federation (CBR);
• to obtain a permission from the CBR;
• to obtain accreditation from the CBR;
• to be added to a register by the CBR; and
• to be a member of a self-regulated organization.

The process and application fees vary depending on the type of authorization.

The CBR maintains and publishes lists of licenses and authorized persons on its official website.

What are the main ongoing compliance requirements?

Threshold conditions (such as a requirement as to the amount of funds held, meeting liquidity ratios and disclosure of information) are an ongoing compliance requirement for most types of authorized persons.

Failure to comply with the threshold conditions and other regulatory rules can result in sanctions being imposed, including loss of authorization.

What are the penalties for failure to be authorized?

Undertaking regulated activities without appropriate authorization can lead to an administrative fine for individuals or legal entities. It can also constitute a criminal offence resulting in a criminal fine, compulsory community service, compulsory labor, arrest for up to six months or imprisonment for up to five years. Performing banking operations without a license is a separate criminal offence with a maximum punishment of seven years’ imprisonment.

In addition, a legal entity acting without authorization may be liquidated by the court and/or have the proceeds of its activities confiscated by the state.

Regulated activities

What finance and investment activities require authorization?

Generally
Certain types of activities are subject to licensing by the Central Bank of Russian Federation (CBR), including:

- performance of banking operations;
- organization of an exchange;
- professional activities on the securities market (brokerage activity, dealer activity, forex-dealer activity, depository activity, repository activity, securities management and maintenance of a securities owners register);
- activities of joint-stock investment funds and non-governmental pension funds; management of joint-stock investment funds, mutual funds and non-governmental pension funds; special depository of joint-stock investment funds, mutual funds and non-governmental pension funds; and
- clearing and insurance activities.

CBR's permission must be obtained, for example, in order to establish a credit organization with foreign investments in Russia, for a Russian credit organization to establish a branch or subsidiary abroad, or for Russian issuers to issue securities abroad.

Accreditation by the CBR is required for representative offices of foreign credit organizations, informational agencies that disclose information on the securities markets, and others.

Some types of activities can only be performed after a firm is added to the official register by the CBR (such as microfinance organizations, credit rating agencies or investment platforms operators) or after it enters into a self-regulated organization on a financial market.

**Consumer credit**

Consumer credit activities are generally performed by credit organizations (which include banks and non-banking credit organizations that are only allowed to perform a limited number of banking operations). Consumer credit activities can also be performed by some non-credit financial organizations, such as microfinance organizations, credit cooperatives or pawnshops.

The performance of banking operations by credit organizations requires a license from the CBR, while non-credit financial organizations must be added to a register of authorized organizations maintained by the CBR.

Federal Law 'On Consumer Credit (Loan)' sets out the framework for consumer credit and contains restrictions and implied terms which protect an individual.

_Last modified 5 Dec 2019_

**Are there any possible exemptions?**

If regulated activities are performed in the territory of Russia, they require an appropriate form of authorization with no exemptions.

_Last modified 5 Dec 2019_

**Do any exchange controls or other restrictions on payments apply?**

Cross-border transfers and the use of foreign currency in the territory of Russia is allowed only in the cases specified in the Federal Law 'On Currency Regulation and Currency Control'.

In general, currency operations between residents are prohibited unless expressly allowed by law. Currency operations between residents and non-residents may be performed subject to certain requirements (payments must be settled through an authorized bank and registrations of cross-border trade and loan/credit contracts by such a bank must take place).

The law also obliges residents to 'repatriate' the currency earnings, meaning that they as a general rule must facilitate the full return by non-residents of foreign currency or Russian currency due under the terms of the relevant foreign trade or loan contract to the resident's bank account opened with the authorized bank. Non-compliance with this rule can lead to an administrative or criminal liability.

Non-residents may open accounts with Russian banks and transfer funds to and from such accounts without restriction. Residents are also allowed to open accounts with foreign banks but generally there is a requirement to report this to the tax authorities. Operations under such accounts are subject to certain restrictions stated in the law.
There may also be anti-money laundering and tax considerations to take into account.

Last modified 5 Dec 2019

**What are the rules around financial promotions?**

**Rules**

Russian law does not specifically define financial promotions. However, there are relevant provisions in legislation regarding advertising, the issuance and operations of financial instruments and the provision of financial services.

Under Federal Law 'On Advertising', any advertising (that is, the distribution of information addressed to the general public and intended to draw attention to an object of advertising, to form or keep up an interest to it or to market it in any form) of financial services or financial activities that requires authorization can only be done by an authorized person.

It is also unlawful to advertise and/or offer to the general public the securities of issuers who have not disclosed information in the order and scope specified by law. Russian law also stipulates that certain types of securities may be offered to qualified investors only.

Foreign securities which are not admitted to public placement/circulation in Russia and foreign financial instruments which are not qualified as securities under Russian law cannot be offered in any form or by any means (including advertising) to the general public or to persons who are not qualified investors. The term 'offering/offer' is understood very broadly. According to informal opinions of the predecessor of the current regulator (the Federal Service for Financial Markets which is the predecessor of the Central Bank of the Russian Federation in the sphere of financial market regulation), an 'offer' is in essence 'advertising or proposing' and it is not allowed to disseminate within the Russian Federation in any way, in any form and by any means, information that (i) is addressed to an unlimited number of persons or to persons that are not qualified investors and (ii) is aimed at (a) drawing attention to foreign financial instruments that are not admitted for public placement and/or public circulation in Russia, (b) creating and supporting interest in such securities and (c) promoting them in the market.

Generally, foreign securities may be admitted for placement (initial sale to initial investors) in Russia provided that the prospectus describing such securities is registered by the Central Bank of the Russian Federation (CBR) and such securities are registered with (held through) a depositary established in accordance with Russian law. A filing of a notice to CBR with the results of the initial placement in the Russian territory and disclosure of this information are required, without which any subsequent trading/transacting in Russia is prohibited.

Foreign legal entities and their representative offices and branches cannot perform activities of non-credit finance organizations including activities of professional participants on the securities market, offer services of foreign legal entities on the financial markets or distribute information about such entities and their activities to the general public in the territory of Russia.

Violations of the stated requirements can lead to a civil and administrative liability or loss of authorization.

**Exemptions**

Public placement (initial sale to initial investors) of Russian securities is generally allowed after the registered prospectus is made available to the public. If securities are designated for qualified investors, then in some cases it is possible to place them without a prospectus.

Public circulation, including offering to the general public, of Russian securities also requires compliance with the disclosure of information requirements. These rules may not be applicable to securities for qualified investors.

Foreign securities which are not admitted to public placement/circulation in Russia and foreign financial instruments which are not qualified as securities under Russian law can only be offered to qualified investors.

Last modified 5 Dec 2019

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**
**Generally**

The most common types of legal entities are joint-stock companies (JSC) and limited liability companies (LLC), both of which are body corporates with separate legal personality.

The charter capital of a JSC is divided into shares and the liability of each shareholder is limited by value of its shares. The charter capital of an LLC is comprised of participation interests, the value of which also limits the liability of a participant. JSCs and LLCs are similar in many ways but differ in that LLCs are easier to establish and maintain, and are more flexible with respect to corporate governance.

Companies can either be public (where the shares of a JSC or other securities convertible into shares are placed through a public offering or are traded on a stock exchange) or private (all other JSCs and LLCs). Some activities require a particular type of legal entity to be used, such as the public offering of shares or other securities convertible into shares which can only be done by public JSCs.

**Funds**

Generally, under Russian law a fund may be established in one of the following ways:

- as an investment fund in a form of a Russian joint-stock company; or
- as a mutual fund being a separate portfolio of assets which does not hold the status of a legal entity.

Management companies of investment funds can be Russian JSCs or LLCs only.

*Last modified 5 Dec 2019*

**Is it possible to conduct lending or investment business through a branch or establishment?**

In Russia it is possible to establish a representative office or a branch. Both are separate divisions of a legal entity and do not create a separate legal personality.

Representative offices are not allowed to undertake commercial activity under the Civil Code of the Russian Federation. Instead, their main purpose is generally to promote commercial relations between the legal entity which they represent and Russian enterprises, and to gather information about the Russian market. Branches may undertake commercial activity, including lending or investment business, and fulfill all or part of the functions of its founding legal entity, provided the founding legal entity is authorized to carry out such activities.

However, foreign legal entities and their representative offices and branches cannot perform activities of non-credit finance organizations including activities of professional participants on the securities market, offer services of foreign legal entities on the financial markets or distribute information about such entities and their activities to the general public in the territory of Russia.

In relation to foreign credit organizations, in Russia it is only possible to establish representative offices of such foreign credit organizations (including banks); branches are not allowed. As mentioned above, representative offices cannot perform commercial activities.

*Last modified 5 Dec 2019*

**FinTech**

**FinTech products and uses**

*What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?*

**General**
According to the latest reports, Russia is one of the leading and fast-growing FinTech markets with approximately 82% of major cities' populations actively using, or at least being familiar with the most common technology products (EY, 'Global FinTech Adoption Index 2019'). Core FinTech products in Russia currently include online payments, mobile transfers, electronic banking, insurance utilizing telematics and automatic financial planning.

The following is an overview of the developing FinTech products based in Russia and their prospects in the near future.

Online wallets, payments and money transfers

Digital currency is a non-bank form of electronic payments and money transfers, which provides a prompt, simple and cost-efficient way of conducting monetary transactions without relying on the intermediary of a bank. Account ('wallet') services, as well as the other parts of infrastructure are provided by the issuer of the currency, with the latter generally not being limited to inter-user operations, but allowing the transfer to either another wallet or a bank account. While digital currencies are capable of performing most traditional bank account functions, their most prominent areas of application are online currency exchange and cross-border transfers, where banks' fees for the respective services are significantly higher.

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P)-type structures, often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds, as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

THE CURRENT POSITION OF PEER-TO-PEER FUNDING AND ITS PERSPECTIVES

Marketplace lending is available to address most forms of traditional bank funding products. Recent products have included:

- consumer loans;
- small and medium-sized enterprises (SME) lending; and
- debt refinancing.

It is likely that the volume of lending in these and additional product areas, will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector and lawmakers become increasingly more motivated to create a legal framework for the sector. To date, the further development of the market is currently has been hindered by the lack of certainty regarding the different platforms' legal standing and unavailability of uniform credit history and rating. It may be expected that in light of recent adoption of Federal Law "On Raising Investments via Investment Platforms and on the Amendments to Certain Legislative Acts of the Russian Federation" (Crowdfunding Law) that uncertainty will decrease to some extent and market players will become more open to the growing peer-to-peer sector.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable
WHAT IS A CRYPTOCURRENCY?

A cryptocurrency is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform).

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

One of widely accepted definitions of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform).
although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency). The legal framework regulating this new form of virtual money is yet to be developed.

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

The current ICO sector is developing in Russia. Its future shape will significantly depend on the approach to be taken by the regulators who are working on the legal framework for the cryptocurrencies and ICOs. Recently adopted Crowdfunding Law allows for offering of certain crypto-assets via "investment platforms", however, comprehensive framework for cryptocurrencies and ICOs is yet to be developed. Russian regulators are expected to develop their approach in the near future following recommendation by the FATF to adopt relevant legislation.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms, which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Data analysis and cloud computing
Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The Central Bank of the Russian Federation (CBR) is the main regulator of the financial and investment market. Its functions, among others, include:

- banking supervision;
- regulating activities of non-banking credit organizations and some non-credit financial organizations;
- regulation and supervision of the securities market and activities of the professional participants on the securities market;
- regulation of payment services;
- organization and performance of currency regulation and control; and
- protection of rights and legitimate interests of investors on the financial markets.

GENERAL

A person must not carry on a regulated activity in the Russian Federation unless authorized. Where FinTech products or applications involve financial activity which requires regulatory authorization, the firms providing such products or applications must be authorized by the CBR.

Undertaking regulated activities without appropriate authorization can lead to an administrative fine for individuals or legal entities. It can also constitute a criminal offence resulting in liability ranging from a criminal fine, to imprisonment for up to five years. In addition, a legal entity acting without authorization may be liquidated by the court or have the proceeds of its activities confiscated by the state.

INNOVATIONS

In 2016 the CBR set its course on embracing the recent trends in the financial market, starting with the launch of association 'FinTech' (a collaboration of the regulator and major finance and technology players) and creation of the Financial Technologies Department. The purpose of both projects is to encourage further development of the market’s technological segment and to monitor significant developments in the sector.

In 2018 the CBR made further steps to embrace FinTech: its “Main Directions of Development of Financial Technologies for 2018 – 2020” envisaged a number of strategies for development of FinTech, RegTech and development of financial infrastructure. The CBR also launched a “regulatory platform” (or “regulatory sandbox”) where innovative FinTech projects may be tested and implemented under the CBR’s control.

Regulation of peer-to-peer lenders

GENERAL

A business carries out a regulated activity (requiring authorization by the CBR) if they provide funding for either individuals or businesses, where the total amount of indebtedness of a borrower does not exceed RUB 1 million and RUB 5 million, respectively (microloans). Such businesses have to be recognized by the CBR as either a microfinance company (an entity allowed to raise funds from high-net worth
individuals and companies and through the offering of certain qualifying bonds) or a microcredit company (an entity only allowed to attract the assets of its shareholders or companies). The more detailed regulatory requirements are provided by the Federal Law ‘On Microfinance and Microfinance Organizations’.

Any lending activity exceeding the abovementioned thresholds for microloans would require a regular credit institution license.

CROWDFUNDING LAW

The Crowdfunding Law which came into force on 1 January 2020 established a legal framework for peer-to-peer lending via online “investment platforms”. An operator of such a platform needs to be incorporated in Russia and be included in the register of investment platform operators maintained by the CBR.

Subject to certain exceptions, companies are allowed to raise investments through investment platforms in the total amount not exceeding RUB 1 billion in a calendar year. The investments may be raised through borrowing funds, issuing tokens or “digital utility rights” and offering securities.

Certain limitations apply to investors acting on investment platforms: an individual may not make investments in the amount exceeding RUB 600,000 in a calendar year. Certain exemptions apply to this rule: for example, this limit is not applicable to sole entrepreneurs and qualified investors.

REGULATION OF PAYMENT SERVICES

The payment systems (including electronic payment platforms) operating in the Russian Federation have to comply with the provisions of the Federal Law ‘On National Payment System’. At present, more than 30 payment systems are functioning in Russia. All participants in a designated payment system will fall under the supervision of the Payment Systems Regulator (CBR), including, amongst others:

- operators that manage or operate the systems;
- the payment service providers using the system; and
- the infrastructure providers to the payment system.

Where a business enterprise provides payment services as a regular occupation or business activity in the Russian Federation, it will have to be recognized as either a bank or an authorized non-banking credit organization, thus requiring the license of the CBR.

ELECTRONIC PAYMENT PLATFORMS

Electronic money (e-money) is defined as ‘monetary funds which are advanced by one person (provider of funds) to another person that records the information on the amount of advanced funds without opening a bank account for the purpose of discharge of payment obligations of the provider of funds to third parties and in respect of which the provider of funds is entitled to give instructions only with the use of electronic means of payments’. Generally, the firms issuing e-money must be licensed by the CBR.

APPLICATION OF DATA PROTECTION AND CONSUMER LAWS

DATA PROTECTION

The Federal Law ‘On Personal Data Protection’ regulates the processing of personal data within the Russian Federation. Where a business determines the purposes and manner in which any personal data is collected, processed and stored, it will be regulated by the law and will be subject to certain notification and compliance obligations. Among other things, the businesses are required to localize the personal data in Russia and obtain consent for transfer of personal data abroad. The CBR Regulation ‘On Data Protection in the course of Money Transfers’ and the Government Decree ‘On Data Protection in a Payment System’ provide more detailed rules on data protection in the financial and investment market.

CONSUMER REGULATION

Professional consumer lending is only allowed for credit organizations and a number of non-credit financial organizations specified in the law (microfinance organizations, credit cooperatives and pawnshops) and included in a relevant list by the CBR. There are also regulatory requirements stated in the Federal Law ‘On Consumer Credit (Loan)’ that apply to such professional consumer lenders.

MONEY LAUNDERING REGULATIONS
The Federal Law ‘On Countering the Legalization of Illegal Earnings (Money Laundering) and the Financing of Terrorism’ give the Federal Service of Financial Monitoring (RosFinMonitoring) responsibility for supervising the anti-money laundering controls of businesses that offer certain services, such as lending, providing payment services and issuing and administering other means of payment.

Generally, where a firm is authorized and supervised by the CBR it will also be supervised by the RosFinMonitoring for complying with anti-money laundering requirements. Electronic currencies such as bitcoin and cryptocurrencies are yet to fall within the legal framework of money-laundering legislation, however, they are already considered by the Russian regulators to represent a higher risk, mostly due to the anonymous nature of transactions and lack of central control (decentralization).

Last modified 5 Dec 2019

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access. It involves members of the public investing in a business by pooling their resources through an intermediary platform.

There are two main types of crowdfunding: equity and reward-based.

• Equity crowdfunding (crowd-investing) involves company shares being given in exchange for investment in the business.

• Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

While most of the local crowdfunding platforms (Planeta.ru, Boomstarter) are in the early stage of development, the international sector is well established, and may be attractive for a Russian FinTech business in the early stages.

ACCELERATORS

There are several incubators or accelerators in the Russian market, which offer support, facilities and funding for startups, often in return for an equity stake. For example, Skolkovo, Generation S and Ideal Machine, offer both investment and mentoring by industry experts.

GOVERNMENT GRANTS

Several government grants are available to early stage companies. Grants are given to companies without any obligation to repay, but with some strings attached to the commercialization and transfer of the technology outside of Russia. The most active organizations that currently give out grants to Russian startups are the Skolkovo and Bortnik funds.

Venture capital and debt

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending, given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the
company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), secured against a company's assets including an equity element, allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

**Senior bank debt and capital markets funding (late stage)**

**SENIOR BANK DEBT**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis, depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**CAPITAL MARKETS FUNDING**

The Russian Federation has both debt and equity capital markets which are accessible to businesses (usually of a certain size).

**Incentives and reliefs**

**STATE INCENTIVES**

There are several government measures designed to help small, early-stage companies:

- tax schemes (Simplified Taxation System and Patent Taxation system);
- state investments (financial aid);
- supervision reliefs (eg simplified accounting standards);
- property grants (working facilities); and
- information help.

**IT COMPANIES**

Russia-based IT companies engaged in software development and sales activities and/or provision of technical services for developed software, are eligible for reduced rates of mandatory contributions until 2019.

**SKOLKOVO TAX INCENTIVES**

Certain tax benefits are available to Russian companies that are residents of Skolkovo Innovation Centre. Generally, Russian companies can become a Skolkovo resident if they conduct qualifying research and development and innovation activities, and comply with certain other requirements. The main benefits are: profits tax exemption for ten years and reduced mandatory contributions.

*Last modified 5 Dec 2019*

**Portfolio sales**

**Loan transfers and portfolio sales**

*What are common ways of buying and selling loans?*

Buying and selling loans is common.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common way of selling loans in Russia is by an assignment of rights. Assignment is allowed unless otherwise stated in law.
Generally, it can be done without the consent of the debtor.

Recently the Civil Code of the Russian Federation recognized the concept of an agreement transfer, which allows the transfer of all rights and obligations under an agreement to another party. However, it is not yet widely used in practice.

**What are the main considerations when transferring a loan and related security?**

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by legal advisors. Some of the key considerations include the following.

**Contractual prohibition or restriction of assignment**

The parties may contractually prohibit or restrict an assignment. This does not invalidate the assignment and cannot be a ground for termination of such agreement, but the assignor is not exempt from liability before the debtor for such breach.

**Form of assignment**

An assignment shall comply with the same form requirements as the main agreement. For more information, see Giving and taking guarantees and security – other issues.

**Assignment of security interest**

Generally, the assignment of rights under the main obligation means simultaneous automatic assignment of rights under the security. However, for the types of pledges that require registration (for more information, see Giving and taking guarantees and security – other issues) the new creditor will not be able to enforce such security until the registration is made.

**Data protection**

If an assignment requires transfer of the borrower’s personal data, there must be consent of the relevant borrower to disclose such personal data to third parties in case of assignment.

**Transfer mechanics**

If a loan agreement specifies a procedure for an assignment, this procedure shall be followed.

**Notifications**

Russian law does not require notifications to be made, but the new creditor bears a risk of any adverse consequences of non-notification. The obligation of a debtor ceases with performance to the original creditor if it is done before a notification has been received. The agreement itself may require notifications to the other parties and any such procedure must be complied with.

**Projects**

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

**Generally**

The ownership of energy and infrastructure assets in Russia varies according to the asset class. Some publicly owned energy and infrastructure companies are still pending privatization in accordance with the relevant government plans.
Federal Law 'On the Procedure of Foreign Investment in Business Undertakings Strategically Important for National Defense and State Security of the Russian Federation' sets out the conditions and procedures allowing the Russian government to restrict, on a case-by-case basis, the right of foreign investors to take control of, or gain influence over, or acquire assets of companies engaged in some activities deemed strategically important for Russia's national defense or security. Some activities in the sphere of energy and infrastructure may fall into this category.

It should also be noted that in Russia the state owns the mineral resources in subsoil until they are extracted. The right to the extracted natural resources could be in any form of ownership depending on the entity exploring and developing subsoil in Russia under the relevant subsoil license.

**Energy**

As a result of reform, the electricity industry in Russia is partially privatized. The public joint-stock company 'The System Operator of the Unified Energy System', which is owned by the Russian Federation, exclusively performs centralized administration of the Unified Energy System of Russia. The electricity network companies are also owned by the state. However, generation and retail companies are now open to private (including foreign) investors.

The most significant participant of the gas industry in Russia is the public joint-stock company 'Gazprom' which is partially owned by the state. It has a monopoly to export pipeline gas, while the export of liquid gas is also allowed by some other companies.

**Telecoms infrastructure**

Under Federal Law 'On Communications', telecommunication networks and devices may be either public or private. At present, there is no particular law that lists the telecommunication networks and devices that may only be owned by the state although such a law may come into existence. In practice, telecommunication infrastructure is owned by several service providers.

**Transport infrastructure**

**RAIL**

The railroads in Russia are mainly owned and operated by the public joint-stock company 'Russian railroads', which is publicly owned. There are also railroads owned by private companies in remote areas which are used primarily for local cargo transportation.

**ROADS**

The roads (including construction elements placed on or over them, such as bridges or tunnels) in Russia are generally publicly owned. Private ownership is possible if a road is built by individuals or companies using their funds on land plots which have been provided to them specifically for these purposes, or where the roads are otherwise transferred into private ownership in accordance with Russian law.

**AVIATION**

Aviation is (for the most part) privatized.

**PORTS**

Certain elements of the ports infrastructure may only be publicly owned, such as approach channels or navigation equipment. Some infrastructure facilities which were produced or acquired using the funds of legal entities or individual entrepreneurs may be privately owned.

**Other infrastructure**

**EDUCATION**

Ownership of a school's infrastructure depends upon which category of school it belongs to. In respect of state and municipal educational organizations, their educational, production and social infrastructure cannot be privatized.

**DEFENSE**
Typically, defense assets are owned by the state.

**WASTE**

The waste treatment infrastructure in Russia is mainly privately owned.

**WATER**

Water infrastructure in Russia is owned by the state, with limited exceptions for certain types of infrastructure.

Last modified 5 Dec 2019

Are there special rules for investing in energy and infrastructure?

Generally

In addition to the general methods of investing, there are also two special legal regimes in Russia that may be used for investments in energy and infrastructure.

A significant part of the investment in energy and infrastructure takes the form of public-private partnerships (PPPs). A PPP project is generally achieved through a long-term agreement between the public sector and the private sector to deliver a service traditionally provided by the public sector. Federal Law 'On Public Private Partnership, Municipal Private Partnership in the Russian Federation and Amendments to Certain Legal Acts of the Russian Federation' (PPP Law) applies to numerous types of infrastructure including, among others, roads, railways, pipelines, sea ports, airports, healthcare and education facilities. The PPP Law specifies essential elements of PPP agreements, tender and selection procedure and certain guarantees for the investors.

Another option is a concession agreement under Federal Law 'On Concession Agreements' (Concession Law). The Concession Law applies to various types of infrastructure, which are nearly the same as in the PPP Law (including, among others, roads, railways, pipelines, sea ports, airports, communal services, and various cultural, education, healthcare, sporting and tourism facilities). Generally, The main difference between the regulation provided under the Concession Law and the PPP Law is that in the case of a concession the newly created infrastructure object remains in the state ownership (as opposed to private ownership under the PPP Law), whereas a private partner typically is responsible for its maintenance and operations.

Federal Law 'On the Procedure of Foreign Investment in Business Undertakings Strategically Important for National Defense and State Security of the Russian Federation' sets out the conditions and procedures allowing the Russian government to restrict, on a case-by-case basis, the right of foreign investors to take control of, or gain influence over, or acquire assets of companies engaged in some activities deemed strategically important for Russia's national defense or security. Some activities in the sphere of energy and infrastructure may fall into this category.

In addition, a particular proposed investment may be subject to other legislative or regulatory control (eg merger control rules). As regards the planning and implementation of the underlying energy or infrastructure project (in which investment is to be made), the legal/regulatory position relevant to that project must be considered.

**Energy**

The energy market in Russia exists in the form of the Unified Energy System which is exclusively administered by the publicly owned public joint-stock company 'The System Operator of the Unified Energy System' (System Operator). There is a complex system of arrangements between the System Operator and other participants of the energy market which is heavily regulated, including, for example, statutory user fare regulation. Some types of activities would also require a special license.

**Telecoms infrastructure**

There is a complex regulatory environment for this sector as specified in Federal Law 'On Communications' as well as in regulations of the Government, the Ministry of Communications and Mass Communications of the Russian Federation and other regulatory bodies.

**Transport infrastructure**

Transport infrastructure also has an extensive and complex framework to consider. For example, in relation to rail, this includes
understanding the regulatory regime for compulsory certification and declaration of conformity of the railroad infrastructure and user fare regulation. Aviation also has various licensing requirements and regulatory bodies requirements.

Other infrastructure

The regulation of PPPs and concession agreements in Russia is in many ways imperative. For example, the law restricts possible security instruments that the parties may choose (it is generally forbidden to pledge the project assets or the rights under concession agreement, however, certain exceptions exist in the latter case if the project is funded by external creditors) and the selection process. Russian policy favors the jurisdiction of the Russian court for the resolution of contractual disputes for such cases, which foreign investors may not be comfortable with.

What is the applicable procurement process?

Public procurement is regulated by the PPP Law and Concession Law. The key principles are that the contracts procured by the public sector shall be awarded fairly, transparently, without discrimination and that all bidders are treated equally.

Investing in energy and infrastructure

The public sector must publish a tender notice online or send the notifications to potential participants. The selection process differs for the opened and closed procedures.

Bid procedures normally allow the winning bidder to submit mark-ups during post-tender negotiations of key terms (for example the timetable to close the deal); however, to a significant extent, a winning bidder is still bound to the published version of the concession agreement. Potential amendments to the concession agreement cannot include the terms which were conditions of the tender or which were contained in the winning bid.

Apart from public tenders both the PPP Law and Concession Law allow private initiative from an interested investor. In this case the initiative on the project comes from a private partner that suggests the conditions of the concession agreement and key terms of the project implementation, which should comply with the effective laws. If the public partner is interested in the project and has general consent to the conditions it publishes the relevant notification for any other party, which may be willing to implement the project. If any alternative investors are interested in the project, then the tender selection procedures take place.

If an investor seeks to invest in a project that has already been procured and is operational, it should be noted that assignments under the concession agreements are possible only if approved by the public sector.

Financing energy and infrastructure

On a publicly procured contract, the public sector may prescribe requirements on the funding arrangements.

What are the most common forms of funding / investing in energy and infrastructure?

Funding

Common forms of funding in energy and infrastructure include:

- loans made on a corporate finance basis;
- loans made on a project-finance basis (to a special purpose project company);
- bond finance;
- refinancing of debt; and
- asset financing (which is less common).
Investing

Common forms of investing in energy and infrastructure include:

- 'equity' investment in special purpose vehicles or entities that may have a portfolio of interests; and
- secondary market investment in operational projects (acquisition of 'equity').

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

The Central Bank of the Russian Federation may launch an audit if it considers that an authorized person may have breached the ongoing compliance requirements. This may result in regulatory sanctions.

What regulatory penalties may apply?

When a rule breach has taken place, the Central Bank of the Russian Federation (CBR) may impose a financial penalty, withdraw authorization or apply to the court for compulsory liquidation of a legal entity or for confiscation of all proceeds from unauthorized activities by the state. Some of these penalties will be published by the CBR.

What criminal penalties may apply?

The regulator itself is not allowed to impose criminal penalties, this can only be done by a court.

Criminal penalties may apply to certain actions specified in the Criminal Code of the Russian Federation, such as:

- performance of commercial activities without registration or a license;
- performance of banking operations without registration or a license;
- malicious avoidance of disclosure or distribution of information under the laws on the securities or distribution of knowingly incomplete or inaccurate information;
- market manipulation or insider dealing;
- fraud in the sphere of lending;
- unlawful receiving of a credit; and
- malicious avoidance of credit repayment.

Tax

Tax issues
Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

No stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

The notarization of a transaction in connection with mortgage agreements, the subject of which should be certified, is required. The notary charges for notarization depending on the value of the transaction. For transaction values of:

- up to RUB 1 million (approx. USD16,000) – RUB 2,000 (approx. USD31) plus 0.3% of the contract value is payable;
- more than RUB 1 million and up to RUB 10 million (approx. USD150,000) – RUB 5,000 (approx. USD78) plus 0.2% of the contract value above RUB 1 million is payable; and
- more than RUB 10 million – RUB 23,000 (approx. USD360) plus 0.1% of the contract value above RUB 10 million, up to a maximum of RUB 500,000 (approx. USD7,800) is payable.

In addition, notaries usually charge fees for their technical services. The amount charged depends on the particular notary and the complexity of the transaction and may vary (usually no more than USD1,000). All United States Dollars equivalents specified are based on the exchange rate of the Russian Federation Central Bank at the time of writing.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

No stamp, registration, transfer or other similar taxes are payable on the issue, transfer or assignment of a debt security.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

Secured lenders and secured debt holders take priority over the Federal Tax Service of the Russian Federation on enforcement of security.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Withholding taxes are only applicable in the context of cross-border operations, ie in the context of Russian-source income (in particular, interest payments under a loan) paid by a Russian legal entity (RLE) to a foreign legal entity (FLE). Accordingly, tax should be withheld by an RLE paying interest to an FLE.

In relation to domestic loan transactions (ie loans between RLEs), no tax is required to be withheld. Corporate income tax is paid by the lender as part of its total taxable income on the earned interest income as per the standard procedure.

If so:
What is the rate of withholding?

Withholding is applied at the standard 20% corporate income tax rate on any interest income paid to a FLE.
What are the key exemptions?

The key reliefs and exemptions from withholding tax on interest income are as follows:

- a reduced rate of withholding for certain types of debt obligations (e.g. certain government securities, municipal securities, and mortgage-backed securities);
- exemption or partial exemption under an applicable double tax treaty when interest income is paid to an FLE resident in a country that has concluded a treaty with Russia; and
- irrespective of the terms of a double tax treaty, certain interest payments are exempt from Russian withholding tax (e.g. interest income payable on certain government securities, municipal securities, and interest income which is paid by Russian organizations on marketable bonds issued in accordance with the legislation of foreign states).

As to application of the exemption under an applicable double tax treaty, the interest income's recipient must be (i) the beneficial owner of the Russian-sourced income and (ii) a tax resident in the corresponding tax treaty country. In particular, the beneficial owner of income is defined as a person who by virtue of (a) having participation interest (directly and/or indirectly) in an organisation; or (b) control over an organisation; or (c) by virtue of other circumstances has the right to independently use and (or) dispose of such income.

The beneficial owner must provide to a Russian company (the “tax agent”) certain documents confirming the beneficial ownership status, given that the tax agent pays the Russian-sourced income and is therefore responsible for remitting withholding tax on this income. The tax agent must keep these documents and provide them to the Russian tax authorities when requested. However, neither Russian tax law nor clarifications from competent authorities indicate which documents constitute proof of beneficial ownership status.

The Federal Tax Service and the Ministry of Finance have defined a wide range of criteria which, from a beneficial ownership perspective, should be taken into account when determining a taxpayer’s entitlement to double tax treaty benefits. Therefore, a tax agent should analyze whether an FLE, which is a foreign recipient of Russian-source income is indeed the beneficial owner of such income based on such criteria, which are often different from the OECD approaches.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of withholding tax (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities both under OHADA Law and the Regulations of the CREPMF.

Under the General Regulation of the CREPMF, offer and sale of debt securities is subject to prior authorization of the CREPMF and the stamp of approval of the information notes.

Any proposed public offer for listed securities must be approved, in advance, by the Regional Council (Article 123).

An information note is to be drafted and must contain information according to the types of public offer in question and is subject to prior distribution.

When issuing public debt securities by a State or a group of States, their governments draw up an information note which is transmitted to the Regional Council before the date of issue of the securities.

That note is exempt from the prior visa before its distribution to the public.

The note for the issuance of public debt securities by local public authorities or guaranteed by a state or a group of states is subject to the prior visa of the Regional Council (Article 2 of Decision No. CM 05/09/2005 modifying article 136 of the General Regulations relating to the organization, operation and Control of the WAMU Financial Market).

What are common issuing methods and types of debt securities?

The most common types of debts securities issued in the WAEMU are bills and bonds.

Other different types and forms include:

- asset-backed securities
- debt securities
- derivative securities
- hybrid securities such as convertible bonds
- equity-linked securities such as convertible bonds
- exchangeable bonds
Issuance of treasury bills and bonds

The issuance of Treasury bills and bonds (issued by the state, under the responsibility of the Minister of Finance) is subject to a tender or a syndication procedure, organized with the assistance of the WAMU Securities Agency (Agence UMOA-Titres).

Open tender Primary subscription of treasury bills and bonds is reserved to credit institutions, brokerage firms and regional financial investors holding settlement accounts with the Central Bank. Other investors, whether they are private individuals or corporations, may also subscribe through credit institutions or brokerage firms established on the territory of the Union.

Targeted tender: states may decide to hold part of their issuance through targeted auctions restricted only to their primary dealers.

Any investor wishing to acquire the security put out to tender can subscribe through those primary dealers.

Issuance of Treasury Bonds by Way of Syndication is carried out in accordance with the applicable regulatory provisions as set out by the CREPMF.

What are the differences between offering debt securities to institutional / professional or other investors?

The main difference between offering debt securities to institutional/professional or other investors lies in the fact that institutional and professional investors are more experienced and sophisticated in understanding the information provided on the listing documents and make sound investment decisions.

Other investors, retail ones, need more detailed information and advice to be able to understand the investment documents and make sound financial decisions. They also need more protection from authorities entrusted with the regulation of the financial market.

There is, generally, no essential distinction between professional and other investors. However, one distinction lays on the channel through which financial securities are issued, for instance, bonds issued through public offerings and bonds issued on the market through auction.

When financial instruments are issued through public offerings, an investment syndicate made up of brokerage firms handles the sale to investors and the general public. After they are issued, they are listed on the BRVM.

As for financial securities to be issued through auction, primary subscription of treasury bills and bonds is restricted to credit institutions, brokerage firms and regional financial investors with settlement accounts with the Central Bank. Other investors, whether they are private individuals or corporations, may also subscribe to bills and bonds on the primary market through credit institutions or brokerage firms established on the territory of the Union.

Securities issued through auction are not listed on the regional stock exchange (BRVM).

When is it necessary to prepare a prospectus?

It is necessary to prepare an information note (concept used in the WAMU instead of prospectus) for any proposed public offer for listed securities which must be approved, in advance, by the Regional Council. It must contain specific information according to the types of public offer involved. (Article 123 of the General Regulations of the CREPMF).

When a state or a group of states intends to issue public debt securities, their governments draw up an information note which is transmitted to the Regional Council before the date of issue of the securities.

Any solicitation transaction must be accompanied by the sending or handing over to the solicited person of the information note or any other explanatory document, endorsed where appropriate, with the approval of the Regional Council before any initial issuance (Article 157).
**What are the main exchanges available?**

The Regional Stock Exchange (BRVM) is the main stock exchange available and it is shared by the eight member states of the WAEMU.

The stock market is divided into two markets which correspond to two levels: the primary market and the secondary market.

**The primary market**

The role of the primary market is to bring together companies looking for financings and capital holders.

The BRVM is regulated and issuers are to comply with different rules and regulations.

On the primary market, securities are issued by companies (issuers).

New issuance of securities is and may be done through the primary market during an IPO or a capital increase.

Securities issuance of a company that goes public can be done on the primary market and those securities may be purchased by investors. Those investors will then put those securities back up for sale on the secondary market.

**The secondary market**

The secondary market is far from being an active one. On the secondary market, stakeholders and investors exchange already issued (on the primary market) securities to be offered to savers. Investors will be able to trade these securities among themselves on the secondary market.

Transactions on this market are conducted through certified intermediaries such as banks, non-bank financial institutions, regional financial institutions, asset managers and brokerage firms.

**Is there a private placement market?**

Yes, there is a private placement market in Senegal and with the multiplication of private financial institutions in the WAEMU zone, more financing investments are thus being provided for companies and individuals.

That multiplication, combined with technological changes and developments, make access to offers and opportunities easier and more investments are being made through the private market in several sectors such as real estate and insurance.

There is no dominant standardization of private placement documentation. The ones from the Loan Market Association (LMA) are sometimes used.

**Are there any other notable risks or issues around issuing or investing in debt securities?**

Risks are of different types:

Foreign exchange risk: the rate of a currency may increase and cause the value of assets denominated in a different currency to decrease.

Interest rate risk: interest rate variations may lead to higher cost(s) or loss(es) of income for an investor.

Liquidity risk is the risk of the impossibility to sell a financial instrument at a certain price.

Inflation risk may occur when repayment is made in a depreciated currency or when an investor ends up with a rate of return below the rate of inflation.
Regulatory risk: changes in Laws or Regulations may have an impact on investments in debt securities.

Solvency risk: borrowers may be unable to meet their commitments and creditors may lose their claims.

Political risk: this type of risk is associated with a political situation where authorities change their tax systems, the ability to repatriate capital and the like.

Risks or issues around issuing debt securities mainly lie on issuers being required to assume responsibility for information relating to debt securities. Any applicable offer document must have the stamp of approval of the CREPMF, failure of which may result in the nullity of the proposed financial transaction and result in criminal and civil penalties.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally

Establishing and operating a fund, offering fund securities are regulated activities under the General Regulations of the CREPMF and therefore subject to regulation by that organization and other organizations.

Collective Investment Schemes

Collective investment schemes include the following arrangements:

Undertakings for Collective Investment in Transferable Securities (UCITS) are financial institutions that collect savings from economic actors and issue stocks or shares. The savings thus collected are used to set up securities portfolios and to provide financing for businesses.

The activities under UCITS are classified collective asset management composed of two subcategories:

- Management for proper account: funds collected from third parties by the fund are invested in all types of securities and other financial products such as bonds, equities, negotiable debt securities and the like.
- Discretionary management: the fund is managed privately as the collective investment funds belong to third parties.

What are common fund structures?

Common fund structures include:

Collective investment funds under the forms of Undertaking for Collective Investment in Transferable Securities (UCITS) and Securitization Mutual Funds (Fonds Communs de Titrisation des Créances, FCTC [Instruction N° 46/2011 (Revised) Relating to the Classification and Allocation Rules Assets of Collective Investment Organizations on the Regional Financial Market of the WAMU]).

UCITS take the form of:

- an open-ended, Investment Companies with Variable Capital, ICVCs (SICAV in French);
- mutual investment funds (Fond Commun de Placement, FCP) and any other collective investment vehicle approved by the Regional Council; or
- qualified investor structures that invest in products such as corporate shares or bonds, real property, commodities (for example, precious metals) and derivatives.
What are the differences between offering fund securities to professional / institutional or other investors?

Retail funds

Retail investors need more detailed information and advice to allow them to understand the investment documents and make sound financial decisions. Considered as laypersons, they benefit from enhanced protection.

Consequently, and based on those considerations, UCITS for instance, being one type of entity through which retail investments are made, are to be authorized by the CREPMF and are subject to considerable regulation.

Institutional/Professional funds

They are usually subject to less protective regulations.

Institutional and professional/Professional funds do have more expertise, are considered more experienced, sophisticated and able to understand and make sound financial and investment decisions.

There is, however, a legal and regulatory framework, in place, to secure subscribers based on the control mechanisms set up by the Central Depository/ Settlement Bank (DCBR) and the CREPMF.

Are there any other notable risks or issues around establishing and investing in funds?

Investment management is a regulated activity and entities wishing to conduct such an activity are to be authorized by the CREPMF.

Risks and issues are of different types:

- Currency or Foreign exchange risk: investments in securities may be made in different currencies. The rates of currencies may change, and the value of a fund's investment be affected. Investments in a foreign market may entail exchange of currencies where an investor may have to exchange a domestic currency into a foreign currency, at an actual exchange rate, and convert it back into a domestic currency. Such conversion transactions may constitute risks that need to be mitigated.

- Liquidity risk is the risk of the impossibility to sell a financial instrument at a certain point of time.

- Diversification risk: investors may be exposed to risks when they invest in only one asset class or in a very limited number of assets. Such restrictive investments do not help in mitigating the risks inherent to the lack of diversification on such investments.

- Solvency risk: borrowers may be unable to meet their commitments and creditors may lose their claims.

- Political risk: this type of risk is associated with a political situation where authorities change their systems, such as the tax system(s), the ability to repatriate capital and the like.

Risks and issues are to be nuanced as there are substantial protections such as those provided for by the CREPMF acting as a regulatory agency entrusted with the protection of household savings invested in securities or any other type of investment through public offerings within the WAMU.

Further protection is provided, for instance, under Article 15.3 (Instruction N. 45 / 2011 of the CREPMF) and requires UCITS’ assets be kept by a single depository, distinct from the UCITS management company.

National and Sub-Regional Legislations recognize the segregation of the Depositary's UCITS Clients' assets from the sub-custodian's own assets.

Those assets are, in some way, protected through entities like the deposit guarantee fund (Fonds de Garantie des Dépôts, the FGD-UMOA) in the WAMU.

The FGD-UMOA's mission is to provide deposit guarantees for customers of credit institutions and decentralized financial systems (DFS), approved in the WAMU.
As such, it is responsible for the compensation of depositors in the event of unavailability of their assets, within a limit defined by the Council of Ministers of the WAMU.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Marketing is generally defined as the proposition to acquire investment products. Under the CREPMF and WAMU systems, it is, mostly, dealt with through the concept of solicitation.

Individuals intending to conduct public solicitation activities (business providers, direct sellers) are required to obtain a professional card issued by the Regional Council (General Regulation of the CREPMF, Article 108: The solicitation of the public).

Financial institutions, such as banks, wealth management companies, management and intermediation companies (SGI), business providers, individual or legal persons authorized for that purpose, are allowed, as of right, to have recourse to solicitation after reporting to the Regional Council (Article 155).

Solicitation of the WAMU’s public by a non-resident entity, or on behalf of it, to propose the acquisition of investment products is subject to prior authorization of the Regional Council and the assent of BCEAO (General Regulation, Article 176).

Reverse solicitation is not specifically provided for under the applicable rules and regulations.

Prospective investors do, sometimes, make the first move, take the initiative to contact investors for potential acquisition of financial products. The financial entity needs to have evidence that the potential investor solicited them.

Are there any restrictions on managing a fund?

Fund management in the WAMU is mainly regulated under the General Regulations of the CREPMF and various implementing instruments.

The CREPMF regulate and authorize public offerings by granting approval. It monitors all private organizations acting on the market. For this purpose, it certifies all commercial stakeholders: brokerage firms, fund managers and individual entities (intermediaries and soliciting dealers).

The collective management of transferable securities is carried through UCITS, divided into open-ended investment companies (SICAV), Mutual Funds (FCP) or any other form of Undertaking for Collective Investment in transferable securities (UCITS) approved by the Regional Council.

Undertakings for Collective Investment in Transferable Securities.

UCITS’ management is governed in accordance with the General Regulations of the CREPMF and Instructions 44, 45, and 46.

Mutual funds that hold more than XOF5 billion in assets are required to set up a system of controls and monitoring, such as a supervisory committee, an Internal Control reporting system and a reporting system for the FCP Custodian. The maximum assets that a Mutual Fund can hold is set at XOF25 billion. (Article 7 of Instruction N° 46/2011 (Revised) Relating to the Classification and Allocation Rules Assets of Collective Investment Organizations on the Regional Financial Market of the WAMU).

Any FCP which comes to hold assets in excess of XOF25 billion must declare it without delay to the Regional Council.

No FCP can hold, during six consecutive months, an asset greater than XOF25 billion, in which case the FCP must, within a six-month period, transform into a SICAV or proceed with a demerger.
**Entering into derivatives contracts**

*Are there any restrictions on entering into derivatives contracts?*

There is no specific legislation on derivatives. Provisions on derivatives can be found in different legal texts.

Certain restrictions do apply.

Businesses and entities proposing derivative contracts and products are to receive prior authorizations (from CREPMF and BCEAO).

The 2014 Uniform Act on commercial companies and Regulation 09/2010 contain some provisions on derivatives.

As per article 744 of that Uniform Act, public limited companies issue transferable securities whose form, class and characteristics shall be defined by the competent body of each state party.

Residents are authorized to conduct transactions on foreign exchange derivative markets through licensed intermediaries or foreign banks (article 12 of Regulation 09/2010).

Authorized transactions must be backed by trade or financial transactions, subject to compliance with all other regulatory provisions applying to the aforementioned transactions.

A limited number of commercial or financial transactions on derivatives can be conducted by residents.

They are authorized to carry out commodity derivative transactions on commodity futures markets (Article 13: Commodity derivatives).

They may use foreign exchange derivatives to hedge foreign-exchange risks, for the following commercial or financial transactions:

- imports and exports of goods and services by residents;
- foreign loan transactions by residents (draw-downs and payments); and
- direct foreign investments in a resident enterprise under negotiation.

Residents may use derivatives to hedge price risks. Those derivatives must be backed by commodity imports or exports carried out by the residents. They are not authorized to purchase commodities on foreign markets for delivery in commodity derivative transactions (Article 18).

*Last modified 29 Jul 2020*

**What are common types of derivatives?**

The main types of derivatives are:

- futures,
- forwards,
- options,
- swaps.

The value of the derivatives is derived from the value of an underlying asset or group of assets, the main classes of which are:

- Assets: commodities, shares or bonds;
- Interest rates, exchange rates, or indices;
- Foreign currencies.

*Last modified 29 Jul 2020*

**Are there any other notable risks or issues around entering into derivatives contracts?**
• Market risk
• Liquidity risk
• Counterparty risk
• Commodity price risk
• Exchange rate risk
• Interest rate risk

Risks are not that notable as the majority of the activities are conducted between sophisticated persons and are to a certain extent reserved for banks, and national and regional financial institutions which have a depository account with the Central Bank.

Residents are authorized to conduct transactions on foreign exchange derivative markets through licensed intermediaries or foreign banks (Article 12 of Regulation 09/2010).

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Lending is only a regulated activity in relation to mortgages and consumer lending. In these circumstances, a lender will need to be authorized by the BCEAO to conduct such business.

Mortgage and consumer loans are subject to a range of regulatory requirements. There are, however, some restrictions on lending. WAEMU residents who intend to borrow and invest abroad are required to get the prior authorization from the Minister of Finance. They must be at least 75% financed through foreign loans. Foreign entities that wish to lend to WAEMU residents who want to invest abroad are required to finance those latter at a minimum percentage of 75% (Article 10: Investment transactions).

Financial institutions are required to comply with the rules governing the formation of the credit contract and to take into account the financial situation of the consumer when granting a credit. Specific legal rules for the credit agreement have been provided for such as ensuring the integrity of the consumer's consent.

The granting of a credit is linked to the borrower's ability to repay loan maturities on time. To achieve such a result, financial institutions have the obligation to take into account the borrower's capacity to pay.

One example, in Labor Law, of determination of that capacity is specified under article 177 of the OHADA Uniform Act on simplified recovery procedures and means of execution which provides that the remuneration of natural persons employed or working in any capacity whatsoever, can be transferred or seized only in the proportions determined by each State Party.

The seized or voluntarily transferred amounts may not, under any circumstances, even for maintenance debts, exceed a threshold fixed by each State Party.

The transferable portion of the persons involved is set according to income and varies from one-third of the salary to half, particularly for home loans.

Borrowing

Yes, there are some restrictions on borrowing.

Regulation 09/2010, for example, provides one restriction pursuant to Article 10: Investment transactions, under which foreign
investments made abroad by WAEMU residents are subject to prior authorization from the Minister of Finance.

Moreover, they must be at least 75% financed through foreign loans.

Another restriction is provided under article 11 where loans contracted by residents from non-residents must, except by special decision of the Minister of Finance, be carried out through licensed intermediaries in all cases where the monies borrowed are made available to the borrower in the country. The licensed intermediaries thus called upon to intervene will ensure that the transactions comply with the applicable laws and regulations.

All foreign loans are subject to mandatory declaration to the External Finance Directorate and the BCEAO, for statistical purposes.

Last modified 29 Jul 2020

What are common lending structures?

Lending structures in Senegal depend on the parties’ projects and needs.

Borrowers can be granted individual loans where one lender provides for the loan or syndicated loans where two or more lenders provide loans to one or more borrowers.

Syndicated loans involve large loans where the different participating banks share the risks as their liability is limited to the amount of their contribution.

Those syndicated loans are very complex transactions requiring the appointment of facility agents. Security agents are also appointed as provided for under Article 5 of the Uniform Act on Securities adopted on December 15, 2010.

Loans structuration depend on different parties’ objectives. They can be commercial loans, concessional loans, non-concessional loans, equity loans, long term loans, short term loans, alternative forms of financing.

Loan durations

The duration of a loan can also vary between:

- a term loan, provided for a set period of time that usually lasts between one and ten years but can last a bit longer up to thirty years;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be withdrawn, repaid and redrawn if repaid; it provides for more flexibility and it can be reused as it is repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a bridge loan gives access to short-term loans that allow to meet short-term liquidity gaps or needs.

Loan security

A loan can either be secured, unsecured or guaranteed. For more information, refer to, among other texts, the Uniform Act on Securities.

Loan commitment

A loan can also be:

- committed, provides for terms and conditions imposed on the borrower and the lender is obliged to provide the loan if those terms and conditions are fulfilled; or
- uncommitted, meaning that the lender is not committed to provide the loan.

Loan repayment
The funds can be repaid on demand, in instalments, or scheduled to be repayable in full at maturity.

What are the differences between lending to institutional / professional or other borrowers?

Lending to institutional/professional borrowers is characterized by less regulatory oversight and is less burdensome from a compliance perspective as institutional/professional borrowers are considered as more experienced and knowledgeable than other categories of borrowers.

Lending in the context of mortgages and to consumers is, by contrast, a more regulated activity and as such requires more protection and BCEAO authorizations. In Senegal, consumer credit is partly regulated through Law n° 2008-08 of January 25, 2008, on electronic transactions, Law n° 2008-11 of January 25, 2008, relating to Cybercrime and Decree n° 2008-718 of June 30, 2008, relating to electronic commerce which also deals with consumer law on a digital standpoint.

Do the laws recognize the principles of agency and trusts?

Senegalese laws do, specifically, recognize the principle of agency but not the principle of trust.

However, the Uniform Act on Securities recognizes the concept of Security Agent which may be considered as a corresponding concept to the security trustee.

The security agent is provided for under Article 5 of the Uniform Act on Securities which provides that "Any security or other guarantee to secure the discharge of an obligation may be made, registered, managed and executed by a financial institution or a national or foreign credit company acting in its own name and as surety agent appointed for that purpose by the creditor of the secured debt."

A financial institution or a national or foreign credit company can act as a security agent.

Are there any other notable risks or issues around lending?

Yes, there are some risks and issues around lending.

Generally, contractual principles apply to loan agreements and other finance documents.

Those risks may be credit risks, default risks, interest rate risks which may be capped to a certain rate, percentage, exchange rate risks for cross-border transactions, security risk value.

Specific types of lending

Banks have access to other sources for their lending activities. They also provide loans in the real estate sector through the creation, in 2010, of the WAEMU Regional Mortgage Refinancing Fund (Caisse Régionale de Refinancement Hypothécaire de l'UEMOA) by the West African States Central Bank, the West African Development Bank (Banque Ouest Africaine de Développement (BOAD)) and the CREPMF. Through that fund, they are able to access international capital markets and get resources for the funding of their mortgage activities.

One of its missions is to provide resources for the refinancing of mortgage loans to credit institutions in the WAEMU through the issuance of loans on the regional financial markets or through concessional financing from development partners.

Insurers in the WAEMU also invest in real estate, through pension funds, for long-term capital to the housing industry. The main Senegalese pension funds are: the Retirement Pension Fund (IPRES, Institution de Prévoyance Retraite du Sénégal) which covers private-sector employees, government employees who are not civil servants and local authority employees, the National Pension Fund (Fonds National de Retraite) which is for civil servants and members of the armed forces and the Social Security Fund.

Standard form documentation
Banks have their own standard form documentation that are used during bilateral finance transactions.

Cross-border financial transactions are sometimes based on the Loan Market Association standard documentation or on other standard forms.

**Are there any other notable risks or issues around borrowing?**

Missed payments can lead to risk defaults and collections processes which can have an impact on one's credit history or rating.

It can also lead to difficulties in accessing to credit in the future.

There is also a possibility of loss of property in case of default as collateral pledging can be very significant on the borrower's side.

**Giving and taking guarantees and security**

**Are there any restrictions on giving and taking guarantees and security?**

There are some restrictions on key areas affecting the giving of guarantees and security.

**Capacity**

The capacity or power of a company to grant a guarantee or security is to be assessed on the basis of its constitutional documents. Such granting of guarantees and security have to be approved by a resolution of the company's board of Directors.

**Insolvency**

Guarantees and securities may be declared void in situations provided for under the Uniform Acts.

Acts done by the debtor during the suspicion period from the date of suspension of payments to the date of the decision to open proceedings shall, as of right, be non-binding or may be declared non-binding on the body of creditors as defined under Article 72 of the Uniform Act on Collective Proceedings for Debt Clearance.

The following shall, as of right, be non-binding on the body of creditors if and when they are done during the suspicion period: any conventional mortgage or conventional pledge, any constitution of pledge granted on the debtor's property for debts previously contracted, any provisional registration of a conservatory judicial mortgage or a conservative judicial pledge.

**Financial assistance**

A company is, in principle, prohibited from purchasing its own shares. Managers are prohibited from contracting, under any form whatsoever, loans from the company, obtaining an overdraft on a current account or otherwise from the company or make the company endorse or guarantee their commitments towards third parties.

This prohibition shall also apply to spouses, ascendants and descendants of the persons referred to above, including any intermediary through whom these persons act.

**What are common types of guarantees and security?**

**Common forms of guarantees**

Under OHADA, personal securities are surety bond and autonomous guarantee and counter guarantee.
Surety bond: A surety-bond shall be a contract whereby the surety undertakes, and the creditor accepts, to discharge an existing or future debt contracted by the debtor in the event of the latter failing to do so.

Autonomous guarantee and counter guarantee:

An autonomous guarantee shall mean an agreement by which, the guarantor undertakes, following an obligation signed by the principal and on its instructions, to pay a fixed sum of money to a beneficiary either at the earliest demand of the latter or as per the agreed terms. The autonomous counter guarantee shall mean the agreement by which the counter guarantor undertakes, following an obligation signed by the principal and on its instructions, to pay a fixed sum of money to a guarantor either at the earliest demand of the latter or as per the agreed terms.

Transferable securities consist of possessory lien, assets held or transferred as security, pledge of real property, pledge of intangible assets and privileges.

**Common forms of security**

- Pledge
- Liens
- Mortgage

Different types of security are suitable for securing different types of assets.

Under Senegalese Law it is possible to grant security over all of a company's assets or on individual assets. Granting security over all of a company's assets will tend to be achieved by way of a debenture which will include:

- a mortgage over real estate; and
- a pledge over movable goods.

Moreover, guarantees and security, to be enforceable as against third parties need to be perfected and registered.

_Last modified 29 Jul 2020_

**Are there any other notable risks or issues around giving and taking guarantees and security?**

To be valid, a guarantee needs to be in writing and contain some mandatory elements:

General contractual principles apply to consideration for a guarantee.

The underlying obligations will usually be the consideration for the guarantee and the execution of the underlying obligations, and the guarantee should be concomitant to avoid a possible qualification of past consideration.

There should generally be no issue as in the majority of cases. The guarantee is provided for in an underlying document as in the case of a loan agreement.

A guarantee may be set aside for different reasons and a beneficiary of a guarantee should take those into account and avoid them.

**Financial regulation**

**Law and regulation**

*What are the main laws and regulations that apply to entities that are involved in*
finance and investments generally?

Generally

Investment activities/services:

Investment activities/services in Senegal are mainly regulated by the following Laws and Regulations:

- The General Regulations of the Regional Council for Public Savings and Financial Markets (Règlement Général du Conseil régional de l'épargne publique et des marchés financiers, CREPMF) (General rules of the CREPMF);
- The General rules of the Regional Stock Exchange (Bourse Régionale Des Valeurs Mobilières, BRVM);
- Law on fixed capital investment companies in the WAEMU 2003 (Loi relative aux entreprises d'investissement à capital fixe dans l'UEMOA);
- Framework Law on Banking Regulations of the WAMU, December 3, 2010; Regulation No. 09/2010/CM/UEMOA on External Financial Relations of the Member States of the West African Economic and Monetary Union (WAEMU); and

Consumer credit, Corporations, Mortgages, Funds and platforms

- Consumer Law No. 2016-412 of June 15, 2016;
- WAEMU;
- Decision No. 397/12/2010 Issuing Regulations, Tools and Procedures to Implement the BCEAO Monetary and Credit Policy (consumer protection-related) (2010);
- Decision No. 397/12/2010 Issuing Regulations, Tools and Procedures to Implement the BCEAO Monetary and Credit Policy – Title III Excerpt (enacted in 2010) (English)

Corporations

- Ohada Uniform Act relating to General Commercial Law adopted on December 15, 2010;
- Revised Uniform Act on commercial companies and economic interest groups (the Revised Uniform Act), adopted on January 30, 2014.

Mortgages

- Uniform Act Organizing Securities of December 15. 2010

Funds and platforms

- Regulation No. 02/2010 / CM / UEMOA relating to securitization of mutual funds and securitization transactions in the WAEMU (Règlement n° 02/2010/CM/UEMOA relatif aux Fonds communs de titrisation de créance et aux opérations de titrisation dans l'UEMOA);
- Instructions 44, 45, and 46 of CREPMF and regulation on the organization and functioning of the financial market of the WAEMU;
- Regulation No. 03/2010 / CM / UEMOA relating to covered bonds in the WAEMU.
Other key market legislation credit

- Regulation n ° 06/2013 / CM / UEMOA of June 28, 2013, on Treasury bills and bonds issued by auction or syndication with the assistance of the WAMU Securities Agency (Agence UMOA-Titres);
- Decision No CM / SJ / 001 / 03/2016 Relating to the Implementation of the Monetary Penalties Mechanisms Applicable on the Regional Financial Market of the WAMU;
- Regional financial markets Instruction 2011;
- Uniform Act on simplified recovery procedures and measures of execution;
- WAEMU Instruction governing activities of electronic money issuers 2015;

Regulatory authorization

Who are the regulators?

The Financial Market Authority is the Regional Council for Public Savings and Financial Markets (CREPMF). It regulates the functioning of the market and authorizes public offering procedures by granting visas.

It enacts rules and regulations on the regional stock market, market access conditions, publicity rules and information of the public.

It has the power to control the different stakeholders operating in the regional market.

The Regional Stock Exchange (BRVM) is responsible for organizing the stock market, ensuring the listing and trading of securities, ensuring the dissemination of stock market prices and information, promoting and developing the market.

The Central Bank of the West African States (BCEAO) issues currency, manages monetary policies, organizes and monitors banking activities in general.

The WAMU Securities Agency (Agence UMOA Titres) assists states, through the regional and international capital markets, in raising their resources needed to finance and fund their economic development through the identification of the most suitable means.

What are the authorization requirements and process?

The main authorization requirements are obtaining an approval and/or a visa depending on the type of entity or individual. Under the General rules of the CREPMF, some investment activities require an approval (agrément) from the CREPMF and others require authorization from both the CREPMF and BCEAO (Regulation 09/2010).

In accordance with the applicable laws, rules and regulations, the conduct of the following activities on the regional financial market, without this list being exhaustive, is subject to the approval or authorization of the Regional Council: securities trading, maintaining securities accounts, reception and transmission of orders, presentation of daily buy and sell offers, asset management mandates, financial marketing or solicitation, collective asset management, debt securitization (titrisation des créances), financial rating, financial transaction guarantee (Garantie des opérations financières),

Once applications are received, they are assessed within a one- to three-month period from the date of filing of the application.

The application fee depends on the type of entity and the nature of the activity, ranging from XOF500,000 to XOF50 million.

The application process will end up with an individual decision by the Regional Council (CREPMF).

A list of authorized entities and individuals can be found with the CREPMF and the Regional Stock Exchange (BRVM).
What are the main ongoing compliance requirements?

Approved or authorized entities have continuous obligations such as sufficient guarantees, in particular with regard to the composition and amount of their capital, their organization, their human, technical and financial resources, the integrity and experience of their managers, as well as their own measures to ensure the security of clients' transactions.

They must undertake, in writing, that any modifications made to their Articles of Association during the course of their existence are subject to the prior authorization of the Regional Council when they relate to a distribution of capital between shareholders, a change in the scope or nature of the guarantees submitted, a change in the accounting methods and information used, for any other modification to the Articles of Association, the Regional Council must be informed.

In case of failure of those entities to comply with key requirements, the Regional Council can take steps to restore compliance with the rules. If violations continue, it can decide on the sanctions to be taken, in accordance with the provisions of the General Regulations, in particular the suspension of all or part of their activities.

What are the penalties for failure to be authorized?

A person, be it a natural or legal person, undertaking a regulated activity without being approved, authorized or exempted is liable to a certain number of sanctions.

Failures are classified into four categories and subject to a range of financial penalties.

The penalties apply to any stakeholder in the regional financial market as well as to any natural or legal person responsible for non-compliance.

Failure, for instance, to obtain the prior visa by the Regional Council results in the nullity of transactions, both with regard to the applicant and the solicited public. In addition, issuers are liable to sanctions from the Regional Council, without prejudice to legal proceedings (Article 115 of the General Regulation of the CREPMF).

Regulated activities

What finance and investment activities require authorization?

Generally

Combined provisions of the General Rules of the CREPMF and the Regulation 09/2010 provide for the financial and investment activities that require authorization.

Under the General rules of the CREPMF, the following activities qualify as investment activities that require an approval (agrément):

- issuing and distributing securities; trading and intermediation on the securities market;
- trading and intermediation on the derivatives market;
- organization and operation of stock exchanges;
- organization and operation of commodities and futures exchanges;
- management of securities portfolios and custody of securities; and
- provision of investment advice.

Moreover, pursuant to article 8 of Regulation 09/2010, the following activities require an authorization from CREPMF and BCEAO:

the issue, exposure, sale of securities of foreign states, public authorities or foreign companies and international institutions;
the solicitation of residents with the aim of constituting deposit funds with foreign private individuals and offshore establishments; and any publicity or marketing, edited on the territory of a WAEMU Member State with the aim of investing offshore funds or subscribing to operations related to offshore real estate constructions.

Consumers credit

Consumer credit activities, including hire-purchase and rental with option purchase, discount, reverse repurchase, acquisition of receivables, guarantees, purchase financing, leasing and service delivery are regulated activities.

Furthermore, these activities can only be offered by firms who are authorized and listed on the financial services register.

Last modified 29 Jul 2020

Are there any possible exemptions?

Transfers of securities listed on the Regional Stock Exchange are made through an SGI, except in the case of an exemption granted by the Regional Stock Exchange (Article 37 of the General Regulation of the CREPMF).

The provision of investment advice, in particular of a stock market nature, as a usual profession to third parties, is subject to prior authorization from the Regional Council (Article 95 of the General Regulation of the CREPMF).

However, SGIs and banking institutions are authorized to exercise the activity of stock market investment advice by way of derogation from the preceding article (Article 96).

Last modified 29 Jul 2020

Do any exchange controls or other restrictions on payments apply?

Payment transfers are, in principle, free. However, some exchange controls and other restrictions on payments apply.

Under article 2 of Regulation n°09/2010/CM/UEMOA, foreign exchange transactions, capital movements (issuance of transfers and/or receipt of funds) and settlements of all kinds from a WAMU Member State to a foreign country or in the WAMU space between residents and non-residents can only be made through the BCEAO, the Administration or the Post Office, a licensed intermediary or a licensed manual exchange agent.

Licensed intermediaries are allowed to perform the following activities to a destination abroad, under their responsibility and on the basis of supporting documents (art. 7 of the Regulation n°09/2010/CM/UEMOA):

- the transfer of money required for contractual debts amortization as well as short-term repayment of loans granted for the financing of commercial and industrial operations;
- the transfer of the liquidation of investment proceeds or the sale of foreign securities by non-residents; and
- the required settlements, either for transactions on derivative instruments or for transactions on commodity derivatives and basic products.

Payments to foreign destinations in respect of capital transactions, other than those provided above, must be done based on an application for foreign exchange authorization submitted to the Minister of Finance.

Last modified 29 Jul 2020

What are the rules around financial promotions?

A financial promotion is a proposition for the acquisition of investment products. It is, mostly, dealt with under the concept of solicitation.

Individuals intending to conduct public solicitation activities (business providers, direct sellers) are required to obtain a professional card issued by the Regional Council (General Regulation of the CREPMF, Article 108: The solicitation of the public).
Financial institutions, such as banks, Wealth Management Companies, Management and Intermediation Companies (SGI), business providers, individual or legal persons authorized for that purpose, are allowed to have recourse to solicitation after reporting to the Regional Council (Article 155).

Solicitation of the WAMU’s public by a non-resident entity, or on behalf of it, to propose the acquisition of investment products is subject to prior authorization of the Regional Council and the assent of BCEAO (General Regulation, Article 176).

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

The types of legal entity that are generally used to undertake financial or investment activity are limited companies, they can be private law companies incorporated as a public limited company.

That type of entity is used for the Regional stock exchange (BRVM) and the Central Depository/Settlement Bank under Article 12 of the General Regulation, where they are specifically characterized as “private law companies incorporated as a public limited company.”

Management and intermediation companies are to be established as Public Limited Companies (Société Anonyme, Article 30).

Funds such as open-ended investment companies (SICAV) are also to be established as Public Limited Companies (Instruction N ° 21/99 Relating to the Classification of UCITS, Article 2).

The types of legal entity that are generally used to undertake financial or investment activity are a Public Limited Company, PLC (Société Anonyme SA), Limited Liability Company (SARL) and a Simplified Public Limited Company (Société par Actions Simplifiées SAS).

Simplified Public Limited Companies (SAS) started being used as a legal entity to undertake financial or investment activity with the 2014 Revised Uniform Act due to their flexibility compared to SAs, for instance.

The AUSCGIE provides for company forms which can be with variable capital, to know PLCs not calling for public capital and Simplified Public Limited Companies (SAS).

Funds

Investment funds can take the following forms. An open-ended investment company (SICAV) is to be established as a Public Limited Company (Instruction N ° 21/99 Relating to the Classification of UCITS, Article 2).

Fixed capital investment companies are provided for under the 2003 Law on fixed capital investment companies in the WAEMU (Loi relative aux entreprises d'investissement à capital fixe dans l'UEMOA). That Law has been transposed, internally, in Senegal under the Uniform Law on fixed capital investment companies (Loi uniforme n° 2007/15 du février 19, 2007, relative aux entreprises d'investissement à capital fixe).

The Uniform Law requires investment firms to obtain prior authorization from the supervisory authority, CREPMF, while international practice has evolved towards prior authorization of fund managers rather than of the funds themselves.

Is it possible to conduct lending or investment business through a branch or establishment?

It is possible to conduct lending or investment business through a branch or establishment in Senegal. Such a possibility is, however, subject to restrictions.

The branch shall not have a separate legal personality distinct from that of the parent company or the natural person who owns it (Article 117 of the AUSCGIE).
The branch may be an establishment of a foreign company or natural person.

Subject to international agreements or laws to the contrary, the branch shall be governed by the law of the State Party in which it is located. (Article 118). It shall be registered in the Trade and Personal Property Rights Register in accordance with the provisions organizing said register.

Where the branch is owned by an entity, it shall be attached to a company in existence or to be created, governed by the laws of one of the State Parties not later than two years after the branch is set up, unless this obligation is waived by order of the minister in charge of trade in the State Party in which the branch is located. (Article 120).

**FinTech**

**FinTech products and uses**

*What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?*

The most common technology products and fintech applications used or being developed in the finance and investment marketplace are:

**Peer-to-peer funding platforms and marketplace lending**

A salient feature of marketplace lending is a wide variety of market participants and financing mechanisms.

The principal characteristics of new marketplace lenders one can name are:

- the recourse to non-bank lending platforms established as specialist corporate or special purpose vehicle (SPV) based structures;
- the use of technology to leverage and optimize the lending platforms; and
- matching borrowers to lenders, through platforms rather than using the traditional financing mechanisms.

Marketplace lending is available to address most forms of traditional bank funding products. Recent products have included:

- consumer loans;
- prepaid cards;
- residential property and commercial property lending; and
- small and medium-sized enterprises (SME) lending.

**How are marketplace lending platforms funding themselves?**

A large number of people contribute small amounts of money, in order to fund projects. That money raising is usually organized via the internet, through platforms.

There is a significant potential for peer-to-peer (p2p) lending in microfinance in Senegal. Recourse to those platforms has been increasing over the years. Eligibility for that type of financing structure is, sometimes, characterized by an absence of intermediaries and based on an assessment of entrepreneurs' credit history, their ability and capacity to pay back their loans that banks and financial institutions have granted them in the past.

This is the case with Zidisha.org, an online microlending community that directly connects lenders and entrepreneurs.

**Blockchain, smart contracts and cryptocurrencies**

Blockchain, smart contracts and cryptocurrencies are not regulated, neither under WAEMU nor in Senegal.
The Central Bank (BCEAO) did not hide their negative position as far as cryptocurrencies are concerned. Their approach stems from a series of concerns especially in terms of protection of personal data, compliance with competition rules, national security and monetary policy. They have reiterated their concerns during a Facebook project to create a cryptocurrency called Libra under the following terms: “This cryptocurrency project is the source of many concerns among regulators, particularly in terms of protection of personal data, compliance with competition rules, national security and monetary policy,” said the Central Bank's representatives in their monitoring report for financial services backed by electronic payment.

Money creation is strictly controlled by the central authority, which issues and destroys it.

It is in the same line of thoughts that members of the CREPMF have, many a time, referenced the regulations. On the money market, only a bank can hold an authorization and provide a financial guarantee from the BCEAO to be able to collect money from the public against the payment of interest.

The situation is not different in the financial market, where only an SGI has the same authorization from CREPMF.

**Initial coin offerings and token-based products**

Initial coin offerings and token-based products have not yet been subject to rules and regulations within the WAEMU. Their use is not tolerated in the WAEMU zone. Senegal, being part of the eight WAMU member countries, has not, at least for now, allowed the creation or use of digital currency.

Money creation is strictly under the power and control of a central authority, BCEAO.

Please refer to response above, on blockchain, smart contracts and cryptocurrencies under (Topic 13).

**Artificial intelligence and robot advisory systems**

Artificial intelligence and robot advisory systems are not specifically regulated in the WAEMU or in Senegal.

However, as a tool using telecommunications, it is also subject to the provisions contained in the Senegalese telecommunication code. In Senegal, telecommunication activities are controlled by the regulatory authority, which is the Telecommunications and Postal Regulatory Authority (ARTP).

Such an activity is not regulated; however, its use is being promoted within the WAEMU zone, including among young people through competitions as was the case of those organized under the auspices of the regional stock exchange, the BRVM Fintech Innovation challenge, the first edition of which was launched from September 18, 2018, to October 17, 2018.

There was no Senegalese recipient and the Ivorian recipient, Mr. Cédric Arthur Yao, presented “the Fetish project,” an application dedicated to technical analysis on the stock market.

The aim of the proposed analysis model was to allow a short-, medium- and long-term investment orientation for securities and to anticipate possible price rises and falls. The intention of the Fetish application was to integrate this technical analysis model into a digital application.

**Data analysis and cloud computing**

Cloud services are at their early stage in Senegal. They are used by banks for investments to improve customer experience and credit risks. Governments are also using them to provide certain public services.
The conduct of regulated financial activities requires prior authorizations, approvals, generally, from the CREPMF and the BCEAO.

Some restrictions, specific laws, regulations and procedures may apply to fintech products.

Entities providing fintech products and services with regulated financial activity components are required to be authorized and comply with different laws, rules and regulations such as data protection and consumer protection Laws.

**Electronic payments platforms and regulation of peer-to-peer lenders**

Electronic payments platforms are governed through BCEAO Instructions, mainly Instruction N° 008-05-2015 governing the terms and conditions for the exercise of the activities of issuers of electronic money in the member states of the West African Monetary Union (WAMU).

E-money transactions done through cards, internet and telephone are regulated under said Instruction.

The definition of e-money has been made taking into account “good international practice” and is characterized by a monetary value electronically stored, issued against funds provided in at least an equal amount and that has been accepted as a means of payment by both individual and corporate third parties.

Banks, payment services companies and microfinance institutions (MFIs) are allowed to issue e-money and can conduct e-money transactions.

Banks and payment services companies holding existing BCEAO licenses along with e-money authorizations, as FI issuers, must notify BCEAO (two months) in advance of any deployment, while microfinance institutions (MFIs) must get prior authorization from the Minister of Finances following consent from BCEAO.

Nonfinancial entities may also issue e-money after obtaining a license. These issuers are called *Etablissements de Monnaie Electronique* (EMEs or non-FI issuers). They must meet separate standards on corporate governance and related matters to obtain a license. These EME companies must be solely dedicated to e-money issuance, (i.e. providing payment, transfer, and cash-in/out services). They cannot provide savings or credit services. EMEs can own shares only in other entities involved in e-money issuance.

**Peer-to-peer lenders**

It is important to mention that there is no specific regulation on this matter.

However, the need to regulate this type of product in order to protect consumers has been noted in some countries. The Regional Council and BCEAO are conducting reflections in this direction, in order to propose protection mechanisms for consumers.

**Regulation of payment services**

Entities intending to exercise payment services are required to be duly approved or authorized, beforehand, by the Central bank. Banks and financial payment institutions, authorized by laws regulating banking, are allowed to conduct transactions related to payment services.

However, they are required to inform BCEAO, at least two months before the start of their electronic money issuance activities or the marketing to the general public, of any new money-related electronic service.

Electronic money institutions must be approved by the Central Bank before starting their electronic money issuing activities.

The exercise, by decentralized financial systems, of activities linked to electronic money, is subject to the prior authorization of BCEAO. (Article 8 of the Instruction).

Electronic money institutions must have a specific legal form and corporate purpose. They must be constituted in the form of Joint Stock Companies or Companies with Limited Pluripersonal Liability, Mutuals, Cooperatives or Economic interest Groups.

With the exception of banks, financial payment institutions and decentralized financial systems, the issuance of electronic money can only be carried out by a legal person whose corporate object relates exclusively to this activity.

Diverse forms of electronic payment are available in Senegal. These include the use of credit and debit cards, mobile phones, online payment services such as Paypal, Alipay or Apple using the iTunes card, bank transfers and payment upon delivery.
Application of data protection and consumer laws

Data Protection in Senegal is regulated under Law No. 2008-12 on the protection of personal data. The Law provides for the collection, registration, processing, storage and transmission of personal data. An independent authority, the Commission of Personal Data (CDP) was established to ensure that personal data related activities are done in accordance and compliance with the Law.

Senegal ratified the convention on Cyber Security and Personal Data Protection adopted by the African Union in 2014. In addition to this text, the "Strategy Senegal Digital 2025" was launched in 2016 with the ambition to achieve emergence through digital technology, strategy the cost of which is estimated at XOF1,361 billion mainly allocated as follows: 73% for the private sector, 17%, for the public sector.

To fill in the gaps partly caused by an increased digitalization and update the legislation on the technology and telecommunications sectors, a bill has been circulated in 2019 for comments and recommendations.

The transfer of personal data to third countries are allowed subject to sufficient protection guarantees.

Sensitive data collection, processing and related activities are subject to prior authorization from the CDP.

The 2008 Law on electronic transactions regulates, among others, direct solicitation marketing by electronic means. It provides for commercial solicitations by prohibiting unsolicited advertising by electronic message, without having obtained prior consent from recipients.

The General Regulation of the CREPMF also regulates solicitation of the WAMU public under Article 176 of the General Regulation of the CREPMF.

Money laundering regulations

An anti-money laundering/countering the financing of terrorism (AML/CFT) framework is used by member states of the West African Economic and Monetary Union (WAEMU). Senegal was the first country to implement it, domestically, through the adoption of a terrorist financing law, Uniform Law n° 2009-16 of March 2, 2009, relating to the fight against the financing of terrorism.

A 2015 WAEMU directive provides for safeguards for the financial sector.

Involved entities include banks, MFIs, e-money issuers, payments and transfers companies, commercial and consumer credit providers, insurance providers and agents that provide financial services.

Know your customer (KYC) procedures are specified in the directive and before any transaction, all involved entities must identify their clients – both individuals and organizations by obtaining the client's full name, place and date of birth, primary address and verifying these by checking a valid "official document" with a photograph (to be copied) and documentary proof of address.

The Money Laundering, Terrorist Financing and Transfer of Funds (Information on the Payer) Regulations 2015 give the National Financial Intelligence Processing Unit CENTIF responsibility for supervising the anti-money laundering control of businesses that offer certain services, such as lending, provision of payment services, issuance and administration of other means of payment.

Generally, where a firm is authorized and supervised by the CENTIF, it will also be authorized and supervised by the CENTIF as far as compliance with anti-money laundering requirements is concerned. Electronic currencies and other cryptocurrencies tend to represent a higher money-laundering risk.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

Seed investment

Alternative financing mechanisms are needed and sought as startups are having difficulties accessing to financing.
Among potential alternatives were the recourse to angel investments and crowdfunding initiatives. Angel investments have been promoted by entities like NGOs such as Enablis. Foreign business angels, especially French ones, provided some fintech businesses with initial investments.

For illustrative purposes, a tech community, composed of some 15 startups, Teranga Tech, participate in strengthening digital growth in Senegal, by encouraging skills transfer, partnerships and job-creating investments that will benefit the Senegalese economy. The community will support projects in fields such as agriculture (agritech), education (edtech), health technologies (medtech), biotechnologies (biotech), finance (fintech) and cultural and creative industries (CCI).

One of the main objectives of the community is to provide technical and financial support aimed at developing innovative entrepreneurship integrating decentralized project leaders.

Investments for small projects, with financing needs ranging between USD10,000 and USD50,000 are scarce and need to be developed.

Crowdfunding

The crowdfunding sector is at its early stage in Senegal. Crowdfunding platforms have been launched bringing together individuals, entities and charities to finance personal and charitable projects.

Crowdfunding has also been seen as a possible alternative through which foreign aid may be sent in order to resolve issues such as corruption. However, legal and regulatory obstacles have slowed that initiative that has been considered by foreign countries such as the UK.

An example of a crowdfunding finance project, is “Peeling of the Onions of Senegal.”

The STARS program (Strengthening African Rural Smallholders), in partnership with the Mastercard Foundation, assists 8,000 onion smallholders to develop marketing tools and financial products and attain a certain level of productivity and food security which will, at the end, support Senegal to become self-sufficient in onion production in the near future.

BaySeddo is a (digital) platform reuniting producer organizations and individuals looking to invest in short-term agricultural projects. The farmers’ lands, representing resources for exploitation from investors, will be added in the hope to achieve win-win results.

BaySeddo is expected to initiate similar projects with other producer organizations participating in STARS program.

Venture capital and debt

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. It provides a viable alternative to traditional lending, given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund. The benefit of having a CVC as an investor for a fintech startup is that the fund is able to share its knowledge and expertise of the fintech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), secured against a company's assets and including an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

Entrepreneur and Director, Mrs. Caty Lo, having a rice trade and processing business activity with an annual turnover of EUR750,000 and a staff of 20, considered EUR300,000 offered by Venture capitalists, insufficient and intends to try to find financing elsewhere without having those venture capitalists to become shareholders in her business.

For the financing of her business, she also admitted that she has been able to finance investment of EUR150,000 for her own factory with own money and credit from family members.

Senior bank debt and capital markets funding

Once a fintech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the
facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**Incentives and reliefs**

The investment code is intended to help investors with their potential projects in Senegal. Indeed, international investors are urged to rely on local companies in the conduct of their operations in order to benefit from certain incentives offered by the legal system.

The objective is, of course, to open up opportunities for SMEs and to give an inclusive character to Senegalese economic growth. Thus, large foreign companies eligible for the benefits of the Investment Code are entitled to tax credits provided that they apply a local content policy on job creation, opening of social capital to nationals and the outsourcing.

**Portfolio sales**

**Loan transfers and portfolio sales**

**What are common ways of buying and selling loans?**

Loans are commonly bought and sold.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio.

The most common ways of selling loans are:

- **Novation** – a transfer of title of a party's rights and obligations. It is a tripartite arrangement between the existing parties and the transferee and results in a new contract between the continuing party and the transferee and the transferor being released from its obligations.

- **Assignment** – a transfer of rights only and not of obligations. Subject to any contractual restrictions, assignment can be done without the consent of the debtor. An assignment can be effected as either an equitable assignment or as a legal assignment.

The Loan Market Association documentation is sometimes used for loan transfers.

**What are the main considerations when transferring a loan and related security?**

Loans contracted by residents from non-residents must, except by special decision of the Minister of Finance, be carried out through licensed intermediaries in all cases where the monies borrowed are made available to the borrower in the country. The licensed intermediaries thus called upon to intervene will ensure that the transactions comply with the applicable Laws and Regulations.

All foreign loans are subject to mandatory declaration to the External Finance Directorate and the BCEAO, for statistical purposes. The repayment of any foreign loan, either by purchase and transfer of foreign currencies or by crediting foreign accounts in Francs or in Euros, must be declared for statistical purposes to the External Finance Directorate and the BCEAO and said transactions must be carried out through a licensed intermediary.

Before transferring a loan, a number of issues, below, must be taken into account:

- **Confidentiality**: whether disclosure of information relating to the loan is allowed, to a potential transferee for instance.

- **Data protection**: whether there is any personal or restricted data or information in the loan that should not be disclosed.

- **Lender eligibility**: whether there are any restrictions on potential transferee entities.

- **Undrawn commitment**: whether the transferee will be subject to continuing obligations for further funding or reduction of claims.
Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

Ownership of energy assets and infrastructure in Senegal varies according to the asset class. The key sectors are discussed below.

Energy:

ELECTRICITY

Senegal is facing problems as the demand for electricity grows faster than its supply. SENELEC, the national electricity company, is far from getting the needed financial resources to invest in powerplants and transmission lines and fill the gap left by an increasing imbalance between the demand and supply for electricity.

The energy sector is managed by and is under the control of the National Electricity Company of Senegal (SENELEC), a state company which deals with the management of state-owned sector assets and ensures the financial equilibrium of the sector.

The Senegalese electricity sector is reorganized under three entities: the national utility company (SENELEC), the Agency for Rural Electrification (L'Agence Sénégalaise d'Électrification Rurale, ASER) and the Electricity Regulatory Board (Commission de Régulation au Secteur de l'Electricité, CRSE).

To settle the low rate of the rural electrification problem, the Senegalese government came up with the Rural Electrification Action Plan (PASER) where the country was divided into ten concessions, six of which were allocated to private sector companies with the monopoly for electricity distribution within their concessions.

Unfortunately, they have encountered tremendous hardship. The remaining four concessions were awarded to SENELEC which remains the major electricity service provider in rural areas, covering 96% of clients.

GAS

The gas industry in Senegal is privatized. A number of private sector companies provide production, transportation and distribution services. The private sector companies involved, which own the generation, transmission and distribution assets, are in particular, Kosmos Energy and British supermajor BP, both of which are partnering through a joint-operating venture.

While ECOWAS representatives called for Member States to develop policies on the popularization of Liquified Petroleum Gas (LPG) and to promote access to modern energy and cooking fuels, the West African Monetary Union (WAMU) encourages and recommends poorer households to return to their traditional fuel usage patterns warning that if subsidies for LPG are not granted or are not sufficient, demand for charcoal may continue to increase leading to more deforestation which leads to annual forest-losses of 0.5%.

A minimum target penetration rate of 30% by 2030 is expected to be attained with an emphasis on rural communities’ access to LPG.

A recommendation has been made to put in place a regional strategy with a proposed implementation timeline of 2019-2030 that will promote and accelerate people’s access to LPG which is a cleaner source of energy than biomass.

Telecom Infrastructure

The Senegalese Telecommunications Regulatory Authority (ARTP) is the regulator of the telecommunications sector in Senegal. It is also
responsible for broadcast services and wireless communications services.

Telecommunication networks (fixed and mobile) is characterized by private ownership. The main company providing a number of services in the sector is Orange Senegal. The opening of the market has brought two other global operators: Free and Expresso.

Around USD910 million is spent on infrastructure, per year.

The country is said to have an excellent telecommunications infrastructure and a connection to more than 40 countries around the world. Services such as cable, telex, fax, and internet are available and there has been an increasing demand for internet-related services and cellphone usage.

A remarkable growth of mobile telephone use was reported, from 1.5 million subscribers in 2005 to 15.3 million in 2016, when mobile penetration reached about 117% by mid-2016.

**Aviation**

Access to financing in the aviation sector is difficult to obtain and may be quite costly when available. Financing from commercial banks are hard to get including for aircraft acquisition.

Guarantees from the government are, at times, sought and granted with little reticence encountered on the part of the Senegalese government.

Aviation leasing is quasi inexistent on the continent and costly when available in foreign markets.

However, financing through Export Credit Agencies (ECAs) have become a source of financing as was the case for the acquisition of Airbuses by Air Senegal.

**Are there special rules for investing in energy and infrastructure?**

**Generally**

There is no specific regime governing or restricting investment in energy or infrastructure projects in Senegal, in addition to existing regulation for investors. However, a particular proposed investment may be subject to legislative or regulatory control (e.g. merger control rules). As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory context relevant to that project must be considered. For example, a project involving development on land will require, among others, planning permission or a development consent order; and a project may require environmental authorizations/permits and/or sector-specific regulatory consents or licenses. Where a public entity (e.g. a government department or a local authority) is procuring a project using private finance, and that entity is to benefit from central government funding, the project will be subject to central government approval.

Whether an investor can invest will depend on the terms of the procurement of that project if it is a public-sector project and, in respect of an existing/operational project, that will depend on whether there are any contractual restrictions on Change of Control. This is less of a concern on private sector infrastructure, although investors would need to consider whether any licenses/consents/permits would be affected by their acquisition of an interest.

**Energy**

**ELECTRICITY**

In 1998, the Law on the electricity sector liberalized the energy sector and brought new perspectives for private-sector investment in electricity generation. It was amended in 2002 to introduce greater transparency to the private sector tenders procedures.

The electricity industry is managed by SENELEC, which is the state-owned company, responsible for the distribution of electricity. There are, however, independent power producers such as GTI-Dakar and ESKOM-Manantali.

The regulator of the energy sector is the Electricity Regulatory Board (CRSE), an independent authority created by Law 98-29 of April 14, 1998, relating to the electricity sector and responsible for the regulation of the production, transport, distribution and sale of electric
energy in Senegal. It approves revenue requirements and licensing for the sector and leads IPP tender processes. It monitors compliance with regulations, manages disputes between industry players, ensures the protection of consumers’ interests and issues opinions on operating licenses and regulatory texts.

SENELEC has a monopoly on transportation across the country, with the exception of the interconnected Manantali hydroelectric dam. The company operates a number of production units (416MW of installed capacity in 2007) and is bound, by contracts, to purchase electricity from independent power producers (IPPs) for a period of 15 years (GTI 1, Manantali 2 and from some Senegalese self-producing industries, totaling about 150MW of additional installed capacity). In addition, SENELEC is under obligation to deploy renewable energy within its concession areas.

Power generation is currently reliant to a significant degree on independent power producers (IPPs).

What is the applicable procurement process?

Different procurement procedures are provided for when purchasing goods and services in Senegal.

An invitation to bid can be opened or restricted.

A contract is awarded without negotiation, after competitive tender, to a bidder which has fulfilled the conditions of the bid and has submitted the lowest bid price.

The open bid process, which is the default procurement process, allow tenderers to submit offers. The tender period is, in principle, set at 30 days for national invitations to tender and 45 days for international invitations to tender, which may be reduced to 10 and 15 days respectively in urgency situations.

Under the restrictive process, bidders are invited to bid; however, this process has not often been used since 2014.

The Direct agreement is permitted to be used in cases of extreme urgency for public service continuity considerations or where only one supplier or service provider is able to provide the requested good, service or work. The authorization of the Central Directorate for Public Procurement (DCMP) is however required for a direct agreement. This procedure is, in practice, mostly used when a government wants to expedite a process for strategic or political purposes. It is often used for large projects.

The Request for Quotation (RFQ): Under this procedure, quotations are requested from at least three suppliers. The procedure is not frequently used, it is mainly for services or products immediately available and, sometimes, for small construction contracts (often less than XOF30 million).

This mechanism is said to be a source of corruption and procurement abuse as the type of contracts involved may be subject to less scrutiny compared to larger contracts.

The Request for proposal (RFP): is a two-stage procedure where a request for proposals is sent to at least the first three candidates selected through a call for expression of interest (EOI). They receive the reference terms and a letter of invitation specifying the selection criteria and information on the application as well as the draft contract. If the estimated amount of the contract falls below the thresholds set out in Article 53 of the Code, the process does not need to be public and five providers may be invited to submit a proposal.

Financing energy and infrastructure

Public procurement in Senegal is based on three main principles:

- Any company, group of companies or any natural person benefits from free access to public procurement. It may apply for a public contract by complying to the requirements set by the rules and regulations.
- There is an equal treatment of candidates and discrimination and obstacles to competition are prohibited.
- There are also efficiency considerations as the procurement procedures must be efficient and provide the contracting authorities with the best services at the best price.

The provisions of Public procurement Code and the decree apply to contracts concluded by contracting authorities such as the state, including its decentralized services and organizations not endowed with legal personality placed under its authority; local authorities;
public establishments; agencies or bodies, legal persons governed by public or private law, other than public establishments, national companies or public limited companies with majority public participation, whose activity is financed mainly by the state or a local community and is carried out mainly in the context of activities of general interest; national companies and public limited companies with majority public participation; and the like.

Last modified 29 Jul 2020

What are the most common forms of funding / investing in energy and infrastructure?

The principal forms of private sector funding/investment in energy and infrastructure in Senegal (including in relation to public-private partnerships) are:

Funding

Common forms of funding in energy and infrastructure include:

• loans made on a corporate finance basis (balance sheet debt);
• loans made on a project-finance basis (to a special purpose project company) on medium to long-term bases – such loans may later be syndicated to other funders;
• refinancing of the debt in operational projects; and
• asset financing: this is particularly relevant in the rail sector.

Last modified 29 Jul 2020

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

Where there is a presumed compliance requirements violation, the Capital Markets Authority, CREPMF, initiates an investigation when it believes that there a potential violation of the rules and regulations.

Investigations can intervene at any time when the financial market authority considers there is a violation of law. The financial market authority can get information from different actors in the market (shareholders, parent companies and subsidiaries, from any legal or natural person having a direct or indirect relationship of interest with the stakeholders).

This investigation may result in sanctions.

Last modified 29 Jul 2020

What regulatory penalties may apply?

The regional council, in application of article 30 of the Appendix relating to the Composition, Organization, Functioning and attributions of the CREPMF, can impose disciplinary, financial and administrative sanctions for any action, omission or maneuver that would be contrary to the general interest of the financial market and its proper functioning and/or prejudicial to the rights of savers.

The CREPMF does not have the power to impose criminal sanctions, but it does have the power to pronounce:

• pecuniary sanction
• administrative sanction
• disciplinary sanction
When there is violation of law, the financial authority can apply pecuniary sanctions (fines), administrative sanction (withdrawal or suspension of authorization) and disciplinary sanction. Those sanctions do not prevent the application of criminal penalty.

Those sanctions are imposed without prejudice to legal sanctions which may be pronounced against the offenders on the basis of a claim for compensation brought on an individual basis by aggrieved persons as a result of these conducts (appendix relating to the Composition, Organization, Functioning and attributions of the CREPMF, article 30).

---

**What criminal penalties may apply?**

The financial regulators have powers to impose criminal penalties in certain cases, against any person who, intentionally:

- does not comply with the restriction, suspension, or prohibition of professional activity that has been notified to it by the Regional Council; (Article 36 of the appendix relating to the Composition, Organization, Functioning and attributions of the CREPMF);
- spreads false information in the public about the stock market and its products;
- performs a stock market maneuver aimed at hindering the regular operation of the market;
- overrides a decision that rejects an application or withdraws a visa taken by the Regional Council;
- infringes the monopolies of stock exchange trading and securities accounts vested in management and intermediation companies; and
- commits an insider trading.

Moreover, in the case of a legal person, the *de jure* or *de facto* managers will be liable to the same proceedings, if they become aware of those acts.

The financial conduct authority cannot apply criminal penalties. They may just apply the sanctions specified above. Criminal penalties are applied by national court.

---

**Tax**

**Tax issues**

*Are stamp, registration, transfer or other similar taxes applicable?*

*Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?*

Generally:

Stamp duties of XOF2,000 apply to:

- deeds, documents, their copies and reproductions, drawn up for the general purpose of establishing legal fact or relationship; and
- an act passed abroad is subject to stamp duty before being used in the legal circuit in Senegal.

Registrations fees apply on loan, if declared, as per as the scope of law includes all deeds and legal facts, whether or not recorded in writing.

Exemptions:

Exemption for stamp duties on:
• account opening agreements concluded by banks; and
• credit agreements binding decentralized financial systems to their clients.

Registration bonus

• BCEAO’s and AFD’s contracts, apart from the rental or transfer of their buildings;
• sales of shares in companies listed on the Regional Stock Exchange (BRVM);
• leasing contracts; and
• Islamic financing operations.

Registration fees:

Are exempt from the registration formality:

• assignments of receivables under factoring contracts of companies approved by the BCEAO; and
• the deeds of advances on Senegalese state fund securities or securities issued by the Treasury.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

Deeds recording the publication of pledge files at the Registry:

• from XOF0 to XOF3 million 5 %;
• from XOF3 to XOF5 million 1.5 %;
• from XOF5 to XOF500 million 1 %;
• from XOF500 million to XOF1 billion 0.5 %; and
• in excess of XOF1 billion 0.25 % and the total amount of fees to be paid in this case may not exceed XOF50 million.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?

Registration of transfer of bond in the month of signature of the deed is mandatory. A fixed duty of XOF5,000 shall apply on registration except of deeds or advances on Senegalese government securities or bonds issued by the Treasury;

Stamp duty is also applicable for the amount of XOF2,000 per sheet.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?

Secured lenders and secured debt security holders take priority over tax authorities on the enforcement of security.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Withholding taxes apply on interest paid under a loan to a destination abroad.
If so:

**What is the rate of withholding?**

The rate is 25% subject to Tax treaty signed by Senegal and 17% for the tax on financial activities.

For payment of interest on fixed term deposit, the rate is 16%.

**What are the key exemptions?** For example, is there an exemption for interest payments to banks, to local lenders/debt security holders, on listed debt, to lenders/debt security holders entitled to the benefit of a double tax treaty etc.?

Exemptions apply on:

- interest on loans, advances, deposits, as well as commissions on signature commitments and similar operations concluded or carried out between banks;
- interest on loans with a term of at least five years on the industrial, agricultural, fisheries or tourism sectors;
- interest on credit distribution operations carried out by the Decentralized Financial Systems;
- interest on loans and advances granted to the state;
- interest received on operations carried out with enterprises established in the Dakar industrial free zone;
- interest on loans granted to natural persons for the construction and acquisition of premises for the purpose of principal residence;
- 8% reduced rate on payment of interest on fixed term deposit paid through a bank account; and
- 7% reduced rate on interest, levied on all export sales financing transactions.

**Would the same analysis apply to interest payments under a debt security (e.g. a bond)?**

The same analysis would apply to interest payments under a debt security.

**Are foreign lenders and debt security holders subject to tax on interest payments?**

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

A withholding tax applies to interest payments remunerating loans granted by lenders (company) or individuals who do not have a permanent establishment or are not resident in Senegal.

Holders of debt securities are taxable if they are tax resident.

**Would the same analysis apply to interest payments under a debt security (e.g. a bond)?**

The same analysis applies to interest payments under a bond. The General Tax Code subjects the income from non-bond loans to the tax on deposit (IRC) and fixes the applicable rates as follows:

- 16% for income from receivables deposits and guarantees; and
- 8% for income from receivables deposits and guarantees opened in the accounts of a bank, a financial institution, etc.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under Singapore law.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Singapore or to request that they are admitted to trading on a regulated market operating in Singapore unless an approved prospectus has been made available to the public.

Last modified 20 Oct 2017

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Singapore are bonds or notes issued on a stand-alone basis or under a program.

Many different types of debt securities are offered in Singapore.

Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities and high-yield bonds;
- guaranteed securities, subordinated securities, perpetual debt securities (i.e., debt securities that have no specified redemption date);
- asset-backed securities;
- derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- hybrid securities (securities with both debt and equity features);
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer);
- exchangeable bonds (debt securities convertible into the equity of a third party);
- depositary receipts (a security issued by a depositary conferring on the holders beneficial ownership of certain underlying assets held by the depositary for the holders); and
- warrants (securities giving the holders the option to purchase the equity of the issuer or a related company).

Last modified 20 Oct 2017
**What are the differences between offering debt securities to institutional/professional or other investors?**

There are additional requirements that would have to be met in order to offer debt securities to retail investors, including the preparation of prospectuses.

The Monetary Authority of Singapore has, however, recently introduced two new frameworks, namely the Bond Seasoning Framework and the Exempt Bond Issuer Framework which will enable retail investors to invest if certain criteria are satisfied.

*Last modified 20 Oct 2017*

**When is it necessary to prepare a prospectus?**

All offers of securities require the preparation of a prospectus unless an exemption is available. Possible exemptions include the issue or transfer of securities for no consideration eg employee share option schemes, small personal offers where the total amount raised from such offers within any 12-month period does not exceed S$5 million or such other amounts as may be prescribed by the Monetary Authority of Singapore and an offer to no more than 50 persons within any period of 12 months and under certain conditions.

*Last modified 20 Oct 2017*

**What are the main exchanges available?**

The Singapore Exchange (SGX) has two principal markets on which debt securities are traded:

- the SGX Mainboard; and
- the SGX Catalist.

*Last modified 20 Oct 2017*

**Is there a private placement market?**

Singapore does have an active private placement market and companies would have to comply with the rules of the Singapore Exchange Securities Trading Limited for such placements. Save for the foregoing, there are no specific regulations governing the same.

*Last modified 20 Oct 2017*

**Are there any other notable risks or issues around issuing or investing in debt securities?**

**Issuing debt securities**

Issuers are required to take responsibility for prospectuses, if applicable, for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil and criminal liability under Singapore law. Singapore has various investor protection statutory provisions relevant to liability for an inaccurate offering memorandum. There are also general fraud statutes and liability may also arise under common law through a civil action for deceit, negligent misstatement or misrepresentation.

**Investing in debt securities**

Debt security terms and conditions typically contain provisions which may permit their modification with the consent of a majority of the investors. If a trust deed is required, it will typically confer certain discretions on the trustee, which may be exercised without the consent of investors and without regard to the individual interests of particular investors. The conditions also provide for meetings of investors to consider matters affecting the investors interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

*Last modified 20 Oct 2017*
Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally

Establishing a fund, offering fund securities and operating a fund (ie fund management), among other things, are regulated activities subject to regulation by the Monetary Authority of Singapore.

Collective Investment Schemes

There are additional requirements which apply to activities undertaken in relation to ‘Collective Investment Schemes’ which are schemes comprising the following arrangements (subject to certain specific exceptions set out in the legislation):

- with respect to property of any description, including money, the purpose or effect of which is to enable persons taking part in the arrangements (whether by acquiring any right, interest, title or benefit in the property or any part of the property or otherwise) to participate in or receive profits or income arising from the acquisition, holding, management or disposal of any right, interest, title or benefit in the property or to receive sums paid out of such profits or income;
- where the participants do not have day-to-day control over the management of the property, whether or not they have the right to be consulted or to give directions;
- pooling of investors' contributions and profits or income; and
- the property is managed as a whole by or on behalf of a manager.

Last modified 20 Oct 2017

What are common fund structures?

Common forms of funds include:

- open-ended and closed-ended funds;
- retail and non-retail funds;
- collective investment schemes; and
- qualified investor structures that invest in, for example, corporate shares or bonds, real property, commodities (for example, precious metals) and derivatives.

Last modified 20 Oct 2017

What are the differences between offering fund securities to professional / institutional or other investors?

Retail funds

Retail funds are usually structured as a unit trust and are subject to the Collective Investment Schemes (CIS) regulatory regime, including the CIS code.

For retail schemes constituted in Singapore to be authorized by the Monetary Authority of Singapore, the following would need to be, inter alia, complied with:

- lodging a prospectus with the Monetary Authority of Singapore in compliance with the CIS Code; and
- the requirements of the CIS Code.
Are there any other notable risks or issues around establishing and investing in funds?

There are none to highlight for the summary purposes of this site.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Fund management companies (FMC) must either be a licensed fund management company which has obtained a capital markets services license under the Securities and Futures Act or be a registered FMC. Both applications are made with the Monetary Authority of Singapore. Each of these FMCs can market their own funds.

Further a person licensed under the Financial Advisers Act (Cap. 110) can market a collective investment scheme.

There are also no restrictions on using intermediaries to market a fund provided the requisite capital markets services license is obtained.

Are there any restrictions on managing a fund?

Fund management companies (FMC) must either be a licensed fund management company which has obtained a capital markets services license under the Securities and Futures Act or be a registered FMC.

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

There are no restrictions on entering into derivative contracts.

The Securities and Futures (Reporting of Derivative Contracts) Act, however, applies to all derivative transactions and requires transactions to be reported to the Monetary Authority of Singapore.

What are common types of derivatives?

Derivative contracts are entered into in Singapore for a range of reasons including hedging, trading and speculation.

Derivatives may be traded over-the-counter or on an organized exchange. Exchange traded derivatives are also subject to rules under the Singapore Exchange Derivatives Trading Limited.

All of the main types of derivative contract are widely used in Singapore:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).
The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying asset seen in Singapore are:

- equity;
- fixed income instruments;
- commodities;
- foreign currency; and
- credit events.

Are there any other notable risks or issues around entering into derivatives contracts?

The derivatives market has seen, and continues to see, the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Although lending itself is not regulated, the business of lending is regulated by the Moneylenders Act. Except for banks, finance companies, merchant banks, pawnbrokers, and cooperative societies, every person who carries on the business of moneylending must be licensed under the Moneylenders Act. Such lenders (including banks or moneylenders) will need to be authorized by the Monetary Authority of Singapore or the Ministry of Law to conduct such business.

There are no specific requirements around how the agreement is drafted and formatted and what information must be included.

There are no additional restrictions that apply to foreign lenders making loans to Singapore borrowers from a Singapore law perspective. However, banks in Singapore that lend Singapore dollars to non-resident financial institutions for any purpose whether in Singapore or elsewhere are subject to restrictions on the amount that they can lend.

Specific restrictions on lending apply to the purchase of real property, as follows:

- An absolute limit of 35 years on the tenure of all loans for residential property, applies to loans to both individual and non-individual borrowers, as well as refinancing loans, from 6 October 2012.
- The Monetary Authority of Singapore will lower the loan-to-value ratio (LTV) for new residential property loans to borrowers who are individuals if the tenure exceeds 30 years or the loan period extends beyond the retirement age of 65 years. For these loans, the LTV limit will be:
  - 40% for a borrower with one or more outstanding residential property loans; and
  - 60% for a borrower with no outstanding residential property loans.
- The LTV for residential property loans to non-individual borrowers from 50% to 40%.

Further, under the Total Debt Servicing Ratio framework, property loans extended by a financial institution should not exceed a Total Debt Servicing Ratio threshold of 60%. Property loans in excess of the Total Debt Servicing Ratio threshold of 60% should only be granted on an exceptional basis (or unless otherwise exempted under the Total Debt Servicing Ratio framework) and financial institutions should clearly
document the basis for granting property loans in excess of the Total Debt Servicing Ratio threshold of 60%.

**Borrowing**

There are specific restrictions on borrowing for unsecured credit an individual:

- 24 times monthly income from 1 June 2015;
- 18 times monthly income from 1 June 2017; and
- 12 times monthly income from 1 June 2019.

Financial institutions will not be allowed to grant further unsecured credit to an individual whose unsecured borrowings exceed the prevailing borrowing limit for three consecutive months.

Further, the Monetary Authority of Singapore has issued a consultation paper on 30 September 2016 proposing to disallow financial institutions from granting new unsecured credit facilities or credit limit increases to individuals whose outstanding unsecured debt already exceeds 12 times their monthly income. The Monetary Authority of Singapore has stated in the consultation paper that it intends to implement the changes on a prospective basis from 1 June 2017.

**What are common lending structures?**

Lending in Singapore can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents and trustees which fulfill certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities.

**Loan durations**

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but may sometimes come with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

**Loan security**

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

**Loan commitment**

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
• uncommitted, meaning that the lender has discretion whether or not to provide the loan.

**Loan repayment**

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

_Last modified 20 Oct 2017_

**What are the differences between lending to institutional / professional or other borrowers?**

For more information see [Lending and borrowing – restrictions.]

_Last modified 20 Oct 2017_

**Do the laws recognize the principles of agency and trusts?**

Yes, both principles are recognized as a matter of Singapore law.

For instance, it is possible to appoint an agent to act on behalf of other parties and a trustee to hold rights and other assets on trust for the lenders or secured parties.

_Last modified 20 Oct 2017_

**Are there any other notable risks or issues around lending?**

**Generally**

Loan agreements and other finance documents are subject to general contractual principles. For example, the Singapore courts will not enforce a penalty and so lenders have to be careful about the rate of default interest charged on a loan. It should be noted though that a contract by an unlicensed moneylender renders the borrower’s obligation to repay unenforceable.

**Specific types of lending**

For more information see [Lending and borrowing – restrictions.]

_Last modified 20 Oct 2017_

**Standard form documentation**

Finance transactions are likely to be documented on bank standard form documentation prepared in-house which are then subject to negotiations between the bank and the borrower.

_Last modified 20 Oct 2017_

**Are there any other notable risks or issues around borrowing?**

There are no notable risks or issues around borrowing.

_Last modified 20 Oct 2017_

**Giving and taking guarantees and security**

**Are there any restrictions on giving and taking guarantees and security?**

Some of the key areas affecting the giving of guarantees and security are as follows.
Capacity

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors' powers that would be preventative. Under Singapore law, directors must act bona fide for what they consider to be in the best interests of the company and not for any collateral purpose; as such, they will need to be able to show that adequate corporate benefit is derived from the company giving the guarantee or security. This is often more difficult in the case of upstream or cross-stream guarantees or security provided by a subsidiary to its parent or sister company. The safe approach is often to have the members of the company approve the giving of the guarantee or security by resolution.

Insolvency

Guarantees and security may be at risk of being set aside under Singapore insolvency laws if the guarantee or security was granted by a company with a certain period of time prior to the onset of insolvency. This would be the case if the company giving the guarantee or security received considerably less consideration, and as such, the transaction was at an undervalue. For such a transaction to be set aside, certain statutory criteria would have to be met, including that the guarantee or security was given within six months (or two years for connected parties) before the presentation of a winding-up petition. Guarantees and security may also be challenged on other grounds relating to insolvency.

Financial assistance

It is unlawful for a public company to provide financial assistance for the purchase of its own (or of its holding company's) shares unless a whitewash resolution is obtained from the shareholders. The prohibition against financial assistance for private companies whose holding company or ultimate holding company is not a public company was abolished on 8 October 2014. Financial assistance in this context would include giving a guarantee or security in connection with the share purchase.

What are common types of guarantees and security?

Common forms of guarantees

Guarantees can take a number of forms.

A particular distinction worth remembering is between a performance guarantee and a payment guarantee:

• A performance guarantee is a term used to describe both performance bonds (in the context of trade finance) and ‘see to it’ guarantees (in other contexts):
  
  • A performance bond describes a financial undertaking used to protect a buyer against the failure of a supplier to deliver goods or perform services in accordance with the terms of a contract. The issuer of the bond undertakes to pay to the buyer a sum of money if the seller fails to deliver the goods or perform the contracted services on time or in accordance with the terms of the contract. However, note that unlike a guarantee, the essential difference is that the obligation to pay is intended to be unconditional and independent of the underlying obligation. The essence of a ‘true’ performance bond is that it is an unconditional undertaking by a third party to pay the beneficiary upon demand, independent and irrespective of the underlying contract between the beneficiary and the principal. The issuer of a performance bond has primary liability, unlike a guarantor, who has secondary or collateral liability.
  
  • A ‘see to it’ guarantee is a promise by the guarantor to see to it that the primary obligor fulfils its obligations under the primary contract. If the primary obligor fails to fulfil its obligations under the primary contract, the guarantor will be in breach of its obligations under the guarantee.
  
  • A payment guarantee is narrower in scope than a performance guarantee as it only covers the payment of money rather than other contractual obligations.

Common forms of security

There are four basic types of security interest that can be created under Singapore law:
• a pledge;
• a lien;
• a charge; and
• a mortgage.

Different types of security are suitable for securing different types of assets.

Under Singapore law it is possible to grant security over all of the assets of a Singapore company or individual assets. Granting security over all of a company’s assets will tend to be achieved by way of a debenture which will include:

• a mortgage over real estate;
• a fixed charge over assets which are identifiable and can be controlled by the creditors (such as equipment);
• a floating charge over fluctuating and less identifiable assets (such as stock); and
• an assignment by way of charge over receivables and contracts.

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

To be valid, a guarantee needs to be in writing, signed by the guarantor and provided for good consideration.

Consideration for a guarantee is subject to general contractual principles. In the case of a guarantee, the underlying obligations will usually be the consideration for the guarantee and so it is advisable to execute the guarantee at the same time as executing the underlying obligations to avoid any suggestion of past consideration. Often the guarantee is included in the loan agreement and so this should not be an issue. Also it can be difficult to establish consideration for a guarantee as the primary obligations are between the underlying obligor and beneficiary, for example between the borrower and lender. As a result guarantees are sometimes executed as deeds to avoid any argument about whether good consideration was provided. Deeds have particular execution requirements namely under seal under Singapore law which need to be observed.

Additionally, there is a risk that a guarantee may be set aside if it was procured by undue influence by a borrower or lender. A party being provided with a guarantee should be alive to this issue and take steps to avoid claims of undue influence by, for example, requiring the guarantor to take separate legal advice. Additionally, a guarantee can be vitiated by misrepresentation, unconscionability, mistake and other like factors such as duress.

Giving or taking security

A security document may need to be executed as a deed if it:

• contains a mortgage over land;
• confers a statutory power of sale and power to appoint a receiver; or
• contains a power of attorney.

Once granted, security needs to be properly perfected before it is valid against third parties. Perfection formalities can range from having the secured asset delivered to the security holder, registration of the security and notice being given to third parties. Most charges created by a Singapore company must be registered at the Accounting and Corporate Regulatory Authority of Singapore within 30 days of its creation. Failure to register within this time will typically mean that the charge will be void against the liquidator and any creditor of the company.

There are no notarization requirements for security documents under Singapore law.
Like guarantees, for a period after a new security interest has been granted, it is at risk of being set aside in certain circumstances under insolvency laws. Reviewable transactions include those conducted at an undervalue, unfair preferences and invalid floating charges.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Banking Act
Finance Companies Act
Monetary Authority of Singapore Act
Hire-Purchase Act
Payment System (Oversight) Act 2006
Securities and Futures Act
Securities and Futures (Licensing and Conduct of Business) Regulations
Securities and Futures (Offers of Investments) (Shares and Debentures) Regulations 2005
Code on Collective Investment Schemes

Consumer credit

Consumer Protection (Fair Trading) Act

Mortgages

Land Titles Act
Registration of Deeds Act

Corporations

Companies Act

Funds and platforms

Financial Advisers Act
Financial Advisers Regulations
Insurance Act

Other key market legislation

Moneylenders Act
Limited Liability Partnership Act
Monetary Authority of Singapore (Control and Resolution of Financial Institutions) Regulations 2013

Regulatory authorization
Who are the regulators?

The Monetary Authority of Singapore is the central bank of Singapore and the main regulator for all financial regulated activities.

The Accounting and Corporate Regulatory Authority is the regulator of business entities and other corporate service providers.

Last modified 20 Oct 2017

What are the authorization requirements and process?

To conduct a regulated activity in Singapore in the financial services sector, a firm must apply to the Monetary Authority of Singapore for authorization if applicable. As the main regulator, the Monetary Authority of Singapore authorizes a firm under legislation applicable to the regulated activity it conducts. Commercial banks are primarily authorized under the Banking Act, financial advisors are authorized under the Financial Advisers Act and capital markets intermediaries are authorized under the Securities and Futures Act.

To obtain authorization, a firm must apply to the Monetary Authority of Singapore with supporting documentation such as constitutional documents, financial information and business plans and must also fulfill all requisite criteria.

Under the Securities and Futures Act, an application fee ranging from S$200 to S$1,000 must be paid, depending on the authorization sought. The application fee is regulated under the Securities and Futures Act. Prospective applicants who intend to conduct banking business in Singapore are encouraged to contact the Monetary Authority of Singapore at an early stage to discuss plans prior to submitting a formal application.

Authorized firms are listed in the Financial Institutions Directory of the Monetary Authority of Singapore.

Last modified 20 Oct 2017

What are the main ongoing compliance requirements?

Ongoing compliance requirements differ depending on the type of license obtained. Typically, threshold conditions regarding the maintenance of adequate financial resources and reporting requirements are ongoing requirements for authorized firms. An annual license fee is also typically payable.

The Monetary Authority of Singapore may take regulatory and enforcement action for a failure to comply with ongoing compliance requirements, resulting in sanctions for regulated entities including a possible revocation of authorization.

Last modified 20 Oct 2017

What are the penalties for failure to be authorized?

A person (including a company) conducting a regulated activity without being authorized or exempt commits an offence and is liable to fines ranging from S$2,000 to S$250,000 and imprisonment (if applicable), or both.

Last modified 20 Oct 2017

Regulated activities

What finance and investment activities require authorization?

Generally

The following are key areas of finance and investment activities regulated and/or requiring authorization in Singapore:

- commercial banking activities including receiving money on current or deposit account, paying and collecting checks and making advances to customers and in particular (merchant banking activities must be conducted and operated within the Guidelines for Operation of Merchant Banks issued by the Monetary Authority of Singapore);
- finance companies in the business of, *inter alia*, borrowing money from the public by acceptance of deposits and issuing certificates or other documents acknowledging indebtedness to the public, as well as providing credit facilities;
- insurers carrying on insurance business in Singapore, including direct life and/or general insurance business, life and/or general reinsurance business or captive insurance;
- activities relating to securities, futures and fund management, including, among other things, dealing in securities, trading in futures contracts, leveraged foreign exchange trading, advising on corporate finance, fund management, real estate investment trust management, securities financing, providing credit rating services and providing custodial services for services;
- financial advisory services, including advising others on investment products, issuing research reports covering investment products, marketing of collective investment schemes, and arranging life policies for others, other than a contract of reinsurance;
- money brokers who provide broking services dealing with banks and financial institutions licensed, approved, registered or regulated by the Monetary Authority of Singapore for direct access to money brokers in Singapore;
- money-changer and remittance business involving the buying and selling of foreign currency notes;
- business trusts that run and operate business enterprise;
- trust companies which provide trust or trustee services for investment and wealth management purposes, such as succession planning; and
- payment and settlement systems.

*Are there any possible exemptions?*

Where finance and investment activities, taken as a whole, fall within the remit of multiple pieces of legislation, entities may be exempt from the multiple authorization and/or licensing requirements under applicable legislation. For example, where banks provide capital markets and financial advisory services, the Financial Advisers Act, the Securities and Futures Act and the Banking Act are applicable to their regulated activities but they are generally exempt from licensing requirements pursuant to the Financial Advisers Act and the Securities and Futures Act.

*Do any exchange controls or other restrictions on payments apply?*

Singapore does not operate any foreign currency controls.

There may be anti-money laundering and tax considerations to take into account. Depending on the way the business is conducted, an analysis on whether a remittance license is required should be conducted.

*What are the rules around financial promotions?*

**Rules**

The Monetary Authority of Singapore issued principle-based Guidelines on Standards of Conduct for Marketing and Distribution Activities which took effect from 1 April 2017. These guidelines set out safeguards that financial institutions should apply when marketing and selling financial products and services to retail customers.

**Exemptions**

The Guidelines on Standards of Conduct for Marketing and Distribution Activities apply to financial institutions which conduct marketing and distribution activities targeting retail customers only, and the representatives who act on behalf of these financial institutions.
Entity establishment

*What types of legal entity are generally used to undertake financial or investment activity?*

**Generally**

The most commonly used legal entity is a limited company, which is a body corporate with separate legal personality and which limits the liability of its members.

Limited companies can either be private (denoted by the suffix Private Limited, Pte Ltd, Sendirian Berhad or Sdn Bhd) or public (denoted by the suffix Limited, Ltd or Berhad). At least one director of a limited company must be ordinarily resident in Singapore. There are no minimum share capital requirements to set up a company in Singapore, however, companies which intend to carry on regulated business (such as banking, money lending or fund management activities) may be subject to minimum capital requirements.

The number of members in a private company limited by shares is restricted to a maximum of 50. The constitution of a private limited company must provide for restrictions on the transfer of shares by its members, for example by providing that transfers require the approval of directors or imposing a right of first refusal for existing members.

There is no limit on the number of members of a public limited company, however, if a public limited company is listed on the Singapore Exchange Securities Trading Limited, at least 10% of the issued shares in each class listed must be publicly held. Such public listed company would also be subject to the Rules of the Singapore Exchange Securities Trading Limited.

A company may convert from private to public or public to private by special resolution of its members and lodging certain documentation with the Accounting and Corporate Regulatory Authority of Singapore.

A limited liability partnership (LLP) established under the *Limited Liability Partnership Act* may also be used. Like a company, a LLP has a separate legal personality. At least one manager of the LLP must be ordinarily resident in Singapore.

**Funds**

Investment funds typically take the form of:

- a collective investment scheme structure, being a trust established using a trust deed between a manager and trustee;
- a corporate entity; or
- a limited partnership structure.

Fund management activities must be conducted by a company incorporated in Singapore, which must hold a Capital Markets Services license for fund management. The relevant persons (as defined in guidelines issued by the Monetary Authority of Singapore), must be, *inter alia*, considered ‘fit and proper’ by the Monetary Authority of Singapore. There are certain exemptions from such requirements under the *Securities and Futures Act*.

**Is it possible to conduct lending or investment business through a branch or establishment?**

A branch office without a separate legal identity from that of its parent company may be registered in Singapore, which may conduct any business activities conducted by its parent company. The branch office must have the same name as its parent company and it must comply with the *Companies Act*, for example provisions requiring the branch office to have its registered office address in Singapore and to appoint an authorized representative who is ordinarily resident in Singapore. Approval of the Monetary Authority of Singapore may be
required in certain circumstances. For applicants that are incorporated in a foreign country, they should satisfy the Monetary Authority of Singapore that the branch in Singapore would be subject to proper management oversight and be able to comply with all laws and regulations governing its operations.

Alternatively, a subsidiary private limited company may be incorporated in Singapore with a legal identity separate from its parent company.

**FinTech**

**FinTech products and uses**

*What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?*

**Overview**

The Singapore government and the Monetary Authority of Singapore (MAS) have actively encouraged the growth of the FinTech industry to entrench Singapore as a global financial hub and further its initiative to transform Singapore into a 'Smart City'. Compared to Western markets, market and consumer maturity in Southeast Asia is lower since a large part of the population is underbanked or unbanked and has limited access to smart technologies. This presents different challenges for companies wishing to enter the FinTech space and for FinTech investors, as entrepreneurs are limited in the extent to which they can employ technological advances in their innovations.

In Singapore, FinTech innovations are within the payments and marketplace lending space, which provide platforms for new consumers to access traditional banking services.

**Peer to peer funding and marketplace lending**

Peer-to-peer (P2P) funding includes both P2P lending and P2P equity platforms. Unlike traditional banks, P2P lending firms operate a platform which connects borrowers and lenders, instead of applying funding raised from a deposit-based relationship. Furthermore, while P2P lending platforms were initially used mainly to help startups raise capital, they now operate across many industries and finance assets which could previously only be financed by bank funding. Examples include lending platforms which deal in consumer loans, real estate or student lending.

P2P lending platforms and other forms of marketplace lending have presented an ever increasing challenge to traditional financial service providers largely because their technological innovation leads to greater efficiency, cost savings and flexibility and their ability to service small and medium-sized enterprises (SMEs) that have been turned down by traditional banks in the post financial crisis era.

MoolahSense (set up in 2014) and FundingSocieties (set up in 2015) were some of the successful early pioneers of marketplace lending in Singapore. They have entered into a partnership with DBS Bank to refer successful borrowers to the bank for larger loans and other traditional banking services. FundedHere and Crowdo are other key marketplace lending players, and they provide both equity and lending based platforms. We can expect to see a longer list of crowdfunding platforms in time to come, as the number of platforms receiving licenses from the MAS is increasing.

Industry specific platforms have also taken off in Singapore. One example is CoAssets – a Singapore grown, Australian listed crowdfunding platform founded in 2013 – which focuses on real estate funding. Another example, Crowdo, earlier this year announced a strategic partnership with BFI Finance, a multi finance company in Indonesia, to offer customers (particularly SMEs) loans for vehicles and fixed assets.

Many of these domestic funds have also been expanding their operations to include securitizing loans through invoice financing which is particularly favorable for asset light SMEs.

**HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?**

Marketplace lending includes P2P-type structures often operated through an electronic platform provider as well as crowdfunding and
also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

ISSUES FOR STARTUP MARKETPLACE LENDERS

In general terms, marketplace lending has not been as successful in Singapore as it has been in the US or the UK, mainly because the local financial market is not large enough to achieve the scale and success of American P2P platforms such as Lending Club. This is a difficult challenge to overcome for Singapore's relatively small domestic funds since they do not have access to the kind of business/investor data that banks have access to and since not many P2P platforms have partnered with banks in Singapore, unlike in the UK or US.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a 'proof of work' process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open ('permissionless' or 'unpermissioned') or structured within a private group ('permissioned').

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an 'address'). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

There seems to be a great push to make Singapore a world leader in distributed ledger technology with many users in Singapore testing the application of blockchain in areas such as:

- interbank payments;
- verifying and reconciling trade finance invoices; and
- executing and verifying the performance of contracts.

Examples of FinTechs in the blockchain space include Attores, a Singaporean FinTech startup which utilizes the ethereum platform (a blockchain that records smart contracts) to allow its customers to create and execute tailored smart contracts securely, while building an open repository of smart contracts. In September 2017, IBM announced it was piloting blockchain technology for managing the design, management and execution of its contracts with Bank of Tokyo Mitsubishi on the IBM cloud.
The Singapore government, acting through its FinTech office, is taking the lead in developing the application of blockchain technology in Singapore. The FinTech office was set up in May 2016 by the MAS and the National Research Foundation, to serve as a one-stop virtual entity for all FinTech matters and to promote Singapore as a FinTech hub. In a keynote address in November 2016, the Managing Director of the MAS expressed that there was an important opportunity for the government to build blockchain infrastructure that the private sector could meaningfully use. He discussed examples in banking, KYC, consent standards in big data and payment infrastructure for mobile payments as possible areas within which blockchain could be successfully deployed. However, attracting and recruiting talent and developing local talent remains an important challenge for the Singapore government, which is actively trying to overcome the issue by hosting events such as the annual FinTech festival since November 2016 (for more information, see here).

In March 2017, the MAS completed phase 1 of a proof-of-concept project named ‘Project Ubin’ to conduct domestic inter-bank payments using blockchain. The project was formed in partnership with R3 and a consortium of financial institutions, and was borne out of a need to explore the use of blockchain in financial transactions. The project evaluated the implications of having a tokenized form of the Singapore dollar (SGD) on a distributed ledger, and its potential benefits to Singapore's financial ecosystem. If blockchain-based interbank payments are successful, it could lead to faster settlements in securities and bond trading. The report for the project, however, mentioned the potential issue of credit risk liability and stated that an appropriate legal structure is required to ensure that the transfer of digital SGD is equivalent to a full and irreversible transfer of the underlying claim on the central bank's currency. This would help ensure that there is no credit risk associated with the creation, distribution, use or redemption of the digital SGD.

With an unprecedented push for the adoption of blockchain led by Singapore's government, Singapore is on its way to being at the forefront of the technology, and perhaps an example of how blockchain can work to improve the lives of its citizens.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

As defined by the Monetary Authority of Singapore, a digital token is a cryptographically secured representation of a token holder's right to receive a benefit or perform a specified function. A virtual currency (examples include bitcoin or ether), also known as cryptocurrency, is a type of digital token.

Initial coin offerings and token based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty initiative or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is
illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

ICOs have become increasingly popular as a way for startups in Singapore to raise funding. Millions of US dollars have been raised through ICOs in Singapore over the last year. Digix, a platform which trades gold backed tokens issued for ethereum, raised US$5.5 million in under 12 hours in 2016, while blockchain startup TenX recently raised close to US$80 million to support the development of a protocol enabling transactions across different blockchains.

TenX is only one of many startups in the digital tokens and cryptocurrency based products space which has raised money to help finance or support the development and application of cryptocurrencies and other tech startups in Singapore. Cofund.it provides a platform much like a P2P lending or equity funding platform to connect startups in the blockchain and cryptocurrency space to investors and experts for both funding and advice. Cross Coin, a Singapore special purpose vehicle, raised US$5 million in one day through an ICO to fund and develop 60 to 70 Russian and Eastern European technology startups in Starta Accelerator, a New York accelerator. FundYourselfNow, which dubbed itself as the first cryptocurrency crowdfunding platform in Southeast Asia, has created a platform to allow entrepreneurs to raise funds for their projects using virtual currencies such as bitcoin or ethereum, instead of regular currency.

Other startups such as Coss and HelloGold Foundation aim to bring cryptocurrencies to the mass market by adopting crypto and blockchain based services and products into a user friendly and intuitive environment.

For information on the regulation of ICOs, see FinTech products and uses – particular rules.

**Artificial intelligence and robo advisory systems**

Digital advisory systems which employ artificial intelligence, such as robo advisory systems, have become increasingly popular in Singapore over recent years. As defined by the MAS, digital advisory services refer to the provision of advice on investment products using automated, algorithm based tools, usually online and with limited or no human interaction.

Since the availability of digital advisory services will increase investor choice and market competition and provide access to low cost investment advice, the MAS has refined the licensing and business conduct requirements for digital advisory service providers.

Digital advisors may operate with a capital markets services license (CMSL) for fund management or for dealing in securities under the Securities and Futures Act (SFA), or a financial advisor's license under the Financial Advisers Act (FAA), depending on their business models and the specific activities that they undertake. Current regulations mean that financial institutions which are already regulated under the
SFA or the FAA can provide digital advisory services. In line with this, OCBC Bank Singapore recently announced plans to launch a robo advisory service targeted at accredited investors, in partnership with Wel Invest. Bambu, a Singapore business-to-business robo advisor services provider, has developed a white label platform for financial institutions to offer robo advisory to their customers. One of their offerings is called ‘Robo-in-a-box’, which is a one-stop-shop for any company to offer end-to-end digital solutions to retail investors. Another one is called the ‘Intelligent Advisor’, which is a propriety algorithm-ranking tool for relationship managers to improve customer experience targeted at high-net-worth investors. Bambu has signed partnerships with notable industry players including Tigerspike, Thomson Reuters and Finantix.

In June 2017, the MAS released a consultation paper on proposals to facilitate the provision of digital advisory services. These proposals discuss the governance, supervision and management of algorithms for robo advisors to ensure integrity and robustness in the delivery of financial advice. At the same time, the MAS recognizes that some digital advisors whose activities fall into fund management and who intend to obtain a CMSL in fund management to service retail investors may not be able to meet the five-year corporate track record requirement of managing funds for retail investors in a jurisdiction which has a regulatory framework that is comparable to Singapore.

In order to make it easier for entities offering digital advisory services to operate in Singapore, among other concessions, these proposals state that the MAS is prepared to admit digital advisors (which operate as fund managers under the SFA) to offer their services to retail investors even if they do not have a five year corporate track record or do not meet the minimum total assets under management requirement (S$1 billion), provided they meet safeguards such as:

- offering diversified portfolios of non complex assets;
- having key management staff with relevant collective experience in fund management and technology; and
- undertaking an independent audit of the advisory bureau within one year of operations on key risk areas (ie prevention of money laundering and countering the financing of terrorism, handling of client moneys and assets, technology risk and suitability of advice).

However, the MAS would require the providers of digital advisory services to manage the new technology risks associated with these activities. The public consultation on these proposals ended on 7 July 2017 but the proposals have not yet been finalized.

**Data analysis and cloud computing**

Cloud computing refers to the use of a network of remote servers hosted on the internet to store and process data, instead of relying on a local server or personal computer. It provides economies of scale, delivers operational efficiencies and, like data analysis, is an enabler for a variety of other FinTech innovations.

There has been a growing trend among financial institutions to outsource aspects of their service delivery to cloud operators. In July 2017, as part of its Guidelines on Outsourcing Risk Management, the MAS set out specific guidelines on the use of cloud services by financial industry players. These mainly required cloud service providers to be aware of the risks to data confidentiality and data recovery posed by cloud services such as multi location processing and to carry out the necessary due diligence and implement appropriate risk management processes.

In this light touch regulatory environment, many startups have begun innovating in the cloud computing and data analytics space. Smartkarma and Call Level, both founded in 2014, provide services based on data analysis for investors. Call Level simplifies tracking investors’ personal investments using tailored notifications which are generated from market analysis whereas Smartkarma provides research and transparency into Asian markets, combining intelligence from analysts, data scientists, academics and industry experts, to help investors enhance returns and proactively manage their investment strategies.

Business-to-business (B2B) platforms such as Matchmove, which provides cloud computing services to enterprises (in the form of a fully customizable secure mobile wallet service) to help businesses increase customer loyalty and user engagement are also popular in Singapore. Innovation using data analysis is also being deployed in the B2B services arena. FitSense is an analytics platform that collaborates with insurance companies to provide data analytics which allows insurance companies to personalize policies for anyone with a smartphone or wearable technology, thereby reducing insurance premiums.

*Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?*

---

Last modified 20 Oct 2017 | Authored by DLA Piper and Shook Lin & Bok

General financial regulatory regime

**GENERAL**

Singapore has recently announced plans to become a 'Smart Nation' and it has recognized that the financial sector is ideally placed to play a leading role since the financial services industry offers vast scope for innovation and the application of technology. The government aims to work towards a 'Smart Financial Centre' where technological innovation is pervasive.

The Securities and Futures Act (SFA) is the main legislation regulating capital markets and the financial investments sector. Section 82 of the SFA provides that no person shall, whether as principal or agent, carry on business in any prescribed regulated activity or hold himself out as carrying on such business unless it holds a capital markets services license (CMSL) issued by the Monetary Authority of Singapore (MAS) in respect of that prescribed regulated activity. Regulated activities include dealing in securities, fund management, advising on corporate finance, providing custodial services for securities and securities financing, amongst others. Therefore, generally, unless a licensing exemption is invoked, all financial institutions would be required to obtain a CMSL. In some instances, the Financial Advisers Act may also be applicable.

The MAS is the main financial services regulator in Singapore. Generally, the MAS's regulatory approach towards FinTech can be described as activity-based regulation to keep pace with innovations. MAS believes that regulation must not front-run innovation since this may stifle or potentially derail innovation or the adoption of useful technology. However, it puts equal emphasis on keeping pace with innovation in order to assess what the risks might be and continually evaluates whether it is necessary to regulate or leave technologies and industries to evolve further. The MAS will only bring regulation in when the risk posed by new technology becomes material or crosses a threshold. Any regulation ought to be proportionate to the risk posed.

In order to provide a safer, less expensive and more controlled environment within which FinTechs can innovate, the MAS has set up a regulatory sandbox framework for financial institutions to test their innovations. This will provide FinTech firms with a space within which to experiment with their technology, even if they are not able to anticipate every risk or meet every regulatory requirement.

To enter the regulatory sandbox, the relevant FinTech must apply to the MAS. The MAS and the applicant will then define the boundaries within which the experiment will take place. The MAS will also determine the specific legal and regulatory requirements, which it is prepared to relax for the duration of the experiment within these boundaries. The sandbox has been a huge success, attracting proposals that leverage on a range of technologies, including blockchain, machine learning and big data analytics. PolicyPal, an insurance technology startup which allows customers to buy and manage insurance policies through a mobile application, is the first ‘graduate’ of the sandbox.

**Regulation of peer-to-peer funding and marketplace lending**

The MAS announced initiatives in June 2016 to improve small and medium-sized enterprises' access to equity and lending-based crowdfunding from accredited and institutional investors by relaxing certain financial requirements for capital markets intermediaries that deal in securities and clarifying the application of certain exemptions from prospectus requirements. Its approach is to regulate equity and lending-based crowdfunding platforms within the existing regulatory framework and accept lower regulatory requirements in accordance with the risks and characteristics of the business model (eg serving only accredited investors and institutional investors, and not handling clients' monies) of the relevant entity. The MAS does not see a need to create a new investor class for equity or lending based crowdfunding since the framework is already calibrated to treat retail and non-retail investors differently. As at June 2016, in light of the high risks inherent in equity crowdfunding, the MAS does not intend to remove the regulatory safeguards such as prospectuses that apply where securities are offered to retail investors but is working to refine its guidelines to facilitate the intermediation of offers to investors (including retail investors) under the existing framework and continues to monitor developments and may make adjustments to the approach in the future, if warranted.

**CMSL REQUIREMENT**

Generally, an equity and lending based crowdfunding platform operator will require a CMSL since it will be dealing in securities (ie by facilitating the offer of debentures even if the platform operator does not itself offer the debentures) or advising on corporate finance (as defined in the Securities and Futures Act) unless it qualifies under one of the prescribed exemptions from the requirement to hold a CMSL. Requirements under the Financial Advisers Act may also apply where financial advisory services are provided by the platform operator to investors who wish to invest in the securities.

Following a public consultation held in 2015, the MAS has simplified the financial pre-qualifications to be met by platform operators to allow them to obtain a CMSL for dealing in securities. Therefore, if the platform operators only serve accredited and institutional investors,
do not hold or handle customer money, assets or positions and do not act as principal against customers, the base capital requirement for dealing licensees will be reduced from S$250,000 to S$50,000 and the requirement to maintain a security deposit of S$100,000 with the MAS will be removed.

In assessing corporate license applications, where an applicant platform operator does not possess the requisite five years' corporate track record (as set out in the Guidelines on Criteria for the Grant of a CMSL other than for Fund Management), the MAS will consider other factors in place of the corporate track record, such as the experience and track record of the shareholders and the key officers of the applicant.

OFFER OF SECURITIES

In addition to the requirement to have the appropriate CMSL, under section 239(3) of the SFA, any invitation to lend money to an entity (eg a company) is deemed to be an offer of debentures, which is a type of security. The entity offering debentures is required to prepare and register a prospectus with the MAS in accordance with the SFA unless it falls within one of the several prospectus exemptions. Currently, securities-based crowdfunding (SCF) can be carried out, albeit in a limited way, without the need to register a prospectus if it is done in reliance on existing prospectus exemptions, such as the small offer exemption under the SFA.

Under section 272A of the SFA, crowdfunding platform operators may make personal offers of securities, up to S$5 million within any 12 month period, without a prospectus (referred to as the small offers exemption), subject to certain conditions. As of June 2016, the MAS has amended the investor pre-qualification process found in the MAS's Guidelines on Personal Offers made regarding the Exemption for Small Offers in order to make it easier for SCF platform operators to rely on the existing regulatory framework for small offers, to raise funds through SCF including from retail investors. However, to ensure investors (including retail) are fully aware of the risks and deterred from investing if they are unable to accept the potential losses, the MAS has concurrently strengthened the existing risk disclosures to require any licensed crowd-funding platform operator appointed by an offeror to intermediate the offeror's small offers online; and such an offeror is to provide, at the minimum, a prescribed risk disclosure statement to each potential investor and obtain the investor's acknowledgement that he is fully aware of and accepts the risks. The MAS has also advised however that in appointing a licensed SCF platform operator to intermediate the offeror's small offers, the offeror should satisfy itself that the SCF platform operator has the necessary procedures to ensure that the revised pre-qualification process, as well as the revised risk disclosure and acknowledgement requirements, are complied with.

Offerors can also rely on prospectus exemptions under sections 274 and 275 of the SFA to make offers of securities to accredited investors and institutional investors through SCF without a prospectus. To ensure that offers made in reliance of the abovementioned prospectus exemptions are limited in scope and reach, and are not subject to mass solicitation, offers to accredited investors are subject to specified conditions, including a restriction on any advertisement on the offer (Advertising Restriction). Although the MAS has clarified the scope of the advertising restriction for offers made pursuant to the prospectus exemptions, the bottom line remains that as exempted offers are intended to be offers that are restricted in scope, these offers should not be subject to any mass solicitation, advertising or canvassing. If the platform operator of a ‘restricted access platform’ (as opposed to an ‘unrestricted access platform’) has conducted due diligence to confirm that investors who have access to the platform are within the scope of the prospectus exemption (eg accredited investors), the publication of statements containing information on the offeror and the terms of the offer on the platform would not be regarded as a breach of the Advertising Restriction.

Licensed platform operators may still offer equity securities to retail investors by registering and providing a prospectus or by utilizing some of the other statutory exemptions (such as the small offers exemption described above) to issuing a prospectus.

Regulation of payment services

Payment services are currently governed by two separate pieces of legislation: the Money Changing and Remittance Businesses Act (MCRBA) which governs stored value and the Payment Systems (Oversight) Act (PS(O)A) which governs remittance businesses. With the advent of FinTech, payments and remittances and the providers of these services can no longer be easily classified and differentiated.

In August 2016, the MAS released a consultation paper on the proposed changes to the payments regulatory framework and the establishment of a National Payments Council to drive innovation, as well as to create a more efficient and competitive business environment. The proposals bring payment services regulations under a single framework that will provide for the licensing, regulation and supervision of all payments services including stored value facility holders, remittance companies and virtual currency intermediaries. Regulation will be applied on the basis of the activity carried out by the service provider and entities will only be required to apply for a single license to undertake several payment activities. The proposed regulation also aims to strengthen standards of consumer protection, anti-money laundering and cybersecurity related to payment activities.
The consultation was the first in a series of consultations on the proposed governance model for Singapore. The proposals from these consultations do not yet appear to have been implemented.

**Regulation of Initial Coin Offerings (ICOs), cryptocurrencies and token based products**

In light of the booming ICO market in Singapore, the MAS clarified in August 2017 that the offer/issue of digital tokens which constitute ‘products’ regulated under the SFA will be regulated by the MAS. Where tokens fall within the definition of securities in the SFA, the issuer is subject to licensing requirements under the SFA (unless exempt) and is required to lodge and register a prospectus with the MAS prior to the offer of such tokens (unless exempted). Any platform facilitating the secondary trading of these tokens would also have to be approved or recognized as an approved exchange or recognized market operator under the SFA.

In line with other countries, the MAS has previously confirmed that virtual currencies are not specifically regulated but that intermediaries in virtual currencies would be regulated for money laundering/terrorist financing risks. It is considering introducing regulations to prevent money laundering/terrorist financing risks involving digital tokens which are not virtual currencies, in the near future.

**Application of data protection and consumer laws**

The increasing sophistication and use of technology within FinTech, data analysis tools and the applications of big data means that more data than ever is being collected and stored. Data protection in Singapore is governed by the Personal Data Protection Act 2012 which fully came into effect in 2014. It governs the collection, use, disclosure and care of personal data (whether electronic or non-electronic) and recognizes individuals' rights to protect their personal data and their rights of access and correction.

**Money laundering regulations**

In order to be compliant with anti-money laundering regulations, companies operating in the FinTech sector must collect the right information to conduct appropriate ‘know your customer’ procedures. This includes determining the business model’s risk of money laundering and carrying out enhanced due diligence if the model is high risk. FinTech companies dealing with online payments and internet-based stored value facility holders are two sub-categories which have been identified as high risk. The MAS has issued guidance papers and ‘Notices on the Prevention of Money Laundering and Countering the Financing of Terrorism’ for different types of FinTech business models. These outline the specific requirements and standards to be met by each type of institution.

Last modified 20 Oct 2017 | Authored by DLA Piper and Shook Lin & Bok

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**

**SEED INVESTMENT**

Initial investment in FinTech businesses may be provided by family and friends of the founders, other high net worth individuals (often known as angel investors) or equity crowdfunding investors in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know how and expertise to assist in the company's development. Seed investors would typically not require the same controls over the business as, for example, venture capital providers.

Investors may also apply to the Singapore government’s Angel Investors Tax Deduction Scheme between 1 March 2010 and 31 March 2020. If approved as an angel investor, the investor will receive a 50% tax deduction of the investment at the end of a two year holding period when he or she commits a minimum of S$100,000 in a qualifying startup.

The Singapore government also stimulates private sector investments into innovative Singapore-based technology startups with strong intellectual property rights and market potential through its Startup SG Equity Scheme by co-investing in them with an independent, qualified third-party investor. The government's Startup SG Founder Scheme aims to provide mentorship support and startup capital grants to first-time entrepreneurs with innovative business concepts. This scheme provides up to S$30,000 by matching S$3 to every S$1 raised by the entrepreneur.

**CROWDFUNDING**
In relation to equity crowdfunding, the sector is well established in Singapore and may be appropriate for a FinTech business in the early stages since they often have limited cashflow, making it easier for them to offer shares in exchange for services or investment in the business. Reward-based crowdfunding, where investors will receive tangible benefit to a product that a startup is developing, is also used in Singapore but more commonly found in the entertainment or fashion industry where consumers may feel a stronger personal affinity towards the products.

ACCELERATORS

There are various incubators or accelerators in the Singapore market which offer support, facilities and funding for startups, often in return for an equity stake. For example:

- The incubator fund Expara (which works closely with the Singapore government) provides services, mentorship and training, and invests money in innovative enterprises including FinTech companies and has previously invested in market-leading FinTech players such as CoAssets (the first listed marketplace lending platform in Asia) and 2C2P (a payment services provider).

- United Overseas Bank worked with SGInnovate (a government-backed technology agency) to create FinLab, a FinTech-focused accelerator initiative that successfully produced a number of interesting FinTech companies in 2016 (including Attores, CardUp and Nickel) and is currently off and running for its second cohort.

In order to support accelerators, the Monetary Authority of Singapore (MAS) runs the Startup SG Accelerator which provides funding and non-financial support to further enhance incubators' initiatives and expertise in nurturing high potential startups.

**Venture capital and debt**

Venture capital (VC) funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. VC provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions. The benefit of having a venture capitalist as an investor for a FinTech startup is that the VC is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

In order to promote venture capital financing for enterprises and in recognition of the factors differentiating a VC fund from other investment funds, the MAS published a consultation paper in February 2017 proposing a simplified authorization process and regulatory framework for venture capital managers and plans to implement the new rules towards the end of 2017. These proposals focus primarily on the fitness and proprietary assessment of VC managers. Therefore, unlike fund managers, VC managers will not be required to have experience as directors and representatives with at least five years of relevant experience in fund management and they can expect a shortened application process. To the extent that there are contractual safeguards to provide sufficient protection to a VC's sophisticated consumer base, the MAS is also looking to exempt VC managers from the business conduct requirements applied to asset managers in general.

An additional funding option is venture debt, which is typically structured as a three year term loan (or series of loans), which is secured against a company's assets and includes an equity element allowing the debt provider to acquire shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

**Platform lending**

Peer-to-peer (P2P) lending platforms bring individual borrowers and lenders together without the involvement of traditional banks. P2P lending does not involve equity investments, and instead interest is paid on the money borrowed.

The total amount that has been financed by the most active players in the P2P lending in Singapore is still negligible compared to the total debt/invoice financing market, though some of the companies have reached a monthly financing volume of several million Singapore dollars. Further, very few players publish their total loan book statistics. Capital Springboard claims to have financed around S$160 million, Capital Match S$44 million, Invoice Interchange S$17 million and Validus S$22 million. These amounts are commendable for startups, but cannot be compared to the overall funding market that is estimated by the MAS at S$633 billion (comprising total loans and advances to non-bank customers) in May 2017.

**Senior bank debt and capital markets funding**
Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**CAPITAL MARKETS FUNDING**

Singapore has both debt and equity capital markets which are accessible to businesses of certain size. Raising funds by way of an initial public offering (IPO) is therefore a popular funding arrangement for FinTech companies that have grown to a certain size.

In 2015, CoAssets listed its shares on the Australian Securities Exchange (ASX) in a deal that represented the first IPO of a Singapore grown P2P lender. Ayondo, a FinTech firm specializing in financial trading technologies, is planning a listing on the Singapore Exchange (SGX) in 2017. Upon its completion, the company will be the first FinTech company to be listed on the SGX.

**CONVERTIBLE BONDS/LOAN NOTES**

FinTech companies may issue bonds as a way of raising more competitive funding. A popular funding tool for fast growing FinTech businesses is to issue convertible bonds or loan notes which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

**Incentives and reliefs**

The regulatory sandbox (as described in FinTech products and uses – particular rules) is a key factor in attracting FinTechs to Singapore. Beyond the regulatory sandbox, there are other tax incentives promoting innovation, research and development and intellectual property management. These incentives also seek to attract new technologies into Singapore.

One of the schemes is the Productivity and Innovation Credit (PIC) scheme which was introduced in Budget 2010. Under the PIC scheme, qualifying businesses may enjoy up to 400% tax deductions/allowances for qualifying expenditure incurred in any of the six qualifying activities (such as research and development or acquisition of PIC IT equipment,) from 2011 to 2018. The concern is that with the phasing out of the PIC scheme in 2018, this could have an adverse effect on the momentum of innovation developed in Singapore over the past few years.

The MAS has also organized a return of the FinTech Festival in November 2017 and launched a new FinTech and Innovation Group within the MAS to provide information and advice to FinTech entrepreneurs.

Finally, the MAS has committed S$225 million over the next five years under the Financial Sector Technology and Innovation scheme (FSTI) to attract FinTech firms to set up innovation centers in Singapore. The FSTI scheme also has a ‘Proof of Concept Scheme’ which provides support to both financial and non-financial institutes in early stage development of innovative projects.

Last modified 20 Oct 2017 | Authored by DLA Piper and Shook Lin & Bok

**Portfolio sales**

**Loan transfers and portfolio sales**

*What are common ways of buying and selling loans?*

Buying and selling loans is common.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are:

- **Novation** – A novation is a full legal transfer of the party’s rights and obligations. It is a tripartite arrangement between the existing parties and the transferee and results in a fresh contract being formed between the continuing party and the transferee and the transferor being released from its obligations.
• **Assignment** – An assignment is a transfer of rights only, not obligations. Subject to any contractual restrictions, assignment can be done without the consent of the debtor. An assignment can be effected as either an equitable assignment or legal assignment depending on whether certain statutory requirements have been satisfied.

• **Sub-participation** – A sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the buyer taking on double credit risk, both on the seller as well as the borrower.

Loan transfers are commonly documented using standard form contracts drafted in-house by banks subject to negotiations between parties. For more complex transactions, a more bespoke form of sale and purchase agreement would tend to be used. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

Last modified 20 Oct 2017

**What are the main considerations when transferring a loan and related security?**

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller’s legal advisors. Some of the key considerations include:

• **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;

• **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;

• **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;

• **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;

• **transfer mechanics** – whether there are any steps and formalities that need to be taken to transfer the loan in accordance with its terms; and

• **consent** – whether a transfer requires the consent or notification of any other parties.

Last modified 20 Oct 2017

**Projects**

**Financing / investing in energy / infrastructure**

**To what extent are energy and infrastructure assets publicly or privately owned?**

**Generally**

Steady progress has been made in Singapore over the last few years in terms of privatization. Significantly, there has been a big leap in energy sector privatization. Notably, in recent years, there has been a rise of public-private partnership (PPP) projects, which involve collaboration between various types of private sector companies and the public agency.

**Energy**

Since 1995, the power system assets have been structured to facilitate commercialization and subsequent privatization. As at the end of December 2008, the Singapore Government’s investment arm, Temasek Holdings (Private) Limited, had divested Singapore’s three main power generating companies, representing a big part of the transition towards a fully liberalized power market in Singapore.

The Energy Market Authority (EMA) was established in 2001 as part of the government’s efforts to liberalize the electricity market. As a regulator, the EMA also ensures a reliable and secure energy supply and promotes effective competition.

**Telecoms infrastructure**
The telecommunications networks (fixed and mobile) are all privately owned.

In January 2000, the Singapore Government decided to advance the introduction of full market competition in the telecommunications sector.

**Transport infrastructure**

Singapore currently adopts a privatized approach for transport infrastructure. Singapore's land transport authority, the Land Transport Authority (LTA), regulates and oversees all three main modes of public transport in Singapore, ie taxis, buses and trains, and ensures that they meet safety and service standards. However, the day-to-day operations of running the MRT train systems, bus systems and taxi services are the responsibility of private operators.

The day-to-day operations of running the MRT train systems are the responsibility of two main public transport operators in Singapore, SMRT Trains Ltd and SBS Transit. These operators are responsible for the daily operations of trains and their maintenance. The main bus operators in Singapore include SBS Transit Ltd, SMRT Buses Ltd, Tower Transit Singapore and Go-Ahead Singapore. Bus operations are regulated by the Public Transport Council (PTC). There are currently seven taxi operators in Singapore, which are regulated by the LTA.

**Other infrastructure**

While most of the attention has been focused on privatization in the energy markets, the water and waste industries have also made significant progress in reaching out to the private sector for progress. For example, design, build, finance and operate (DBFO) desalination and NEWater projects have formed the backbone of the Public Utilities Board's (PUB) existing procurement strategy for private sector participation in new capital works.

**Are there special rules for investing in energy and infrastructure?**

**Generally**

There is no specific regime governing or restricting investment in energy or infrastructure projects in Singapore over and above existing regulation for investors and funders more generally but a particular proposed investment may be subject to legislative or regulatory control (eg merger control rules). As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory position relevant to that project must be considered. For example, a project involving development on land will require planning permission or a development consent order; and a project may require environmental authorizations/permits and/or sector specific regulatory consents or licenses.

**Energy**

Under the Electricity Act and the Gas Act, no person is permitted to supply or engage in activities related to the supply of electricity or gas respectively in Singapore without the appropriate license to do so issued by the Energy Market Authority (EMA).

Certain types of licenses issued by EMA may be subject to controls and restrictions on the ownership or transfer of shares in the licensees.

The EMA may designate any electricity licensee (DEL) or any entity (DE) or any business trust (DBT) operated by such licensee to be subject to additional restrictions. In particular, prior written approval of the EMA is required for:

- the appointment of chief executive officer, director or chairman of any DEL; and
- any person to acquire the business of a DEL or a DE as a going concern, or certain prescribed levels/forms of control over a DEL, DE or DBT.

**Telecoms infrastructure**

Although the Singapore telecommunication services market has been fully liberalized since 1 April 2000, pursuant to the Telecommunications Act, any person operating and providing telecommunication systems and services in Singapore has to be licensed by the Info-communications Development Authority of Singapore (IDA). Further, although there are no foreign equity limits or restrictions...
imposed on licensees, any such licensee must be a company incorporated in Singapore.

The IDA may designate any telecommunication licensee (DTL) or any trust (DT) or any business trust (DBT) operated by such licensee to be subject to additional restrictions. In particular, prior written approval of the IDA is required for:

- the appointment of chief executive officer, director or chairman of any DTL; and
- any person to acquire any part of the business as a going concern, or certain prescribed levels/forms of control over a DTL, DT or DBT.

**Transport infrastructure**

Under the Bus Services Industry Act 2015, any person operating a bus service in Singapore has to be licensed by the Land Transport Authority (LTA), or otherwise authorized to do so by contract with the LTA. Similarly, any person operating a rapid transit system in Singapore has to be licensed by the LTA. There are no express foreign equity restrictions imposed on such licensees.

With effect from 2016, Singapore will adopt a new contracting model which will enable the Singapore Government to make public bus services more responsive to changes in ridership. Under this model, LTA will determine the bus services to be provided and the service standards, and bus operators will bid for the right to operate these services.

**Other infrastructure**

Singapore is generally an open economy with minimal foreign ownership or investment restrictions. However, there is legislation relating to particular industries which limits or requires prior regulatory approval for share ownership in companies engaged in those industries. Those industries are generally industries perceived to be critical to national interest, such as banking, insurance and media.

Additionally, the Competition Act prohibits certain business practices that restrict competition in the market and prohibits mergers and acquisitions that substantially, or may be expected to substantially, lessen competition within the Singapore market.

*Last modified 20 Oct 2017*

**What is the applicable procurement process?**

In general, competitive bidding is the preferred procurement procedure of multilateral agencies. Public bidding processes have several advantages for host governments. A bid process increases competition among potential providers of the goods or services, minimizes the cost of the solicited good or service, and fosters public support and credibility for the project by ensuring that the process is transparent and thereby free of bribes and other corruption.

**Investing in energy and infrastructure**

The general procurement process would involve the following stages:

- refinement of appraisal;
- the Invitation to Tender (ITT);
- receipt and evaluation of bids;
- selection of preferred bidder and the final evaluation;
- contract award and financial close; and
- contract management.

**Financing energy and infrastructure**

The general procurement process would be similar.

*Last modified 20 Oct 2017*

**What are the most common forms of funding / investing in energy and infrastructure?**
The principal forms of private sector funding/investment in energy and infrastructure in Singapore (including in relation to public-private partnerships) are as follows.

**Funding**

Common forms of funding in energy and infrastructure include:

- public financing where the government uses funds from either tax revenue or public sector borrowing such as bonds;
- loans made on a corporate-finance basis (balance sheet debt);
- loans made on a project-finance basis (to a special purpose project company) on medium- to long-term bases – such loans may later be syndicated to other funders;
- bond finance;
- mezzanine debt (in some sectors);
- refinancing of the debt in operational projects; and
- asset financing.

**Investing**

Common forms of investing in energy and infrastructure include:

- ‘equity’ investment in special purpose vehicles or entities that may have a portfolio of interests, i.e. share capital and subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of ‘equity’).

**Restructuring**

**Enforcement and sanctions**

*When can there be regulatory investigations?*

When the Monetary Authority of Singapore considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

*What regulatory penalties may apply?*

When a breach has taken place, the Monetary Authority of Singapore may impose a financial penalty or censure, or withdraw regulated status against the firm and/or regulated individuals. The regulator will publicize these penalties.

*What criminal penalties may apply?*

Following formal investigation, the regulators have powers to impose criminal penalties in certain cases, including:

- insider dealing and misleading statements and practices;
- breaches of the money laundering regulations; and
Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

No stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

Most security interests created by Singapore companies and Singapore limited liability partnerships must be registered at the Accounting and Corporate Regulatory Authority of Singapore to perfect the security and ensure it is valid against third parties. The grant of most security interests over Singapore real estate should be registered at the Singapore Land Authority to ensure that the security interest takes effect as a legal charge. Fees are payable for such registrations but it would be unusual for such fees to be of a material amount.

Other forms of registration may also be required (or be advisable), depending on the nature of the asset over which security is taken. Such registrations may also require the payment of fees.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

There is generally no charge to stamp duty, registration, transfer or other similar taxes on the issue, transfer or assignment of a debt security.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

Secured lenders and secured debt security holders take priority over the Inland Revenue Authority of Singapore on enforcement of security.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Withholding tax is applicable where a person is liable to pay another person (not known to such person to be resident in Singapore) any interest, commission, fee or any other payment in connection with any loan or indebtedness or in connection with any arrangement, management, guarantee, or service relating to any loan or indebtedness, if such payments are borne, directly or indirectly, by a person resident in Singapore or a Singapore permanent establishment of a person not resident in Singapore or if such payments are deductible against any income accruing in or derived from Singapore, unless exempted under applicable regulations.
If so:

What is the rate of withholding?

The applicable withholding tax rate for any interest, commission, fee or other payment in connection with any loan or indebtedness is 15%, if such income is derived by a person not resident in Singapore through operations carried on outside Singapore.

What are the key exemptions?

Payments made from 21 February 2014 onwards to a Singapore permanent establishment of a person not resident in Singapore, including Singapore branches of non-resident banks, are not subject to withholding tax.

Until 31 March 2021, specified entities such as banks licensed under the Banking Act or approved under the Monetary Authority of Singapore Act, finance companies licensed under the Finance Companies Act and certain other financial institutions do not need to withhold tax on any interest, commission, fee or any other payment in connection with any loan or indebtedness or with any arrangement, management, guarantee, or service relating to any loan or indebtedness which is made to persons not resident in Singapore (and without a permanent establishment in Singapore), where the payments are made for the purposes of the trade or business of such specified entities.

In addition, if the person receiving the income is a resident of a country which has entered into a double tax treaty with Singapore, the applicable double tax treaty may provide for a reduced withholding tax rate or an exemption.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes, the analysis described above is applicable to both interest payments under a loan or other form of debt security.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both Slovak law and EU law.

Any securities, including debt securities can be traded on the stock exchange market only one day following the publication of the prospectus, or offered to the public only after an approved prospectus has been made available to the public.

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Slovakia are bonds. You can mainly deal in the following types of bonds:

- state bonds;
- municipal bonds;
- employee bonds;
- subordinate bonds; and
- ensured bonds (bank bonds as a specific kind of ensured bonds).

Furthermore, treasury bonds are often issued by the state, usually via the National Bank of Slovakia. The maturity of the treasury bonds is typically shorter compared to government bonds, and cannot be longer than one year.

What are the differences between offering debt securities to institutional / professional or other investors?

The Slovak Securities Act makes no distinction between professional and other investors for the purposes of public offering of securities.

However, the obligation to publish a prospectus does not apply to an offer which is addressed solely to qualified investors (ie professional clients).
When is it necessary to prepare a prospectus?

Under the Slovak Securities Act the obligation to publish a prospectus shall apply to public offers of securities if the total value of each offer in the European Union, calculated over a period of 12 months, exceeds EUR1 million.

Last modified 6 Dec 2019

What are the main exchanges available?

The Bratislava Stock Exchange (Burza cenných papierov v Bratislave, a.s.) is the responsible authority for trading on regulated markets. Regulated markets are divided into the:

- Regulated Free Market; and
- Listed Securities Market.

The establishment and position of the Bratislava Stock Exchange in the process of trading of securities is governed by the Stock Exchange Act. The Stock Exchange Act also regulates the operation and dissolution, the trading of securities and other financial instruments, and the supervision of the Bratislava Stock Exchange.

The Regulated Free Market

The Regulated Free Market is a stock exchange market. The traded securities and their issuers must meet the requirements provided under the Stock Exchange Act. A security may be admitted to the Regulated Free Market only in the following circumstances:

- The security is a financial instrument.
- The security is a fungible security.
- The security's transferability is not limited.
- The security is a book-entry security.
- Securities issued by issuers located in another member state which permits the admission of definitive securities on the listed securities market may be admitted to the Regulated Free Market, provided that the Bratislava Stock Exchange discloses that the other member state permits the admission of definitive securities on its listed securities market.
- The security is issued in accordance with the law of the country where it was issued and the issuer complies with the applicable requirements for the issuance of securities under the laws of the country in which the issuer has its registered office.
- Bratislava Stock Exchange is not aware of facts which, if the security is admitted to trading on a regulated market, could cause damages for investors or pose a serious threat to their interests or be contrary to public interest.
- A prospectus has been approved and published, unless provided otherwise.
- The issue price of the security has been fully paid up.
- The security's subscription was successfully completed based on a public offer, or the period during which it was possible to receive applications for subscription of securities has lapsed (this does not apply to bonds which are issued continuously when the deadline for subscription is not fixed).
- Other requirements provided under the Act on Stock Exchange or a separate Act must also be considered.

The Listed Securities Market

The Listed Securities Market is a stock exchange market where the traded securities and their issuers meet the conditions provided under the Act on Stock Exchange described above, as well as separate conditions provided under the Stock Exchange Act, depending on the type of security (bonds or shares).

A bond may be admitted to the Listed Securities Market only if the bond and its issuer satisfies the above stated conditions and the value of its issuance as determined by the issue price of the bonds is less than EUR200,000.
Is there a private placement market?

Slovakia does not have an active private placement market yet.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers are required to take responsibility for prospectuses, as well as for information provided in the documents promoting the issue of debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil liability for damages, as well as criminal liability.

Investing in debt securities

No specific issues.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally

Establishing, operating and abolishing a fund are regulated by the Act on Collective Investment and subject to supervision of the National Bank of Slovakia.

Collective Investment

The regulations apply to activities undertaken in relation to collective investment which is a business activity comprising the following arrangements:

- collecting funds from investors in order to invest in accordance with a defined investment policy for the benefit of those persons from whom funds were collected;
- if the funds are collected from the public, collective investment can be carried out only on the basis of risk spreading;
- collective investment can be carried out only by creating a domestic collective investment entity, or by collecting funds through the offering of securities or investing in a foreign collective investment entity.

What are common fund structures?

Common forms of funds include:

- open-end mutual funds/open-end foreign collective investment entities;
- close-end mutual funds/close-end foreign collective investment entities;
- standard funds (which comprise of mutual funds or investment funds with variable capital, for which funds are collected through public...
offer and with the purpose of investing the funds collected in transferable securities and other liquid financial assets on the basis of
risk spreading);

- special funds (which comprise of mutual funds or investment funds with variable capital, for which funds are collected through public
  or private offer); and
- alternative investment funds, which are further divided into public special funds and special funds for qualified investors.

What are the differences between offering fund securities to professional / institutional or other investors?

Raising funds on the basis of a public offer of securities or equity participation in the domestic investment funds with variable capital,
provided these domestic investment funds are companies or cooperatives established in the Slovak Republic, is prohibited. Distribution of
securities or equity participations in domestic investment funds with variable capital, provided these domestic investment funds are
companies or cooperatives established in the Slovak Republic, can be carried out only by private offers and only addressed to professional
investors.

Qualified Investors Fund

A Qualified Investors Fund is a special fund for qualified investors and domestic investment funds, which is a company or a cooperative
established in the Slovak Republic. The establishment of a Qualified Investors Fund is not subject to licensing according to the Act on
Collective Investment.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

Establishment and operation of a fund, except for a Qualified Investors Fund, is a regulated activity under the Act on Collective Investment
rules and is subject to licensing and supervision by the National Bank of Slovakia.

Investing in funds

No specific issues.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Generally in Slovakia, offering securities is either covered by the Act on Collective Investment or by the Act on Securities.

Undertakings for Collective Investments in Transferable Securities (UCITS)

In Slovakia, standard funds, which can be mutual funds or investment funds with variable capital, are considered UCITS. A management
company which decides to distribute securities of the standard fund it manages in another member state, is required to notify its
intention to the National Bank of Slovakia prior to the commencement of such activity.

Alternative Investment Funds (AIFs)

Under the Act on Collective Investment, which implemented the respective provisions of the Alternative Investment Fund Managers
**Are there any restrictions on managing a fund?**

Fund management in Slovakia is regulated under the Act on Collective Investment. Any legal or natural person is prohibited from carrying on regulated activities, such as fund management, without authorization, unless a statutory exemption applies.

Full registration with the National Bank of Slovakia involves a significant authorization process – three-to-six months from completion of the application, which must include information on personnel and organizational prerequisites for operation, internal policies and procedures, etc.

Subject to the requirements provided under the Act on Collective Investment, a company who wishes to manage alternative investment funds may be exempted from the full licensing process. Such exemption applies for instance in case of a person, who directly or indirectly through a company to which the person is personally linked or in a controlling relationship, manages portfolios of alternative investment funds, the total value of which is:

- under EUR100 million including assets acquired through leverage; or
- under EUR500 million where assets are not leveraged and investors have no redemption rights for five years.

In such case, the manager of investment fund must still be registered with the National Bank of Slovakia.

**Entering into derivatives contracts**

**Are there any restrictions on entering into derivatives contracts?**

Unless an exemption or exclusion applies, a person entering into a derivatives contract by way of business in Slovakia (such as a financial agent) will ordinarily have to be authorized under the Act on Financial Intermediation and Financial Advisory Services.

This applies:

- if the transaction is one of the specified activities within the provision of financial intermediation as set out in Section 2 of the Act on Financial Intermediation and Financial Advisory Services; or
- in case of securities dealer which will ordinarily have to be authorized under the Act on Securities and Investment Services if the transaction is one of the specified activities within the provision of investment services as set out in in Section 6 of the Act on Securities and Investment Services.

Both financial intermediation and provision of investment services include activities such as:

- forwards;
- futures;
- swaps; and
- options.

The European Market Infrastructure Regulation applies to all derivative transactions and requires transactions to be reported to regulators, for transactions between dealers to be cleared or subject to other risk mitigation techniques such as initial margin and...
variation margin requirements.

Last modified 6 Dec 2019

**What are common types of derivatives?**

Pursuant to the Act on Securities and Investment Services, all of the following main types of derivative contracts are recognized under Slovak law:

- forwards;
- futures;
- swaps; and
- options.

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying assets in Slovakia are:

- securities;
- interest rates;
- exchange rate indices of funds held in euros or a foreign currency;
- securities contracts; and
- commodities.

Last modified 6 Dec 2019

**Are there any other notable risks or issues around entering into derivatives contracts?**

Since the global financial crisis in 2007-to-2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. The European Commission has sought in particular to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative positions;
- reclearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen and continues to see the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

Last modified 6 Dec 2019

**Debt finance**

**Lending and borrowing**

**Are there any restrictions on lending and borrowing?**

In general, lending and borrowing in Slovakia are regulated by the Civil Code (which regulates loans) and by the Commercial Code which regulates credits). Special regulation may apply with respect to special types of loans or credits, such as, for instance, consumer credits.

**Lending**

Provision of loans or credits does not fall under the supervision of the National Bank of Slovakia, unless a loan or credit comes from
financial resources acquired from third persons on the basis of a public call. In these circumstances, and assuming none of the available exemptions apply, a lender will need to be authorized by the National Bank of Slovakia to conduct such business.

Public call means any announcement, offer or recommendation made by any person to collect funds for their own benefit or the benefit of a third party done by any means of publication, including personal contact with several persons, whether with individual persons or simultaneously with multiple parties. An announcement, offer or recommendation made solely through personal contact and to no more than ten persons is not considered a public call.

Housing loans provided to consumers are regulated by the Act on Housing Loans which regulates the information that needs to be provided to the consumer before the conclusion of the contract for a housing loan, the process of credit assessment, the consequences of breaching the obligations of the parties, as well as the obligations of financial agents and financial advisors.

**Consumer loans and credits**

Consumer loans and credits are subject to the requirements provided in the Act on Consumer Credits and Other Credits and Loans for Consumers which sets the requirements for:

- the information that needs to be provided to the consumer before the conclusion of the contract for a housing loan;
- the information that may be used in advertising consumer loans and credits;
- the process of credit assessment;
- the obligations of the creditors, as well as the information contained in the list of creditors which is maintained by the National Bank of Slovakia;
- the form and content requirements applicable to consumer credit contracts and the consequences of non-compliance;
- the mechanism for calculation of the annual percentage rate; and
- the obligations of the financial agents and financial advisors.

**Mortgage loans and municipal loans**

Housing loans are loans provided only to consumers for the purposes of purchasing residential property. Mortgage loans are generally provided on the basis of the Act on Banks and may be granted to any party (provided that the conditions stipulated in the Act on Banks are fulfilled). However, a mortgage loan will still be considered a housing loan if provided to consumers for the purposes of purchasing residential property.

Mortgage loans and municipal loans are regulated by the Act on Banks and are subject to a range of regulatory requirements that do not apply to unregulated loans. For example, for regulated mortgage contracts, there are particular requirements for:

- the maturity period;
- the purposes of such mortgage contract; and
- the financing of such mortgage contract.

According to the Act on Banks, a bank may not provide a loan or guarantee liabilities under a loan for:

- any acquisition of shares it issued;
- any acquisition of shares issued by a person who holds a qualified interest in the bank;
- any acquisition of shares issued by legal persons who control or are controlled by persons holding a qualified interest in the bank;
- any acquisition of shares issued by legal persons controlled by the bank; and
- the repayment of another loan granted for any of the above acquisitions of shares or to guarantee liabilities under such a loan.

**Borrowing**

While borrowers are generally not regulated, it is advisable for borrowers to consider whether either the mortgage or consumer lending
What are common lending structures?

Lending in Slovakia can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or a syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents who fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicates taking the lead in coordinating and arranging the financing.

Loans can be structured to achieve specific objectives, e.g. bank overdraft, discount credit, consumer loan, acceptance credit, loan against securities, bridging loan etc.

Loan durations

The loans may be divided on the basis of their duration into:

- short- and medium-term loans, such as discount credits, consumer loans or acceptance credits; and
- long-term loans, such as mortgages, municipal credits or consumer housing loans.

Loan security

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

Loan commitment

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

Loan repayment

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or on a scheduled basis (usually meaning the loan is repayable in full at maturity).

What are the differences between lending to institutional / professional or other borrowers?

In general, lending to institutional/professional borrowers is subject to less regulatory oversight and is consequently less burdensome from a compliance perspective.

Lending in the context of mortgages and lending to consumers is a regulated activity and requires authorization from the National Bank of Slovakia.

Do the laws recognize the principles of agency and trusts?
Slovak law recognizes the principle of agency. For instance, it is possible to appoint an agent to act on behalf of other parties. Financial agents are listed in the Register of Financial Agents and Financial Advisors maintained by the National Bank of Slovakia.

Slovak law does not recognize the principle of trust, so it is not possible to appoint a trustee to hold rights and other assets on trust for the lenders or secured parties.

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual principles. For example, the Slovak courts will not enforce a penalty that does not correspond to the amount of the loan. Lenders therefore, have to be careful about the rate of default interest charged on a loan.

Specific types of lending

Specific to the area of mortgage lending is the issue of whether a lender falls within the recently formed Slovak housing loans regime. The Mortgage Credit Directive, implemented in Slovakia mainly through the Act on Housing Loans and a series of primary and secondary legislation, aims to prevent the irresponsible lending and borrowing practices that were exposed during the global financial crisis.

The Mortgage Credit Directive applies to first and second charge mortgages. It imposes a number of requirements on lenders including the need to:

- conduct affordability tests before lending;
- provide standard information about the mortgage to enable borrowers to compare products; and
- ensure that staff are suitably trained.

Company in crisis

Pursuant to the Commercial Code a company is considered ‘in crisis’ if it is:

- bankrupt (i.e. insolvent or in default); or
- under the threat of bankruptcy (i.e. the ratio of its equity to liabilities is less than the statutory limit ratio of 8:100).

A creditor who grants a loan to a company ‘in crisis’ or until the declaration of bankruptcy or the restructuring permit, may not be able to recover (some or) the full amount of the loan if it was aware of the company's financial position at the time the loan was granted.

Standard form documentation

Bilateral finance transactions are typically documented on bank standard form documentation prepared in-house.

Are there any other notable risks or issues around borrowing?

Borrowers should be aware of the potential implications of the EU's Bank Recovery and Resolution Directive (BRRD), which outlines certain measures for dealing with failing financial institutions. The BRRD has been implemented mainly by the Act on Resolution in the Financial Market.

This regulative framework is applicable to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

The Act on Resolution in the Financial Market which has, among others, implemented also the Article 55 of the BRRD, gives authorities the power to ‘bail in’ obligations of failed EEA financial institutions. Institutions to whom the resolution applies shall include a contractual term
in any agreement creating a liability. The creditor or party to the agreement recognizes that the liability may be subject to write-down or conversion, and agrees to be bound by any reduction in the principal or outstanding amount due, or conversion or cancellation that is effected by the exercise of the write-down or conversion power by the resolution authority, provided that such liability is:

- not excluded;
- not a deposit under Slovak law;
- governed by the law of third country; and
- entered into or changed after the date on which the Act on Resolution in the Financial Market became effective (this does not apply to a change of obligation, including an automatic change, that does not affect the fundamental rights and responsibilities of the party of this obligation).

Last modified 6 Dec 2019

Giving and taking guarantees and security

**Are there any restrictions on giving and taking guarantees and security?**

Some of the key areas affecting the giving of guarantees and security are as follows.

**Capacity**

It is important to check the constitutional documents of a company giving a guarantee or security to confirm whether it is duly established, and whether a separate resolution of the shareholders is not required in order to duly provide such guarantee or security. The safe approach is often to have the shareholders of the company approve the giving of the guarantee or security by resolution. Furthermore, it is necessary to ensure that the directors of the company act on behalf of the company in compliance with the way of acting prescribed by the constitutional documents and way of acting registered in the Commercial Register.

**Insolvency**

Guarantees and security may be at risk of being contested in bankruptcy proceedings, if the guarantee or security was granted by a company without adequate consideration, caused the debtor’s bankruptcy or made during the debtor’s bankruptcy and granted during one year prior to the initiation of bankruptcy proceedings. If it is a legal act without adequate consideration made in favor of a party related to the debtor, it is also possible to contest the guarantee or security made during the three years prior to the initiation of bankruptcy proceedings.

Last modified 6 Dec 2019

**What are common types of guarantees and security?**

**Guarantees**

In general, by providing a guarantee, the guarantor undertakes that it will fulfill the obligation of the debtor (as a whole or part), in case the debtor fails to duly perform its obligation. The law does not differentiate between the performance of payment obligations or any other kind of obligation. Therefore, the guarantee may also be granted in order to secure the obligation of the debtor to provide services etc.

**Common forms of security**

Basic types of security that can be created under Slovak law include:

- pledges;
- secured transfer of a right; and
- bills.
Under Slovak law it is possible to grant security over all of the assets of a company or individual assets. Granting security will tend to be achieved by way of:

- pledge over a business share;
- pledge over the real estate;
- pledge over the receivables or over accounts receivables;
- a pledge over assets which are identifiable and can be controlled by the creditors (such as equipment); or
- secured transfer of right to the real estate.

**Are there any other notable risks or issues around giving and taking guarantees and security?**

**Giving or taking guarantees**

To be valid, a guarantee has to be granted in writing. A guarantee may be provided with or without consideration.

If several guarantors secure the same obligation, each of them is liable for the entire obligation. In case one of the guarantors fulfils the obligation, it has the right to recourse towards the other guarantors.

The guarantee does not expire if:

- the obligation expired due to the debtor's inability to fulfil it and the obligation may be fulfilled by the guarantor; or
- due to the dissolution of the legal entity that is the debtor.

**Giving or taking security**

Depending on the type of security, security may have to be granted in writing and notarization may be required.

Once granted, security in the form of a pledge needs to be properly perfected before it is valid against third parties. Perfection formalities can range from having the secured asset delivered to the security holder, registration of the pledge in the notarial register of pledges or in the Commercial register and notice being given to third parties.

Like guarantees, a pledge may be at risk of being contested in bankruptcy proceedings, if the security was granted by a company without adequate consideration, caused the debtor’s bankruptcy or was made during the debtor’s bankruptcy and was granted during the one year period prior to the initiation of bankruptcy proceedings.

**Financial regulation**

**Law and regulation**

**What are the main laws and regulations that apply to entities that are involved in finance and investments generally?**

**Generally**

Act No. 186/2009 Coll. on Financial Intermediation and Financial Advisory Services, as amended (Zákon o finannom sprostredkovaní a finannom poradenstve a o zmene a doplnení niektorých zákonov) (regulating mainly financial intermediation and financial counselling)
Act No. 747/2004 Coll. on Supervision of the Financial Market, as amended (Zákon o dohade nad finančním trhom a o zmene a doplnení niektorých zákonov) (regulating the supervision of the financial markets as exercised by the National Bank of Slovakia)

Act No. 483/2001 Coll. on Banks, as amended (Zákon o bankách a o zmene a doplnení niektorých zákonov) (regulating the establishment, organization, management, business operations, and termination of banks)

Act No. 566/2001 Coll. on Securities and Investment Services, as amended (Zákon o cenných papieroch a investiných službách a o zmene a doplnení niektorých zákonov) (regulating mainly securities and investment services)

Act No. 429/2002 Coll. on Stock Exchange, as amended (Zákon o burze cenných papierov) (regulating the stock exchange)

Act No. 492/2009 Coll. on Payment Services, as amended (Zákon o platobných službách a o zmene a doplnení niektorých zákonov) (regulating the payment services and establishment and operation of payment systems, payment institutions and electronic money institutions)

Act No. 530/1990 Coll. on Bonds, as amended (Zákon o dlhopisoch) (regulating bonds)

Act No. 202/1995 Coll. the Foreign Exchange Act, as amended (Devízový zákon) (regulating trading in foreign exchange assets, foreign exchange authorities and foreign exchange supervision)

Act No. 566/1992 Coll. on National Bank of Slovakia, as amended (Zákon o Národnej banke Slovenska) (regulating the activities of the National Bank of Slovakia)

Act No. 118/1996 Coll. on Deposit Protection, as amended (Zákon o ochrane vkladov a o zmene a doplnení niektorých zákonov) (regulating the protection of deposits held in accounts with banks and branches of foreign banks)

Act No. 371/2014 Coll. on Resolution in the Financial Market, as amended (Zákon o riešení krízových situácií na finančnom trhu a o zmene a doplnení niektorých zákonov) (regulating the procedure to be followed in connection with resolution in the financial market of the Slovak Republic)

Act No. 343/2015 Coll. on Public Procurement, as amended (Zákon o verejnom obstarávaní a o zmene a doplnení niektorých zákonov) (regulating procurement processes in Slovak Republic)

Act No. 18/2018 Coll. on Protection of Personal Data and on amending and supplementing of certain acts (Zákon o ochrane osobných údajov a o zmene a doplnení niektorých zákonov) (regulating processing of personal data in Slovak Republic)

**Consumer credit**

Act No. 129/2010 Coll. on Consumer Credits and Other Credits and Loans for Consumers, as amended (Zákon o spotrebiteľských úveroch a o iných úveroch a pôžívkach pre spotrebiteľov a o zmene a doplnení niektorých zákonov) (regulating the provision of consumer credits)

Act No. 250/2007 Coll. on Consumer Protection, as amended (Zákon o ochrane spotrebiteľov) (regulating the rights of consumers and the obligations of producers, traders, importers and suppliers)

Act No. 40/1964 Coll. Civil Code, as amended (Obiadnsky zákoník) (regulating the property relations of natural persons and legal entities as well as property relations between such persons and the state)

**Mortgages**

Act No. 90/2016 Coll. on Housing Loans, as amended (Zákon o úveroch na bývanie a o zmene a doplnení niektorých zákonov) (regulating the provision of housing loans)

**Corporations**

Act No. 513/1991 Coll. Commercial Code, as amended (Obchodný zákoník) (regulating the status of entrepreneurs, commercial obligations and some other relations relating to entrepreneurial activity)

**Funds and platforms**

Act No. 43/2004 Coll. on Old-Age Pension Saving Scheme, as amended (Zákon o starobnom dôchodkovom sporení a o zmene a doplnení
niektorých zákonov) (regulating the scope and financing of old-age pension scheme)

Act No. 650/2004 Coll. on Supplementary Pension Scheme, as amended (Zákon o doplnkovom dôchodkovom sporeni a o zmene a doplnení niektorých zákonov) (regulating the supplementary pension scheme and the transformation of supplementary pension insurance companies)

Investment funds

Act No. 203/2011 Coll. on Collective Investment, as amended (Zákon o kolektívnom investovaní) (regulating the rules of collective investment)

Other key market legislation

Capital Requirements Regulation (Regulation (EU) 575/2013) (capital requirements)

European Market Infrastructure Regulation (Regulation (EU) 648/2012) (derivatives)

Market Abuse Regulation (Regulation (EU) 596/2014) (market abuse)

Last modified 6 Dec 2019

Regulatory authorization

Who are the regulators?

The National Bank of Slovakia is responsible for the supervision of the financial markets.

The supervisory tasks of the National Bank of Slovakia include:

- laying down prudential business rules and other requirements in relation to the business activities undertaken by supervised entities;
- monitoring compliance with the relevant laws and regulations of Slovakia, as well as with legal acts of the EU;
- conducting proceedings, issuing authorizations, licenses, permissions and approvals, and imposing sanctions and remedial measures;
- issuing other decisions, opinions, methodological guidelines and recommendations relating to financial markets supervision;
- conducting on-site and off-site supervision of supervised entities; and
- preventing the legalization of proceeds of criminal activity and financing of terrorism.

Last modified 6 Dec 2019

What are the authorization requirements and process?

Relevant firms must apply to the National Bank of Slovakia for authorization.

The regulator must assess whether the application meets the required threshold conditions. In the case of issuance of a banking license, the regulator must complete the assessment within six months of the submission of the complete application.

The application fee depends on the type of the application ranging from EUR40 to EUR5,000.

The regulator will also approve key individuals (e.g. senior management) in their roles.

Authorized firms and individuals are listed in a number of different registers (e.g. Register of Alternative Investment Fund Managers) maintained by the National Bank of Slovakia.

Last modified 6 Dec 2019

What are the main ongoing compliance requirements?
Threshold conditions (such as having adequate financial resources and compliance arrangements in place) are an ongoing compliance requirement for authorized firms.

Failure to comply with the threshold conditions and the more detailed regulatory rules can result in sanctions for firms and regulated individuals, and even result in a loss of regulated status.

Legal entities undertaking a regulated activity without being authorized or exempt may also be subject to various monetary and non-monetary sanctions issued by the National Bank of Slovakia.

Last modified 6 Dec 2019

What are the penalties for failure to be authorized?

A natural person undertaking a regulated activity without being authorized or exempt, commits a criminal offence and is liable to imprisonment.

Pursuant to the Act on Criminal Liability of Legal Entities, a legal entity may also be held liable for undertaking a regulated activity without being authorized or exempt. In this case, the sanctions for such conduct may include winding-up of the legal person, forfeiture of property, pecuniary penalties, prohibition to undertake certain activities or disclosure of the court decision.

Last modified 6 Dec 2019

Regulated activities

What finance and investment activities require authorization?

Generally

A person must not carry on a regulated activity in Slovakia unless authorized or exempt.

Activities supervised by the National Bank of Slovakia require authorization. As part of its supervision of the financial markets, the National Bank of Slovakia is responsible for the supervision of legal entities and natural persons charged with obligations under the laws of Slovakia in the area of banking, capital markets, insurance business, pension insurance or pension schemes, as well as with the supervision of the property associations with a designated purpose and groups of persons and property associations with a designated purpose charged with the same obligations as stated above.

Consumer credit

Pursuant to the Slovak Act on Consumer Credits and Other Credits and Loans for Consumers a creditor is only entitled to provide consumer credit if it has been authorized to do so by the National Bank of Slovakia.

Last modified 6 Dec 2019

Are there any possible exemptions?

The available exemptions relate to the nature of the agreement, the lender and the borrower, the number of repayments to be made and the total charge for credit. In case of consumer credit exemptions do not apply, according to the Slovak Act on Consumer Credits and Other Credits and Loans for Consumers, no one shall, in the course of his business, offer or provide consumer loans without authorization or beyond the scope of the authorization of banking licence or other authorization to carry out banking activities.

There are two types of exclusions available when regulated activities may be undertaken without authorization from National bank of Slovakia, as follows:

General exclusions
Certain persons may carry on a regulated activity without being authorized. In certain cases regulated activities carried on by overseas persons may be undertaken without authorization. For example, exercising passporting rights allows firms, provided they are authorized to provide financial services in one jurisdiction, to provide such services in another jurisdiction without the need for authorization in this host jurisdiction.

**Specific exclusions**

For each type of regulated activity there are a number of specific exemptions that could also apply. For instance persons that provide investment services exclusively for their parent undertakings, for their subsidiaries or for the subsidiaries of their parent undertakings do not require authorization.

*Last modified 6 Dec 2019*

**Do any exchange controls or other restrictions on payments apply?**

Slovakia does not operate any foreign currency controls.

For cases of money transferring from non-EU member states, imports of foreign currency may need to be declared in the custom declarations, but there is no legal restriction on moving money in and out of the country.

Compliance with the EU rules on payments (EU Payments Regulation and the Transfer of Funds Regulations) must be ensured.

There may also be anti-money laundering and tax considerations to take into account.

*Last modified 6 Dec 2019*

**What are the rules around financial promotions?**

A financial promotion is a communication of an invitation or inducement to engage in investment activity made by a person in the course of business.

An investment firm and a bank authorized by the National Bank of Slovakia may use bound investment agents for the promotion of investment services and secondary services, provided that the bound investment agent is registered in the relevant register.

A bound investment agent may perform financial intermediation only for one financial institution.

*Last modified 6 Dec 2019*

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

**Generally**

The most common types of legal entities used to undertake financial or investment activity are joint stock companies, which are body corporates with separate legal personality.

A joint-stock company has registered capital which is divided into shares with a specified nominal value. It can have any number of shareholders. A joint-stock company is liable for the breach of its obligations with its entire property and therefore its liability is limited to the value of this property. The shareholders are not liable for the obligations of the company. However, each shareholder is liable to the company for the issue rate of the subscribed shares. Some activities require a particular type of legal entity to be used. For example, pursuant to the Slovak Act on Banks, banks may only be incorporated in the form of a joint stock company.

The list of shareholders is available at the Central Securities Depository. Joint-stock companies can be either public or private. A public joint-stock company has all or part of its shares accepted for trading on a regulated market in the European Economic Area. Joint-stock
companies can have a sole corporate shareholder (not a natural person) or at least two shareholders (who are natural persons). The company must execute a memorandum of association (or founding deed, where there is a sole shareholder), which includes the company’s articles of association.

Funds

Pursuant to the Act on Collective investment, investment funds are most commonly set up as joint-stock companies although for certain types of investment funds, such as collective investment undertakings, other types of corporate entities may be used.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

A company can conduct lending or investment business in Slovakia through an establishment (also known as a 'branch') but this does not create a separate legal entity.

The branch office of a foreign company does not have a separate legal personality from its parent company, but has its own management (director of a branch), accounting and tax requirements. It must be registered in the Slovak Commercial Registry, although liability for the operations of the branch remains with the parent.

Overseas companies carrying on a trade in Slovakia through a 'permanent establishment' will be subject to Slovak corporation tax.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
- consumer loans;
- student lending products;
- small and medium-sized enterprises (SME) lending; and
- residential property and commercial property mortgage lending.
Recently, peer-to-peer (P2P) products in Slovakia have included:

- (non-regulated) consumer loans;
- loans in order to pay down payments for property mortgages; and
- lending to SMEs.

**HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?**

Marketplace lending includes P2P-type structures often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. Funding platforms are mostly backed by individual investors but financial institutions are also starting to invest in the platforms (mainly in the case of crowdfunding).

**Blockchain, smart contracts and cryptocurrencies**

**WHAT IS BLOCKCHAIN?**

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the block using sophisticated algorithms and add the verified block to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a 'proof of work' process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (e.g. in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third-party intermediary. It may be public and open ('permissionless' or 'unpermissioned') or structured within a private group ('permissioned').

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an 'address'). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

**WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?**

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called 'smart contracts'. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced, more-complex interactions with the outside world using so called 'Oracles'. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which
automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Banking Authority definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority, nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, stored or traded electronically. The European Central Bank (ECB) defines a cryptocurrency (or virtual currency) as a “type of unregulated, digital money, which is issued and usually controlled by its developers, and used and accepted among the members of a specific virtual community”. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICO is a popular method of raising funds primarily for startups (even though in Slovakia their use is rather limited). ICOs come in a wide variety of forms and may be used for a wide range of purposes. It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal in Slovakia and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security, or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- a prospective return on investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of the underlying technology;
- quantity of coins or tokens that are reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

Artificial intelligence and robo advisory systems
Automated financial advice tools, also known as 'robo advisers' are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact the banking and private wealth advisor sectors. Robo advisors are one of many ways that minimize human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

**Data analysis and cloud computing**

**DATA ANALYSIS**

Data analysis is a process through which data can be inspected, transformed or modeled with the goal of discovering new information and providing an ability to draw conclusions. Data analysis is usually directed to improve the process of decision-making, although there are multiple approaches and diverse techniques, each under a variety of names, that can be used to analyze data.

**CLOUD COMPUTING**

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data on remote servers (privately-owned cloud, or a third-party server), accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years. Use of third-party clouds allows companies to focus on their business without the need to invest as much as they otherwise would in their own IT infrastructure.

Last modified 6 Dec 2019

**Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?**

**General financial regulatory regime**

**National Bank of Slovakia** is the main regulatory body for the financial market as a whole, including both retail and wholesale markets.

**GENERAL**

In general, a person cannot carry on a regulated activity in the Slovak financial sector without being regulated by the National Bank of Slovakia. Therefore, there is a need for specific authorization where a particular activity carried out as a business in Slovakia may or may not fall under the regulation. This mostly applies to activities of traditional financial market institutions, as most FinTech services and innovations currently do not fall under the regulatory power of the National Bank of Slovakia.

**STATEMENT OF THE NATIONAL BANK OF SLOVAKIA ON FINTECH SERVICES**

On 27 April 2016, the National Bank of Slovakia warned against the use of peer-to-peer (P2P) or crowdfunding methods for providing loans, as these types of contracts, as well the entities providing them, currently do not fall under its regulatory competence.

On 8 April 2019, the National Bank of Slovakia, in cooperation with the Ministry of Finance of the Slovak Republic launched, an innovative hub. It aims to support the implementation of modern technologies in the Slovak financial market and to improve the rules of their functioning.

The innovative hub is designed for those, with a real business plan, interested in the FinTech area. Thanks to the innovative hub, interested parties can have a dialogue with National Bank of Slovakia experts who will help them understand the details of business requirements in the financial market. In order to establish communication with the National Bank of Slovakia, a contact form has been created to enable the National Bank of Slovakia to obtain a basic overview of the intention of the FinTech applicant. “The innovation hub will provide those interested in doing business in this area with information about the ecosystem of innovative business models and help them navigate the relevant regulatory requirements,” explained the Executive Director for Financial Consumer Regulation and Protection from National Bank of Slovakia.
Electronic payments platforms and regulation of peer-to-peer lenders

Electronic payments platforms

In recent years, many innovative payment solutions have been introduced to the Slovak market, such as contactless payments (introduced by VISA and MasterCard in alliance with the mainstream banks) and increasingly popular mobile payments. One of the most used and popular applications for mobile payments in Slovakia is VIAMO, which enables money transfers to a mobile phone number, without knowing the actual account details of the receiver.

With respect to the electronic money (e-money) institutions, such institutions need to be granted authorization by the National Bank of Slovakia in order to handle e-money and perform payment transactions related thereto. E-money is money that is exchanged exclusively electronically. E-money transfers (EFT), credit or debit cards are all examples of e-money.

Peer-to-peer lending regulation

Currently, P2P lending is not regulated in Slovakia and therefore does not fall within the regulatory competence of the National Bank of Slovakia.

Regulation of payment services

In order to provide payment services and to issue and manage e-money in Slovakia, it is necessary to obtain an authorization which is granted by the National Bank of Slovakia pursuant to Act No. 492/2009 Coll. on payment services. Failure to provide services without a respective license is a criminal offence.

To become authorized by the National Bank of Slovakia, a payment services business or business wishing to issue and manage e-money will need to meet certain criteria, including initial capital, functional procedures for safeguarding of the financial funds, adequate, appropriate organizational prerequisites for conducting the services, etc. One notable provider of payment services in the Slovak FinTech sector is a payment gateway called TrustPay.

Application of data protection and consumer laws

Slovak Republic reflected adoption of the European General Data Protection Regulation (GDPR) in Act No. 18/2018 Coll. on Protection of Personal Data and on amending and supplementing of certain acts (Data Protection Act). The Data Protection Act became effective as of 25 May 2018. The Data Protection Act repealed the previous Act No. 122/2013 Coll. on protection of personal data. The Data Protection Act regulates the processing of personal data within Slovakia. Where a business determines the purposes and manner in which any personal data is processed, it will be regulated by the Data Protection Act and certain notification and compliance obligations will apply. In addition to the above, Act No. 351/2011 Coll. on electronic communications, as amended regulates unsolicited direct marketing by electronic means. Furthermore, Act No. 250/2007 Coll. on consumer protection, as amended and Act No. 266/2005 Coll. on the consumer protection at distance financial services, as amended shall apply as well, as they provide general legislative regulations relating to consumer protection.

Nowadays, GDPR alongside with the Data Protection Act are regulating processing of personal data in Slovak Republic.

Money laundering regulations

The basic legislative framework is primarily determined by Act No. 297/2008 Coll. on protection against legalization of proceeds from crime and on protection against financing of terrorism, as amended (AML Act). The AML Act empowers the National Bank of Slovakia to supervise and control fulfillment of anti-money laundering obligations by the entities that fall into its regulatory competence (i.e. in particular, businesses offering services such as lending, payment services and issuing and administering other means of payment). The National Bank of Slovakia also actively cooperates with the Financial Intelligence Unit (a central national police unit specializing in the prevention and detection of money laundering and terrorist financing), in order to enforce the AML Act.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage
SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING

The crowdfunding sector is not yet well established in Slovakia, however there have been other projects which have been successfully funded through crowdfunding. Therefore, in the future this may be an appropriate source of funding for a FinTech business in its early stages. Crowdfunding involves members of the public investing in a business by pooling their resources through an intermediary platform, such as Crowdberry or Conda.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

ACCELERATORS

Accelerators are currently not a common way of offering support, facilities and funding for startups in Slovakia, even though an international incubator/accelerator for startups, RubixLab, is present in Slovakia. Slovak startups usually take part in the programs of foreign accelerators, such as Ycombinator or Blackbox (e.g. M.Dot – a startup that allows users to create web pages through their mobile phones – took part in Blackbox and was subsequently acquired by GoDaddy).

Even though it seemed that real estate project Binarium (created by the co-founder of IT security company ESET, Miroslav Trnka) could have become a Slovak accelerator, currently this is not the case and it serves more as a co-working space. Nevertheless, Binarium could in the future offer its tenants (mostly businesses in the technology sector) the possibility to attend professional events targeted at the community of IT specialists and technologists. However (at least so far), Binarium does not plan to provide the targeted mentoring programs nor financial investment that would normally be provided by startup accelerators.

Venture capital and debt

Venture capital (VC) funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. VC provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions. In Slovakia, examples of VC funds investing into FinTech startups and technology startups more generally include Neulogy, G4 and LUKA & BRAMER GROUP.

Corporate venture capital (CVC) is a type of VC and involves an equity investment by a corporate fund. Even though it is uncommon in Slovakia, one example of CVC is the acquisition of PoSam (a leading Slovak IT business) by Deutsche Telecom (DTAG) in 2010.

An additional funding option is venture debt, which is typically structured as a loan (or series of loans), secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through VC.

Warehouse and platform funding

Even though warehouse financing, as a form of inventory financing, may not be the best option for all FinTech companies, it remains a potential option to obtain financing for those companies that own a portfolio of assets.

Another alternative form of funding is through peer-to-peer (P2P) lending platforms such as Zltymelon.sk or ZincEuro.sk, which bring individual borrowers and lenders together without the involvement of traditional banks. P2P lending does not involve equity investments;
interest is paid on the money borrowed instead.

### Senior bank debt and capital markets funding

#### SENIOR BANK DEBT

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdrafts, accounts management and general liquidity purposes.

#### CAPITAL MARKETS FUNDING

Although formally capital market funding is available in Slovakia, due to the fact that Slovakia itself is a small market and there is limited liquidity in the market, capital market funding is not a commonly used method of obtaining funding.

Even though it is possible to raise finance by way of an Initial Public Offering (IPO) on the Bratislava Stock Exchange, this is not a popular funding arrangement for companies. If a company grows to a certain size and considers an IPO, it usually reaches out to bigger and more active capital markets and stock exchanges in the region, such as those stock exchanges in Warsaw, Vienna or Prague.

Moreover, it is worth noting that over 95% of trades on the Bratislava Stock Exchange represent bond trades. Even though obtaining funding by way of issuing bonds to retail investors might be a reasonable option to raise more competitive funding, due to the costliness of the whole process it would not be a viable funding option for the vast majority of startups.

### Incentives and reliefs

In order to encourage companies to invest in research and development (R&D), businesses that invest in R&D can, under the condition stipulated by Act No. 595/2003 Coll. on income tax, benefit from a 'super-deduction' of their R&D expenditure (costs) from their tax base.

Last modified 6 Dec 2019

### Portfolio sales

#### Loan transfers and portfolio sales

*What are common ways of buying and selling loans?*

A loan can be transferred on an individual basis or packaged up with other loans and transferred as a portfolio.

The ways of transferring loans are:

- **Novation** – By means of novation, the existing contract (rights and obligation) is replaced with a new contract. Transfer of a loan to the third party should be concluded as a tripartite agreement between the existing parties and the transferee, whereas the rights and obligations of the transferor shall be transferred to the transferee.

- **Assignment of receivables** – An assignment of receivables constitutes a transfer of rights only, not obligations. Subject to any contractual restrictions, the assignment of receivables can be done without the consent of the debtor (but an assignor is obliged to notify the debtor, without undue delay, of the assignment of the receivables). Accessory rights and all other rights connected with the receivables shall be transferred together with the assigned receivables.

The form and content of the transfer documentation will depend on the nature of the loan which is being transferred. For complex transactions, a more bespoke form of transfer agreement shall be used.

Last modified 6 Dec 2019

*What are the main considerations when transferring a loan and related security?*
There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise. Some of the key considerations include:

- **confidentiality** – whether the transferor of the loan is allowed to disclose information relating to the loan to a potential transferee;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential transferee;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred (e.g. in case of consumer credit loans, which can be provided only by a credit institution authorized by the National Bank of Slovakia);
- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and
- **consent** – whether a transfer requires the consent or notification of any other parties.

Projects

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

**Generally**

The ownership of energy and infrastructure assets in Slovakia varies according to the asset class. The main asset classes are usually considered to be:

- economic infrastructure (energy, aviation, rail, telecommunications, water, roads and waste); and
- social infrastructure (education, health and justice/prisons, housing).

Key sectors are considered below.

**Energy**

The gas and electricity industries in Slovakia are partially privatized, with the generation, distribution and supply services provided by a number of private sector companies. The relevant private sector companies own the generation and distribution assets.

The Regulatory Office for Network Industries, as the national regulation authority, performs its tasks pursuant to Act No. 250/2012 Coll. on regulation in network industries, as amended and determines the relevant prices and conditions of their application in network industries, as well as the conditions for the regulated activities performance. The Regulatory Office for Network Industries is a state authority which is independent from state authorities, municipal authorities, other public authorities or other persons. The Regulatory Office for Network Industries shall exercise its competence fairly and independently. Within its performance it is not subject to any political or business groups.

**Telecoms infrastructure**

The telecommunications networks (fixed and mobile) in Slovakia are privately owned by a number of service providers.

The Regulatory Authority for Electronic Communications and Postal Services is the regulator for the telecommunications sector in Slovakia. It also regulates television broadcast services, wireless communications services as well as postal services.

**Transport infrastructure**

LIGHT RAIL
Typically, light rail assets (such as trams) are owned by respective local municipalities by way of designated local transport companies.

HEAVY RAIL

The heavy rail sector is mainly operated by the following three state-owned companies Železnice SR (ŽSR) – Slovak Railways, Železná spolonoš Slovensko a.s. and Železná spolonoš Cargo Slovakia a.s.

The rail sector is regulated by the Ministry of Transport and Construction of the Slovak Republic.

Furthermore, there are number of private companies such as RegioJet a.s. or Leo Express a.s. that operate railway passenger transport services in Slovakia. The arrival of a private railway carriers has started a competitive rivalry for the passengers between the private and state-owned carriers resulting in a general increase of standard of the railway transportation.

ROADS, BRIDGES AND TUNNELS

Národná dianiná spolonoš a.s. (National Highway Company) is a joint-stock company that was established in 2005 and its sole shareholder is the Slovak Republic acting through the Ministry of Transport and Construction of the Slovak Republic. The main activities of the company include the building of highways and motorways, management and maintenance of motorways and highways and charging for the use of Slovak motorways and highways. The company operates in the territory of the Slovak Republic through its 15 management and maintenance centers.

A government entity, Slovak Road Administration, operates, maintains and improves the motorways and major first class roads (i.e. the strategic road network) in Slovakia. Slovak Road Administration is regulated by the Ministry of Transport and Construction of the Slovak Republic. Slovak Road Administration has its regional representation through organizational units deployed under a single name Investment Construction and Management of Roads, specifically in the following cities: Bratislava, Banská Bystrica, Žilina and Košice.

Local roads owned by the municipalities in Slovakia are the responsibility of local authorities (municipalities) or responsibility of legal entities established by the municipalities with the purpose of maintaining roads.

AVIATION

Aviation in Slovakia is (for the most part) privatized. With respect to the airport infrastructure, there are airports that are owned by the Slovak Republic as well as airports that have been privatized. Aviation in Slovakia is regulated by the Transport Authority and by the Ministry of transport and construction of the Slovak republic.

THE TRANSPORT AUTHORITY

The Transport Authority was established by the Act on Regulatory Authority for Electronic Communications and Postal Services and on Transport Authority in January 2014 as a state administrative body with nationwide competence in the area of railways and other guided transport, civil aviation and inland waterway transport. The Transport Authority undertakes activities in the area of railways and other guided transport, civil aviation and inland waterway transport, cooperates in the area of its competences with the Ministries and other state administration bodies, with the EU bodies as well as with a number of relevant international bodies. The Transport Authority is financed from the state budget. The Transport Authority is an independent body and state administration bodies, entities, authorities, nor any other persons may manipulate or interfere the activities of the Transport Authority.

Other infrastructure

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS/PRISONS)

Typically, these are mainly owned by the public sector and are regulated by the state authority depending on the type of social infrastructure. The majority of social infrastructure assets in the Slovak republic are directly financed by the government. Subject to value for money considerations, private finance may also be used in the procurement of social infrastructure assets.

Education

The ownership of a school's infrastructure can be public or private. Schools of the Slovak Republic must be included in the network of schools and registered with the Central register of the schools maintained by Slovak Centre of Scientific and Technical Information which is governed by the Ministry of Education, Science, Research and Sport of the Slovak Republic.
Hospitals

Ownership of hospitals can be public or private, both types must hold a license for operating granted by the Ministry of Health of the Slovak Republic. The regulatory authority in this area is the Health Care Surveillance Authority.

DEFENSE

Typically, defense assets are state-owned.

WASTE

The Ministry of Environment is the relevant state authority responsible for setting goals with respect to the waste management in Slovak Republic in order to develop an appropriate approach for using materials in the area of cycle, recycle, devaluation and destruction of waste.

WATER

Water and wastewater (sewerage) services in Slovakia are delivered by private sector companies (water companies) which own the relevant infrastructure assets. In Slovakia, the ownership of public water and wastewater pipelines, can be only owned by legal entities with registered seat in the territory of Slovak Republic. The Regulatory Office for Network Industries is the relevant regulator of the water sector in Slovakia.

Are there special rules for investing in energy and infrastructure?

Generally

In general, there is no specific regime governing or restricting investment in energy or infrastructure in Slovakia over and above existing regulation for investors and funders, however, a particular proposed investment may be subject to regulatory control. As regards the planning and implementation of the energy or infrastructure project, the legal/regulatory position relevant to that project must be considered (e.g. whether any permissions or consents of or licenses issued by the public authorities are required, etc). Key sector-specific issues are flagged in the sections below.

Whether an investor can invest in a public sector project will depend on the terms of the procurement of such project and, in respect of an existing/operational project, that will depend on whether there are any contractual restrictions on ‘Change of Control’. This is less of a concern on private sector infrastructure projects although investors would need to consider whether any licenses/consents/permits would be affected by their acquisition of an interest.

Energy

The energy market in Slovakia is heavily regulated. In particular, there is a complex regulatory framework regarding licensing, subsidies and demand/charging mechanism and these are subject to regular updates. Therefore, the investors need to have a good understanding of the current framework. Investors need to understand how technology changes may impact on the overarching regulatory framework and vice versa.

Investors should also consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with any license conditions or the granting of specific subsidies.

Telecoms infrastructure

The Act on Electronic Communications regulates an environment for this sector, including access and interconnection between the networks, rights and obligations to third party real estate in connection with the establishment and operation of networks, as well as the competence of the state authorities to regulate the prices.

The industry is privatized, therefore investors should consider if any permits/consents/licenses will be affected by their interest.

Transport infrastructure
**RAIL**

There is an extensive and complex regulatory framework governed by the Act on Tracks and by the Act on Transport on Tracks, which also includes the conditions for acquiring a license for provision of transport services and which shall be taken into consideration in respect of involvement in this sector. Depending on how an investor wishes to invest in a project (specifically what type of entity or asset), there is a varying degree of difficulty for investors to enter into an existing project. Moreover, investors should consider if, depending on the way of investment, any permits/consents/licenses will be affected by their investment.

**ROADS**

The administration of the roads is, in accordance with Roads Act the responsibility of the state, municipalities or other public sector entities. The respective public sector entity is also responsible for carrying out the maintenance of the roads, however, such duties may be delegated to private sector partners, based on the respective procurement rules. With respect to the highways, the state may procure the construction of and future operation of the highways by a private sector partner under a concession contract awarded on the basis of the public procurement procedure. The precise scope of the restrictions (e.g. whether change of control is allowed) will depend on the contractual terms.

**What is the applicable procurement process?**

Public procurement in Slovakia is governed by the Act on Public Procurement which is based on EU Directives. There are some sector-specific regulations and exemptions applicable, for instance, to the rail sector, as well as with regard to the provision of services in water sector, energy or defense.

Under the key principles applying to the procurement process, contracts procured by the public sector are awarded fairly, transparently and without discrimination on the grounds of nationality and that all potential bidders are treated equally.

**Investing in energy and infrastructure**

Public procurement is relevant where public sector entities are seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium, to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset.

In most cases, the public sector entity will need to publish a contract notice in the Journal of Public Procurement (Vestník verejného obstarávania), as well as in the Official Journal of the European Union (OJEU) and run one of the following procedures:

- **Public tender** – This procedure is suitable for easy-to-evaluate projects and tenderers simply submit a tender in response to the notice published in Journal of Public Procurement and in OJEU. Change and negotiations to the tender are not permitted.

- **Restricted procedure** – There is a shortlisting of at least five tenderers following a stage in which the tenderers submit their requests for participation in the tender. Change and negotiations to the tender are not permitted.

- **Competitive dialogue** – This procedure suits the purposes of complex infrastructure projects and involves a shortlisting of at least three bidders who are invited to dialogue with the public sector to develop detailed solutions which are capable of being accepted by the public sector entity.

- **Negotiation procedure with publication** – This procedure involves a shortlisting of at least three bidders who are invited to dialogue with the public sector. It is used when there is a need to develop a detailed innovative solution, whereas due to the nature or complexity of the subject matter of the order, the order cannot be awarded without the dialogue and in the previous public tender or restricted procedure all of the submitted offers were unacceptable.

- **Direct negotiation procedure** – Direct negotiation can be used for public procurement only under particular restrictive conditions stipulated by the Act on Public Procurement. Such conditions include, for instance, the fact that:
  - no entity submitted an offer in the previous public tender or restricted procedure, or no entity fulfilled the criteria of such previous procedure;
  - the requested services or goods may be provided only by a particular entity; or
The requested goods are produced only for research, development, study or experimental purposes.

Investors may, however, seek to invest in a project (by acquiring an interest in a private sector partner) that has already been procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the original awarded contract rather than procurement regulations themselves.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement-related considerations.

**Financing energy and infrastructure**

On a publicly procured contract, the public sector entity may have prescribed requirements on the funding arrangements which have to be followed.

*Last modified 6 Dec 2019*

**What are the most common forms of funding / investing in energy and infrastructure?**

**Funding**

The most common form of private sector funding in energy and infrastructure in Slovakia (including in relation to public-private partnerships) are loans made on a project-finance basis and provided by financial institutions on medium- to long-term bases, or provision of own resources by the private sector partner.

Funding/funding products can also be, sometimes, provided by the European Investment Bank or European Bank for Reconstruction and Development.

**Investing**

The most common form of investing in energy and infrastructure includes 'equity' investment in a special purpose project company (either a green field company or a functioning project) or in entities that may have a portfolio of interests.

*Last modified 6 Dec 2019*

**Restructuring**

**Enforcement and sanctions**

**When can there be regulatory investigations?**

When the National Bank of Slovakia considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

*Last modified 6 Dec 2019*

**What regulatory penalties may apply?**

When a rule breach has taken place, the National Bank of Slovakia may impose a financial penalty against the firm and/or regulated individuals, or withdraw regulated status.

*Last modified 6 Dec 2019*

**What criminal penalties may apply?**

Following formal investigation, the court may impose criminal penalties for any criminal offences, including:
Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

**ADVANCE OF LOAN**

No stamp, registration, transfer or other similar taxes are payable on the advance of a loan.

**TRANSFER OR ASSIGNMENT OF A DEBT UNDER A LOAN**

There are no stamp, registration, transfer or other similar taxes payable on the transfer or assignment of a debt under a loan. Some administrative fees may, however, apply.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

No stamp, registration, transfer or other similar taxes are payable on the taking, transfer or assignment of a mortgage, debenture or other security. Some administrative fees may, however, apply.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?

No stamp, registration, transfer or other similar taxes are payable on the issue, transfer or assignment of debt securities. Various fees, the rate of which depends on the relevant financial institutions, may apply to the issue of debt securities.

**Do tax authorities take priority on enforcement?**

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?

No. Only the National Bank of Slovakia takes priority on the enforcement of security relating to secured lenders and secured debt security holders.

**Is withholding tax on interest payments applicable?**

Is there withholding tax on interest payments under a loan?
Yes, withholding tax is imposed on interest payments under a loan.

If so:

What is the rate of withholding?

The rate of withholding tax in the case of interest payments by a taxpayer resident in the Slovak Republic to a taxpayer also resident in the Slovak Republic, is 19%.

In the case of interest payments paid to a taxpayer resident outside of the Slovak Republic but in a jurisdiction which has concluded a double tax treaty with the Slovak Republic, the withholding tax rate is 19% or such lower rate as may be stipulated in that double tax treaty, if applicable. In the case of interest payments paid to a taxpayer resident outside of the Slovak Republic in a non-contracting state (jurisdiction that has not concluded a double taxation treaty or an international treaty providing for the exchange of information for tax purposes with the Slovak Republic), the withholding tax rate is 35%.

What are the key exemptions?

Interest payments to banks or other lenders, in each case, resident in the Slovak Republic, are not subject to withholding tax.

An exemption may be applicable, in whole or in part, under a double tax treaty.

An exemption from withholding tax may also be applicable under the EU Interest and Royalties Directive, as implemented in the Slovak Republic, provided that certain conditions are met.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding tax (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

The South African debt capital market is regulated mainly by the Financial Markets Act (FMA), the Companies Act and the Banks Act. The Collective Investment Scheme Control Act and the Exchange Control Regulations may also be applicable to some debt instrument structures.

To offer and issue debt securities, an issuer must be registered as a bank, or authorized as a branch of a foreign bank under the Banks Act or must offer and issue debt securities in compliance with one of the available exemptions. The most prominent exemption for non-bank issuers is the exemption set out in the Commercial Paper Regulations which applies to prospective issuers that are listed companies or issuers that have a net asset value of at least ZAR100 million for at least 18 months prior to any issue of commercial paper.

The offer and sale of debt securities by a non-resident in South Africa is subject to the prior approval of the Financial Surveillance Department and SARB.

The Financial Advisory and Intermediaries Services Act (FAIS) prohibits any person other than a person licensed under the FAIS from marketing debt securities, acting as an intermediary in offers and sales of debt securities and recommending or providing guidance on the purchase of securities.

What are common issuing methods and types of debt securities?

A corporate special purpose vehicle (SPV) is commonly used for issues of asset-backed securities, high yield debt securities and other types of secured debt securities. This SPV structure is not generally used for issues of unsecured debt securities. The trust structure is not commonly used for issues of debt securities, as a trust is not the most tax-efficient way of structuring these types of transactions. However, there are circumstances where the trust structure has been used.

Types of debt instruments include:

- securities characterized by the type of interest or payment;
- debentures;
- bonds;
- notes;
- derivative instruments;
• convertible debt securities;
• exchange-traded funds or notes;
• asset-backed debt securities;
• depository receipts; and
• warrants.

Last modified 5 Dec 2019

**What are the differences between offering debt securities to institutional/professional or other investors?**

**The disclosure requirements**

Section 96 of the Companies Act sets out types of offers that are not offers to the public.

They are:

• an offer to persons that deal with securities in the ordinary course of business, banks, mutual funds, financial institutions and financial services providers and wholly owned subsidiaries of banks, mutual funds, financial institutions and financial services providers; and

• an offer where the total acquisition cost of the securities for any single offeree is equal to or greater than a certain threshold, which is currently ZAR1 million.

Where the offer is not to the public, the offer does not require a prospectus.

Last modified 5 Dec 2019

**When is it necessary to prepare a prospectus?**

If the offer is an ‘offer to the public’ as defined in the Companies Act, the issuer must prepare and register a prospectus satisfying the requirements of the Companies Act. There are certain exemptions as to what constitutes an ‘offer to the public’ (see section 96 of the Companies Act as discussed above).

Last modified 5 Dec 2019

**What are the main exchanges available?**

**JSE Limited (JSE)**

Subject to compliance with both the Debt Listings Requirements and the listings requirements relating to the main market of the JSE, an issuer can list its debt securities on the main market of the JSE. An issuer may also list its debt securities on an alternative exchange of the JSE called the Interest Rate Market.

Last modified 5 Dec 2019

**Is there a private placement market?**

Yes.

Last modified 5 Dec 2019

**Are there any other notable risks or issues around issuing or investing in debt securities?**
Issuing debt securities and investing in debt securities

The JSE can suspend the listing of debt securities on failure by an issuer to comply with the Debt Listings Requirements of the JSE – which include ongoing disclosure obligations. The JSE can also censure the issuer (publicly or privately) or impose a fine or any other penalty that is appropriate in the circumstances.

Macro-economic risks

South Africa has recently received a credit-rating downgrade, which has prompted issuers to sidestep the bond market and opt for less public forms of fundraising. A number of South Africa's state-owned entities are in precarious financial positions with their respective corporate governance structures coming under increasingly intense public scrutiny.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally, funds in South Africa are classified as collective investment schemes and are regulated by the Collective Investment Schemes Control Act (CISCA).

A Collective Investment Scheme is defined in CISCA as ‘a scheme, in whatever form, including an open-ended investment company, in pursuance of which members of the public are invited or permitted to invest money or other assets in a portfolio, and in terms of which:

- two or more investors contribute money or other assets to and hold a participatory interest in a portfolio of the scheme through shares, units or any other form of participatory interest; and
- the investors share the risk and the benefit of investment in proportion to their participatory interest in a portfolio of a scheme or on any other basis determined in the deed’.

The primary forms of collective investment schemes are detailed in Establishing and investing in debt and hedge funds – common structures.

South Africa has recently received a credit-rating downgrade, which has prompted issuers to sidestep the bond market and opt for less public forms of fundraising. A number of South Africa's state-owned entities are in precarious financial positions with their respective corporate governance structures coming under increasingly intense public scrutiny.

The definition of 'Hedge Fund' for the purpose of applying CISCA is 'an arrangement in pursuance of which members of the public are invited or permitted to invest money or other assets and which uses any strategy or takes any position which could result in the arrangement incurring losses greater than its aggregate market value at any point in time, and which strategies or positions include but are not limited to (a) leverage; or (b) net short positions.'

Although Collective Investment Schemes do not need to be registered, all companies which wish to manage collective investment schemes (Management Companies) must register with the Registrar of the Collective Investment Schemes in terms of section 42 of CISCA. Also see Managing and marketing debt and hedge funds – investment management restrictions.

Provided that private equity funds are not made available to members of the public, the structures under which they operate are not directly regulated by the FSCA.

What are common fund structures?

Asset managers and hedge funds

COLLECTIVE INVESTMENT SCHEMES (CIS) (BOTH HEDGE FUNDS AND UNIT TRUSTS ARE CLASSIFIED AS CISS)
CIS in securities

The portfolio consists mainly of securities and includes local funds registered with the FSCA (most collective investment schemes fall in this category).

CIS in properties

The portfolio consists mostly of shares in property investment companies or directly held property.

CIS in participatory bonds

The scheme consists mostly of participatory bonds.

Declared CIS

This is a scheme declared by the Minister of Finance as a CIS (eg hedge funds, as above).

Foreign CIS

These are foreign schemes which solicit investments from South Africans. In terms of Collective Investment Schemes Control Act (CISCA), a foreign CIS must apply to the Registrar of Collective Investment Schemes to be approved and registered.

En commandite partnerships

En commandite partnerships are regulated by the common law. The main advantage of this type of partnership is that a commanditarian, or limited partner, is not liable for the debts of the partnership in an amount greater than its investment commitment to the partnership (provided applicable common law requirements are met). The managing partner (also known as the general partner) has unlimited liability for the debts of the partnership.

Also see Entity establishment.

Debenture funds

Investors in debenture structures subscribe for debentures issued by a company. The company lends or contributes the proceeds of such subscription to a trust. The trust appoints a hedge fund manager to manage its portfolio of assets, and vests income and gains resulting from the portfolio in the holders of the debentures (in their capacities as beneficiaries of the trust).

Private equity funds

EN COMMANDITE PARTNERSHIPS

See above and also see Entity establishment.

Bewind trusts

A bewind trust is a type of trust vehicle registered under the Trust Property Control Act, in terms which the applicable assets that are subject to the trust arrangements are owned by the beneficiaries of the trust, but the trustees of the trust hold and manage such assets. When a bewind trust is used for purposes of a private equity vehicle, the cash contributions of the investors to the trust form the initial assets of the trust. Each investor is a beneficiary of the trust, and the investors own the assets of the trust jointly in undivided shares in proportion to their respective contributions.

Last modified 5 Dec 2019

What are the differences between offering fund securities to professional / institutional or other investors?

In terms of board notice 52 of 2015 (Financial Sector Conduct Authority (previously known as the Financial Services Board): Determination on the Requirements for Hedge Funds) (Board Notice 52) there are two categories of hedge funds, namely Qualified Investor Hedge Funds (QIHFs) and Retail Investor Hedge Funds (RIHFs).
RIHFs are aimed at the general public whilst QIHFs are aimed at more advanced investors.

There are no requirements in order to invest in an RIHF and RIHFs are able to set their own minimum investment levels.

Only 'Qualified Investors' may invest in QIHFs. A Qualified Investor is an investor which invests a minimum investment of ZAR1 million per hedge fund and has:

- demonstrable knowledge and experience in financial and business matter which would enable the investor to assess the merits and risks of a hedge fund investment; or
- appointed a Financial Services Provider (authorized in terms of Financial Advisory and Intermediaries Services Act (FAIS)) who has demonstrable knowledge and experience to advise the investor regarding the merits of a hedge fund investment.

The regulations relating to QIHFs are not as stringent as those attached to RIHFs, with QIHFs having more autonomy over their risk profiles and not being subject to the same liquidity and exposure requirements as RIHFs. For more information, see Managing and marketing debt and hedge funds – investment management restrictions.

**Are there any other notable risks or issues around establishing and investing in funds?**

For more information, see Managing and marketing debt and hedge funds – investment management restrictions.

**Managing and marketing debt / hedge funds**

**Are there any restrictions on marketing a fund?**

In terms of the Collective Investment Schemes Control Act (CISCA), no Management Company (see Establishing and investing in debt and hedge funds – establishment) may publish any advertisement, brochure or pamphlet referred to in before the management company has been informed by the Registrar of Collective Investment Schemes that he has no objection to the terms thereof.

Qualified Investor Hedge Funds (QIHFs) may only be marketed to Qualified Investors (see Establishing and investing in debt and hedge funds – investor considerations), whilst any investor may invest in a Retail Investor Hedge Funds (RIHFs). As a result, RIHFs are more highly regulated than QIHFs in terms of the risk profile of the assets under investment.

For more information, see Managing and marketing debt and hedge funds – investment management restrictions.

**Are there any restrictions on managing a fund?**

No person may manage a fund which is open to the public for investment without being registered in terms of the Collective Investment Schemes Control Act (CISCA) or licensed in terms of the Financial Advisory and Intermediaries Services Act (FAIS).

For registration of Management Companies, see Establishing and investing in debt and hedge funds – establishment.

Under FAIS, four types of licenses are issued to asset managers:

- category I (issued to financial services providers providing non-discretionary intermediary services or advice);
- category II (issued to financial services providers who provide discretionary fund management);
- category IIA (issued to financial services providers who manage hedge funds on a discretionary basis); and
- category III (issued to administrative financial services providers who aggregate client funds or securities, often through providing one-stop investment platform services).
Such license holders (Authorized Financial Services Providers) are bound by principles and rules set out in the relevant codes of conduct created by the Financial Sector Conduct Authority (previously known as the Financial Services Board) (FSCA).

Individuals exercising oversight over the rendering of financial services by a license holder under the FAIS (Key Individuals) or who represent the license holder in rendering financial services to clients (Representatives) must successfully complete certain regulatory examinations prescribed by the FSB.

Hedge fund managers must comply with the Category IIA (Hedge Fund Financial Services Provider) license requirements under FAIS in order to manage investor funds. Hedge fund managers must also register as such with the Registrar of Collective Investment Schemes in terms of section 42 of Collective Investment Schemes Control Act (CISCA).

In addition to the above, hedge funds are regulated in terms of board notice 52 of 2015 (Financial Sector Conduct Authority (previously known as the Financial Services Board)): Determination on the Requirements for Hedge Funds) (Board Notice 52), in terms of which, **inter alia**:  

- Both Qualified Investor Hedge Funds (QIHFs) and Retail Investor Hedge Funds (RIHFs) must appoint a separate depository for the safekeeping of assets.
- Managers of QIHFs and RIHFs must comply with leverage, liquidity and asset exposure restrictions imposed by the FSCA. Restrictions are also placed on a fund’s ability to invest in derivatives. RIHFs are placed under more stringent restrictions in terms of exposure limits and permitted securities for investment.
- All fund managers must report to the Registrar of Collective Investment Schemes on a quarterly basis, which report must contain information on, **inter alia**:  
  - the value assets in long/short positions as a percentage of total assets invested;
  - the exposure permitted under the fund mandate and the actual exposure applied at quarter end;
  - the method used to calculate exposure; and
  - a list of all portfolios administered by that manager.
- Hedge fund managers must provide the Registrar of Collective Investment Schemes with their audited annual financial statement and annual report within 90 days of their year end.

**Entering into derivatives contracts**

**Are there any restrictions on entering into derivatives contracts?**

‘Derivative Instruments’ are included in the definition of ‘securities’ under the Financial Markets Act (FMA). Any person wishing to carry on the business of buying or selling listed securities must either be an authorized user or effect such transactions through an authorized user. As such anyone wishing to enter into listed derivatives contracts in South Africa must be authorized by a licensed exchange or enlist the services of such a person.

Unlisted derivatives (OTCs), have historically been largely unregulated. The large majority of OTCs in South Africa are traded and cleared bilaterally and there have been no central risk management regimes imposed outside of the limits which the counterparties impose upon themselves.

Following the 2007-2008 financial crisis, in line with its G20 obligations, South Africa begun the process regulating OTCs and is moving towards a system of central clearing by enacting the FMA, which requires (once fully implemented) that all future derivatives trading will need to be performed through central counterparties (CCPs). The counterparties will each contract with the CCP, which will result in the CCP taking settlement risk and thus being more circumspect in the types of transactions they allow.

No CCP’s have, as yet, been licensed in South Africa and the regulation of the OTC market is currently managed through increased reporting requirements on entities which bilaterally clear derivative contracts. The latest draft amendments to the FMA include provisions to allow for the JSE Limited to act as clearing agent for OTCs until 2022, at which point all CCPs will need to be independently owned and managed.
What are common types of derivatives?

South Africa has a robust derivative market, which makes up approximately 7.5% of GDP, and as such uses all the main types of derivatives contracts, including:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

Banks are the primary traders of derivatives in South Africa and as a result the most commonly traded derivatives are:

- interest rate derivatives (swaps), which make up 85% of the derivative transactions traded in the South African domestic market; and
- foreign exchange derivatives (currency swaps), which make up approximately 12% of South Africa’s derivative trading.

Commodity and Agricultural derivative contracts (futures and options) are also traded extensively in the South Africa.

Are there any other notable risks or issues around entering into derivatives contracts?

As discussed above, South Africa has not been exempt from the regulatory attention afforded to OTC derivative trading, particularly in the last seven to ten years. As such the reporting requirements in respect of derivative transactions have become increasingly onerous and as South Africa begins licensing CCPs there will be additional compliance and regulatory costs imposed on people transacting in derivatives.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Unless exempted, lenders are required to be registered as credit providers and financial service providers with the applicable regulatory bodies.

Lending to individuals and/or juristic entities which fall within the scope of the National Credit Act (due to their lower level of annual turnover and asset value) is subject to greater regulatory scrutiny as the information that is required to be provided to those borrowers prior to entering into a credit is more extensive. The agreements also need to follow a prescribed format and must include certain prescribed information. There is a heavy onus on lenders in these circumstances to ensure that a borrower will not be over-indebted as a result of the credit made available by the lender to that borrower. A court may declare a contract which does not comply with the prescribed format unlawful and a lender will therefore not be able to enforce its rights thereunder.

All financial institutions are required to complete the necessary ‘know-your-client’ procedures in terms of the Financial Intelligence Centre Act before providing finance to a borrower. In relation to companies, these procedures involve the collection of information regarding the directors and shareholders of that company, ensuring that the company is duly registered in its jurisdiction of incorporation and that the company has filed the necessary tax returns for the preceding tax years.

Lending to state-owned enterprises and other government agencies is subject to a separate legislative regime. State-owned enterprises
are created by statute and the provision of finance to those state-owned entities will need to comply with the provisions of the legislation which governs that entity as read together with the Public Finance Management Act.

**Borrowing**

Borrowers are generally not restricted by legislation from borrowing. There may, however, be restrictions contained in the particular borrower’s constitutional documents with regards to the incurrence of financial indebtedness. A detailed review of the borrower’s constitutional documents should always be a prerequisite to providing financing.

Also, in relation to the provision of financial assistance, see [Giving and taking guarantees and security](#).

_Last modified 5 Dec 2019_

**What are common lending structures?**

**Loans**

Other than pursuant to the provisions of the National Credit Act, as contemplated above, there is no prescribed structure for lending transactions and such transactions may be tailored to suit the commercial requirements of the parties.

A loan may be provided on a bilateral basis (a single lender providing the entire facility) or on a syndicated basis (multiple lenders providing portions of the overall facility) to one or multiple borrowers.

**Loan durations**

The duration of the loan is subject to negotiation between the parties. Generally, the duration of loans varies between:

- **bridging loans** – short-term loans, normally for up to three to six months (there are generally tighter operational restrictions placed on the borrower and the margin is higher than longer-term loans);
- **term loans** – provided for an agreed period of time and is made available for a specific purpose (the availability period of such loans ends once the borrower has utilized the loan for the applicable purpose);
- **revolving loans** – provided for an agreed period of time and may be redrawn if repaid; and
- **working capital facilities** – made available to the borrower for a period of 365 days and is repayable on demand (these types of loans are ordinarily utilized by the borrower to fund its general working capital requirements and may be redrawn if repaid).

**Loan security**

Loans may be secured or unsecured. For more information, see [Giving and taking guarantees and security](#).

**Loan commitment**

Loans may be committed or uncommitted. It is common, in relation to committed facilities, for the lender to charge a commitment fee for the duration of the availability period of the particular commitment. In order for a loan to qualify as being uncommitted, the provision of that loan must be subject to conditions which are in the lender’s discretion (eg credit committee approval).

**Loan repayment**

Loan repayments vary according the commercial capabilities of the borrower and the purpose for which the transaction was implemented. Repayments vary between:

- **capital bullet** – the full amount of capital is repaid on the maturity date with interest being paid in arrears on each interest payment date (normally monthly or quarterly);
- **equal payments** – equal payments comprising capital and interest payable at set intervals during the term of the loan;
- **equal capital payments** – equal payments of capital plus accrued interest payable at set intervals during the term of the loan;
• sculpted profile – instalments vary according to the borrower's projected income during the term of the loan; and
• on demand – capital is repayable on demand with interest having been paid at set intervals during the term of the loan.

Preference shares

An alternative basis on which to provide financing is by way of subscribing for preference shares in the borrower. The advantage of using this type of funding is that the dividends that a preference shareholder receives (ie akin to the interest it would have received on a loan) is exempt from tax under South African tax legislation. In order to benefit from the exemption on dividends, the provision of finance by way of preference shares does, however, need to comply with the requirements set out in the Income Tax Act as to the purpose of such financing and the security provided for such financing. Failure to comply with the provisions of the Income Tax Act for preference share funding has the consequence that the dividends received on account of the preference shares are deemed to be interest (which is taxable) and, accordingly, the tax benefit of such preference share funding will be lost.

In the event of the insolvency of the borrower, a preference shareholder will rank behind secured creditors of the borrower and ahead of the ordinary shareholders of the borrower.

What are the differences between lending to institutional / professional or other borrowers?

Lending to large corporations/institutional investors is less burdensome, particularly on enforcement, than lending to individuals or small corporations. Enforcement of a lender’s rights under a loan advanced by a lender to an individual or any other entity regulated by the National Credit Act requires the lender to first refer the applicable borrower to a debt counsellor in order to agree a payment plan before the lender is entitled to enforce its rights under the applicable credit agreement.

A lender is also obliged to ensure that, when lending to an individual or small corporation, that individual or small corporation will not become over-indebted as a result of loan advanced by the lender. The lender must take reasonable steps to ascertain a borrower’s understanding of the credit agreement it is to enter into, its debt repayment history and its existing financial means, prospects and obligations.

Do the laws recognize the principles of agency and trusts?

Under South African law, an agent does not have locus standi (the right to bring an action) in litigious proceedings before South African courts. South African law therefore does not recognize the provision of security in favor of an agent (on behalf of other parties) or in favor of a trust (other than a trust which has been properly established in accordance with South African law). Further, the Deeds Registries Act does not permit registerable security (mortgage bonds, special notarial bonds and general notarial bonds) to be registered in favor of an agent. Security, under South African law, should be provided to the finance parties directly or to a special purpose vehicle (Security SPV) as described below.

For syndicated lending transactions, the most common security structure in the South African markets, involves the creation of a guarantee and indemnity structure and the interposition of a Security SPV (which is owned by an independent orphan trust). Pursuant to the structure, the special purpose vehicle issues an on demand guarantee in favor of the finance parties, in terms of which the Security SPV undertakes to guarantee the obligations of the borrower in favor of the finance parties. The security providers then enter into an indemnity agreement in terms of which the security providers indemnify the Security SPV against any claims made against it under the guarantee. All security provided by the security providers is provided in favor of the Security SPV as security for the security providers’ obligations under the indemnity agreement.

Are there any other notable risks or issues around lending?

Generally
No contractual arrangement may breach a legal rule or public policy. Legal rules may be derived from statute or from the common law whereas public policy is a subjective determination made by a judge by taking into account various policy issues, including the spirit and purport of the Constitution of South Africa.

There are a number of rules regarding the charging of interest and penalties. For instance, the *in duplum* rule states that the amount of interest charged by a lender may not exceed the capital amount of the loan. Further, under and in terms of the Conventional Penalties Act, a creditor shall not be entitled to recover, in respect of an act or omission which is the subject of a penalty stipulation, both the penalty and damages or, except where the relevant contract explicitly provides, to recover damages in lieu of a penalty. A court may also reduce a penalty where it is of the opinion that the penalty is out of proportion to the prejudice suffered by the creditor.

The rights of a creditor may also be limited by application of insolvency, reorganization, business rescue or other similar laws and a creditor may therefore not be able to enforce its rights under a finance agreement to the full extent contemplated therein.

It is important that all financial assistance resolution have been passed as a failure to do so results in the provision of such financial assistance being void. For more information, see Giving and taking guarantees and security – restrictions.

**Specific types of lending**

Lending to individuals and small corporations which are subject to the National Credit Act requires the lender to take greater precautions in order to ensure that the borrower will not be over-indebted. For more information, see Lending and borrowing – borrower considerations.

**Standard form documentation**

Most syndicated and large bilateral financing transactions are governed by loan documentation based on the recommended forms published by the Loan Markets Association and which have been tailored to suit the South African market. Documentation developed in-house by the banks is more commonly used for smaller, bilateral finance arrangements.

_Are there any other notable risks or issues around borrowing?_

None.

_Are there any restrictions on giving and taking guarantees and security?_

Some of the key areas affecting the giving of guarantees and security are:

**Financial assistance**

When providing a guarantee or security for the obligations a related or inter-related company the guarantor or security provider must be able to comply with the financial assistance provisions and solvency and liquidity requirements as contemplated in the Companies Act. The Companies Act considers the entry into of a guarantee and/or the provision of security for the obligations of a related or inter-related company as the provision of financial assistance. Financial assistance may only be provided if the shareholders of the company, as a first step, have passed a resolution authorizing the provision of that financial assistance, in particular, or financial assistance generally. In order for a company to provide financial assistance, the shareholders of that company must have passed such a shareholder resolution within the preceding two years.

As a further step, the directors of the company will need to pass a separate resolution authorizing the provision of the financial assistance and confirming that the company will comply with financial assistance provisions as contemplated in the Companies Act which require the directors to confirm that:

- the guarantor's/security provider's assets (fairly valued) exceed its liabilities (fairly valued);
• the guarantor/security provider will be able to pay its debts as they fall due for the 12 months; and
• the terms under which the financial assistance is proposed to be given are fair and reasonable to the company.

Distributions

The Companies Act includes, in its definition of a distribution, the incurrence of a debt or other obligation by a company for the benefit of one or more holders of any of the shares of that company or of another company within the same group of companies. The provision of a guarantee or security by a company in respect of the obligations of a company within the same group of companies would therefore be classified as a distribution. Accordingly, the company providing that guarantee and/or security will need to comply with the applicable provisions of the Companies Act and the directors of that company will need to pass a resolution confirming that, at the time of the provision of such guarantee and/or security:

• the guarantor's/security provider's assets (fairly valued) exceed its liabilities (fairly valued); and
• the guarantor/security provider will be able to pay its debts as they fall due for the 12 months.

Capacity

The guarantor's/security provider's constitutional documents must make provision for that guarantor/security provider to enter into a guarantee and/or provide security for the obligations of a related party or a third party.

Agency

For information regarding the provision of security in favor of an agent, see Lending and borrowing – agency and trusts.

What are common types of guarantees and security?

Common forms of guarantees

The most common type of guarantee in financing transactions is a first demand payment guarantee where the guarantor undertakes to make payment in the event of a default by the borrower.

It is important to ensure that the guarantee creates a principal obligation to pay or perform regardless of the enforceability, validity or legality of the underlying obligation. For more information, see Giving and taking guarantees and security – other issues.

Common forms of security

The most common forms of security are as follows.

PLEDGE OF SHARES

Perfection requirements include the delivery of share certificates evidencing the shares together with signed, undated share transfer forms where the shares are in certificated form or the noting of the pledge on the account held by the security provider with a central securities depository where the shares are dematerialized.

CESSION OF RIGHTS

All incorporeal rights may be cede in security, provided that the subject of that cession does not expressly prevent the cession of such rights. The most common forms of rights ceded are rights in and to insurance policies and amounts payable thereunder; bank accounts and amounts standing to the credit thereof; key customer contracts; and debtors book.

MORTGAGE BONDS

These provide real security over immovable property and are required to be registered in the South African Deeds Office nearest to where the property is located. This form of security must be prepared and filed by a conveyancing lawyer.
SPECIAL NOTARIAL BOND

A special notarial bond is provided over specified movable assets and is required to be registered in the South African Deeds Office where the security provider’s principal place of business is located. This form of security must be prepared and filed by a conveyancing lawyer.

GENERAL NOTARIAL BOND

A general notarial bond is provided over the security provider’s movable assets in general and is required to be registered in the South African Deeds Office where the security provider’s principal place of business is located. This form of security must be prepared and filed by a conveyancing lawyer.

In relation to the Security SPV structure, also see Lending and borrowing – common structures.

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

Guarantees must explicitly state that the guarantee creates a primary obligation and not a suretyship and that the guarantor’s obligations thereunder will not be affected by the enforceability, legality of validity of the underlying obligations. A suretyship under South African law creates an ancillary obligation and a defect in the underlying obligation will similarly impact the suretyship. By way of example, if a company is placed under business rescue, the business rescue practitioner is entitled to cancel certain contracts in order to improve the financial position of the company. If the main contract is cancelled, then the suretyship will too be cancelled as it is merely ancillary to the principal obligations.

If the financial assistance provisions of the Companies Act have not been complied with the provision by a company of that financial assistance will be void. Directors may, however, face personal liability, in certain instances, for failing to comply with the financial assistance provisions of the Companies Act.

Giving or taking security

Under, and in terms of, the Insolvency Act, a mortgage bond passed for the purposes of securing a debt that was not previously secured must be registered in the applicable South African Deeds Office within two months from the date on which the debt it is securing is incurred. If registration has not occurred within the aforementioned time period and the security provider is liquidated within six months from the date on which the mortgage bond was registered, the mortgage bond will not secure that debt.

It is also important for the board of directors to have confirmed that the security provider is able to comply with the provisions of the Companies Act relating to financial assistance and distributions (see above) as, upon the occurrence of the liquidation in insolvency of the security provider, a liquidator may consider the provision of the security to have been a voidable disposition and require the creditor to return the assets acquired pursuant to the enforcement of such security.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally
Banks Act No. 94 of 1990  
Co-Operative Banks Act No. 40 of 2007  
Financial Advisory and Intermediaries Services Act No. 37 of 2002  
Financial Intelligence Centre Act No. 38 of 2001  
Financial Markets Act No. 19 of 2012  
Income Tax Act No. 58 of 1962  
Mutual Banks Act No. 124 of 1993

**Consumer credit**

Consumer Protection Act No. 68 of 2008  
Insolvency Act No. 24 of 1936  
National Credit Act No. 34 of 2005

**Mortgages**

Home Loan and Mortgage Disclosure Act No. 63 of 2000

**Corporations**

Companies Act No. 71 of 2008  
Trust Property Control Act No. 57 of 1988

**Funds and platforms**

Collective Investment Schemes Control Act No. 45 of 2002

**Energy and infrastructure**

Civil Aviation Act No. 13 of 2009  
Electricity Regulation Act No. 4 of 2006  
Gas Act No. 48 of 2001  
Independent Communications Authority of South Africa Act No. 13 of 2000  
Petroleum Pipelines Act No. 60 of 2003  
Preferential Procurement Framework Act No. 5 of 2000

**Other key market legislation**

Broad-Based Black Economic Empowerment Act No. 53 of 2003  
Commercial Paper Regulations  
Competition Act No. 89 of 1998  
Conventional Penalties Act No. 15 of 1962  
Currency and Exchanges Act, No. 9 of 1933 (including the Exchange Control Regulations)  
Inspection of Financial Institutions Act No. 80 of 1998  
Securitization Regulations

*Last modified 5 Dec 2019*

**Regulatory authorization**

**Who are the regulators?**

The Bank Supervision Department of the South African Reserve Bank (the central bank of South Africa) (SARB), headed up by the Registrar of Banks, is responsible for regulating and supervising all banks and banking groups registered in South Africa.

The SARB and the Financial Surveillance Department of South Africa are responsible for implementing and administering South African
exchange control policy and as such oversee the inflow and outflow of local currency and other local assets.

The Financial Sector Conduct Authority (previously known as the Financial Services Board) oversees the non-banking financial services industry, which includes retirement funds, short-term and long-term insurance, companies, funeral insurance schemes, collective investment schemes (unit trusts, funds and listed derivatives) and financial advisors and brokers. The Financial Sector Conduct Authority (previously known as the Financial Services Board) also supervises JSE Limited (the Johannesburg Stock Exchange).

What are the authorization requirements and process?

Depending on the type of services a prospective applicant wishes to render in South Africa, an applicant must submit an application:

- to the Registrar of Banks, in accordance with the Banks Act in order to register as a bank in South Africa;
- in accordance with the Collective Investment Schemes Control Act (CISCA), to register as a manager of a collective investment scheme, (see Establishing and investing in debt and hedge funds); or
- to the Financial Sector Conduct Authority (previously known as the Financial Services Board) or a recognized representative body, in accordance with Financial Advisory and Intermediaries Services Act (FAIS) to become a financial services provider. FAIS regulates the activities of all non-banking financial services providers.

International banks can operate in South Africa as either a representative office or a branch with the approval of the Registrar of Banks. Each of these models is subject to the requirements of the Banks Act, and the overall regulatory oversight of the South African Reserve Bank. The authorization requirements and process (the process can take up to six months) in respect of branches are more onerous than those of representative offices, as representative offices are not authorized to accept deposits from the public.

Foreign investment funds may register as 'foreign collective investment schemes' under CISCA. In order to qualify for South African registration, a foreign fund must have an investment policy which is consistent with the requirements set out under CISCA.

What are the main ongoing compliance requirements?

The main ongoing compliance requirements include:

- the payment of annual fees, such as licensing fees;
- if required, maintaining required levels of capital; and
- adhering to any conditions of authorization imposed by regulators, such as continuous disclosure.

What are the penalties for failure to be authorized?

A person undertaking regulated activity without being duly authorized or exempt commits a criminal offence and is liable to imprisonment and, if applicable, fines.

Regulated activities

What finance and investment activities require authorization?

Generally

PROVISION OF CREDIT AND OTHER REGULATED ACTIVITIES
A person who is required to register as a credit provider but who has not done so must not offer, make available or extend credit, enter into a credit agreement or agree to do any of those things without first having registered as a credit provider with the National Credit Regulator. A credit provider includes:

- any person who extends credit under a credit facility;
- a mortgagee under a mortgage agreement; and
- a lender under a secured loan agreement.

A person must apply to be registered as a credit provider if the total principal debt owed to that credit provider under all credit agreements (as defined in the National Credit Act) exceeds the prescribed threshold. With effect from 1 November 2016, the current threshold has been set at ZAR nil. This has far-reaching consequences as companies providing employee loans will be required to register as credit providers in terms of the National Credit Act. A credit arrangement will only fall within the definition of ‘credit agreement’ in terms of the National Credit Act if the person providing the credit will earn some form of fee (such as interest).

Banks, pension funds and other collective investment schemes are also required to obtain licenses from the relevant regulators in order to carry on their businesses. In relation to legislation applicable to these entities, see Law and regulation.

**PROVISION OF ADVICE**

A person may not act or offer to act as a financial services provider, unless such person has been issued with a license by the registrar of financial services. A financial services provider is any person who as a regular feature of such person's business provides any recommendation, guidance or proposal of a financial nature in respect of the purchase of, or investment in, any financial product, the conclusion of any transaction aimed at the incurring of any liability or the variation of any term relating to a financial product.

Persons not domiciled in South Africa must also obtain a license in order to provide financial advice in South Africa.

**Consumer credit**

See above in relation to entities which are required to be registered as credit providers and financial services providers.

Last modified 5 Dec 2019

**Are there any possible exemptions?**

Certain persons may carry on business as a credit provider without having to register with the National Credit Regulator, for example, where that person carries on business in only one province in South Africa and it has complied with the provincial regulations applicable to it.

Financial services may also be provided without having to obtain a license if that person has been exempted from having to obtain a license under the Financial Advisory and Intermediaries Services Act.

Last modified 5 Dec 2019

**Do any exchange controls or other restrictions on payments apply?**

Payments out of South Africa are regulated by the Exchange Control Regulations published under and in terms of the Currency and Exchanges Act. Approval must be sought for the making of such payments from the Financial Surveillance Department of the South African Reserve Bank. Applications are required to be made through specified authorized dealers (including commercial banks).

There are also tax considerations which should be taken into account particularly when financing assets which are to be imported into South Africa.

Last modified 5 Dec 2019

**What are the rules around financial promotions?**
A credit provider must not harass a person in an attempt to persuade that person to apply for credit or to enter into a credit agreement or related transaction. Credit providers are restricted from entering into credit agreements at various times and at specific places unless they comply with a number of legislative requirements. Only persons that are registered as credit providers may advertise the availability of credit, or of goods or services to be purchased on credit.

Any advertisement concerning the granting of credit must clearly state the interest rate and other credit-related costs in the format prescribed by the applicable legislation.

**Entity establishment**

*What types of legal entity are generally used to undertake financial or investment activity?*

**Generally**

**PRIVATE COMPANIES**

The choice for most setting up a business in South Africa. Private companies (denoted by the suffix Proprietary Limited (Pty Ltd)) are seen as separate legal, limited liability, entities and as such are taxed in their own right and offer the shareholders protection against liabilities (commonly known as the corporate veil). Private companies are not prohibited from having foreign shareholding and only require one shareholder and one director. The Companies Act, however, prohibits a private company from offering its equity to the public.

**PUBLIC COMPANIES**

A public company is a limited liability company incorporated to offer shares to the general public for purposes of capital raising. Public companies are identified by the suffix Limited/Ltd and have their own legal identity. Public companies must have at least three directors.

**PARTNERSHIPS**

A partnership is akin to a coming together of between two and 20 people who contractually agree to operate a profit-generating business together. They further agree to split any profits as per their agreement (usually in proportion to their interests). In establishing a partnership each partner needs to make a contribution, which contribution may be in cash, expertise or otherwise. A partnership is not a separate legal entity, leaving partners liable for the liabilities of the partnership and exposed to creditors of the partnership.

**FOREIGN COMPANIES**

Section 23(2) of the Companies Act requires a foreign company that has established a permanent ‘place of business’ in South Africa for more than 21 days to register as an ‘external company’, unless a separate legal entity (ie a private company) is established. The registered external company is colloquially referred to as a ‘branch’ in South Africa. The effect of registration is not to create a new legal entity, but merely results in the foreign company becoming subject to the Companies Act. Under the Companies Act, a branch does not enjoy an identity separate from that of the foreign company. Consequently, the foreign company will remain liable in respect of all acts carried on by the branch in South Africa through its employees/agents/directors. The foreign company must operate in South Africa in its own name and the foreign country in which the foreign company is incorporated must be disclosed. This therefore creates unlimited liability in South Africa for the foreign company.

**Funds**

**FOREIGN COLLECTIVE INVESTMENT SCHEMES**

Foreign investment funds may register as ‘foreign collective investment schemes’ under the Collective Investment Schemes Control Act (CISCA). In order to qualify for South African registration, a foreign fund must have an investment policy which is consistent with the requirements set out under CISCA.

*EN COMMANDITE PARTNERSHIPS*
The principal vehicle housing South African private equity funds investing in South Africa is the limited liability partnership (called en commandite partnerships). A trust structure (called a bewind trust, and is governed by the Trust Property Control Act No. 57 of 1988) is also sometimes used. Unless the trust structure is used, there are no registration requirements for establishing, and no legislation regulating, en commandite partnerships.

An en commandite partnership is carried on by one or some of the partners, called the general or managing partner, to which every partner whose name is not disclosed (called a commanditarian partner or partner en commandite) contributes a fixed sum of money on condition that he or she receives a certain share of the profit, if there is any, but that in the event of loss he or she is liable to his or her co-partners to the extent of the fixed amount of his or her agreed capital contribution only. Because commanditarian partners are undisclosed, this means that they are not presented as partners, are not liable for partnership debts (enjoy limited liability), may not actively participate in the business of the partnership and cannot reclaim payment of their partnership contribution or payment of their share of the partnership profits in competition with the creditors of the partnership. The general partner of the en commandite partnership has unlimited liability toward creditors of the partnership in circumstances where the partnership’s assets are insufficient to settle relevant debts.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes. International banks can operate in South Africa as either a representative office or a branch with the approval of the Registrar of Banks. Non-banking foreign companies may also establish branches in South Africa in accordance with the Companies Act. As set out above, registration may be required as an ‘external company’ as contemplated in section 23(2) of the Companies Act.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

South Africa is recognized as one of the main FinTech hubs in Africa. South African FinTech companies are currently focusing on mobile banking, payment services and alternative financing. Major banks and FinTech companies are slowly starting to tap into the large unbanked population and are designing FinTech products aimed at this group.

Mobile banking

South Africa has experienced exponential growth in the uptake of mobile banking, mostly due to the fact that a large percentage of the South African population lives in rural locations with limited access to traditional banking infrastructure. Socially, there is a need for workers in urban areas to transfer money to dependents living in rural areas and with both parties having access to mobile phones, this creates a platform for the transfer of funds, thus providing banking services to the unbanked. The major South African banks have identified the need and there has been significant growth in the remittance space, through electronic wallet services.

Peer-to-peer funding platforms and marketplace lending

Lending platforms and crowdfunding arrangements are growing steadily in the South African market, in particular gaining popularity with small to medium-sized enterprises who are seeking funding. Retail and institution based interfaces have been developed by non-bank lending enterprises and the major banks and other financial institutions. In addition to corporate lending, these platforms are also being used for philanthropic purposes (an example being a major bank setting up a crowdfunding platform where individuals can contribute to assisting tertiary level students in paying their fees).

Payment services
In the mobile payment space, there are a number of startups which are receiving good traction from customers in South Africa. These startups offer a number of services, including mobile payment solutions for e-commerce and mobile businesses. There are some startups which are tackling the hugely successful funeral parlor industry, by introducing point of sale (PoS) devices which assist insurers and their clients in keeping track of payments using invoices, especially in rural areas where this type of insurance is prone to fraud.

**Blockchain, smart contracts and cryptocurrencies**

The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Cryptocurrency attracted a lot of attention in South Africa during 2017, with significant growth in trade volumes and token values. It has also been announced that the South African Reserve Bank is currently testing regulations with regard to bitcoin and other cryptocurrencies and will be introducing new rules regarding the use of cryptocurrencies in the coming months. The South African Reserve Bank also stated that it will be carrying out feasibility studies regarding the associated technology in South Africa and increasing numbers of South African FinTech startups are being established. According to bitcoinzar.co.za there are two fully licensed exchanges, ICE Cubed and Luno, and the first bitcoin ATM in South Africa has been installed in a Johannesburg suburb. There are more than five other unlicensed bitcoin exchanges which are currently operating in South Africa.

**Artificial intelligence and robo advisory systems**

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. AI and automated advice tools also impact the banking and private wealth advisor sectors; the implications include decreased human involvement although based on experiences elsewhere, it may be preferable to operate hybrid structures which combine AI and human inputs.

**Data analysis and cloud computing**

Cloud computing enables delivery of information technology services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of FinTech business targeting this space in South Africa.

**Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?**

**General financial regulatory regime**

Although banking and financial services are tightly regulated industries in South Africa, there is currently no FinTech specific regulatory regime. FinTech activity is therefore regulated by legislation which governs lending, deposit taking, investments and electronic communications and transactions. Broadly, these laws have onerous requirements and have a focus on protecting consumers.

**Electronic payments platforms and regulation of peer-to-peer lenders**

**ELECTRONIC PAYMENT PLATFORMS**

In South Africa, there is no specific legislation that regulates electronic payment platforms and peer-to-peer (P2P) lending. However, some of the provisions contained in the National Payment Systems Act 78 of 1998 relating to payment services can have application in the context of electronic payment platforms.
P2P or marketplace lenders are largely constrained by the National Credit Act, 34 of 2005 (NCA), which subject to certain exceptions, requires all lenders to register as credit providers. The NCA also regulates fees, interest and other charges that lenders may levy. P2P lending for project development purposes may also fall within financial intermediary services within the Financial Advisory and Intermediary Services Act, 37 of 2002 (FAIS), and as a result, lending through an online platform may trigger the requirement to obtain a license as a financial services provider under sections 7 and 8 of FAIS.

There are certain exemptions in sections 44(1) and (2) of FAIS, where the registrar of financial services providers may, based on a list of factors set out in section 44(1), exempt persons or categories of persons from the section 7 authorization requirements. It may be argued that a P2P platform could be exempted under one of these headings; however, there is no regulator approved route for these businesses and currently no specific regulations addressing the P2P space.

**Regulation of payment services**

The National Payment Systems Act 78 of 1998 (the NPS Act) identifies and regulates two kinds of persons in the market who are non-banks.

- A ‘systems operator’ is non-bank authorized to provide services in respect of payment instructions. In essence, a systems operator provides the electronic means to two or more persons to make payments and/or to receive the proceeds of payment instructions. A systems operator is required to be authorized by the Payments Association of South Africa, on behalf of the South African Reserve Bank. Any entity which effectively facilitates the transfer of information between a payment portal and a payment provider or acquiring bank will be authorized as a systems operator in terms of the NPS Act.

- A ‘third-party payment provider’ accepts money or payment instructions from other persons for the purpose of making payments on behalf of those other persons to third parties to whom those payments are due. A third-party payment provider may hold funds in its own bank account for a short period of time prior to paying those funds over to the third party concerned. This differs from systems operators, which provide the technology for the payments but typically do not receive money or the proceeds of payment instructions.

**Application of data protection and consumer laws**

In South Africa, the Protection Personal Information Act 4 of 2013 (POPI), is the proposed legislative framework for the protection of personal information. POPI will only come into effect in its entirety, by presidential proclamation, on a date which is still to be determined. In the interim, the laws relating to data protection and consumer protection can be found in several pieces of legislation, with the most pertinent being the Electronic Communications and Transactions Act 25 of 2002 (ECTA) and the Consumer Protections Act 68 of 2008 (CPA). Briefly, the CPA aims to create certain protections for consumers in the marketplace and to protect consumers’ rights to privacy, particularly in the context of direct marketing. ECTA also aims to provide consumer protection in the context of unsolicited goods, services and communications. In relation to the protection of personal information, ECTA merely sets out the principles to be used, when a data controller collects personal information electronically.

**Money laundering regulations**

In South Africa, the primary statute governing anti-money laundering is the Financial Intelligence Centre Act, 39 of 2001, as amended (FICA). FICA established a Financial Intelligence Centre and a Counter-Money Laundering Advisory Council in order to combat money laundering activities and the financing of terrorist and related activities; and it imposes certain duties on institutions and other persons who might be used for money laundering purposes and the financing of terrorist and related activities. FICA imposes obligations on accountable institutions to conduct customer due diligence and where the institution is unable to satisfactorily verify the identity of the customer, it is precluded from entering into a business relationship with the customer, may not conclude a transaction with the customer or must terminate the relationship in line with its risk and compliance procedures. However these provisions are only applicable to accountable institutions which include financial instrument traders, persons carrying on the ‘business of a bank’, or persons carrying on the business of lending money against the security of securities. A number of FinTech companies may not fall within the definition of an accountable institution but may elect to comply with these provisions to manage their risk.

Last modified 5 Dec 2019

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**
With the current drive to grow the South African economy, attract foreign investment and ultimately increase employment in South Africa, small and medium-sized businesses in the FinTech sector are seeing an increase in funding and support opportunities from both the private and public sector.

**Private loans**

Given the inherent risk, unstructured loans from family or friends of founders are arguably the most viable funding option for startup and early stage FinTech businesses. FinTech businesses can also privately place shares in their enterprises in order to raise funds. In South Africa, because the angel investor community is still relatively small, the terms of this type of financing can range from relatively generous to extremely onerous. Angel investment sizes will typically range from as little as ZAR 100,000 to ZAR 4 million, with almost all such investments originating from personal relationships. Aspiring FinTech entrepreneurs with limited angel investor personal relationships can connect with the South African Business Angels Network in order to get in touch with parties interested in making angel investments.

**Venture capital and debt**

The South African Revenue Service and National Treasury, with effect from 1 July 2009, introduced section 12J to the Income Tax Act, 58 of 1962 (the Act) to cater for investments in venture capital (VC) companies. Section 12J of the Act allows a person who invests in VC shares through a VC company to claim an upfront tax deduction of a 100% of the amount invested. However, as an anti-avoidance measure, section 12J is subject to strict requirements that must be adhered to by both VC companies and investors. This is one of the ways in which South Africa has created an enabling environment for VC funding. VC companies in South Africa will only invest in a company that has a scalable business model and strong intellectual property with the ability to scale five to twenty times the value at which they buy in at within a limited time frame. A list of the main VC companies can be accessed through the Southern African Venture Capital and Private Equity Association website.

**Crowdfunding**

Given that the Financial Sector Conduct Authority (previously known as the Financial Services Board), which oversees the non-banking financial services industry in the public’s interest, has not crafted any regulations around crowdfunding there is a lack of certainty and as such no encouragement or protection for investors, making crowdfunding a less attractive investment option at present. As a result, both entrepreneurs and the economy miss out on the benefits that this funding model offers. There are however a number of platforms actively setting the South African crowdfunding space, namely, RainFin (which is an online lending marketplace that connects borrowers and lenders) and Uprise.Africa (which is looking to be South Africa’s first equity crowdfunding platform).

**Senior bank debt and capital markets funding**

**SENIOR BANK DEBT**

The amount of bank debt available to FinTech entrepreneurs is often limited by the security that can be offered against the loan. Senior debt requires security in the form of mortgage bonds, with security being registered over fixed assets, or in the case of term-financing of moveable assets. When making use of these forms of financing, financial institutions have no vested interest in the business’ ultimate success or failure and, as such, provide no on-going business support. The collateral requirements often make this an option that is out of reach of many aspiring FinTech entrepreneurs. However, this funding option is particularly attractive for FinTech enterprises with an existing track record and positive cash flows and those entrepreneurs wishing to retain control over the strategic direction of the enterprise.

**CAPITAL MARKETS FUNDING**

South Africa has both debt and equity capital markets which are accessible, subject to certain requirements, to enterprises.

**EQUITY CAPITAL MARKETS**

In South Africa, over the last couple of years, the sectors most actively raising finance by way of Initial Public Offering are healthcare, financial services and real estate, among others. Technology is a sector that is rapidly increasing its activity in the equity capital markets. Although, no FinTech focused business has listed on the Johannesburg Stock Exchange (JSE) to date, we have seen FinTech founders in South Africa raise funds by way of sale of business. For example, Tyme, a mobile money business, was acquired by the Commonwealth Bank of Australia, and Fundamo, a mobile based financial services enterprise, was acquired by Visa.
DEBT CAPITAL MARKETS

Subject to compliance with both the Debt Listings Requirements and the listings requirements specifically relating to the main board of the JSE, established FinTech enterprises, acting as issuers, can list debt securities on the JSE. To offer and issue debt on a public exchange securities, an issuer must be registered as a bank, or authorized as a branch of a foreign bank under the Banks Act or must offer and issue debt securities in compliance with one of the available exemptions. The most prominent exemption for non-bank issuers is the exemption set out in the Commercial Paper Regulations which applies to prospective issuers that are listed companies or issuers with a net asset value of at least ZAR 100 million for at least 18 months prior to any issue of debt securities. The offer and sale of debt securities by a non-resident in South Africa is also subject to the prior approval of the South African Reserve Bank.

PREFERENCE SHARES

Although typically reserved for larger businesses, an alternative basis on which to raise finance is by way of issuing preference shares. The advantage of using this type of funding is that the dividends that a preference shareholder receives are exempt from tax under South African tax legislation. In order to benefit from the exemption on dividends, the provision of finance by way of preference shares does, however, need to comply with the requirements set out in the Income Tax Act as to the purpose of such financing and the security provided for such financing. Failure to comply with the provisions of the Income Tax Act for preference share funding has the consequence that the dividends received on account of the preference shares are deemed to be interest (which is taxable) and, accordingly, the tax benefit of such preference share funding will be lost.

Incentives and reliefs

There are also some options for obtaining government grants which, unlike loans, are awards of money that do not need to be repaid. Grants from the South African government are typically tied in with key deliverables such as; black economic empowerment, job creation and developing the economy. The selection criteria is strict, the paperwork extensive and there are often on-going reporting obligations on the business receiving a grant. The government also offers low cost finance to entrepreneurs through state owned entities such as: the Industrial Development Corporation, the National Empowerment Fund, the Technology Innovation Agency and the Development Bank of Southern Africa. The application process for government grants and financing is highly competitive.

There are a range of FinTech accelerator programs in South Africa, which are looking to rapidly grow FinTech startups not just in South Africa but in emerging markets generally. In addition, the vast majority of large corporates in South Africa have government mandated enterprise development initiatives, which provide supplier opportunities, business support and in some instances, funding opportunities. Barclays Africa, for instance, has an established global innovation program called RISE which supports FinTech innovation, provides FinTech business development support and offers opportunities for global collaboration.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

There is no formal market for the buying and selling of loans. Rather, these transactions are negotiated between the lender looking to sell all or part of its participation in a loan and a financial institution interested in buying that particular interest. This process may need to be performed in consultation with the borrower, unless the facility agreement provides otherwise.

The most common ways of selling loans are:

- **Assignment** – Both the rights and obligations of a lender are transferred; assignment generally requires the consent of the borrower.

- **Cession** – All or a portion of the rights of the existing lender are transferred to the new lender; this may be done without the consent of the borrower, but notice should be provided.

Most finance documents cater for an ability of the finance parties to transfer with or without consent or to any persons listed on agreed list of transferees. The general market position is that no consent is required to transfer all or a portion of a loan following the occurrence
What are the main considerations when transferring a loan and related security?

The main considerations for transferring a loan and related security are whether:

- the underlying contract allows for such transfer;
- there are limitations on the financial institutions to whom the loan and related security may be transferred;
- the consent of the borrower or any other party is required for such transfer;
- there are any other formalities that need to be adhered to for the transfer of a loan and related security;
- the transfer will prejudice the borrower; and
- costs.

Using a Security SPV structure for syndicated transactions (see above) obviates the need for security to be re-registered in the event of a transfer of the loan. The timing and costs associated with transferring a loan are reduced considerably as a result of using this structure.

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

The ownership of infrastructure in South Africa is a combination of private, public (directly by government or through state-owned enterprises) and public-private partnerships. This applies to a large extent in respect of both economic infrastructure (energy, aviation, telecommunications and roads) and social infrastructure (education, health and housing).

The state has, however, maintained a near monopoly when it comes to rail infrastructure and to a large extent the corrections/prisons infrastructure (there are only two ‘privately owned’ prisons in South Africa and the South African government has stopped granting concessions to private corporations for the construction of private prisons).

Energy

Eskom Holdings SOC Limited, a state-owned enterprise (SOE) owns the bulk of the energy generation and transmission infrastructure in South Africa. The infrastructure ranges from a nuclear power plant (Koeberg Power Station in Cape Town), a hydro-electric power plant (Gariep Power Station), an open cycle gas turbine plant (Ankerlig Power Station), various coal fired power plants (such as Lethabo Power Station), a pumped storage scheme (Palmiet Power Plant) and various wind farm projects (such as Sere Power Station). Eskom is in the process of constructing a number of new coal fired power plants, the most prominent of which are Medupi Power Station and Kusile Power Station which are expected to be completed by 2021 and 2023 respectively.

In and around 2010 the government of South Africa launched a renewable energy program which saw a number of Independent Power Producers entering the energy sector and by the end of October 2016 Eskom had procured approximately 6400 MW from 102 Independent Power Producers. There have been five bid windows during which independent power producers bid for the right to set up renewable energy projects. The renewable energy projects are a mixture of wind, solar photovoltaic, biomass, biogas, and concentrated solar thermal plants.

The National Energy Regulator (NERSA) is the regulatory body tasked with the regulation of the electricity, piped-gas and petroleum pipelines industries in terms of the Electricity Regulation Act, the Gas Act and the Petroleum Pipelines Act.
The Independent Power Producer Procurement Programme is administered by the IPPPP Unit which was established by the Department of Energy (DoE), National Treasury and the Development Bank of Southern Africa (DBSA) for the purposes of delivering on the Independent Power Producer procurement objectives.

**Telecoms infrastructure**

Ownership of infrastructure in telecoms is also a combination of private and public (through an SOE) ownership. Telkom SA SOC Limited owns the bulk of the wireline telecommunications infrastructure and also owns a sizeable portion of the wireless telecommunications infrastructure. Wireless telecommunications infrastructure is mostly privately owned, with Vodacom and MTN being the largest players in this space.

The Independent Communications Authority of South Africa (ICASA) is the regulator for the South African communications, broadcasting and postal services sector. It was established in terms of the Independent Communications Authority of South Africa Act.

**Transport infrastructure**

**RAIL INFRASTRUCTURE**

Transnet SOC Limited, through its Transnet Freight Rail division (Transnet Freight Rail), controls the heavy rail infrastructure sector and owns the majority of South Africa’s extensive national rail network, representing approximately 80% of Africa's total rail network as well as rolling stock.

The Passenger Rail Agency of South Africa SOC Limited (PRASA), an SOE, controls the passenger rail sector and owns a portion of South Africa's national rail network through its Metrorail and Mainline Passenger Service divisions.

The Bombela Concession Company (RF) Proprietary Limited owns and operates the Gautrain rapid train service which services commuters from Sandton to O.R Tambo Airport and Pretoria to Park Station (Johannesburg CBD). The Bombela consortium is owned by private shareholders.

**ROAD TRANSPORT INFRASTRUCTURE**

Ownership of the road network is held by the state (through the South African National Roads Agency SOC Limited (SANRAL)), with concessionaires (the Bakwena Concession (Bakwena), the N3TC Concession (N3TC) and the TRAC Concession (TRAC)) performing infrastructural development and management on three major national routes.

**AVIATION**

Cargo and passenger aviation is a combination of state and private ownership. South African Airways SOC Limited and its divisions dominate the local passenger routes, however, there are a number of private passenger airlines which operate within South Africa. ComAir (through the British Airways franchise and Kulula) is the longest surviving private commercial passenger aviation company. A number of private airlines have taken to the skies since 1994, however, most of them have since been liquidated amid a harsh operating environment due to their failure to compete with the state-owned airlines and their access to public funds.

The major airports are owned and managed by the Airports Company South Africa (majority owned by the South African Government) most notably O.R Tambo International Airport and Cape Town International Airport. The only other international accredited airport in Johannesburg, Lanseria International Airport is privately owned and is host to a number of commercial and charter airlines.

The South African Civil Aviation Authority (established in terms of the Civil Aviation Act) is responsible for the regulation of the aviation industry in South Africa.

**PORTS AND PORT TERMINALS**

Transnet, through its various divisions dominates infrastructure ownership in this sector.

Transnet, through its National Ports Authority division (National Ports Authority) owns and provides port infrastructure at the eight commercial seaports in South Africa. The National Ports Authority owns 19 container berths, 36 dry-bulk berths, 29 break-bulk berths, 13 liquid-bulk berths and eight entrance channels with supporting breakwaters, turning basins, networks and utilities.

Transnet, through its Transnet Port Terminals division (Transnet Port Terminals) owns infrastructure or packing and unpacking of
containers, agricultural, breakbulk and mineral bulk.

Transnet, through its Transnet Pipelines division (Transnet Pipelines) transports 100% of South Africa’s bulk petroleum products and owns a petroleum and gas transportation pipelines. It also owns a tank farm capable of carrying 30 million litres of petroleum products.

**Other infrastructure**

**DEFENSE INFRASTRUCTURE**

Defense infrastructure is owned by the state.

**EDUCATION INFRASTRUCTURE**

Ownership of education infrastructure is a combination of public and private ownership with public schools being in the majority. There are a number of prominent private schools which service the middle to high income market with two of the big private school players ie Curro and Advtech being listed on the JSE.

**HOSPITAL INFRASTRUCTURE**

Ownership of health facilities is a combination of public and private ownership. There a number of private entities operating health centers most notably Netcare and Mediclinic hospitals.

*Last modified 5 Dec 2019*

### Are there special rules for investing in energy and infrastructure?

**Generally**

The overarching consideration for any investment in infrastructure in South Africa, especially where government or regulatory consent is required, is the impact on the country’s transformation agenda ie the impact of black economic empowerment (BEE). For example, in the renewable energy sector, each project has been required to have a certain level of black (as defined in the Broad-based Black Economic Empowerment Act) ownership. The Development Bank of Southern Africa provided the primary project finance funding for many of the BEE investors wishing to invest in these projects, allowing for greater participation by historically disadvantaged South Africans in the projects, as investors and developers.

**Energy**

This is a very regulated sector regardless of the type of energy infrastructure involved and there is a complex licensing regime which usually has the attainment of certain ownership thresholds for example, black ownership and procurement as prerequisites. Accordingly, potential investors must consider the impact of their investment on any licenses held by the investee entity as well as any potential local partners. Any investment that potentially dilutes black ownership in a project is unlikely to receive regulatory approval.

**Telecoms infrastructure**

South Africa’s telecommunications sector is regulated by a number of statutes that enforce certain requirements for applications for different licenses and approvals to establish and operate telecommunications infrastructure.

The Independent Communications Authority of South Africa (ICASA) is the regulator for both the telecommunications and broadcasting sectors. A company wishing to deploy and operate a physical network will require an Electronic Communications Network Service license. An Electronic Communications Service license is required for a company to provide electronic communications services to customers on its own network or through another company’s network. Some resources in the telecommunications sector are considered a scarce resource, and as a result there is certain criteria which applicants must meet to obtain the various licenses, with particular emphasis on meeting the South African black economic empowerment requirements and limiting the amount of foreign investment in telecommunications infrastructure to 30%.

**Transport infrastructure**

**RAIL, PORT AND PIPELINE INFRASTRUCTURE**
Any form of infrastructure development in relation to railways, ports and pipeline infrastructure will need to be done in conjunction with procurement processes run by Transnet Freight Rail, PRASA, National Ports Authority and Transnet Port Terminals and Transnet Pipelines respectively.

ROAD TRANSPORT INFRASTRUCTURE

As stated above, all national roads are controlled by SANRAL. These concessions granted to Bakwena, N3TC and TRAC are for 30 years and will expire around 2030. All road infrastructure development will need to be performed in conjunction with SANRAL and its procurement processes.

AIRPORTS

In order to service the international market an airport will need to be granted ‘international status’ from the Department of Home Affairs in order to have the ability to clear customs from the airport terminal.

What is the applicable procurement process?

Investing in energy and infrastructure

The constitution of South Africa imposes certain obligations on government entities (including state-owned enterprises) to ensure proper and responsible expenditure of public funds and allows such government entities to give priority to the government's socio-economic goals particularly transformation. This is given effect to through the Preferential Procurement Framework Act which imposes certain thresholds to be met by an entity seeking to do business with an SOE for example with regard to the local goods and services to be procured as part of the contract or project. The Preferential Procurement Framework Act also requires bidders to submit a certificate issued under the Codes of Good Practice prescribed by the Broad-Based Black Economic Empowerment Act. This certificate indicates what level of black economic empowerment contributor the bidder is and depending on the level, a certain score is allocated to the bid and counts towards the overall evaluation of the bid.

Financing energy and infrastructure

There are no specific procurement processes which attach to the financing of energy and infrastructure but due to the fact that a funder may end up acquiring an interest in a project or investment pursuant to the occurrence of an event of default, funders may need to consider some of the aspects raised above which affect investors. Examples of such considerations may include the conditions under which certain licenses were awarded to certain project companies or restrictions on the transferability of shares in black-owned project companies, such that the project companies remain predominantly black-owned in terms of the black economic empowerment requirements of the tender prerequisites.

What are the most common forms of funding / investing in energy and infrastructure?

Funding

Common forms of funding in energy and infrastructure are:

- **debt funding (senior, junior and mezzanine)** – both on a balance sheet basis and project finance basis; and
- **preference share funding** – this has been prominent in the renewable energy sector where the initial participants, particularly the black economic empowerment partners, were initially funded through development funding institutions (such as the Development Bank of Southern Africa and the Industrial Development Corporation) and, now that the projects are operational, are refinancing the development funding through the issue of preference shares (which entitle the holder to set dividends ahead of ordinary shareholders and to take over the issuer in the event of a default) to some of the investment banks, which results in a lower cost of funding for those investors.
Investing

The most common form of investing is through the acquisition of equity shares or concessions.

Restructuring

Enforcement and sanctions

*When can there be regulatory investigations?*

**Companies Act**

The Companies Act makes provision for any person to initiate a complaint in terms of which it is alleged that a person has acted in contravention of the provisions of the Companies Act. Upon receipt of a complaint the Companies and Intellectual Property Commission (CIPC) may elect:

- not to investigate the complaint if it appears vexatious or frivolous;
- refer the complaint to the Companies Tribunal for resolution; or
- appoint an investigator to investigate the complaint.

**Competition Act**

The Competition Commission is a statutory body constituted in terms of the Competition Act. The Competition Commission is empowered by the Competition Act to investigate, control and evaluate restrictive business practices, abuse of dominant positions and mergers in order to achieve equity and efficiency in the South African economy. One of the Competition Commission's stated objectives is to investigate and evaluate alleged anti-competitive conduct. As such the Competition Commission has wide-ranging powers to investigate any alleged or suspected anti-competitive conduct.

**FICA**

In terms of the Financial Intelligence Centre Act (FICA), an inspector may at any reasonable time and on reasonable notice enter and inspect any premises at which an 'accountable institution' (eg banks, lawyers, estate agents, insurers, casinos and forex traders) conducts its business, in order to investigate any possible non-compliance.

**Inspection of Financial Institutions Act**

Inspectors, appointed in terms of the Inspection of Financial Institutions Act (including the Registrar of Banks) have the power to investigate the affairs, or part of the affairs, of any financial institution (including registered medical schemes). Inspectors have the power to (i) summon any person and any document relating to the affairs of the financial institution and (ii) administer an oath or affirmation in order to examine any person referred to in (i). On the authority of a warrant issued by a judge or magistrate with jurisdiction, the inspector has wide ranging powers to search premises and seize documents and other evidence.

*What regulatory penalties may apply?*

**Companies Act**

In terms of the Companies Act, if the Companies and Intellectual Property Commission believes a person has contravened the Companies Act, it may issue a compliance notice to that person directing that any steps reasonably designed to rectify the contravention be taken. In the event that a company fails to comply with a compliance notice, CIPC may apply to a court for an administrative fine to be imposed.
Such administrative fine may not exceed the greater of:

- 10% of that company's turnover for the period during which the person failed to comply with the compliance notice; or
- ZAR1 million.

**Competition Act**

Section 59(2) of the Competition Act limits the maximum administrative penalty which may be imposed by the Competition Commission to 10% of that company's annual turnover (in South Africa and from its exports from South Africa) for the preceding financial year.

**Financial Intelligence Centre Act (FICA)**

The Financial Intelligence Centre has wide discretion when imposing 'administrative sanctions' within the following categories:

- a caution not to repeat the conduct which led to the non-compliance;
- a reprimand;
- a directive to take remedial action or make specific arrangements;
- the restriction or suspension of certain specified business activities; or
- a financial penalty not exceeding ZAR10 million in respect of natural persons and ZAR50 million in respect of any juristic person.

**Inspection of Financial Institutions Act**

Administrative penalties will be derived from the relevant legislation which the financial institution is found to have contravened.

*Last modified 5 Dec 2019*

**What criminal penalties may apply?**

**POCA**

The primary piece of legislation to combat organized crime, racketeering and money laundering is the Prevention of Organized Crime Act (POCA). In terms of POCA the courts may impose severe punishments in the form of fines or, in certain instances, imprisonment.

Convictions for racketeering activities can result in a fine of up to ZAR1 billion or life imprisonment being imposed.

Money laundering convictions may result in a fine of up to ZAR100 million being imposed or possible imprisonment for up to 30 years.

**Competition Act**

Any person convicted of an offence in terms of the Competition Act is liable to a fine not exceeding ZAR500,000 or to imprisonment for a period not exceeding 10 years, or to both a fine and such imprisonment.

**Companies Act**

Any person convicted of an offence in terms of the Companies Act, is liable:

- in the case of a contravention of section 213 (1) (disclosure of confidential information) or 214 (1) (false statement, reckless conduct and fraudulent conduct) to a fine or to imprisonment for a period not exceeding ten years, or to both a fine and imprisonment; or
- in any other case, to a fine or to imprisonment for a period not exceeding 12 months, or to both a fine and imprisonment.

*Last modified 5 Dec 2019*

**Tax**
Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

No stamp duty is imposed in South Africa.

Securities Transfer Tax is imposed on the transfer of securities, except as part of an intra-group asset-for-share transaction.

Intra-group transactions between related companies may result in tax roll-over provisions being applied, which allow for any tax consequences to be rolled over until the relevant assets are transferred outside of that particular group of companies.

Transfer Duty is imposed on the transfer of immoveable property, unless the transaction is subject to Value Added Tax (VAT). If the transfer of immoveable property is part of the sale of a business as a going concern between two VAT-registered persons, the transaction will be zero-rated and no VAT (or Transfer Duty) will be payable.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

The South African Revenue Service (SARS) is a preferred creditor under the Insolvency Act, 1936. However, SARS still ranks behind any secured creditors on the liquidation of a company, but ranks (with other preferred creditors) ahead of concurrent creditors.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

There is no withholding tax levied on interest payments made to South African residents.

Interest payments made to, or for the benefit of, persons not resident in South Africa (which includes individuals and natural persons) are subject to withholding tax.

If so:

What is the rate of withholding?

The withholding tax rate is 15%.

What are the key exemptions?

An exemption may be available (in whole or in part) under a double tax treaty where applicable.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding tax (if any)), assuming the lender is not
otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both Spanish and EU law.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Spain or to request that they are admitted to trading on a regulated market operating in Spain unless an approved prospectus has been made available to the public.

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Spain are bonds or notes issued on a stand-alone basis or under a program.

Many different types of debt securities are offered in Spain. Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities and high-yield bonds;
- guaranteed securities, subordinated securities, perpetual debt securities (i.e. debt securities that have no specified redemption date);
- asset-backed securities;
- derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- hybrid securities (securities with both debt and equity features);
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer);
- exchangeable bonds (debt securities convertible into the equity of a third party);
- depositary receipts (a security issued by a depositary conferring on the holders beneficial ownership of certain underlying assets held by the depositary for the holders); and
- warrants (securities giving the holders the option to purchase the equity of the issuer or a related company).

In Spain, the Real Decreto Legislativo 4/2015, de 23 de octubre, por el que se aprueba el texto refundido de la Ley del Mercado de Valores (Securities Market Law) considers as financial instruments all transferrable securities of public or private persons or entities and grouped in issues (an issuance of such securities is required). A transferable security is defined as any in rem right, regardless of its nature, which,
due to its legal configuration and rights of transfer, is capable of being traded on a financial market.

In general, debt securities which are also considered transferable securities include (but are not limited to):

- internationally issued bonds (bonos de internacionalización);
- bonds, debentures and similar securities representing part of a debt claim, including those which are convertible or exchangeable;
- mortgage covered bonds, mortgage bonds and mortgage participations;
- asset-backed securities;
- money market instruments (which means all categories of instruments which are normally traded on the money market, such as treasury bills, certificates of deposit and commercial paper, except those issued on a unique basis and excluding instruments of payment deriving from preceding commercial transactions that do not involve the capture of repayable funds);
- preference shares;
- territorial covered bonds; and
- warrants and any other derivative transferable security giving the right to acquire or sell any other transferable security or giving the right to a cash settlement determined by reference to transferable securities, currencies, interest rates or yields, commodities, credit risk or other indices or measures.

**What are the differences between offering debt securities to institutional / professional or other investors?**

The legal regime on public offerings of securities in Spain is governed by the Regulation (EU) 2017/1129 of 14 June 2017 on the prospectus to be published when securities are offered to the public and admitted to trading on a regulated market (Prospectus Regulation), the Securities Market Law and Real Decreto 1310/2005, de 4 de noviembre, por el que se desarrolla parcialmente la Ley 24/1988, de 28 de julio, del Mercado de Valores, en materia de admisión a negociación de valores en mercados secundarios oficiales, de ofertas públicas de venta o suscripción y del folleto exigible a tales efectos (Royal Decree 1310/2005).

**Definition of public offering**

According to the provisions of Article 35 of the Securities Market Law and Article 38 of Royal Decree 1310/2005, an ‘offer of securities to the public’ or ‘public offering’ means a communication to persons in any form and by any means, presenting sufficient information on the terms of the offer and the securities to be offered, so as to enable an investor to decide to purchase or subscribe for those securities.

Any offer of securities in Spain which is deemed to be considered as ‘public’ under the terms of the above referred definition, would entail the obligation for the issuer to have approved by and filed with the Comisión Nacional del Mercado de Valores (CNMV), an informative prospectus (folleto informativo), comprising:

- a registration document (documento de registro) disclosing information about the issuer;
- a securities note (nota de valores) describing the main terms and conditions of the offering; and
- a summary note (resumen) thereto (the Prospectus) (the Prospectus should be published through the CNMV's website).

**Exceptions to the definition of public offering**

Notwithstanding the above, according to the provisions of Article 35 of the Securities Market Law and Article 38 of Royal Decree 1310/2005, the obligation to publish a prospectus would not apply to the following types of offerings (which, therefore, will not be considered as public offerings):

- an offer of securities exclusively addressed to qualified investors (as defined below);
- an offer of securities addressed to less than 150 natural or legal persons per EU member state, without including the qualified
investors;

- an offer of securities addressed to investors who acquire securities for a minimum amount of €100,000 per investor, for each separate offer;
- an offer of securities the unit par value of which is not less than €100,000; and
- an offer of securities where the total consideration of the offer is less than €5 million within the EU, which limit shall be calculated over a period of 12 months.

**Private placement**

As opposed to a public offering, a private placement entails an offer to a relatively small number of selected investors as a way of raising capital. Every offer that does not qualify as a public offering will be considered a private placement. Thus, when any of the exceptions described above apply, the offer will not qualify as a public offering in Spain and, therefore, the issuer will not be required to complete any registration or filing or obtain any approval or consent from the **CNMV**, as Spanish competent authority, or from the relevant market, for making the offer available to investors in Spain.

**Qualified investors**

For the purposes of the exceptions referred to above, the principal categories of ‘qualified investors’ under Spanish law include:

- financial institutions and other entities which are required to be authorized or regulated to operate in the financial markets by a state, irrespective of whether it is a member state or a non-member state, including credit institutions, investment firms, insurance and reinsurance companies, collective investment schemes and their management companies, private equity funds, closed-ended investment schemes and their management companies, pension funds and their management companies, securitization funds and their management companies, commodity and commodity derivatives dealers and other institutional investors;
- national and regional governments, public bodies that manage public debt, central banks, international and supranational institutions such as the World Bank, the International Monetary Fund, the European Central Bank, the European Investment Bank and other institutions of a similar nature;
- companies meeting at least two of the following capacity requirements on an individual basis:
  - total balance sheet total equal to or above €20 million;
  - annual net turnover equal to or above €40 million; and
  - own funds equal to or above €2 million;
- institutional investors, beyond those specified in the bullet point above, whose main activity is to invest in securities and other financial instruments; and
- individuals and small- and medium-sized companies which request in advance to be treated as qualified investors and expressly waive their treatment as retail customers, and which are registered as such in the relevant client registries of the relevant entities providing investment services.

*Last modified 5 Dec 2019*

**When is it necessary to prepare a prospectus?**

Under the **Prospectus Regulation**, unless an exemption applies, it is necessary to publish a prospectus where there is an offer of securities to the public or an application for the securities to be admitted to trading on a regulated market.

For more information, see [Issuing and investing in debt securities – investor considerations](#).

If the offer is deemed not to be made to the public, a Prospectus Regulation compliant prospectus may still be required if an application is made for the securities to be admitted to trading on a regulated market. An exemption from both the offer to the public and the admission to trading on a regulated market is needed to avoid having to publish a prospectus.

*Last modified 5 Dec 2019*
What are the main exchanges available?

The main exchanges on which debt securities are traded in Spain are:

- the AIAF Mercado de Renta Fija, S.A.U. (AIAF); and
- the Mercado Alternativo de Renta Fija (MARF).

**AIAF**

AIAF is the Spanish regulated market for corporate debt and private bonds integrated in Bolsas y Mercados Españoles (BME is the holding company of the Spanish regulated exchanges), the Spanish securities markets operator. AIAF is a regulated market and is under the control and supervision of the public authorities in respect of its operation, admission to trading and disclosure of information.

**MARF**

MARF is the Spanish alternative bond market and considered as an alternative funding resource where different solvent companies may raise funds through the issuance of bonds. MARF adopts the legal structure of a multilateral trading facility (MTF), hence, it is considered as non-official market, similar to those that may be found in other European countries. Thus, the access requirements of MARF are more flexible than the requirements for regulated markets and, as a consequence, MARF has a greater flexibility and lower costs throughout the issuance process.

Securities which may be admitted to trade in the MARF are those exclusively targeted to qualified investors and whose nominal value is of a minimum amount of €100,000 (i.e. they do not fall under the requirement to publish a prospectus).

Is there a private placement market?

There is no private placement market in Spain.

However, every offer that does not qualify as a public offering is considered a private placement (as stated in Issuing and investing in debt securities – investor considerations).

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers are responsible for the information contained in the prospectus, and they may face both civil and criminal liability in respect of the inaccuracy of such information.

With respect to civil liability, the civil liability of the Issuer relates to the content of the prospectus and is contained in article 38 of the Securities Markets Law and articles 32 to 37 of the Royal Decree 1310/2005. However, this liability is only applicable when Spain is the home member state (i.e., when the Comisión Nacional del Mercado de Valores (Spanish Securities and Exchange Commission, CNMV) is the competent authority approving the prospectus).

In relation to criminal liability, the Spanish Organic Act 10/1995, dated 23 November, on the Criminal Code (the Criminal Code) includes a specific criminal offence which may affect issuers if the relevant securities are admitted to trading in a Spanish regulated market or multilateral trading facility. Article 282 bis of the Criminal Code provides that:

> [...] those who, as de facto or de jure managers of a company that issues securities admitted to trading on securities markets, falsify the economic-financial information contained in a prospectus used to issue any financial instruments or information that the company must publish and make known pursuant to securities market legislation, concerning its resources, activities and present
Investing in debt securities

Issuance of debt securities will qualify as a public offer, if:

- their terms and conditions are governed by Spanish law or by a non-EU or non-OECD country; and
- they are offered in Spain or admitted to trading in a Spanish regulated market or multilateral trading facility requiring a bondholder’s syndicate and the appointment of a commissioner, who will be the legal representative of the bondholders’ syndicate (there is also a requirement to convene investor meetings at the request of bondholders which represent, at least, 5% of bonds issued and not repaid).

The directors of the issuer and the commissioner may convene investors meetings. The investors meetings have to approve any modification to the terms and conditions of the bonds by majority. A reinforced majority is required to the amendment to the term redemption conditions of the bonds, and conversion or exchange of the bonds.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally

Establishing a fund, offering fund securities and operating a fund, among other things, are regulated activities under the Collective Investment Schemes Law (CIS) Law and the Close-ended Collective Investment Law and are therefore subject to regulation by the Comisión Nacional del Mercado de Valores (Spanish Securities and Exchange Commission, CNMV).

The CIS Law regulates open-ended collective investment schemes. The Close-ended Collective Investment Law regulates close-ended collective investment entities.

Open-ended collective investment schemes

The CIS Law defines CIS as entities whose corporate purpose is raising funds, assets or rights from the public in order to manage and invest in assets, rights, securities or other instruments, financial or otherwise, provided that the investor’s yield is established in accordance with the collective results.

Close-ended collective investment entities

The Close-ended Collective Investment Law defines close-ended collective investment as the investment carried out by venture capital entities and other collective investment entities whose divestment policy fulfils the following requirements:

- such divestments are made simultaneously for all investors; and
- the yield obtained by each investor is in accordance with the rights which correspond to each investor, according to the terms set forth in the by-laws or regulations of the entity for each class of shares or units.

What are common fund structures?
Open-ended collective investment schemes (open-ended CIS)

Open-ended CIS can have the form of investment company or investment fund (separated pool of assets with no legal personality, belonging to a number of investors, whose management and representation is carried out by a management company).

Open-ended CIS can also be of a financial nature or not, depending on the investments made. Open-ended CIS of a non-financial nature are those which invest in real estate assets.

Open-ended CIS may have restrictions in their investments. Therefore, open-ended CIS can qualify as UCITS or as non-UCITS, for the purposes of the Undertakings for Collective Investment in Transferable Securities Directive (2009/65/EC). Non-UCITS open-ended CIS are also called hedge funds. Hedge funds can be pure hedge funds or funds of hedge funds.

Close-ended collective investment entities

Close-ended collective investment entities can also take the form of an investment company or an investment fund. Close-ended collective investment entities can take two forms, depending on the nature of their investments:

- **venture capital entities** – which have as their corporate purpose the investment in non-listed companies different from financial or real estate companies; and

- **other close-ended collective investment entities** – which can invest in all kind of assets, in accordance with a defined investment policy.

All close-ended collective investment entities qualify as alternative investment funds, as per the definition of the Alternative Investment Fund Managers Directive (2011/61/EU).

Last modified 5 Dec 2019

What are the differences between offering fund securities to professional/institutional or other investors?

Definition of marketing and reverse solicitation

Under the Collective Investment Schemes (CIS) Law and the Close-ended Collective Investment Law, offering/marketing of funds means attracting clients through an advertising campaign, by the CIS/close-ended collective investment entity or any other entity acting on its behalf or on the marketing entity’s behalf, in order to raise funds, assets or rights to the CIS/close-ended collective investment entity.

For these purposes, marketing of funds shall be understood as any form of communication addressed to potential investors in order to promote, either directly or through third parties acting on behalf of the CIS/close-ended collective investment entity or on behalf of the management company of the CIS/close-ended collective investment entity, the subscription or acquisition of units or shares of the CIS/close-ended collective investment entities. In any case, there is marketing of funds when the CIS/close-ended collective investment entities or their management company approaches the investors through phone calls, home visits, personalised letters, emails or any other electronic means, which are part of a marketing and promotional campaign.

A marketing of promotional campaign in Spain means any campaign addressed to investors resident in Spain. In case of email or any other electronic means, the offer is deemed to be addressed to investors resident in Spain when the CIS/close-ended collective investment entity or their management company, or any person acting on their behalf through the electronic means:

- proposes the purchase or subscription of the shares or units; or

- furnishes to residents in Spain all the necessary information regarding the characteristics of the offer and how they can subscribe to the offer.

In light of the above, in the event that Spanish resident investors are contacted for the purposes of offering units or shares in a fund, this will be considered as marketing. If, on the contrary, a Spanish resident investor has requested the investment upon his/her own initiative, this would not be deemed as an offer (ie this would be a reverse solicitation).

Offering of funds to retail and professional investors
Open-ended CIS qualifying as UCITS can be offered/marketed to retail investors without limitation. However, non-UCITS open-ended CIS and close-ended collective investment entities can only be offered/marketed to professional investors with the following exceptions:

- funds of hedge funds can be offered to retail investors;
- hedge funds and close-ended collective investment entities can be offered/marketed to retail investors if:
  - such investors undertake to invest at least €100,000; and
  - such investors make an statement in writing declaring they are aware of the risks inherent with such investment (this exception is not applicable to hedge funds which invest in invoices, loans, or hedge funds which grant loans (these can only be offered/marketed to professional investors);
- venture capital entities can also be offered/marketed to retail investors if:
  - the investors are managers, directors or employees of the manager of the venture capital entity;
  - the investors ordinarily invest in listed venture capital entities; and
  - the investors have experience in these types of investments, i.e., management or advisory experience regarding a similar venture capital entity to that in which they want to invest.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

Managing funds is a regulated activity under the Collective Investment Schemes (CIS) Law and the Close-ended Collective Investment Law and therefore subject to authorization. For more information, see Managing and marketing debt and hedge funds – marketing restrictions.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

For more information, see Establishing and investing in debt and hedge funds – investor considerations.

Generally in Spain, the marketing of funds is regulated under the Undertakings for Collective Investment in Transferable Securities Directive regime or under the Alternative Investment Fund Managers Directive regime.

Undertakings for Collective Investments in Transferable Securities (UCITS)

UCITS, including those established in Spain, have an EU passport which enables fund promoters to create a single product for marketing in all EU member states and on the completion of the appropriate notification procedure, a UCITS established in one member state can be sold in any other.

A UCITS intending to market in another member state must complete and submit to its home regulator a notification including certain specified information, including copies of key investor documents. The home regulator then completes a notification file which is sent in a regulator-to-regulator transmission, following which the UCITS can be sold in the other member state.

Alternative Investment Funds (AIFs)

Under the Alternative Investment Fund Managers Directive, marketing is defined as: a direct or indirect offering or placement at the initiative of the Alternative Investment Fund Manager (AIFM) or on behalf of the AIFM of units or shares in an AIF if it manages to or with investors domiciled or with a registered office in the European Union.

An AIFM may only market an AIF to EU investors if it is authorized by a relevant EU regulator – registration with one EU regulator opens
access, subject to certain further limited conditions, to marketing to professional investors across the EU under a EU passport or if it complies with national private placement regimes (where available).

Last modified 5 Dec 2019

Are there any restrictions on managing a fund?

Fund management in Spain is regulated under the Collective Investment Scheme (CIS) Law and Close-ended Collective Investment Law, their developing regulation and the Comisión Nacional del Mercado de Valores (Spanish Securities and Exchange Commission, CNMV) Rules. The CNMV is responsible for regulating funds, fund managers and those marketing funds and any legal or natural person is prohibited from carrying on regulated activities, such as fund management, without authorization.

Various restrictions arise on manager structuring/compensation and profit-sharing arrangements as a result of the regulations and any manager that is subject to the remuneration rules must apply those rules proportionate to its size, internal organization and scope and complexity of its activities. The rules impact on, among other things, reporting, equity remuneration, deferred compensation arrangements and clawback.

Alternative Investment Fund Managers (AIFMs) are also subject to regulation under the Alternative Investment Fund Managers Directive (as implemented in Spain by the Close-ended Collective Investment Law) and managers of Undertakings for Collective Investments in Transferable Securities (UCITS) are subject to certain requirements under the Undertakings for Collective Investment in Transferable Securities Directive (as implemented in Spain by the CIS Law). Full CNMV registration involves a significant authorization process – three-to-six months from completion of the application which must include:

- for the manager, information on senior personnel (must be suitable persons etc), organizational structure, policies and procedures, remuneration practices; and
- for each fund, investment strategy, constitutional documents, depositary information and disclosure requirements.

However, AIFMs based in Spain may be exempted from full regulation on certain grounds, including managing assets under €500 million where assets are not leveraged and investors have no redemption rights for five years, and managing assets under €100 million including assets acquired through leverage. Exempted managers must still register with the regulator, are subject to limited reporting and it should be noted that they do not benefit from the general passporting for marketing purposes.

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

Unless an exemption or exclusion applies, a person entering into a derivatives contract by way of business in Spain (such as a dealer) will ordinarily have to be authorized under the Securities Market Law, as such activity would be deemed as dealing on own account on financial instruments.

One of the key exclusions to the requirements above applies to persons who only deal in derivatives for risk management purposes. The European Market Infrastructure Regulation applies to all derivative transactions and requires transactions to be reported to regulators, for transactions between dealers to be cleared or subject to other risk mitigation techniques such as initial margin and variation margin requirements.

Last modified 5 Dec 2019

What are common types of derivatives?

Derivative contracts are entered into in Spain for a range of reasons including hedging, trading and speculation.

Derivatives may be traded over-the-counter or on an organized exchange.
All of the main types of derivative contract are widely used in Spain:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying asset seen in Spain are:

- interest rates;
- equity;
- fixed income instruments;
- commodities;
- foreign currency; and
- credit events.

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007-to-2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. The European Commission has sought in particular, to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative position;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen and continues to see the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

There has been a number of national courts decisions (even from the Spanish Supreme Court confirming the jurisprudence) within the last years in relation to derivatives entered into with non-institutional/professional borrowers (mainly, consumers) in which the hedge provider has been sentenced to pay large sums given that, pursuant to the decisions, there was an error of understanding and a lack of information on the side of the borrower and, therefore, it executed the derivative not being duly aware of its possible consequences and costs (the courts understand that the providers, inter alia, breached any information requirements, ignored the financial knowledge of the customer and/or made available complex documentation and contracts without the due explanation of the underlying products). As a result, the institutions offering derivatives are nowadays really keen on their duties of information and clear documentation (including several pre-signing processes) and have ceased to offer certain kinds of products which were contentious.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending
Lending is only a regulated activity in relation to mortgages and consumer lending. In these circumstances, a lender that is not a credit institution or other entity registered with the Bank of Spain is required to register on a special administrative public registry before its commencing such lending activity (for foreign entities, the relevant registry is the State Registry created for this purposes within the Consumer General Directorate, or Dirección General de Consumo). There is no prior licensing requirement so this is a simple registration process.

Mortgage and consumer financing agreements are subject to a range of regulatory requirements that do not apply to unregulated loans. For example, for regulated mortgage contracts, there are particular restrictions around how:

- the loans are marketed, originated and sold;
- lenders administer the loans on an ongoing basis; and
- to deal with borrowers who fall behind with their payments.

Furthermore, regulated financing agreements have specific requirements around the information that shall be provided to the borrowers before the execution of the loan and during its life, how the agreement is drafted and formatted and what information must be included. In addition, borrowers under mortgage and consumer loans enjoy certain rights that they do not enjoy in case of non-regulated loans.

As far as exchange control regulations are concerned, there will be reporting requirements to the Bank of Spain on a Spanish resident who receives funds from a non-Spanish resident. The Spanish resident must comply with such reporting requirements (for statistical and information purposes only), if any, on a periodic basis. The timing of the reporting obligations depend on certain thresholds.

There are no additional restrictions that apply to foreign lenders making loans available to Spanish borrowers.

### Borrowing

While borrowers are generally not regulated, it is advisable for borrowers to consider whether either the mortgage or consumer lending regimes apply to their activities, in which case they will benefit from the protections mentioned above.

---

**What are common lending structures?**

Lending in Spain can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A financing can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents which fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Facilities will be structured to achieve specific objectives, e.g. term loans, revolving credit facilities, working capital loans, equity bridge facilities, project facilities and letter of credit facilities.

Within the last years, it has become increasingly popular to finance certain transactions (usually LBOs) through private placements issued by the borrower, which are subscribed by Alternative Capital Providers (instead of usual credit institutions). For more information, see [Private placement](#).

### Facility durations

The duration of a facility can also vary between:

- a term loan or credit facility, provided for an agreed period of time but with a short availability period;
- a revolving credit facility, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
• a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Facility security

A facility can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

Facility repayment

A facility can also be repayable on demand, on an amortizing basis (in instalments over the life of the facility) or scheduled (usually meaning the facility is repayable in full at maturity).

What are the differences between lending to institutional / professional or other borrowers?

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

By contrast, lending in the context of mortgages and to consumers is a regulated activity and so additional protection will be afforded to borrowers. For more information, see Lending and borrowing – restrictions.

Do the laws recognize the principles of agency and trusts?

No, the concept of a trust or a split between legal ownership and beneficial ownership is not generally recognized under Spanish law. Therefore, for instance, if security is granted in favor of a security agent or security trustee instead of each of the creditors, there is a risk that the Spanish courts may consider that the security agent or security trustee may only enforce the security in respect of the amounts owed individually to such security agent or security trustee under the secured obligations, but not in respect of the amounts owed to the other secured creditors. Therefore, it is highly advisable that, if possible, the security is granted in favor of all the relevant creditors.

Regarding the agency role, it is possible to appoint an agent to act on behalf of other lenders. This appointment will be principally for administrative purposes however, for example for the purposes of receipt of notices on behalf of each of the lenders.

Are there any other notable risks or issues around lending?

Generally

Facility agreements and other finance documents are subject to general contractual principles and laws. For example, the Spanish courts have, in relation to payment obligations, the discretion to grant cure periods and to moderate the enforcement of any event of default having consideration to the debt and economic circumstances.

In relation to defaults, Spanish courts are reluctant to accept the early termination of a loan or the enforcement of security for reasons apart from non-payment of the financing or, in some cases, material defaults (e.g. financial covenants).

Specific types of lending

MORTGAGE LOANS

Specific to the area of mortgage lending is the issue of the Mortgage Credit Directive, which has been implemented in Spain through Law 5/2019, dated 15 March. This directive aims to prevent the irresponsible lending and borrowing practices that were exposed during the global financial crisis. The Law 5/2019 applies to mortgage loans granted for the purpose of acquiring or renovating a residential dwelling,
or acquiring property rights over land plots or buildings. It imposes a number of requirements on real estate lenders, including the need to:

- conduct affordability tests before lending;
- provide standard information about the mortgage to enable borrowers to compare products; and
- ensure that staff are suitably trained.

A lender is only entitled to declare the early termination of the loan on the grounds of non-payment of monies due in the event that this has been provided for in the loan agreement and duly recorded at the Land Registry. In the absence of an early termination clause duly recorded at the Land Registry, the lender is only entitled to claim the principal and interest overdue but not the whole amount of the loan. If the mortgaged property is transferred before the payment of any overdue instalment and there are other instalments not yet due, the property will be transferred subject to the mortgage corresponding to that part of the loan pending payment.

Early termination of the loan cannot be declared (and therefore security may not be enforced) unless the default in payment extends to (i) 3% of the total amount of the loan or 12 monthly instalments, if default occurs in the first half of the term of the loan; or (ii) 7% of the total amount of the loan or 15 monthly instalments, if default occurs in the second half of the term of the loan.

Law 5/2019 also applies to real estate credit intermediaries who are defined as any natural or legal persons that, not acting as a lender nor a notary public, engage in a commercial or professional activity, in return for remuneration, whether pecuniary or in any other form of agreed economic benefit, consisting in bringing a natural person into direct or indirect contact with a real estate lender. Real estate credit intermediaries are subject to registration and supervision requirements.

This law also regulates the advisory service provided by the real estate lender or credit intermediary. The advisory service in relation to the real estate loan is a separate activity from the granting and intermediation of real estate loans.

Consequently, real estate advice is configured as an ancillary activity to the real estate loan or intermediation, so that it can only be provided by those who are registered as lenders or intermediaries.

Regarding the registration regime, depending on the geographical scope of action of the real estate credit intermediary or lender, lenders and real estate credit intermediaries must be registered with the Bank of Spain or with the competent body of each Autonomous Community.

The Bank of Spain shall be responsible for the management of the registration of:

- real estate credit intermediaries and lenders that operate or are going to operate with borrowers with domiciles located throughout Spain or in the territorial area of more than one Autonomous Community, provided that they have their head office in Spain, regardless of whether they additionally operate or are going to operate through a branch or under the freedom to provide services in other EU States, and

- real estate credit intermediaries and lenders who are going to operate in Spain through a branch or under the freedom to provide services, whatever the geographical area in which they are going to carry out their activity.

The management of the registration of real estate credit intermediaries and lenders that operate or are going to operate exclusively with borrowers domiciled within the territorial scope of a single Autonomous Community shall correspond to the competent body of said Autonomous Community, provided that the headquarters of its central administration is located in the same.

Credit institutions and Spanish branches of foreign credit institutions providing services subject to Law 5/2019 are exempted from the obligation to register, as they are already authorized and registered in their condition of credit institutions.

LEVERAGED LENDING

In case of leverage lending, it is important to bear in mind the issue of any potential financial assistance. For more information, see Giving and taking guarantees and security.

Last modified 5 Dec 2019

Are there any other notable risks or issues around borrowing?

Borrowers should be aware of the potential implications of the EU's Bank Recovery and Resolution Directive (BRRD) which outlines certain
measures for dealing with failing financial institutions, and which was implemented in Spain by Law 11/2015, of 18 June, on the Restructuring and Resolution of Credit Institutions and Investment Firms.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to ‘bail in’ obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. ‘Bail in’ describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of Spanish or other EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

There are some reporting requirements when a Spanish resident receives funds from a non-Spanish entity. All Spanish residents shall report to the Bank of Spain:

- own-account transactions with non-residents, however structured and/or settled (i.e. through accounts of residents in Spain or abroad, or through cash delivery); and
- the relevant balance of their total foreign assets and liabilities.

There is no requirement for Spanish residents to report to the Bank of Spain when the total aggregate amount of such transactions with foreign entities is less than €1,000,000 in any year, unless the Bank of Spain has specifically requested a report to be submitted.

Last modified 5 Dec 2019

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the giving of guarantees and security are as follows.

Capacity

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors’ powers that would be preventative. The safe approach is often to have the directors of the company approve the giving of the guarantee or security by resolution. Likewise, if the guarantee or the security is going to encumber an asset which is considered as ‘essential’ for the relevant company (an asset shall be considered as essential if its value exceeds 25% of the total value of the assets of the company according to the latest approved balance sheet), the approval of the shareholders’ must be also obtained by resolution.

Fiduciary duties

Although Spanish law does not recognize a legal concept of ‘corporate benefit’, there might be a breach of fiduciary duties by the directors of a Spanish company giving a guarantee or security to the extent that the transaction pursuant to which the guarantee or security is given is not found to result in the ultimate corporate benefit of the company (the referenced directors must act diligently and loyally in the best interest of the company (i.e., judgement business rule and risk/benefit approach) and, in any case, in accordance with any applicable laws and the company's by-laws).

Insolvency

Pursuant to the Spanish Insolvency Law, any agreement entered into by a Spanish company within the two-year period preceding the adjudication of bankruptcy may be set aside by the relevant insolvency court if the insolvency officials can prove that it was detrimental to the insolvent estate

Upstream restrictions

Spanish private limited liability companies (sociedades de responsabilidad limitada) cannot grant loans, issue guarantees or provide
financial assistance in favor of shareholders or directors, unless such transactions have been authorized on a case-by-case basis at the shareholders' meeting.

**Financial assistance**

Under Spanish law, the scope of the financial assistance prohibition varies depending on the corporate nature of the relevant company:

- a public limited liability company (sociedad anónima) may not advance funds, grant loans, grant guarantees/security or provide any kind of financial assistance whatsoever for the acquisition of its shares or of the shares of its parent companies (sociedades dominantes).
- a private limited liability company (sociedades de responsabilidad limitada) may not advance funds, grant loans, grant guarantees/security or provide any kind of financial assistance whatsoever for the acquisition of its shares or of the shares of any of its group companies.

Breach of financial assistance regulations may result in fines for the directors of the company granting the guarantee or security, and may also result in the guarantee or security or the relevant underlying transaction being deemed void. Any objection to the financial assistance must be invoked by the shareholders (usually minority shareholders) or the company's creditors.

Last modified 5 Dec 2019

**What are common types of guarantees and security?**

**Common forms of guarantees**

There are two common forms of guarantees used in Spain.

**GUARANTEE (FIANZA)**

A guarantor undertakes to pay the guarantee obligation if the borrower fails to pay. The guarantor's liability with respect to the borrower can be either:

- **subsidiary (subsidiaria)** – the guarantor is only required to pay if the borrower fails to do so; or
- **joint and several (solidaria)** – the creditor may claim against the debtor or the guarantor at the same time.

As to each guarantor's liability with respect to other guarantors, it can be can be either:

- **several (mancomunada)** – each guarantor would only be required to pay up to the obligations expressly guaranteed by such guarantor; or
- **joint and several (solidaria)** – each guarantor would be liable for the total amount of the guaranteed obligations.

Usually, the guarantor's liability is joint and several (both with respect to the borrower and the remaining guarantors).

**FIRST DEMAND GUARANTEE (GARANTÍA A PRIMER REQUERIMIENTO)**

A guarantor undertakes to pay the guarantee obligation at any time, upon first demand from the relevant creditor, if the relevant conditions set out in the guarantee clause or agreement are met, without any further requirements or exceptions (other than willful misconduct of the creditor). The guarantee is autonomous and independent from the guaranteed obligation.

First demand guarantees are the most common form of guarantee used in Spanish wholesale financing transactions.

**Common forms of security**

There are two main types of security in rem available for creditors: mortgages (hipotecas) and pledges (prendas).

**MORTGAGE**

A mortgage may be sub-categorized as:
• a mortgage over real estate assets (hipoteca inmobiliaria); and
• a mortgage over movable assets (hipoteca mobiliaria).

PLEDGE

A pledge may be sub-categorized as:

• a pledge without delivery of possession (prenda sin desplazamiento); and
• a pledge with delivery of possession (prenda con desplazamiento).

The nature of the security taken will depend on the asset expressed to be subject to such security.

In this regard:

• Movable assets which may be subject to a mortgage include intellectual and industrial property rights, industrial machinery, commercial establishments, motor vehicles, tramways, train carriages and aircrafts.

• Movables assets which may be subject to a pledge without delivery of possession include machinery, stored merchandise, raw materials, agricultural machinery, works of art, credit rights arising from permits, licenses and authorizations, subsidies or from other agreements with governmental authorities, and other credit rights not represented by securities and not qualifying as financial instruments for the purposes of Royal Decree-Law 5/2005 of 11 March 2005, implementing Directive 2002/47/EC of the European Parliament and the Council of 6 June 2002 on financial collateral arrangements.

• Movable assets which may be subject to a pledge with delivery of possession include shares, quotas, credit rights, receivables and bank accounts.

When the creation of security triggers a significant amount of stamp duty tax and the relevant assets are not significant in the context of the transaction, it is standard market practice to grant a promissory security over the such relevant assets.

The promissory security does not grant to the beneficiary any in rem right over the asset expressed to be subject thereto, until:

• the relevant security is effectively granted; and
• each of the actions required for the perfection of the security is fully performed.

Finally, it is relevant to note that Spanish law permits the creation of guarantees and security interests in favor of future obligations (such as, those arising under the hedging agreements if not signed at closing of a transaction), provided that the main features defining the relevant future obligation are duly determined at the date of creation of the guarantee or security interest.

Are there any other notable risks or issues around giving and taking guarantees and security?

General considerations

In general terms, under Spanish law, any guarantee, pledge or mortgage must guarantee or secure another obligation to which they are ancillary and which must be clearly identified in the relevant guarantee or security agreement. Therefore, the guarantee or security will follow the underlying obligation in such a way that the invalidity of the underlying obligation entails the invalidity of the guarantee or security, and termination of the underlying obligation will entail cancellation of the guarantee or security.

Giving or taking security

FORMALITIES AND REQUIREMENTS

As a general rule, pledges with delivery of possession (prendas con desplazamiento) over shares, quotas, credit rights, receivables and/or bank accounts must comply with the following requirements in order to be perfected:

• Notarization (by means of a deed (póliza) or a public deed (escritura pública) is required.
In relation to share pledges, the pledgor should deliver the share certificates (títulos múltiples) to the secured creditor or to a third party acting as custodian (usually, the agent or security agent) and it is particularly advisable to record the creation of the pledge on the share certificates. Those share certificates shall be kept by the secured creditor or the custodian until the cancellation of the pledge, when they shall be returned to the shareholder.

In relation to quotas’ pledges, quotas are not physically represented (there are not quotas certificates) so they cannot physically be delivered to the secured creditor or to a third party custodian so, in order to render the pledge effective, notice to the company shall be given and the pledge recorded in the (physical or electronic) book registry of quota holders (socios), kept by the company, and it is advisable to record the creation of the pledge on the public document evidencing the ownership of the quotas.

Notification to the relevant company, relevant counterpart and/or depository bank is not required for perfection purposes but advisable in order to ensure that, upon enforcement, payments are made to the account designated by the beneficiary).

In relation to bank accounts, although the pledgor may be allowed to deal with the account in the course of its business (unless otherwise agreed, usually until a default takes place), it is compulsory to keep a positive balance in the bank account during the life of the pledge and some sort of control over the account (it is usually opened with the secured creditor or such secured creditor is able to control certain actions of the depository bank) to justify the delivery of possession.

In relation to shares and/or quotas, the pledgor will retain voting rights and the rights to receive payment of dividends until enforcement, unless otherwise agreed in the pledge agreement.

Likewise, as a general rule, mortgages over real estate assets (hipotecas inmobiliaria), mortgages over movable assets (hipotecas mobiliaria) and pledges without delivery of possession (prendas sin desplazamiento) must comply with the following requirements in order to be perfected:

- The mortgages must be documented in a public deed (escritura pública) while the pledges may be documented in a deed (póliza) or a public deed (escritura pública), as the case may be.
- The assets must be adequately described and identified, as necessary, in the security documents.
- There must be due registration within the relevant Land and/or Moveable Assets Registry, as applicable (until the public document is duly registered, the relevant security will not be perfected).
- As regards floating mortgages (i.e., real estate mortgages securing multiple obligations), beneficiaries of such floating mortgages must always be ‘credit entities’ (i.e., those set out in article 2 of Law 2/1981 of 25 March, regulating the mortgage market), regardless of whether they are Spanish or foreign credit entities (such requirement would also apply to any assignee of a loan secured by a floating mortgage).

In relation to all the above, if the security is documented in a public deed (escritura pública), notarial and registration fees (as appropriate), along with stamp duty, shall apply. However, if the security is documented in a deed (póliza), no stamp duty will be levied.

With regard to registrar and notary fees, these are set by the government and are based on a sliding scale, although notary’s fees can be negotiated down if the value of the transaction exceeds €6 million.

With regard to stamp duty rates, this will depend on the region where the asset is located (rates vary from 0.5% to 1.5%). The stamp duty rate is calculated over the relevant secured amount.

ENFORCEMENT

Spanish law provides for specific enforcement proceedings in respect of each type of security referred to in sub-question above. However, as a general rule, enforcement proceedings will usually be based on a sale at public auction of the relevant asset, conducted either by a Court or by a Spanish Notary (or, in certain cases, a specialized entity), while the proceeds obtained out of the auction process shall be used to repay the secured liabilities.

In this regard, in order to be able to proceed to the enforcement of any security governed by Spanish law through summary enforcement proceedings, a so called ‘liquidity clause’, which complies with the formal requirements set out in Spanish Procedural Law, shall be included in the relevant secured financing agreement (whether it is governed by Spanish law or otherwise). Additionally, notarization of the underlying financing agreement (and sworn translation into Spanish if drafted in a different language) is also a pre-requisite in order to benefit from summary enforcement proceedings.

INSOLVENCY CONSIDERATIONS
Upon declaration of insolvency of a Spanish company, no security interests over assets of such insolvent company which are ‘necessary for the continuity of its business or professional activity’ can be enforced (this will also apply to enforcement proceedings commenced before the declaration of the bankruptcy will also be held up) until the earlier of:

• the date on which an agreement (convenio) which does not prevent the enforcement of the relevant security interest has been reached between the insolvent company and its creditors; and

• the date on which one year has elapsed after the declaration of insolvency.

Although the Spanish Insolvency Law does not include a definition of assets which are ‘necessary for the continuity of its business or professional activity’, shares or quotas of project finance SPVs will not fall into that category. There are no clear rules followed by the Spanish Courts in relation to the assessment of when an asset shall fall into such category, so an analysis on a case by case basis will be required.

Receivers of the insolvent company may prevent any security interest being enforced after the end of the above referred ‘stay period’ by immediately paying the relevant secured amounts, including an undertaking to pay amounts which become due in the future under the relevant agreement as ‘claims against the insolvency estate’ (créditos contra la masa) (provided that, should a receiver fail to pay future claims as they become due, the secured creditor will be entitled to enforce the relevant security interest).

Any claims owed by an insolvent company to a ‘related party’ will be regarded as subordinated claims. Moreover, any security interest granted by the insolvent in favor of the ‘related party’ will be set aside by the court.

Any transaction entered into by the insolvent company within the two years immediately preceding the declaration of insolvency which are deemed as ‘detrimental to the insolvency estate of the debtor’ may be set aside by a receiver.

The Spanish Insolvency Law does not provide for a definition of ‘detrimental to the insolvency estate of the debtor’, however, it presumes that the following transactions will be detrimental:

• transactions involving donations or prepayments in respect of obligations which otherwise would be due after the adjudication of bankruptcy (this presumption does not permit the submission of evidence to the contrary);

• transactions between the insolvent and related parties (this presumption allows for the submission of evidence to the contrary); and

• granting by the insolvent of in rem security in relation to pre-existing non-secured obligations (this presumption allows for the submission of evidence to the contrary).

In any other case, the burden of proof will be on the person or entity arguing that the transaction is detrimental to the insolvency estate of the debtor.

Notwithstanding the above, new security granted in the context of a refinancing process shall not be subject to rescission (save in the case of fraud), so long as the refinancing process/agreement complies with the following requirements:

• the refinancing agreement creates a ‘significant increase’ of the funds available to the borrower, or a modification of the terms by extending the maturity date or by entering into new obligations that replace existing obligations;

• the refinancing agreement must have been reached as a result of a viability plan ensuring the solvency of the debtor in the short and medium term;

• the refinancing agreement is approved by creditors representing at least the 60% of the total value of the liabilities (certified by the company’s auditor) at the time the refinancing agreement is executed; and

• the refinancing agreement and any other ancillary documents must be set out in a public document.

These rules apply to the validity of the refinancing agreement itself, as well as to any other obligation and/or payment deriving from or connected with such refinancing. It is also worth mentioning that the exception to the general rule of rescission shall also apply to other transactions where the above-mentioned requirements have been fulfilled prior to the application for insolvency proceedings.

Financial regulation
Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Law 10/2014, dated 26 June, on the management, supervision and solvency of credit entities (Ley 10/2014, de 26 de junio, de ordenación, supervisión y solvencia de entidades de crédito) (banking regulation)

Royal Legislative Decree 4/2015, dated 23 October, which enacts the consolidated text of the Securities Market Law (Real Decreto Legislativo 4/2015, de 23 de octubre, por el que se aprueba el texto refundido de la Ley del Mercado de Valores) (securities markets)

Royal Decree-Law 21/2017, dated 29 December, on urgent measures for the adaptation of the Spanish legislation to the EU legislation on securities market (Real Decreto-ley 21/2017, de 29 de diciembre, de medidas urgentes para la adaptación del derecho español a la normativa de la Unión Europea en materia del mercado de valores) (securities markets)

Law 11/2015, dated 18 June, on the recovery and resolution of credit entities and investment services companies (Ley 11/2015, de 18 de junio, de recuperación y resolución de entidades de crédito y empresas de servicios de inversión) (recovery and resolution)

Royal Decree-Law, dated 11 March, on the urgent measures to encourage productivity and improve public sector procurement (Real Decreto-ley 5/2005, de 11 de marzo, de reformas urgentes para el impulso a la productividad y para la mejora de la contratación pública) (collateral and close-out netting)

Consumer credit

Law 16/2011, dated 24 June, on credit agreements for consumers (Ley 16/2011, de 24 de junio, de contratos de crédito al consumo) (credit agreements for consumers)

Mortgages

Law 2/2009, dated 31 March, which regulates contracting with consumers of mortgage loans or mortgage-backed facilities and brokering services for loan or credit facility agreements (Ley 2/2009, de 31 de marzo, por la que se regula la contratación con los consumidores de préstamos o créditos hipotecarios y de servicios de intermediación para la celebración de contratos de préstamo o crédito) (mortgages with consumers)

Law 5/2019, dated 15 March, on real estate credit agreements (Ley 5/2019, de 15 de marzo, reguladora de los contratos de crédito inmobiliario) (mortgages with consumers)

Corporations

Royal Legislative Decree, dated 2 July, by virtue of which it is enacted the consolidated text of Companies Law (Real Decreto Legislativo 1/2010, de 2 de julio, por el que se aprueba el texto refundido de la Ley de Sociedades de Capital) (companies law)

Funds and platforms

Undertakings for Collective Investment in Transferable Securities Directive (2009/65/EC) (Directiva 2009/65/ce del parlamento europeo y del consejo de 13 de julio de 2009 por la que se coordinan las disposiciones legales, reglamentarias y administrativas sobre determinados organismos de inversión colectiva en valores mobiliarios) (UCITS funds)

Law 35/2003, dated 4 November, on the Collective Investment Schemes (Ley 35/2003, de 4 de noviembre, de Instituciones de Inversión
Colectiva) (collective investment schemes)

Law 22/2014, dated 12 November, which regulates venture capital companies, close-ended collective investment entities and management companies of close-ended collective investment entities, and which amends Law 35/2003, dated 4 November, on Collective Investment Schemes (Ley 22/2014, de 12 de noviembre, por la que se regulan las entidades de capital-riesgo, otras entidades de inversión colectiva de tipo cerrado y las sociedades gestoras de entidades de inversión colectiva de tipo cerrado, y por la que se modifica la Ley 35/2003, de 4 de noviembre, de Instituciones de Inversión Colectiva) (closed-ended collective investment entities)

Other key market legislation

Bank Recovery and Resolution Directive (2014/59/EU) (Directiva de Reestructuración y Resolución) (recovery and resolution)
Capital Requirements Regulation (Regulation (EU) 575/2013) (Reglamento de Requisitos de Capital) (capital requirements)
European Market Infrastructure Regulation (Regulation (EU) 648/2012) (Reglamento de Infraestructura Europea del Mercado) (derivatives)
Market Abuse Regulation (Regulation (EU) 596/2014) (Reglamento de Abuso de Mercado) (market abuse)
Markets in Financial Instruments Directive (2014/65/EU) (Directiva de Mercados de Instrumentos Financieros) (financial instruments)
Markets in Financial Instruments Regulation (Regulation (EU) 600/2014) (Reglamento de Mercados de Instrumentos Financieros) (financial instruments)

Regulatory authorization

Who are the regulators?

The Comisión Nacional del Mercado de Valores (Spanish Securities and Exchange Commission, CNMV) is the conduct regulator for firms providing investment services and fund managers in both retail and wholesale markets, and also the prudential regulator for investment firms and fund managers. It is also responsible for enforcing the market abuse and listing regimes.

The Bank of Spain is responsible for the prudential regulation of credit institutions, payment and e-money service providers, financial credit establishments and real estate lenders and intermediaries. It is also the conduct regulator for firms providing banking, payment and e-money services, financial credit establishments and real estate lenders and intermediaries.

What are the authorization requirements and process?

Depending on the type of firm, a firm must apply to the Comisión Nacional del Mercado de Valores (CNMV) or Bank of Spain for authorization or registration, as the case may be.

The regulators must assess whether the application meets the required threshold conditions within six to twelve months (depending on the kind of entity) of the submission of the complete application.

The application fee depends on the type of the application ranging from €2,500 to €10,000.

The regulators will also approve key individuals (e.g. senior management) in their roles.

Authorized firms are listed on the Bank of Spain's register and CNMV's register.

What are the main ongoing compliance requirements?

Threshold conditions (such as having adequate financial resources and compliance arrangements in place) are an ongoing compliance
requirement for authorized firms.

Failure to comply with the threshold conditions and more detailed regulatory rules can result in sanctions for firms and regulated individuals, and loss of regulated status.

Last modified 5 Dec 2019

What are the penalties for failure to be authorized?

A person undertaking a regulated activity without being authorized or exempt may be subject to a fine and other penalties (e.g. suspension of management position).

Last modified 5 Dec 2019

Regulated activities

What finance and investment activities require authorization?

Generally

A person must not carry on a regulated activity in Spain unless authorized, registered or exempt.

A financial activity requires regulatory authorization and/or registration when it is identified as a specified activity in relation to a specified investment, it is carried on by way of business in Spain and it does not fall within any of the available exemptions.

- Specified activities include activities such as accepting deposits, mortgage lending, dealing in, managing, arranging and advising on investments, and establishing collective investment schemes.
- Specified investments include deposits, shares, debt instruments, options, futures, units in a collective investment scheme and government and public securities.

Consumer credit

Consumer credit activities are not regulated activities. However, the granting of mortgage loans to individuals or consumers requires prior registration of the mortgage provider in a designated register in the event that such mortgage provider is not a credit institution.

In any event, the granting of consumer credit in Spain is subject to complying with the requirements under Law 16/2011, dated 24 June, on the credit agreements for consumers.

Last modified 5 Dec 2019

Are there any possible exemptions?

Depending on the nature of the regulated activity, and how this is performed with Spanish resident investors, such regulated activity can be undertaken without authorization.

For example, for banking services generally, the criteria used is the ‘characteristic performance test’, which focuses on whether the characteristic performance is fulfilled in Spain. For investment services, the criteria used is the ‘solicitation or initiative test’ which focuses on which party has taken the initiative to contact the other.

Last modified 5 Dec 2019

Do any exchange controls or other restrictions on payments apply?

Spain does not operate any foreign currency controls.

For cases of cash being transferred to Spain or outside Spain, cash transfers equal or exceeding €10,000 have to be declared, but there is
no legal restriction on moving money in and out of the country.

Compliance with the EU rules on payments (EU Payments Regulation and the Transfer of Funds Regulations) must be ensured.

There are also anti-money laundering and tax considerations to take into account.

Last modified 5 Dec 2019

What are the rules around financial promotions?

The promotion of investment services is deemed also as a restricted activity which can only be undertaken by authorized entities.

Last modified 5 Dec 2019

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common types of legal entities are limited companies (sociedad anónima) and limited partnerships (sociedad limitada), both of which are body corporates with separate legal personality and limit the liability of their members.

Limited companies (sociedades anónimas) can either be private or public depending on whether their shares are offered to the public. Some activities require a particular type of entity to be used. For example, banks and investment firms need to be limited companies (sociedades anónimas).

Limited partnerships (sociedades limitadas) are similar to limited companies (sociedades anónimas) in many ways, the main difference being that the transferability of interests in limited partnerships has more restrictions than the transfer of shares in a limited company (which is generally unrestricted, unless otherwise stipulated in the articles of association of the limited company).

Funds

Investment funds can take the form of legal entities (sociedades anónimas) or separate pools of assets without legal personality (fondos).

Investment funds without legal personality shall always have a fund manager in charge of representing, administering and managing the fund.

Fund managers have to be set up as limited companies (sociedades anónimas).

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

A company can conduct lending or investment business in Spain through an establishment (also known as a ‘branch’) but this does not create a separate legal entity.

Foreign companies having a Spanish branch need to be passported (if EU based) or authorized (if non-EU based) if they intend to conduct regulated activities. In addition, Spanish branches of foreign companies need to be registered with the Commercial Registry and with the Bank of Spain registry or the Comisión Nacional del Mercado de Valores (Spanish Securities and Exchange Commission, CNMV) registry. The Bank of Spain's registry is in charge of registering Spanish branches of foreign credit institutions and payment services and e-money firms. The CNMV's registry is in charge of registering Spanish branches of foreign investment firms and fund managers.
Foreign companies carrying on activities in Spain through a ‘permanent establishment’ will be subject to Spanish corporation tax.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform, rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently, products have included:

- virtual credit cards;
- consumer loans;
- student lending products;
- small and medium-sized enterprises (SME) lending; and
- residential property and commercial property mortgage lending.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P)-type structures often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to or rather than, individual investors on a traditional P2P basis.

ISSUES FOR STARTUP MARKETPLACE LENDERS

Following the initial incorporation and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform. As the startup lender will not have an established track record, deposit base or asset pools, the funding structure will often follow the format of a warehouse securitization structure. Origination of new assets will be funded through drawings on a note issuance facility backed by security over the new assets. Each of the new assets will be subject to eligibility criteria determined by reference to the nature of the underlying asset. In order to provide an efficient financing structure, the assets will typically be held through a SPV with origination and servicing provided by the marketplace lender. In order to cover expected losses on the asset pool, the senior facility will be subject to the lending platform maintaining sufficient subordinated capital in the form of equity, or a combination of equity and subordinated debt.

While the funding may be structured through a revolving loan or note program, if there is tranching of the debt this will typically result in
the platform being treated as a securitization for the purposes of the European Union Capital Requirements Regulation, with the attendant requirements to hold risk retention and provide appropriate reporting and disclosures.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (e.g., in the case of cryptocurrencies such as bitcoin) or providing an indisputable record, for example, relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?
The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether, based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

**Initial coin offerings and token-based products**

**WHAT IS AN INITIAL COIN OFFERING (ICO)?**

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

**Artificial intelligence and robo advisory systems**

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms, which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

**Data analysis and cloud computing**

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by
way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Last modified 5 Dec 2019

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The Bank of Spain (Banco de España) and the Comisión Nacional del Mercado de Valores (CNMV) are the conduct regulators for firms providing financial products and services in both retail and wholesale markets.

The Bank of Spain is responsible for firms providing banking services, payment services and e-money services.

The CNMV is responsible for firms providing investment services and for regulated crowdfunding/crowdlending platforms.

GENERAL

A person must not carry on a regulated activity in Spain unless authorized or exempt. A financial activity requires regulatory authorization when: it is identified as a specified activity in relation to a specified investment, it is carried on by way of business in Spain and it does not fall within any of the available exemptions. Where FinTech products and/or applications involve financial activity which require regulatory authorization, the firms providing such products and/or applications must be authorized by the Bank of Spain or the CNMV, as applicable.

FINTECH/INNOVATION PORTAL AND REGULATORY SANDBOX

In December 2016, the CNMV launched the Fintech/Innovation Portal.

The CNMV has made available a space on its website (called the FinTech Portal) in order to receive information and requests of any kind related to the FinTech phenomenon. It provides an informal channel of communication for the CNMV to exchange information with promoters and financial institutions on their initiatives in this area.

The philosophy of this portal or FinTech space is to provide quality customer service and supervision, as the CNMV’s aims with respect to FinTech are to be receptive, respond to queries and help where possible so that projects can be authorized.

In short, the aim is to enable the FinTech aspect of any project, to the extent that it conforms to the legal requirements, so that it does not hinder its success.

The CNMV has created a multidisciplinary internal group, made up of technicians from all of the CNMV departments that relate to Fintech, in order to assist the Portal, improve internal coordination and thus provide an agile response to the requests that are sent to the CNMV.

Of the enquiries received to date by the CNMV, most relate to crowdfunding and the digitization of financial services. There have also been a significant number of queries relating to automated advice or robo advisors and various enquiries about social trading, big data and Distributed Ledger Technology or blockchain.

The CNMV has issued Q&A documents on these FinTech topics.

The Ministry of Economy is currently working on the launch of a regulatory sandbox. This would be a ‘testing space’, governed by a set of rules previously determined by the regulator, which would allow companies to test new technology or innovative products and services in a secure environment.

A fundamental requirement of the sandbox is that tests would only be performed on a certain number of people, previously defined and agreed with a supervisor.

In addition, companies that participate in the sandbox will have the certainty that if they work during the tests as agreed with the regulator, they will not be sanctioned for carrying out a regulated activity without a license.

The role of the supervisor in a sandbox is to evaluate the legal framework of the products, services or innovative business models being tested.
REGULATORY DEVELOPMENTS ON CROWDFUNDING/CROWDLENDING PLATFORMS

Crowdfunding/crowdlending is regulated in Spain in Law 5/2015 on the Promotion of Business Financing. Crowdfunding/crowdlending in Law 5/2015 is known as Participative Financing Platforms (PFP) and these are based on the principle of neutrality in the coming together of investors and promoters.

PFPs are companies authorized by CNMV, whose activity consists of contacting, through websites or other electronic means, natural or legal persons offering financing, with natural or legal persons who request funding in their own name, to use it for a project. The projects financed are related to business, training or consumer affairs.

Up to November 2019, 29 PFPs have been authorized; many of them are generic (that is, they are set up for any type of project), other projects are focused on real estate, corporate social responsibility, technological sectors and training courses. The Ministry of Economy and CNMV are currently carrying out a review of Law 5/2015 to strengthen this industry and investor protection.

PFPs are intended to be an alternative channel to bank financing. It is also reasonable to expect that many of the companies financed through them will be able to move to the stock markets more easily, either directly or through venture capital, generating a larger capital market in Spain.

Electronic payments platforms and regulation of peer-to-peer lenders

ELECTRONIC PAYMENT PLATFORMS

A number of FinTech businesses are offering electronic payment platforms to rival traditional payment systems and the future implementation of the European Union Payment Services Directive II in Spain will recognize the rise in such business, with the aim of creating a more level playing field for payment services providers, while addressing the need for enhanced security and customer protection.

Spanish law also regulates the issuance of electronic money (e-money). E-money is defined as electronically (including magnetically) stored monetary value, represented by a claim on the issuer, which is issued on receipt of funds for the purpose of making payment transactions. E-money must be accepted by a person other than the electronic money issuer and includes pre-paid cards and electronic pre-paid accounts for use online. Generally, firms issuing e-money must be authorized and registered with the Bank of Spain.

PEER-TO-PEER LENDERS

Generally, lending in Spain is not a regulated activity which requires the authorization of the Bank of Spain. However, the granting of mortgage loans to consumers and individuals requires the prior registration of the mortgage loan provider in a designated register in the event that such mortgage provider is not a credit institution.

In addition, the granting of consumer credit in Spain is subject to complying with the requirements under Law 16/2011, dated 24 June, on credit agreements for consumers.

Therefore, unless caught by the above mentioned requirements or by the fact that the peer-to-peer (P2P) lender meets the requirements of PFPs (crowdlending platforms), there are no specific regulations for P2P lenders.

Regulation of payment services

Where a Spanish business provides payment services as a regular occupation or business activity in Spain, it will require authorization by the Bank of Spain to become an authorized payment institution under the Spanish Payment Services Royal Decree-Law 19/2018. Failure to obtain the required authorization is a very serious administrative breach. Please note that Spain has not yet implemented partially the European Union Payment Services Directive II.

In order to become authorized by the Bank of Spain, a payment services business will need to meet certain criteria, including, in relation to its business plan: initial capital, processes and procedures for safeguarding relevant funds, sensitive payment data and money laundering, along with other controls.

Application of data protection and consumer laws
EU General Data Protection Regulation 2016/679 (“GDPR”) and Spain’s Data Protection and Digital Rights Guarantee Fundamental Act 3/2018/1999 (“NLOPD”) regulate the processing of personal data within Spain. The NLOPD develops and completes the GDPR, which is directly applicable all across the European Union. The new regulatory framework for privacy reinforces the information duties of data controllers (the entities or individuals deciding on how the personal data shall be processed). It also replaces the prior pre-eminence of consent by a more diverse scenario, in which compliance with contractual and legal obligations and even the legitimate interest of controllers may be preferable as legal basis for processing. Fines are much higher than before, reaching 20 million euros or the 4% of the global turnover of the controller in most serious cases.

Money laundering regulations

The Anti-Money Laundering and Terrorist Financing Law 10/2010 gives the Executive Service for Anti-Money Laundering (SEPBLAC) responsibility for supervising the anti-money laundering controls of businesses that offer certain services, such as lending, providing payment services and issuing and administering other means of payment. This law and its implementing regulations have partially implemented the European Union’s Fourth Money Laundering Directive.

Generally, where a firm is authorized and supervised by the Bank of Spain or CNMV, it will also be authorized and supervised by the SEPBLAC for compliance with anti-money laundering requirements. Electronic currencies such as bitcoin and cryptocurrencies tend to represent a high money-laundering risk.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING

The crowdfunding sector is being establishing progressively in Spain, and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform, such as Crowdcube, which is one of the 29 regulated crowdfunding/crowdlending platforms in Spain as of November 2019.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or an application that the business is developing. This type of crowdfunding is not regulated under Law 5/2015.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses, to which they may otherwise not have had access.

ACCELERATORS

There are various incubators or accelerators in the Spanish market which offer support, facilities and funding for startups, often in return for an equity stake.
**Venture capital and debt**

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending, given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), which is secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

**Warehouse and platform funding**

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

Some FinTech companies may see warehouse funding as a temporary form of financing to be followed by a larger capital markets transaction at a later date.

Another alternative form of funding is by way of crowdlending platforms (Participative Financing Platforms regulated under Law 5/2015), which bring individual borrowers and lenders together without the involvement of traditional banks. Crowdlending does not involve equity investments, and instead interest is paid on the money borrowed.

**Senior bank debt and capital markets funding**

**SENIOR BANK DEBT**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**CAPITAL MARKETS FUNDING**

Spain has both debt and equity capital markets which are accessible to businesses (usually of a certain size).

Raising finance by way of an Initial Public Offering (IPO) could be a funding arrangement for FinTech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange, such as any of the four Spanish Stock Exchanges (Bolsas de Valores). The Alternative Stock Market (Mercado Alternativo Bursátil or MAB) in particular caters for small, growth-orientated companies.

FinTech companies may also start to access funding by issuing bonds as a way of raising more competitive funding.

**CONVERTIBLE BONDS/LOAN NOTES**

Another funding tool for fast-growing FinTech businesses is to issue convertible bonds or loan notes, which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

**Incentives and reliefs**

The 'business angel' regime is designed to encourage investment in small, early-stage companies by offering a 30% income tax deduction for individuals who acquire shares of qualifying startups. The deduction base is limited to €60,000 per year. In addition, capital gains derived from the sale of these shares are exempt from Personal Income Tax, provided the investor reinvests the amounts resulting from
the sale in the acquisition of shares of another company of new or recent creation.

Research and development (R&D) deductions from CIT (Corporate Income Tax) are an incentive to increase investment in R&D. The deduction rates are 25% to 42% (R&D expenses) and 8% (acquisition of certain fixed assets used for R&D activities).

The Patent Box regime provides for a reduction on net income derived from the licensing of qualifying intellectual property, (patented inventions etc.) subject to compliance with certain requirements.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Buying and selling loans is very common.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are:

- **Novation** – A novation is a full legal transfer of the party’s rights and obligations. It is a tripartite arrangement between the existing parties and the transferee and results in a fresh contract being formed between the continuing party and the transferee and the transferor being released from its obligations.

- **Assignment** – An assignment is a transfer of rights only, not obligations. Subject to any contractual restrictions, assignment can be done without the consent of the debtor. An assignment can be effected as either an equitable assignment or legal assignment depending on whether certain statutory requirements have been satisfied.

- **Sub-participation** – A sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the buyer taking on double credit risk, both on the seller as well as the borrower.

Loan transfers are commonly documented using standard form contracts made available by the Loan Market Association. For more complex transactions, a more bespoke form of sale and purchase agreement would tend to be used. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

Last modified 5 Dec 2019

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider when transferring a loan or portfolio of loans. Some of the key considerations include:

- **nature of assignment** – whether if the assignment is for the contractual position or just the economic rights;

- **effective date** – determination of the moment when the economic rights are effectively assigned by the assignor;

- **security** – determination of the security under the relevant loan, in particular the ranking and registration of the security (a transferee creditor cannot enforce any registered security if the transfer is not registered too – however, the registration of any transfer triggers stamp duty);

- **court information** – if the loan has been challenged before the courts before its assignment, it will be important to obtain all the information regarding the judicial proceeding and the legal advisors involved in the ongoing claims;

- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed without the prior consent of the borrower;

- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
• **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;

• **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms;

• **consent** – whether a transfer requires the consent or notification of any other parties;

• **notification** – notification to the borrower is not mandatory (unless otherwise agreed under the loan), however, is essential in order for existing borrowers to effect payment to the assignee to know who should repay the credit to and to avoid potential set-offs between assignor and assignee; and

• **registration** - even if it is not a requirement under the loan, the transfer agreement should be granted by means of a Spanish public document if the underlying agreement was also notarised before a Spanish public notary.

**Projects**

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

**Generally**

The ownership of energy and infrastructure assets in Spain varies according to the asset class. The main asset classes are usually considered to be:

• economic infrastructure (energy, aviation, rail, telecommunications, water, roads and waste); and

• social infrastructure (education, health and justice/prisons, housing).

Key sectors are considered below.

**Energy**

The gas and electricity industries in Spain are privatized, with the generation, transmission, distribution and supply services provided by a number of private sector companies. The relevant private sector companies own the generation, transmission and distribution assets. Notably, the private company *Red Eléctrica de España, S.A.* (REE) owns all the high voltage electricity grid. The private company *ENAGÁS, S.A.* is the main gas natural transport operator in Spain and it is certificated as a Transmission System Operator (TSO) by the Spanish public authorities and the European Commission.

The private sector finances and delivers most of the required infrastructure but there are a number of government policy mechanisms (adopted through legislation) which are used to incentivize investment in eligible energy generation technologies.

The principal body of the energy sector in Spain is the National Authority for Markets and Competition (CNMC), as the new independent authority in charge of both competition and regulatory matters in Spain in the fields of energy, electronic communications, audiovisual, postal and transport (railway and airport).

CNMC is fully independent from the Government, Public Administration and market players, has organizational and functional autonomy and is subject to judicial and parliamentary control.

**Telecoms infrastructure**

The telecommunications networks (fixed and mobile) in Spain are privately owned by a number of service providers. A good example is Telefonica which is responsible for most of the Spanish broadband infrastructure but whose work is heavily regulated by government.

**Transport infrastructure**
LIGHT RAIL

Typically, light rail assets (such as trams and associated track) are owned by local public sector promoting bodies, although certain elements of light rail projects may be outsourced to the private sector; for example, the private sector may provide new trams, run a concession or operate and maintain a light rail system on behalf of a local transport executive – the assets will continue, however, to be owned by the public sector.

HEAVY RAIL

The rail market in Spain is privatized but its composition (which is complex) involves both public and private entities.

ROADS, BRIDGES AND TUNнNELS

The public sector may outsource the construction, operation and maintenance (sometimes on a project financed basis) of such assets to the private sector. In the case of tolled roads, the private sector has taken on roads/crossings on a full concession basis – namely, responsible for the design, build, financing, operation, maintenance and collection of tolls for a number of years with the main revenue stream being the collection of toll revenues from users (rather than any service payments from the public sector) but these types of projects are no longer considered viable as the private sector is not willing to take ‘demand risk’ in order to service the upfront capital costs and associated bank debt.

AVIATION

Commercial aviation management in Spain is (for the most part) privatized. As regards airport infrastructure, there are a number of ownership structures in the Spanish market, including private ownership, local government ownership and various forms of public-private ownership. All models are heavily regulated by government and another public sector entities such as AENA, AESA and ENAIRE.

PORTS

The Spanish ports sector comprises a complex variety of public and private agents and operators. The current regulations distinguish between local ports and ports of general interest, being the latter monitored by the public bodies Autoridades Portuarias.

Other infrastructure

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS/PRISONS)

Typically, these are owned by the public sector. The majority of social infrastructure assets in Spain are directly financed by the government.

Education

The ownership of a school’s infrastructure depends upon which category of school it belongs to. For example, in the case of a local authority maintained school, the school and playing fields will be typically owned by the local authority; an academy school can receive funding directly from the government and may lease land from a local authority.

Hospitals

More than half of the hospitals in Spain are in some way involved in the public sector: they belong to the public health and hospitals system, operate through concerted public-private actions or by means of public funds/contracts.

Social housing

This is a diverse sector involving many different organizations and individuals including housing developers, building contractors, mortgage lenders, local authorities, housing associations, landlords, owner-occupiers, private renters and those in the social rented sector, which are constrained by public sector regulations.

DEFENSE

Typically, defense assets are owned by the public sector.
Are there special rules for investing in energy and infrastructure?

Generally

There is no specific regime governing or restricting investment in energy or infrastructure projects in Spain over and above existing regulation for investors and funders more generally but a particular proposed investment may be subject to legislative or regulatory control (e.g., merger control rules). As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory position relevant to that project must be considered. For example, a project involving development on land will require planning permission or a development consent order; and a project may require environmental authorizations/permits and/or sector specific regulatory consents or licenses.

Whether an investor can invest will depend on the terms of the procurement of that project if it is a public sector project and, in respect of an existing/operational project, that will depend on whether there are any contractual restrictions on ‘Change of Control’. This is less of a concern on private sector infrastructure although investors would need to consider whether any licenses/consents/permits would be affected by their acquisition of an interest.

Energy

The energy markets Spain have a complex system of arrangements between suppliers, generators, transmission and distribution which are heavily regulated. In particular, there are complex arrangements in respect of licensing, subsidies and demand/charging mechanism with suppliers, customer and REE (operator of the Spanish electricity system) or ENAGAS (operator of the Spanish gas grid) and these are subject to change/regular updates meaning that investors will need to have a good understanding of the current framework and the potential directions in which the market may move. Investors need to understand how technology changes may impact on the overarching regulatory framework and vice-versa.

Investors should also consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with any license conditions or the granting of specific subsidies. In particular, if a breach of those conditions could lead to the revocation of a license/subsidy that might make the potential target less attractive or viable.

Telecoms infrastructure

There is a complex regulatory environment for this sector including how access and interconnectors (between networks) are regulated under the General Telecommunications Law of 2003.

The industry is largely privatized, therefore investors should consider if any permits/consents/licenses will be affected by their interest.

Transport infrastructure

RAIL

There is an extensive and complex regulatory framework to consider in respect of a practical and operational involvement in this sector. Key areas include understanding the regulatory regime for certification for train use and acceptance and user fare regulation. Depending on how an investor wishes to invest in a project (specifically what type of entity or asset), there is a varying degree of difficulty for investors to enter into an existing project.

ROADS

In order for a private sector partner to carry out its duties on certain types of roads projects, the procuring public sector authority may delegate certain of its statutory duties to the private sector partner. This will be dependent on the project and the specific contractual requirements. Any investor will, therefore, need to understand those duties and whether it is able to subcontract those duties to an appropriate person.

Other infrastructure

On publicly procured infrastructure, it is quite common for long-term projects to have a ‘change in control’ clause which restricts change in ownership structures of the private sector. For example, in most sectors there is a restriction on change in control during the
construction period. How strict these restrictions are will often depend on the sector. For example, the defense sector usually gives the Ministry of Defense a strong degree of discretion.

Last modified 5 Dec 2019

What is the applicable procurement process?

Public procurement in Spain is, for the time being, in most instances governed by the Act 9/2017, dated 8 November, on Public Sector Contracts. There are some sector-specific regulations such as the Act 31/2007, dated 30 October, on Public Procurement in the Sectors of Water, Energy, Transports and Postal Services and the Act 24/2011, dated 1 August, on Public Sector Contracts on Defense and Security. All the regulations mentioned are based on EU Directives.

The key principles are that contract procured by the public sector are awarded fairly, transparently and without discrimination on the grounds of nationality and that all potential bidders are treated equally.

Investing in energy and infrastructure

Public procurement is relevant where Spanish public sector bodies or entities, seek to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset. The relevant procurement legislation applies to all bodies and entities that make up the so-called ‘public sector’, conforming to the regulations of the European Directives, including all types of public administrations, autonomous agencies (organismos autónomos), state owned companies (entidades públicas empresariales), public universities and foundations, state agencies etc. A regulated procurement is required where certain financial thresholds are met and on most major infrastructure projects (where limited exclusions do not apply), it is likely that those thresholds will be met so a regulated procurement would need to be run.

In most cases, the public sector will need to publish a contract notice in the Office Journal of the European Union (OJEU) and typically run one of the following procedures:

- **Open procedure** – This is suitable for easy-to-evaluate projects and tenderers simply submit a tender in response to the OJEU notice. Change and negotiations to the tender are not permitted.

- **Restricted procedure** – There is a shortlisting of at least five tenderers following an expression of interest stage and tenderers submit a bid. Again, no negotiation is permitted other than clarification and finalization of the contract terms.

- **Competitive dialogue** – This is often the most common procedure for complex infrastructure projects and involves a shortlisting of at least three bidders who are invited to dialogue with the public sector to develop detailed solutions which are capable of being accepted by the public sector. Clarification and further negotiations are allowed following final tender but only on the basis of confirming the financial and other commitments in a tenderer’s bid.

- **Competitive procedure with negotiation** – This is sometimes described as a hybrid procedure as it allows dialogue with bidders but also allows the public sector to award a contract on the basis of an initial tender (or further stages) but clarification and negotiation is not allowed following final tender.

An investor may choose, however, to seek to invest in a project (by acquiring an interest in a private sector partner) that has already been procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the original awarded contract rather than procurement regulations themselves.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement-related considerations that need to be borne in mind.

Financing energy and infrastructure

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector.

Last modified 5 Dec 2019
**What are the most common forms of funding / investing in energy and infrastructure?**

The principal forms of private sector funding/investment in energy and infrastructure in Spain (including in relation to public-private partnerships) are as follows.

**Funding**

Common forms of funding in energy and infrastructure include:

- loans made on a corporate finance basis (balance sheet debt);
- loans made on a project-finance basis (to a special purpose project company) on medium to long-term bases – such loans may later be syndicated to other funders;
- bond finance; and
- asset financing (this is particularly relevant in the aviation and naval sectors).

Funding/funding products can also, sometimes, provided by the European Investment Bank and export credit agencies.

**Investing**

Common forms of investing in energy and infrastructure include:

- ‘equity’ investment in special purpose vehicles or entities that may have a portfolio of interests, i.e., share capital and subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of 'equity').

**Restructuring**

**Enforcement and sanctions**

**When can there be regulatory investigations?**

When the Comisión Nacional del Mercado de Valores (Spanish Securities and Exchange Commission, CNMV) or the Bank of Spain considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. They may also launch a formal investigation for alleged breach of any laws and regulations applicable to entities operating in the banking and securities sector, including investigations of entities providing regulated activities without authorization or license. This may result in regulatory sanctions.

**What regulatory penalties may apply?**

When a rule breach has taken place, the Comisión Nacional del Mercado de Valores (Spanish Securities and Exchange Commission, CNMV) or the Bank of Spain may impose a financial penalty or censure, or withdraw regulated status against the firm and/or regulated individuals. The regulator will publicize these penalties.

**What criminal penalties may apply?**

Following formal investigation, the regulators have powers to impose criminal penalties in certain cases, including:
• fraud;
• insider dealing; and
• breaches of the money laundering regulations.

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

No stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

The taking, transfer or assignment of a mortgage, debenture or other security over real estate assets located in Spain is subject to stamp duty at the tax rate approved by the Spanish region where the real estate asset is located. The applicable tax rate ranges between 0.5% and 1.5% depending on the region where the real estate asset is located.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g., a bond)?

No stamp, registration, transfer or other similar taxes are payable on the issue, transfer or assignment of debt securities.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g., secured bond holders)?

In case of real estate transactions, the Spanish Tax Authorities take priority for the collection of payments of Spanish Real Estate Tax (Impuesto sobre Bienes Inmuebles) corresponding to the year of the enforcement and the four previous years. Furthermore, the Spanish Tax Authorities take priority for the collection of transfer tax and stamp duty due on previous transfers or other taxable events related to the property itself in a period of four years.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Withholding tax applies when a payment of interest with a Spanish source is paid under a loan.

If so:
What is the rate of withholding?
The current rate of Spanish withholding tax is 19%.

What are the key exemptions?

The most commonly relied on exemptions to ensure that interest payments made by Spanish companies can be made free of Spanish withholding tax include:

- the exemption for interest paid to a bank resident for tax purposes in Spain;
- reliance on a double tax treaty (such treaty may provide for a total or partial exemption); or
- reliance on the EU Interest and Royalties Directive, as implemented under Spanish domestic law, provided that certain conditions are met (the key conditions being that the lender is resident for tax purposes in a member state of the EU and is not acting through a permanent establishment in Spain nor through a territory considered as a tax haven).

Would the same analysis apply to interest payments under a debt security (e.g., a bond)?

Yes.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding tax (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both Swedish and EU law.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in Sweden or to request that they are admitted to trading on a regulated market operating in Sweden unless a prospectus approved by the Swedish Financial Supervisory Authority (Finansinspektionen) has been made available to the public.

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in Sweden are bonds or notes issued on a stand-alone basis or under a program.

Many different types of debt securities are offered in Sweden. Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities and zero-coupon securities;
- debt securities characterized by the type of issuer (investment grade or high yield bonds);
- asset-backed securities;
- derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer);
- depositary receipts (a security issued by a depositary conferring on the holders beneficial ownership of certain underlying assets held by the depositary for the holders); and
- warrants (securities giving the holders the option to purchase the equity of the issuer or a related company).

What are the differences between offering debt securities to institutional/professional or other investors?
The Prospectus Directive (implemented in Swedish law mainly through the Financial Instruments Trading Act 1991 (Lag (1991:980) om handel med finansiella instrument)) does not make a distinction between professional and other investors for the purposes of its disclosure requirements but does include different disclosure regimes by reference to the minimum denomination of a single security.

If the denomination of the securities is equal to or above €100,000 (or the equivalent in another currency), the ‘wholesale’ rules apply. If the denomination is under €100,000, the ‘retail’ rules apply. Additional disclosure requirements apply for retail securities.

**When is it necessary to prepare a prospectus?**

Under the Prospectus Directive (implemented in Swedish law mainly through the Financial Instruments Trading Act 1991 (Lag (1991:980) om handel med finansiella instrument) and the Swedish Act on Supplementary Provisions to the Prospectus Directive (Lag (2019:414) med kompletterande bestämmelser till EU:s prospektförordning)), unless an exemption applies, it is necessary to publish a prospectus where there is an offer of securities to the public or an application for the securities to be admitted to trading on a regulated market.

An offer would not be deemed to have been made to the public if it is made solely to qualified investors, addressed to fewer than 150 persons (other than qualified investors) per European Economic Area state or where the minimum denomination per unit is at least €100,000.

If the offer is deemed not to be made to the public, a Prospectus Directive compliant prospectus may still be required if an application is made for the securities to be admitted to trading on a regulated market. An exemption from both the offer to the public and the admission to trading on a regulated market is needed to avoid having to publish a prospectus.

**What are the main exchanges available?**

**Regulated markets**

Sweden has three regulated markets for the purpose of the Markets in Financial Instruments Directive (MiFiD II), being NASDAQ OMX Stockholm (Nasdaq OMX), Nordic Growth Market NGM Equity (NGM Equity) and Nordic Growth Market Nordic Derivatives Exchange (NDX).

As a consequence of Nasdaq OMX, NGM Equity and NDX being regulated markets, issuers on these markets are subject to the requirements of a number of EU Directives, including the Market Abuse Directive and the Transparency Directive. Securities listed on these markets can be passported to other European Economic Area markets in order to access international investors.

**Multilateral trading facilities (MTFs)**

First North, Nordic MTF and Aktietorget are so called MTFs under MiFiD II, which means that they are not considered regulated markets and therefore provide a more flexible alternative to the requirements regarding denomination and financial information, compared to the rules which apply to regulated markets across Europe. As such MTFs permit reporting under national Generally Accepted Accounting Principles (GAAP), they offer an alternative for issuers not wishing to prepare their accounts in accordance with International Financial Reporting Standards (IFRS).

**Is there a private placement market?**

Sweden has an active private placement market.

There is no dominant standard for documentation but efforts have been made by the Loan Market Association and International Capital Markets Association to standardize private placement documentation.

**Are there any other notable risks or issues around issuing or investing in debt**
Issuing debt securities

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil liability and sanctions under Swedish law. Sweden has various statutory provisions which impose liability for an inaccurate offering memorandum and which provide investors with protection. Furthermore, general statutes regarding fraud and liability for negligence may be applicable.

Investing in debt securities

Debt security terms and conditions typically contain provisions which may permit their modification without the consent of all investors and confer significant discretion on the agent, which may be exercised without the consent of investors and without regard to the individual interests of particular investors. The conditions also provide for meetings of investors to consider matters affecting the investor's interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Establishing a fund, offering fund securities and operating a fund, among other things, are regulated activities mainly under the Securities Market Act 2007 (Lag (2007:528) om värdepappersmarknaden) and Alternative Investment Fund Managers Act 2013 (Lag om förvaltare av alternativa investeringsfonder (2013:561)) and therefore subject to regulation by the Swedish Financial Supervisory Authority (Finansinspektionen or SFSA).

Authorization from the SFSA is required in order to establish a fund. Authorization requires, inter alia, that the fund is established by a limited company incorporated in Sweden, that there are reasons to believe that the fund will be managed in accordance with the Securities Market Act 2007 and that the managers of the fund are considered suitable.

What are common fund structures?

Common forms of funds include:

- open-ended (the most commonly used in Sweden and also what is mostly referred to as a 'fund') and closed-ended funds (CEFs);
- retail and non-retail funds (including Alternative Investment Funds (AIFs));
- Undertakings for Collective Investments in Transferrable Securities (UCITS) and non-UCITS funds; and
- qualified investor structures that invest in, for example, corporate shares or bonds, real property, commodities (for example, precious metals) and derivatives.

Funds domiciled outside of Sweden mostly comprise of UCITS funds established in other jurisdictions.

What are the differences between offering fund securities to professional / institutional or other investors?

Retail funds must be authorized by the Swedish Financial Supervisory Authority (Finansinspektionen).
Retail funds, including UCITS, are subject to substantial regulatory oversight and restrictions, including obligations with regard to independent custodian/depositary arrangements for assets, investment and borrowing powers specifications (for open-end retail funds), concentration requirements and other matters.

Non-retail funds that are offered in Sweden generally fall into the category of Alternative Investment Funds (AIFs) and therefore are subject to the Alternative Investment Fund Managers Directive (implemented in Swedish law through the Alternative Investment Fund Managers Act 2013 (Lag om förvaltare av alternativa investeringsfonder (2013:561)) regime in relation to authorization of the manager/fund, marketing arrangements, reporting and governance etc.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

Separately managed accounts are also commonly used in Sweden as an investment management structure; investor funds are generally held in a separate account subject to the discretionary investment authority of a manager who can acquire and dispose of assets using the investor funds in line with a pre-determined strategy and parameters set out in an Investment Management Agreement. These are often also structured as ‘funds of one’.

Managing investments is a regulated activity under the Swedish Financial Supervisory Authority's (Finansinspektionens) rules and therefore subject to authorization; however, managed accounts and ‘funds of one’ themselves are generally not classed as (and therefore avoid the regulatory restrictions in being classed as) Collective Investment Schemes or Alternative Investment Funds.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Swedish selling restrictions

Generally in Sweden, offering securities is either covered under the Undertakings for Collective Investment in Transferable Securities Directive regime or under the Alternative Investment Fund Managers Directive regime. All Directives have been incorporated into Swedish law.

Undertakings for Collective Investments in Transferable Securities (UCITS)

UCITS, including those established in Sweden, have an EU passport which enables fund promoters to create a single product for marketing in all EU member states and on the completion of the appropriate notification procedure, a UCITS established in one member state can be sold in any other.

A UCITS intending to market in another member state must complete and submit to its home regulator a notification including certain specified information, including copies of key investor documents. The home regulator then completes a notification file which is sent in a regulator-to-regulator transmission, following which the UCITS can be sold in the other member state.

Alternative Investment Funds (AIFs)

Under the Alternative Investment Fund Managers Directive (implemented in Swedish law through the Alternative Investment Fund Managers Act 2013 (Lag om förvaltare av alternativa investeringsfonder (2013:561))), marketing is defined as: a direct or indirect offering or placement at the initiative of the Alternative Investment Fund Manager (AIFM) or on behalf of the AIFM of units or shares in an AIF it manages to or with investors domiciled or with a registered office in the EU.

An AIFM may only market an AIF to EU investors if it is authorized by a relevant EU regulator. Registration with one EU regulator opens access, subject to certain further limited conditions, to marketing to professional investors across the EU under a EU passport or if it complies with national private placement regimes (where available).
Reverse solicitation and the definition of ‘marketing’

Applicable in the context of professional investors, this is a sensitive area in Sweden and Europe generally. The Alternative Investment Fund Managers Directive generally continues to permit professional investors who wish to invest in AIFs based on their own initiative (reverse solicitation); however, the EU is currently reviewing this area during 2017 and may impose tighter requirements.

Are there any restrictions on managing a fund?

Fund management in Sweden is regulated under various statutory instruments and by the Swedish Financial Supervisory Authority's (Finansinspektionens or SFSA) regulations. The SFSA is responsible for regulating funds, fund managers and those marketing funds and any legal or natural person is prohibited from carrying on regulated activities, such as fund management, without authorization.

Various restrictions arise on manager structuring/compensation and profit-sharing arrangements as a result of the regulations and any manager that is subject to the remuneration rules must apply those rules proportionate to its size, internal organization and scope and complexity of its activities. The rules impact on, among other things, reporting, equity remuneration, deferred compensation arrangements and clawback.

Alternative Investment Fund Managers (AIFMs) are also subject to regulation under the Alternative Investment Fund Managers Directive (implemented in Swedish law through the Alternative Investment Fund Managers Act 2013 (Lag (2013:561) om förvaltare av alternativa investeringsfonder) and managers of Undertakings for Collective Investments in Transferable Securities (UCITS) are subject to certain requirements under the Undertakings for Collective Investment in Transferable Securities Directive. Registration with the SFSA involves a significant authorization process – it generally takes three to six months from completion of the application and must include:

- for the manager, information on senior personnel (must be suitable persons etc), organizational structure, policies and procedures, remuneration practices; and
- for each fund, investment strategy, constitutional documents, depositary information and disclosure requirements.

However, AIFMs based in Sweden can be exempted from full regulation on certain grounds, including managing assets under €500 million where assets are not leveraged and investors have no redemption rights for five years, and managing assets under €100 million including assets acquired through leverage. Exempted managers must still register with the regulator, are subject to limited reporting and it should be noted that they do not benefit from the generalpassporting for marketing purposes.

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

Unless an exemption or exclusion applies, a person entering into a derivatives contract by way of business in Sweden (such as a dealer) will ordinarily have to be authorized under the Securities Market Act 2007 (Lag (2007:528) om värdepappersmarknaden) if the transaction is one of the specified activities set out in the act such as:

- options;
- futures;
- swaps;
- contracts for difference; or
- rights to or interests in investments.

One of the key exclusions to the requirements above applies to persons who deal in derivatives for risk management purposes.

The European Market Infrastructure Regulation applies to all derivative transactions and requires transactions to be reported to
regulators, for transactions between dealers to be cleared or subject to other risk mitigation techniques such as initial margin and variation margin requirements.

Last modified 22 Jan 2020

What are common types of derivatives?

Derivative contracts are entered into in Sweden for a range of reasons including hedging, trading and speculation.

Derivatives may be traded over-the-counter or on an organized exchange.

All of the main types of derivative contracts are used in Sweden:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying asset seen in Sweden are:

- equity;
- fixed income instruments;
- commodities;
- foreign currency; and
- credit events.

Last modified 22 Jan 2020

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007-to-2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. The European Commission has sought, in particular, to:

- enhance transparency by requiring the provision of comprehensive information on the over-the-counter derivative positions;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen and continues to see the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending
Lending (as such, without deposit-taking) is only a regulated activity in relation to mortgages and consumer lending. In these circumstances, and assuming none of the available exemptions apply, a lender will need to be authorized by the Swedish Financial Supervisory Authority (Finansinspektionen) to conduct such business.

Mortgage and consumer loans are subject to a range of regulatory requirements that do not apply to other loans. For example, there are particular restrictions around how:

- the loans are marketed, originated and sold;
- lenders administer the loans on an ongoing basis; and
- to deal with borrowers who fall behind with their payments.

**Borrowing**

While borrowers are generally not regulated, it is advisable for borrowers to consider whether either mortgage or consumer lending regimes apply to their activities, in which case they will benefit from the protections mentioned above.

**What are common lending structures?**

Lending in Sweden can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or a syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents which fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, multi-option and revolving facilities and project facilities.

**Loan durations**

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

**Loan security**

A loan can either be secured, unsecured or guaranteed.

**Loan commitment**

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.
Loan repayment

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or on a scheduled basis (usually meaning the loan is repayable in full at maturity).

What are the differences between lending to institutional / professional or other borrowers?

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

By contrast, lending in the context of mortgages and to consumers is a regulated activity and so requires the Swedish Financial Supervisory Authority's (Finansinspektionens) authorization.

Do the laws recognize the principles of agency and trusts?

Sweden has its own, complex principle of agency which is subject to rules under both statutory law and case law.

Sweden does not recognize the principle of trusts.

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual legislation and principles, such as the following:

- Section 36 of the Contract Act 1915 (Avtalslagen), the general clause, gives the courts the ability to modify or set aside a contractual provision if the court deems the clause unreasonable. The threshold for the application of the general clause is, however, quite high.

- Section 31 of the Contract Act 1915, a provision against usury (or the practice of lending money at unreasonably high rates of interest), if applicable, will cause the affected clause or contract to be ruled as invalid.

- A contractual provision may, in accordance with general contractual principles, be modified or set aside if it is deemed to be inconsistent with one party's basic assumptions in relation to the contract, even if it is due to events subsequent to the conclusion of the contract.

Specific types of lending

An issue specific to the area of mortgage lending is whether a lender falls within the recently formed Swedish mortgage regime. The Mortgage Credit Directive, implemented in Swedish law mainly through the Act on Mortgage Credit Activities 2016 (Lag (2016:1024) om verksamhet med bostadskrediter), aims to prevent the irresponsible lending and borrowing practices that were exposed during the global financial crisis. The Mortgage Credit Directive applies to first and second charge mortgages. It imposes a number of requirements on lenders including the need to:

- conduct affordability tests before lending;

- provide standard information about the mortgage to enable borrowers to compare products; and

- ensure that staff are suitably trained.

Standard form documentation
Most Swedish law syndicated finance transactions are governed by documentation based on recommended forms published by the Loan Market Association (LMA). In general, the documentation has been adopted for Swedish purposes and is not as comprehensive as the English law equivalents. Bilateral finance transactions are more likely to be documented on bank standard form documentation prepared in-house.

*Are there any other notable risks or issues around borrowing?*

Borrowers should be aware of the potential implications of the EU’s Bank Recovery and Resolution Directive (BRRD), which has been implemented into Swedish law and outlines certain measures for dealing with failing financial institutions.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to ‘bail in’ obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. ‘Bail in’ describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of Swedish or other EEA law contracts, such powers override what the contracts say. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

*Giving and taking guarantees and security*

*Are there any restrictions on giving and taking guarantees and security?*

As a general rule, the Swedish Companies Act 2005 (Aktiebolagslagen (2005:551)) provides that all transactions of a Swedish limited liability company must provide commercial benefit for the company. In evaluating what constitutes commercial benefit, several factors shall be considered. This is primarily a factual matter rather than a legal one and it is the responsibility of the board of directors to ensure that commercial benefit accrues to the company.

Some of the key areas affecting the giving of guarantees and security are as follows.

**Insolvency**

If a company becomes insolvent, any guarantees and security given by the company may become worthless as the company will not have the monetary power to support its commitment, and they would be susceptible to being challenged in bankruptcy proceedings.

**Financial assistance**

The Swedish Companies Act 2005 (Chapter 21, Section 5) stipulates an absolute prohibition on the provision of advances, loans or security for the purposes of assisting in the acquisition of shares in the company providing the assistance or any parent company in the same group of companies. However, ‘group’ in the context of financial assistance, means a group where the parent company is Swedish.

**General upstream restrictions**

The Swedish Companies Act 2005 further stipulates that a Swedish limited liability company may not provide loans, guarantees or security to or for the benefit of anyone owning, directly or indirectly, shares in the company (including instances of cross/side-stream debt or security). The most notable exception to this rule is the group exception which provides that upstream loans and security are permitted where the debtor/beneficiary is a company in the same group as the company lending the funds or granting security. ‘Group’ in this context means a group of companies where the parent is a legal entity domiciled in the EEA.

A further exception to the upstream restrictions is where an upstream loan, or security, is provided exclusively in relation to the parent’s business operations and the company lending the funds or providing the security does so for purely commercial reasons.

Swedish law is largely silent on how commercial reasons and commercial benefit should be assessed. However, by way of example, it...
would generally be possible to demonstrate commercial reasons and commercial benefit where loans are made or security is provided to an entity which is important for the lending or charging company's business. This may be the case if a loan is made to a servicing company (providing certain services to the lending company) or a group's primary trading company. A government ruling has clarified though that inter-company lending in the form of cash-pooling should be allowed and is thus considered a commercial benefit and reason.

**Value transfer**

In addition to the restrictions described above, it should also be noted that enforcement of upstream security in Sweden is always subject to certain restrictions which aim to protect the restricted equity of the company. Depending on the conditions on which security is given, it may be considered a value transfer to the shareholders of the company. As such, it will only be enforceable if and to the extent that:

- it is equal to or less than the unrestricted shareholders' equity (free capital reserves) of the relevant company at the time of the granting of security; and
- it is justifiable in view of the amount of equity and cash required for the running of the company's business, having due regard to the type, size and risks of the business.

The Swedish Companies Act 2005 (Aktiebolagslagen (2005:551)) provides that anyone who has received a payment which was not made in accordance with the foregoing must repay those funds.

**What are common types of guarantees and security?**

**Common forms of guarantees**

Some common forms of guarantees include:

- a tender guarantee (anbudsgaranti), which covers the buyer’s loss in the event the seller refuses to sign the contract, withdraws his offer or cannot provide the required performance guarantee;
- an advance guarantee (förskottsgaranti), which covers the repayment of any advanced monies in the event that delivery does not occur;
- a performance guarantee (fullgörelsegaranti), which covers all of the seller’s contractual obligations;
- a warranty guarantee (garantitidsgaranti), which covers the seller's obligations under the warranty period; and
- a payment guarantee (betalningsgaranti), which is usually issued in connection with larger building projects and consists of two parts:
  - a guarantee covering the building period; and
  - a guarantee covering the warranty period.

**Common forms of security**

There are four basic types of security interest that can be created under Swedish law:

- a pledge;
- a floating charge;
- a mortgage; and
- security assignment.

Different types of security are suitable for securing different types of assets.

Under Swedish law it is not possible to grant security over all of the assets of a Swedish company. A floating charge covers several types of personal property but excludes others (eg cash).
Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

A guarantee made in contravention of the rules on financial assistance, upstream loan restrictions and value transfers may entail criminal liability for the board of directors and the managing director and will render the affected guarantee invalid and unenforceable. The invalid guarantee will in such case be cancelled.

Additionally, there is a risk that a guarantee may be set aside if it was procured by undue influence by a borrower or lender.

Giving or taking security

Once granted, security needs to be properly perfected before it is valid against third parties. Perfection formalities vary depending on the type of security and the type of secured asset, but can either entail: a requirement for the secured asset to be delivered to the security holder (tradition) (the Non-Recourse Principle); registration of the security in a certain registry; or notice being given to a third party.

The Non-Recourse Principle is the main rule and means, *inter alia*, that any pledged asset (or any instrument representing such asset) must be physically surrendered to the pledgee. In cases where the relevant asset or right is in the possession, or otherwise under the control, of a third party (e.g., a bank in the case of a bank account), notification must be given to the third party with a stipulation that the pledgor may not dispose of, or be granted access to, the pledged asset or right. As a result, the Non-Recourse Principle may cause difficulties with regards to the perfection of security under Swedish law as removing any assets from the pledgor’s control may cause operational disruption to the pledgor’s business and its continuation.

As with guarantees, when security is granted in contravention of the rules on financial assistance, upstream loan restrictions and value transfers, the board of directors and the managing director may face criminal liability and the affected security may be rendered invalid and unenforceable.

There are no notarization requirements for security documents under Swedish law.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Penalties for Market Abuse on the Securities Market Act 2016 (Lag (2016:1307) om straff för marknadsmissbruk på värdepappersmarknaden)

Act on Supervision over Credit Institutes and Securities Companies 2014 (Lag (2014:968) om särskild tillsyn över kreditinstitut och värdepappersbolag)

Marketing Practices Act 2008 (Marknadsföringslag (2008:486))

**Consumer credit**

Consumer Credit Act 2010 (Konsumentkreditlagen (2010:1846))

Act Concerning Certain Activities with Consumer Credits 2014 (Lag (2014:275) om viss verksamhet med konsumentkrediter)

Credit Reporting Act 1973 (Kreditupplysningslag (1973:1173))

**Mortgages**

Act on Mortgage Credit Activities 2016 (Lag (2016:1024) om verksamhet med bostadskrediter)

Mortgage Credit Directive (2014/17/EU) (mortgage credit)

**Corporations**

Companies Act 2005 (Aktiebolagslagen (2005:551))

Partnership and Non-registered Partnership Act (Lag (1980:1102) om handelsbolag och enkla bolag)

**Funds and platforms**

Swedish UCITS Act 2004 (Lag (2004:46) om värdepappersfonder)

Alternative Investment Fund Managers Act 2013 (Lag om förvaltare av alternativa investeringsfonder (2013:561))

**Other key market legislation**

Bank Recovery and Resolution Directive (2014/59/EU) (recovery and resolution)

Capital Requirements Regulation (Regulation (EU) 575/2013) (capital requirements)

European Market Infrastructure Regulation (Regulation (EU) 648/2012) (derivatives)

Market Abuse Regulation (Regulation (EU) 596/2014) (market abuse)

_Last modified 22 Jan 2020_

**Regulatory authorization**

**Who are the regulators?**

The Swedish Financial Supervisory Authority (Finansinspektionen or SFSA) is the conduct regulator for firms providing financial products and services in both retail and wholesale markets. The SFSA is also the prudential regulator for many firms and is responsible for the regulation of systemically important financial institutions, including banks, insurers and major investment firms.
What are the authorization requirements and process?

Depending on the type of firm, a firm must apply to the Swedish Financial Supervisory Authority (Finansinspektionen) for authorization. The regulator must assess whether the application meets the requirements. Depending on the type of application, this will be done within 45 days to five months of the submission of a complete application. The application fee depends on the type of application ranging from SEK600 to SEK720000.

What are the main ongoing compliance requirements?

Threshold requirements (such as having adequate resources and compliance arrangements in place) are an ongoing compliance requirement for authorized firms. Failure to comply with the threshold conditions and more detailed regulatory rules can result in sanctions for firms and regulated individuals, and loss of regulated status.

What are the penalties for failure to be authorized?

The Swedish Financial Supervisory Authority (Finansinspektionen) takes action against companies operating in the financial markets without the proper authorization by ordering the company to cease operations. The order may be coupled with a fine.

Regulated activities

What finance and investment activities require authorization?

Generally

Generally, a company which offers financial services aimed to the public must be authorized by the Swedish Financial Supervisory Authority (Finansinspektionen), unless there is an applicable exemption. The requirement for authorization is contained in different pieces of legislation depending on the type of business.

The Banking and Financing Act 2004 (Lag (2004:297) om bank och finansieringsrörelse) is generally applicable to banking and financing business, which includes:

- payment services via general payment systems;
- the receipt of funds which are available to the creditor within 30 days of demand; and
- commercial operations which involve the acceptance of repayable funds from the public, the granting of loans, the provision of guarantees for loans or, for financing purposes, the acquisition of claims or the granting of rights to use personal property (ie leasing).

Consumer credit

A company which gives or processes consumer credit must be authorized by the Swedish Financial Supervisory Authority (Finansinspektionen), unless the company is authorized under any other legislation or if the business is exempt from authorization.
Are there any possible exemptions?

There are exemptions available for certain entities and for certain types of financing activities, as listed in Chapter 2, Section 2 and 3 of the Banking and Financing Act 2004 (*Lag (2004:297) om bank och finansieringsrörelse*), which mean that such entities and activities can be undertaken without authorization. Exemptions include certain activities by licensed foreign undertakings, intra-group loan activities and financings in connection with the sale of certain goods or services.

Lending as such does not require a license unless it involves deposit-taking. But other rules may become applicable, such as payment services etc.

There are also exemptions available for certain consumer credit-related activities, as listed in Section 5 of the Act Concerning Certain Activities with Consumer Credit 2014 (*Lag (2014:275) om viss verksamhet med konsumentkrediter*), which are similar to the exemptions in the Banking and Financing Act 2004 but which also include an exemption for legal entities engaged in small-scale business that involves the provision of credit to consumers but not with a view to making a profit.

Do any exchange controls or other restrictions on payments apply?

Sweden does not operate any foreign currency controls.

For cases of money transferring from non-EU member states, imports of foreign currency may need to be declared in the custom declarations, but there is no legal restriction on moving money in and out of the country.

Compliance with the EU rules on payments (EU Payments Regulation and the Transfer of Funds Regulations) must be ensured.

There may also be anti-money laundering and tax considerations to take into account.

What are the rules around financial promotions?

A financial promotion is a communication of an invitation or inducement to engage in investment activity made by a person in the course of business. The Swedish Financial Supervisory Authority (*Finansinspektionen*) has developed regulations with regards to financial promotions. Such promotions must, amongst other things, represent a balance between the opportunities and risks of investment. If a company does not comply with the regulations, the SFSA may impose sanctions.

Pursuant to the Consumer Credit Act (Sw. *konsumentskreditlagen* (2010:1846) there are certain information requirements that need to be met when consumer credits are marketed to the public. The requirements are, inter alia, that consumers are adequately informed about the risks of entering into the credit agreement and informed of whether the credit at issue is to be deemed a "pay day loan" (Sw. *höökostnadskredit*) under the Consumer Credit Act.

Furthermore, the Marketing Act 2008 (Marknadsföringslagen) has general provisions regarding marketing which must be adhered to.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common types of legal entities are limited companies, limited partnerships and economic associations (*ekonomiska föreningar*). Limited companies and economic associations are body corporates with separate legal personality and with limited liability of their members. Limited partnerships are body corporates with separate legal personality, which require at least one general partner with
unlimited liability.

Limited companies can either be private or public (denoted by the suffix AB or Aktiebolag, with the addition of the suffix (Publ) for public companies) depending on whether their shares are offered to the public.

Generally, the shareholders of a limited company are not liable for the company’s debts, although in some circumstances the rights and liabilities of the company may be treated as the rights and liabilities of the shareholders.

Limited partnerships are similar to limited companies in many ways, with the main difference being that they are:

- formed by partners whose relationship is governed by private agreement; and
- taxed like a partnership.

**Funds**

Investment funds are limited companies which have been authorized by the Swedish Financial Supervisory Authority (Finansinspektionen).

*Last modified 22 Jan 2020*

**Is it possible to conduct lending or investment business through a branch or establishment?**

Yes.

A company can conduct lending or investment business in Sweden through an establishment/branch (filial). An establishment/branch is not a separate legal entity.

Overseas companies that have a Swedish establishment/branch need to comply with Swedish legislation which imposes registration, accounting, disclosure and other requirements. Overseas companies also need authorization by the Swedish Financial Supervisory Authority (Finansinspektionen).

Overseas companies carrying on a trade in Sweden through a ‘permanent establishment’ will be subject to Swedish corporation tax.

*Last modified 22 Jan 2020*

**FinTech**

**FinTech products and uses**

*What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?***

**Peer-to-peer funding platforms and marketplace lending**

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
• consumer loans;
• student lending products;
• small and medium-sized enterprises (SME) lending; and
• residential property and commercial property mortgage lending.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P)-type structures, often operated through an electronic platform provider as well as crowdfunding and also direct to retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

ISSUES FOR STARTUP MARKETPLACE LENDERS

Following the initial incorporation and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate the growth of the ongoing lending activities of the platform. As the startup lender will not have an established track record, deposit base or asset pools, the funding structure will often follow the format of a warehouse securitization structure. Origination of new assets will be funded through drawings on a note issuance facility backed by security over the new assets. Each of the new assets will be subject to eligibility criteria determined by reference to the nature of the underlying asset. In order to provide an efficient financing structure, the assets will typically be held through a SPV with origination and servicing provided by the marketplace lender. In order to cover expected losses on the asset pool, the senior facility will be subject to the lending platform maintaining sufficient subordinated capital in the form of equity, or a combination of equity and subordinated debt.

While the funding may be structured through a revolving loan or note program, if there is tranching of the debt, this will typically result in the platform being treated as a securitization for the purposes of the European Union Capital Requirements Regulation, with the attendant requirements to hold risk retention and provide appropriate reporting and disclosures.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database, operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features, such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions, which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a 'proof of work' process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.
Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open ('permissionless' or 'unpermissioned') or structured within a private group ('permissioned').

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an 'address'). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another or advanced more-complex interactions with the outside world using so called 'Oracles'. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form, or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question, if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security, or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:
availability and limitations on the total amount of the tokens;

decision-making process in relation to the rules or ability to change the rules of the scheme;

nature of the project to which the tokens relate;

technical milestones applicable to the project;

basis and security of the underlying technology;

amount of coin or token that is reserved, or available to the issuer and its sponsors and the basis of existing rights;

quality and experience of management; and

compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms, which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The Swedish Financial Supervisory Authority (Finansinspektionen or SFSA) is the regulator of conduct for firms providing financial products and services in both retail and wholesale markets.

GENERAL

A person must not carry on a regulated activity in Sweden unless authorized or exempt (known as the general prohibition). A financial activity requires regulatory authorization when it:

- is specified by law as a regulated activity;
- is carried on by way of business in/to Sweden; and
- does not fall within any of the available exemptions.

Where FinTech products and/or applications involve financial activity which require regulatory authorization, the firms providing such products and/or applications must be authorized by the SFSA.

THE SFSA'S MONITORING OF THE FINTECH SECTOR
In March 2017, the Swedish government instructed the SFSA to draft a report including:

- a survey of the players offering new innovative financial services in the Swedish financial market;
- a statement of the issues and needs that exist among their businesses;
- an explanation of what measures the SFSA can take to meet the needs of the businesses; and
- an identification of new regulation that might be required for businesses operating in this sector.

REGULATORY DEVELOPMENTS

The SFSA hosted a number of round table discussions with the FinTech sector in June 2017 and published a report on 1 December 2017 named “FI’s role regarding innovation” (Sw. Myndighetens roll kring innovationer), at the request of the Swedish government. The European Banking Authority published a FinTech Roadmap for the years 2018-2019 which the SFSA participated in.

Electronic payment platforms and regulation of peer-to-peer lenders

ELECTRONIC PAYMENT PLATFORMS

Sweden does not have specific regulations for payment systems, as is the case in certain other jurisdictions. Electronic payments are governed by the Swedish Payment Services Act (Lag (2010:751) om betaltjänster), which is based on Directive (EU) 2015/2366 on payment services in the internal market (PSD II). Pursuant to the PSD II, the SFSA has issued Ordinance FFFS 2018:4.

A number of FinTech businesses are offering electronic payment platforms to rival traditional payment systems and the Swedish transposition of PSD II recognizes the increase of such business, and has been implemented in order to create a more level playing field for payment services providers, while addressing the need for enhanced security and customer protection.

The Swedish Act on Electronic Money (Lag (2011:755) om elektroniska pengar) and Ordinance FFFS 2011:49 on Electronic Money Institutions and Registered Issuers, contains a number of electronic money-related rules, directions and guidance aimed at businesses that are issuing or are considering issuing electronic money (e-money). E-money is defined as electronically stored monetary value, represented by a claim on the issuer, which is issued on receipt of funds for the purpose of making payment transactions. E-money must be accepted by a person, other than the electronic money issuer. E-money includes pre-paid cards and electronic pre-paid accounts for use online. Generally, firms issuing e-money must be authorized or registered with the SFSA.

PEER-TO-PEER LENDERS

The act of offering or providing credit to consumers is a regulated activity (requiring authorization by the SFSA). The major peer-to-peer (P2P) lending businesses in Sweden are regulated as Consumer Credit Institutions under the Swedish Act on Certain Activities with Consumer Credits (Lag (2014:275) om viss verksamhet med konsumentkrediter) or as Payment Institutions under the Swedish Payment Services Act (Lag (2010:751) om betaltjänster).

Regulation of payment services

Where a Swedish business provides payment services in Sweden, it will require authorization by the SFSA to become an authorized payment institution under the Payment Services Act (Lag (2010:751) om betaltjänster). The regulations implement PSD II on payment services in the internal market.

In order to become authorized, a payment services provider will have to meet certain criteria related to: its business plan, initial capital, having processes and procedures in place for safeguarding relevant funds and sensitive payment data as well as money laundering and other financial crime controls.

Application of data protection and consumer laws

The European General Data Protection Regulation (GDPR) replaced the Data Protection Act from 25 May 2018. The GDPR is more prescriptive and restrictive compared to the Data Protection Act, including mandatory notifications where a breach occurs and provide for severe monetary sanctions for breach.

The Swedish Marketing Act (Marknadsföringslagen (2008:486)) also regulates unsolicited direct marketing by electronic means, in addition
to sector specific regulations, such as Ordinances issued by the SFSA.

**Money laundering regulations**

Financial institutions providing services in Sweden are obligated to comply with the Swedish Act on Measures Against Money Laundering and Terrorism Financing (Lag (2017:630) om åtgärder mot penningtvätt och finansiering av terrorism), the Act on Registration of Beneficial owners (Lag (2017:631) om registrering av verkliga huvudmän) and Ordinance FFFS 2017:11 (issued by the SFSA). These regulations implement the European Union’s Fourth Money Laundering Directive. The SFSA has responsibility for supervising the anti-money laundering controls of businesses that offer certain services, such as P2P lending, providing payment services and issuing and administering other means of payment.

The SFSA supervises the firms it authorizes (including anti-money laundering requirements). Electronic currencies such as Bitcoin and cryptocurrencies tend to represent a higher money-laundering risk.

**What type of funding arrangements and incentives are available to FinTech businesses?**

**Early stage**

**SEED INVESTMENT**

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

**CROWDFUNDING**

The crowdfunding sector is well established, and may be appropriate for the early stages of a FinTech business which is a public company (Sw. publikt bolag). It involves members of the public investing in a business by pooling their resources through an intermediary platform.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or an application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses, to which they may otherwise not have had access.

**ACCELERATORS**

There are various incubators or accelerators in Sweden which offer support, facilities and funding for startups, often in return for an equity stake.

**Venture capital and debt**

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), secured against a company’s assets and including an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.
Warehouse and platform funding

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

Some FinTech companies may see warehouse funding as a temporary form of financing to be followed by a larger capital markets transaction at a later date.

Another alternative form of funding is by way of peer-to-peer (P2P) lending platforms such as Lendify, Toborrow and Savelend, which bring individual borrowers and lenders together without the involvement of traditional banks. P2P lending does not involve equity investments, and instead, interest is paid on the money borrowed.

Senior bank debt and capital markets funding

SENIOR BANK DEBT

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

CAPITAL MARKETS FUNDING

Obtaining financing by way of an Initial Public Offering (IPO) is a popular funding arrangement for FinTech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange, such as Nasdaq Stockholm or First North. First North in particular caters for small, growth-orientated companies.

CONVERTIBLE BONDS/LOAN NOTES

A popular funding tool for fast-growing FinTech businesses is to issue convertible bonds or loan notes, which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are, under certain circumstances, convertible into shares in the issuing company at prescribed prices.

Incentives and reliefs

There are currently no incentives or reliefs that apply specifically to FinTech companies in Sweden.

SWEDISH FINTECH ASSOCIATION

The Swedish FinTech Association is a newly formed industry association for Swedish FinTech companies whose purpose is to provide a unifying platform for the Swedish FinTech community, enabling it to speak with one voice.

The association was officially formed on 17 January 2017 and it will act as a lobbyist and spokesperson within the financial industry. More information can be found here.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.
The most common ways of selling loans are:

- **Assignment** – The normal way of selling loans is by way of an assignment of the rights and obligations under the loans. Subject to any contractual restrictions, assignment can be done without the consent of the debtor but it is normally prudent to ask for consent if the contract is silent on this issue.

- **Sub-participation** – A sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the buyer taking on double credit risk, both on the seller and the borrower.

Loan transfers are commonly documented using standard form contracts made available by the Loan Market Association and adopted for Swedish purposes as applicable. For more complex transactions, a more bespoke form of sale and purchase agreement would tend to be used. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

**What are the main considerations when transferring a loan and related security?**

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller’s legal advisors. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;

- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;

- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;

- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;

- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms;

- **perfection** – what actions must be taken to perfect the sale; and

- **consent** – whether a transfer requires the consent or notification of any other parties.

**Projects**

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

**Generally**

The ownership of energy and infrastructure assets in Sweden varies depending on the asset class.

There are three main ownership structures:

- asset classes which are mainly wholly-owned by the state;

- asset classes that are mainly deregulated but where state/municipal companies own the assets; and

- asset classes that are deregulated and where the assets are mainly privately owned.

**Energy**

The gas and electricity industries in Sweden are partly privatized, with the generation and supply services being provided by a number of
private sector companies. The national transmission network is, however, owned by the state-owned entity Svenska Kraftnät and operates under the protection of a statutory monopoly. In the same way, regional and local distributors operate regulated monopolies which control local and regional distribution.

The Swedish energy market supervisory authority is the Energy Markets Inspectorate (Energimarknadsinspektionen). The authority supervises, among other things, the distribution monopoly and monitors network charges to ensure that they are fair.

The private sector finances and delivers most of the required infrastructure but there are a number of government policy mechanisms (adopted through legislation) which are used to incentivize investment in eligible energy generation technologies. In certain instances, including on major energy infrastructure, projects may be procured by the public sector and depending on the terms of the procurement, the asset may either be publicly or privately owned. Public-private partnerships (PPPs) are not common funders of energy infrastructure in Sweden.

**Telecoms infrastructure**

The telecommunications networks (fixed and mobile) in Sweden are privately owned by a number of service providers.

**Transport infrastructure**

**LIGHT RAIL**

Typically, light rail assets (such as trams and associated track) are owned by local public sector promoting bodies. For example, Storstockholms Lokaltrafik (SL) owns the metro (the only one in Sweden), track and supporting infrastructure in Stockholm. The metro system is maintained by MTR Tunnelbanan AB, which won the contract through a procurement process. Other light rail is similarly operated.

**HEAVY RAIL**

The rail market in Sweden is privatized but its composition (which is complex) involves both public and private entities. The principal elements to the rail sector in Sweden are:

- **Sveriges Järnvägar (SJ)** – Owned by the Swedish state, the company is the largest operator in Sweden.
- **Freight companies** – Freight companies are wholly commercial entities.

The rail sector is regulated by the Swedish Transportation Board (Transportstyrelsen).

**ROADS, BRIDGES AND TUNNELS**

The Swedish Transportation Board operates, maintains and improves the motorways and major roads in Sweden. The public sector may outsource the construction, operation and maintenance (sometimes on a project financed basis but this is still very uncommon in Sweden) of such assets to the private sector. An infrastructure charge may be taken out by people using particular roads or bridges in order to finance the construction, maintenance or upgrade of the same. PPPs are not common funders of transport infrastructure in Sweden.

**AVIATION**

Aviation in Sweden is privatized. Ten airports in Sweden including the two largest, Stockholm Arlanda Airport and Göteborg Landvetter Airport, are run and owned by the wholly state-owned company Swedavia. The remaining two airports in Sweden, Ronneby Airport and Luleå Airport, are run and owned by other entities but Swedavia is responsible for commercial air traffic.

**PORTS**

Sweden has over 50 commercial ports along the coasts and in the two larger lakes. Most of them are owned by the municipal in which they are located. Others may be co-owned by private companies and the municipal, or solely privately owned. There are also privately owned industrial ports. The largest industrial port in Sweden is Brofjorden and it is privately owned by Preem.

**Other infrastructure**

**SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS/PRISONS)**
All, except schools, are mainly owned and run by the public sector.

Education

Schools may be public or private, but are subject to Swedish law and regulations.

Hospitals

Hospitals are mainly owned and run by the county councils of the area in which they are located. There are private hospitals as well, and the health care at such hospitals can be financed by the county council, by the patients private health insurance or by the patients themselves. At the basic level, Sweden maintains a state-financed health care system.

Social housing

This is a diverse sector involving many different organizations and individuals including housing developers, building contractors, mortgage lenders, local authorities, housing associations, landlords, owner-occupiers, private renters and those in the social rented sector.

DEFENSE

Defense assets are owned by the public sector.

WASTE

The municipalities have a monopoly on and an obligation to manage the transfer of household waste. The municipalities can decide to manage the transportation by itself, through a company owned by the municipality or to hire a private operator.

WATER

Water services in Sweden are privatized, but with wholly state or municipal owned companies operating on the commercial market.

Are there special rules for investing in energy and infrastructure?

Generally

Private financing of infrastructure in Sweden is made through so-called OPS-projects (offentlig-privat samverkan), which are kinds of public-private partnerships. An OPS-project generally means that a project company is established to provide the infrastructure service. OPS-projects are, however, very rare in Sweden.

There is no specific regime governing or restricting investment in energy or infrastructure projects in Sweden over and above existing regulation for investors and funders more generally but a particular proposed investment may be subject to legislative or regulatory control (eg merger control rules). As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal and regulatory position relevant to that project must be considered. For example, a project involving development on land will require planning permission or a development consent order; and a project may require environmental authorizations/permits and/or sector specific regulatory consents or licenses.

Energy

The energy markets in Sweden have a complex system of arrangements between suppliers, generators, transmission and distribution which are heavily regulated. In particular, there are complex arrangements in respect of licensing, subsidies and demand/charging mechanism with suppliers; customer and these are subject to change and/or regular updates meaning that investors will need to have a good understanding of the current framework and the potential directions in which the market may move. Investors need to understand how technology changes may impact on the overarching regulatory framework and vice versa.

Investors should also consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with any license conditions or the granting of specific subsidies. In particular, if a breach of those conditions could lead to the...
revocation of a license or subsidy that might make the potential target less attractive or viable.

**Telecoms infrastructure**

The industry is largely privatized, therefore investors should consider if any permits/consents/licenses will be affected by their interest.

**Transport infrastructure**

**RAIL**

The railway system has, until recently, been closed off from private investments. Only recently has it been made possible for private entities to operate alongside the public. The railway system is first and foremost a state responsibility. Private investment into the railway system would require a new order of budgeting, as the current system is quite rigid.

**ROADS**

Responsibility for the roads is shared between the state, the municipals and private road associations (some of which receive government funding). As with the railway system, private investment into the road system would require a new order of budgeting, as the current system is quite rigid.

*Last modified 22 Jan 2020*

**What is the applicable procurement process?**

Public procurement in Sweden is in most instances governed by the Public Procurement Act 2016 (Lag (2016:1145) om offentlig upphandling) which is based on EU Directives.

The key principles are that contract procured by the public sector are awarded fairly, transparently and without discrimination on the grounds of nationality and that all potential bidders are treated equally.

**Investing in energy and infrastructure**

Public procurement is relevant where the Swedish government, or a branch of it, is seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset. The relevant procurement legislation applies to certain public bodies including central government departments, local authorities, police and fire authorities and municipals. A regulated procurement is required where certain financial thresholds are met and, on most major infrastructure projects (where limited exclusions do not apply), it is likely that those thresholds will be met so a regulated procurement would need to be run.

In most cases, the public sector will need to publish a contract notice in the *Office Journal of the European Union* (OJEU) and typically run one of the following procedures:

- **Open procedure** – This is suitable for easy-to-evaluate projects and tenderers simply submit a tender in response to the OJEU notice. Change and negotiations to the tender are not permitted.

- **Restricted procedure** – There is a shortlisting of at least five tenderers following an expression of interest stage and tenderers submit a bid. Again, no negotiation is permitted other than clarification and finalization of the contract terms.

- **Competitive dialogue** – This is often the most common procedure for complex infrastructure projects and involves a shortlisting of at least three bidders who are invited to dialogue with the public sector to develop detailed solutions which are capable of being accepted by the public sector. Clarification and further negotiations are allowed following final tender but only on the basis of confirming the financial and other commitments in a tenderer’s bid.

- **Competitive procedure with negotiation** – This is sometimes described as a hybrid procedure as it allows dialogue with bidders but also allows the public sector to award a contract on the basis of an initial tender (or further stages) but clarification and negotiation is not allowed following final tender.

An investor may choose, however, to seek to invest in a project (by acquiring an interest in a private sector partner) that has already been
procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the original awarded contract rather than procurement regulations themselves.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement-related considerations that need to be borne in mind.

Last modified 22 Jan 2020

**What are the most common forms of funding / investing in energy and infrastructure?**

The principal forms of private sector funding/investment in energy and infrastructure in Sweden (including in relation to public-private partnerships) are as follows.

**Funding**

Common forms of funding in energy and infrastructure include:

- loans made on a corporate finance basis (balance sheet debt);
- loans made on a project-finance basis (to a special purpose project company) on a medium to long-term basis; such loans may later be syndicated to other funders; this is predominately a source of financing of certain energy assets;
- bond finance;
- refinancing of the debt in operational projects; and
- asset financing which is particularly relevant in the rail sector.

Funding/funding products can also sometimes be provided by the European Investment Bank and export credit agencies.

**Investing**

Common forms of investing in energy and infrastructure include:

- 'equity' investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of 'equity').

**Restructuring**

**Enforcement and sanctions**

**When can there be regulatory investigations?**

When the Swedish Financial Supervisory Authority (Finansinspektionen) considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

Last modified 22 Jan 2020

**What regulatory penalties may apply?**

When a rule breach has taken place, the Swedish Financial Supervisory Authority (Finansinspektionen) may impose a fine or an injunction, or withdraw regulated status against the firm and/or regulated individuals. The regulator will publicize these penalties.

Last modified 22 Jan 2020
What criminal penalties may apply?

Following formal investigation, the regulators have powers to impose sanctions and fines, and in certain cases, criminal penalties, including:

- insider dealing and misleading statements and practices;
- breaches of the Anti-Money Laundering Act 2014 (Lag (2014:307) om straff för penningtvättsbrott); and
- conducting regulated activities when not authorized.

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

There are no stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

Yes, the following stamp tax rates apply to mortgages over the following types of underlying property:

- real estate – 2% of the mortgage amount;
- aircrafts and businesses – 1% of the mortgage amount; and
- ships – 0.4% of the mortgage amount.

All other types of property are exempt from mortgage stamp tax.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

There are no stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security.

Last modified 22 Jan 2020

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

Secured lenders and secured debt security holders take priority over the Swedish Tax Agency on enforcement of security.

Last modified 22 Jan 2020

Is withholding tax on interest payments applicable?
Is there withholding tax on interest payments under a loan?

There is no withholding tax on interest payments.

If so:
What is the rate of withholding?

N/A.

What are the key exemptions?

N/A.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding tax (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

Generally, restrictions on the issuance of debt securities is dependent on the types of debt securities to be issued. For example:

- **Bonds / debentures and notes** – A private limited company can issue bonds/debenture subject to approval from the SEC. A public limited company can issue bonds/debentures, convertible bonds/debentures, notes and structured notes with filing and/or approval as well as report requirements by the SEC.

- **Basel III Subordinated debt instruments** – An issuer must be a financial institution under the Financial Institution Act B.E. 2551 (2008). A branch of a foreign commercial bank (although categorized as a financial institution under Thai laws) is not allowed to issue Basel III Subordinated debt instruments.

A foreign company can offer a sale of its bonds and/or debentures in Thailand and may be exempt from certain duties (eg the duty to file certain documents and a prospectus) if the foreign debt securities are offered to not more than ten investors within four months as this would be deemed a private placement.

Thai companies, foreign companies and certain entities under foreign laws (eg a unit or organization of foreign government, international organization and legal entities established under foreign laws and supervised by an authority which is a member of the International Organization of Securities Commissions) can issue bonds denominated in a foreign currency in Thailand provided the issuing entity complies with the relevant filing, approval and reporting requirements of the SEC.

What are common issuing methods and types of debt securities?

There are two major types of debt securities recognized under Thai law, being bonds / debentures and bills / notes, including:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities and high-yield bonds;
- guaranteed securities, subordinated securities, perpetual debt securities (ie debt securities that have no specified redemption date);
- derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rates, currency rates or indexes;
- equity-linked securities such as convertible debentures (ie debt securities convertible into the equity of the issuer); and
- warrants (securities giving the holders the option to purchase the equity of the issuer or a related company).
**What are the differences between offering debt securities to institutional/professional or other investors?**

Under the laws of Thailand, offering debt securities to institutional/professional or other investors is differentiated by whether the offering is by way of private placement or public offering.

A private placement of debt securities can be made by way of:

- limited offer of debentures:
  - to not more than ten investors within a four month period – calculation of investors will base on the actual beneficiary whose shares may be held via broker, dealer or underwriter;
  - to Institutional Investors;
  - to High Net Worth (HNW) Investors regardless of whether the offer is made to Institutional Investors or not;
  - to existing creditors for purpose of a debt restructuring;
  - which are made with specific relaxation from the Securities and Exchange Commission (SEC); or

- limited offer of bills:
  - to Institutional Investors (short-term bills);
  - to High Net Worth (HNW) Investors whereby an issuer shall be a financial institution, securities company or a life insurance company regardless of whether the offer is made to Institutional Investors or not (short-term bills); or
  - to limited to persons related to the issuer which does not exceed 10 bills at any time.

For the purposes of the above:

- 'Institutional Investors' means specific institutional investors, e.g. finance companies, securities companies, insurance companies and mutual funds.

- 'HNW Investors' means a juristic person or a natural person having shareholdings or investments in securities or derivatives contracts reaching the amount specified by the Securities and Exchange Commission (SEC), as follows:
  - for a juristic person HNW – shareholders' equity of at least THB100 million, or direct investment in securities of at least THB20 million or at least THB40 million (including deposits) based on the latest audited financial statements; and
  - for a natural person HNW – net assets of at least THB50 million (excluding main residence), annual income of at least THB4 million, or funds for direct investment in securities of at least THB10 million or at least THB20 million (including deposited funds).

The laws of Thailand also make a distinction between the offering of securities by Thai and non-Thai issuers.

The main distinction between the offering of debt securities by private placement or public offering largely concerns approval and disclosure requirements.

The public offering of debt securities requires the approval of the SEC, rating requirements and detailed disclosure and reporting requirements. Private placement is simpler as rating requirements and approval from SEC are not normally required.

**When is it necessary to prepare a prospectus?**

Subject to certain exemptions, submission of a draft prospectus is generally required upon offering of debt securities. Exemptions includes, for example:

- offering debt securities to investors outside Thailand;
What are the main exchanges available?

Apart from the primary market in which debt securities are traded after issuance, the Thai Bond Exchange (TBX) regulated by the Stock Exchange of Thailand is the main exchange platform. The TBX enhances the bond secondary market. Prior to the TBX, bonds were traded over-the-counter among the institutional investors. Currently, only bonds issued by publicly listed companies are allowed to be traded on the TBX.

An investor seller needs to open an account with a member of the TBX or a brokerage company in order to sell and purchase securities. Investors submit orders to sell or purchase through such members or brokerage companies who will forward such order into the exchange platform. Automatic Order Matching is applicable to match orders of sale and purchase of debt securities.

Is there a private placement market?

There is a limited private placement market in Thailand.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil and criminal liabilities under regulations of the Securities and Exchange Commission and other applicable laws.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Establishing a fund, offering fund securities and operating a fund, among other things, are regulated activities under the Securities and Exchange Act B.E. 2535 (1992) (SEA) and therefore subject to regulation by the SEC and the SET.

The mutual fund for Institutional Investors and Ultra High Net Worth (UHNW) Investors under the supervision of the SEC are similar in nature to hedge funds (eg no investment restrictions on the type of financial assets, no ratio requirements on investment). The mutual fund set up for this investment purpose must not be a retirement mutual fund, ETF fund or long term equity fund.

Investment made by mutual funds must comply with the governing rules and investment policy specified in the prospectus. The investment policy must be risk diverse in terms of assets, industrial sector and in line with investment restrictions, if any.

For the purposes of the above:

- 'Institutional Investors' means specific institutional investors, e.g. finance companies, securities companies, insurance companies and mutual funds.
- 'UHNW Investors' means a juristic person or a natural person having shareholdings or investments in securities or derivatives contracts reaching the amount specified by the SEC, as follows:
What are common fund structures?

Common forms of funds include:

- open-ended and closed-ended funds; and
- retail and non-retail funds.

What are the differences between offering fund securities to professional / institutional or other investors?

Retail funds

Retail funds are known as mutual funds under Thai law. Open-ended retail funds or close-ended retail funds must be authorized and supervised by the SEC and the SET.

Retail funds are subject to substantial regulatory oversight and restrictions, including obligations with regard to independent custodian/depositary arrangements for assets, investment and borrowing powers specifications (for open-ended retail funds), concentration requirements and other matters.

Institutional / professional funds

Non-retail funds are known as private funds under Thai law and are subject to authorization and supervision by the SEC. Private funds are described in detail in Entity establishment.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

Risk can emanate from a fund manager’s failure to comply with laws, rules, regulations, prescribed practices, internal policies, procedures or prospectus rules approved by the SEC.

For property funds or Real Estate Investment Trusts, foreign investment limits will apply. Not more than 49% of all purchased investment units can be held by foreign investors. In addition, the SEC also requires the registrar to oversee the ratio of foreign investment units and to reject any transfer of units resulting in the violation of foreign investment limits.

Investing in funds

Apart from usual commercial risks, there are no notable risks associated specifically with investing in funds in Thailand.

Managing and marketing debt / hedge funds
Are there any restrictions on marketing a fund?

Marketing and advertisements must not contain any misleading or false information. The asset management company (which must be approved and licensed by the SEC) must provide investors with appropriate services and complete information relating to the funds and investments, especially if the funds have special features. Any information disclosed for the purposes of marketing or advertisement of investment products (including securities and derivatives contracts as well as funds and collective investment schemes established under foreign law) will be subject to the regulations of the SEC.

Last modified 4 Apr 2020

Are there any restrictions on managing a fund?

The asset management company must have a reliable operational system that supports segregation of duties, compliance, risk management, recruitment and monitoring of business operations. The systems should also strengthen efficiency of internal control and recordkeeping for audit trails, and enforce information barriers to safeguard non-public information that could cause conflicts of interest

The asset management company must conduct due diligence and implement an efficient policy and procedure to prevent conflicts of interest covering at least the following areas:

- affiliated transaction;
- proprietary trading;
- front running;
- staff dealing; and
- soft dollar / rebate.

Personnel in the asset management company must be qualified under Securities and Exchange Commission regulations.

An asset management company can operate other business only if such other business will not cause risk to clients' assets or create a conflict of interest with its securities business and provided that it will support its fund management activities.

Last modified 4 Apr 2020

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

A person, being a natural person or a legal entity, operating derivatives business in Thailand will ordinarily have to be authorized under the Derivatives Act B.E. 2546 (2003).

Last modified 4 Apr 2020

What are common types of derivatives?

Common types of derivatives traded in Thailand include:

- forwards, being contracts in which one party is obliged to deliver goods as specified in the contract to the other party at a given time in the future, and the other party, in turn, is obliged to make payment for such goods at a price specified therein;
- futures, being contracts in which one party is obliged to make payment to the other party, or vice versa, in the amount which is equivalent to the difference between the price or value of goods or other variable specified in the contract and the price or value of such goods or variable prevailing at a given time or period of time in the future as specified in the contract; and
- swaps and options, being contracts in which one party is entitled to demand the other party delivers goods, or makes payment for goods, or makes payment in the amount which is equivalent to the difference between the price or value of goods or variable specified
in the contract and the price or value of such goods or variable prevailing at a given time or period of time in the future as specified in the contract, or to demand the other party enters into any of the contracts described above.

Derivatives may be traded over-the-counter or on an organized exchange, being the Thailand Futures Exchange (TFEX).

Permitted underlying assets in respect of which futures and options may be traded on the TFEX include:

- **equities** – stock indexes and individual stocks;
- **debt instruments** – bonds and interest rates;
- **commodities** – precious metals, base metals and energy; and
- **other indexes** – exchange rates, commodity indexes and others as may be announced by the Securities and Exchange Commission.

Currently, products available in Thailand include SET50 Index Futures, SET50 Index Options, Single Stock Futures, Gold Futures, Interest Rate Futures, USD Futures and Sector Index Futures.

The Bank of Thailand also regulates and supervises certain types of over-the-counter financial derivatives conducted by financial institutions.

**Are there any other notable risks or issues around entering into derivatives contracts?**

The Thai derivatives market has developed in recent years. Significant regulatory focus has been placed on transparency and minimizing counterparty defaults in over-the-counter derivatives in particular. The Bank of Thailand has also implemented Basel III.

Since 2010, Thai law has recognized the derivative warrant, which is an instrument that that gives the holders rights to buy and sell underlying securities or the right to earn profits from derivative warrant prices or an underlying asset's index. The SEC allows only derivative warrants with securities as the underlying asset. The issuer of a derivative warrant must be a third party and not the listed company issuing the underlying securities.

Generally, there are two types of derivative warrant as follows.

**Non-collateral derivative warrant**

The risk of this derivative warrant will be the issuer's obligation to deliver the underlying securities or pay the differences. The SEC will consider the issuer's risk management, financial condition and operating system as criteria for granting approval for offering of non-collateral derivative warrants. Issuers can be securities companies or commercial banks having in place robust risk management systems, financial stability and effective controls operations.

**Collateral derivative warrant**

The risk of this derivative warrant will depend on the collateral, not the issuer's risk management. The SEC will consider the safekeeping of the underlying securities by trustee, as specified by the Trust for Transactions in Capital Market Act B.E. 2550 (2007).

**Debt finance**

**Lending and borrowing**

**Are there any restrictions on lending and borrowing?**

**Lending**

Lending is generally not a regulated activity unless the lending activity ordinarily carried out by certain business operators such as the...
financial institution, securities company or regulated non-bank business operators providing consumer-related loans eg personal loan, nano finance and credit card business which is regulated by BOT or pico finance which is regulated by the FPO.

The general restrictions on lending relate to interest rate and debt collection activities. The maximum interest rate for lending is 15% per annum unless certain cases apply such as a loan provided by financial institutions or a consumer loan. Violation to the maximum interest rate could result in voidance of the interest rate plus separate criminal penalty.

Under Thai law, directors have a general duty to apply the diligence of a careful businessman in their conduct of a company's business. Adequate corporate benefit must be shown by the directors to derive from the company lending or that such lending is for the best interest of the company and necessary in the ordinary course of the business. The safe approach is often to have the members of the company approve the lending by resolution.

**Borrowing**

Borrowing is not a regulated activity. However, borrowing limits may apply in certain situations. For example, if the borrower has been granted certain incentives, such as under the promotional investment scheme of the Board of Investment of Thailand or it has obligations regarding financial indebtedness under contractual agreements.

If the borrower is a retail consumer, the borrower will benefit from protections under certain laws concerning personal loans, nano finance, pico finance and consumer protection.

Last modified 4 Apr 2020

**What are common lending structures?**

Lending can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents and trustees), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities.

**Loan durations**

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

**Loan security**

A loan can either be secured, unsecured or guaranteed.

**Loan commitment**

A loan can also be:
• committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
• uncommitted, meaning that the lender has discretion whether or not to provide the loan.

Loan repayment

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

The laws of Thailand do not allow accrued interest to be capitalized to the principal amount unless the interest has been in default for at least one year and compound interest is prohibited. Therefore, the principal amount of a loan is generally structured to be due and payable in full at the maturity date or on demand, while the interest and other payments will generally be due and payable periodically or upon occurrence of certain trigger events. The relevant statutory limitation periods are five years for loan instalment repayments and ten years for scheduled repayments of loans in full at maturity.

What are the differences between lending to institutional/professional or other borrowers?

Lending to institutional and/or professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

By contrast, lending in the context of consumer lending is a regulated activity under the supervision of Bank of Thailand and Fiscal Policy Office.

Do the laws recognize the principles of agency and trusts?

Only the agency concept is recognized under Thai law.

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to specific provisions under the Civil and Commercial Code of Thailand.

Agreements are also subject to general contractual principles, rules regarding excessive interest rates and consumer protection law. In certain circumstances, breach of these rules is a criminal offence.

As noted above, if the business operator providing lending as non-banks is a foreign majority owned company, a foreign business license/certificate is needed to be granted by the Ministry of Commerce.

Standard form documentation

There is no legally required standard form documentation.

While it has become common practice to use the standard form loan agreements recommended by the Asia Pacific Loan Market Association (APLMA), it is prudent for such forms to be amended by a Thai-qualified lawyer as there are material concepts and provisions in the APLMA forms which are not recognized or suitable under Thai law.

Are there any other notable risks or issues around borrowing?
The laws of Thailand do not allow accrued interest to be capitalized to the principal amount unless the interest has been in default for at least one year. Compound interest is also prohibited under Thai Law.

From a borrower's perspective, if the borrower has paid to the lender interest at a rate which is not permissible under the laws of Thailand, the borrower cannot later claim or bring an action against the lender for a refund from the lender of such overpayment of interest.

From the lender's perspective, pursuant to the Excessive Interest Rate Prohibition Act B.E. 2560 (2017), excessive interest rates and the use of structured payments or arrangements to conceal the use of excessive rates of interest are prohibited and subject to both civil and criminal sanctions.

If a foreign majority owned company which is incorporated in Thailand provides a guarantee or use its assets as collateral to secure loans either in Thailand or outside Thailand, a foreign business license/certificate is additionally needed to be granted by the Ministry of Commerce for the provision of security.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the giving of guarantees and security are as follows.

Capacity

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors' powers that would be preventative. Under Thai law, directors have a general duty to apply the diligence of a careful businessman in their conduct of the company's business; as such, they will need to be able to show that adequate corporate benefit is derived from the company giving the guarantee or security or that such guarantee or security granted as it is necessary in the course of ordinary business of the company and the best interests of the company. The safe approach is often to have the members of the company approve the giving of the guarantee or security by resolution, however, shareholders are generally able to ratify the actions of the company directors. Thai law does not prohibit upstream guarantees and therefore guarantees may be provided by a subsidiary to guarantee the performance of its parent company obligations provided such action is contemplated in the company's objectives.

Insolvency

Guarantees and security may be at risk of being set aside under Thai insolvency laws if the guarantee or security was granted by a company within a certain period of time prior to the onset of insolvency. This would be the case if the company giving the guarantee or security received considerably less consideration, and as such, the transaction was at an undervalue. If such undervalued transaction is made within the period of one year prior to the insolvency petition or after that, it can be revoked. If the company provides security with an aim to give advantage to one creditor over other within three months before the insolvency petition or thereafter, such security can be revoked. If fraudulent motive can be shown, the company and/or its directors may be liable for a fine and / or imprisonment.

What are common types of guarantees and security?

Common forms of guarantees

According to the CCC, a guarantee can secure the performance and payment of principal obligations which must legally valid. A guarantee must be made in writing in order for it to be used as evidence in court proceedings and only an original signed version may be used as evidence in such proceedings.

Common forms of security
There are three basic types of security interest that can be created under Thai law:

- a pledge under the CCC;
- a mortgage under the CCC; and
- a business security under the Business Security Act B.E. 2558 (BSA); and
- a leasehold right under the Leasehold Right in Immovable Property Act B.E. 2562 (LRIPA).

A mortgage may only be taken over immovable property and certain registrable movable property, e.g. registered machinery, ships of five tons and over, floating houses and beasts of burden (i.e., elephants, horses, cows, buffalos, mules and donkeys). A pledge, on the other hand, is available only for movable property.

Business security is a new security interest recognized under Thai law which may be granted by a legal entity or a natural person over its business, including all property relating to such business. Collateral under BSA includes:

- the business itself;
- its claims;
- movable property that the security provider uses in its business operation (e.g., machinery, inventory or raw materials);
- immovable property if the security provider operates a business involving immovable property (e.g., property development business); and
- intellectual property.

In addition to the business security, a leasehold right in immovable property is recently upheld as another class of asset under the new law, i.e., LRIPA which is aimed to increase the economic possibilities of the leased property and investment of immovable properties and growth in Thai economy.

Under the LRIPA, the registered leasehold right can be transferred and used as security, for example, an owner of the property who registers the leasehold right over such property is able to transfer such leasehold right to the lessee and the lessee can utilise such leasehold right as if they are the owner of the immovable property. The 30-year period is the maximum leasehold right duration permissible under the LRIPA.

Last modified 4 Apr 2020

Are there any other notable risks or issues around giving and taking guarantees and security?

If a guarantor is a company, it must have an express or ancillary power to provide a guarantee or security to secure the debt of another person. A foreign owned company must hold a foreign business license in order to provide a guarantee or security to secure debt of another person.

Giving or taking guarantees

- The guaranteed obligation, objectives and type of obligation, maximum amount of guarantee and period of time that such obligation will be incurred must be expressly specified unless the guarantor is in respect of a series of transaction which can be terminated at the sole discretion of the guarantor by informing the creditor.
- An agreement results in the guarantor being jointly liable with the debtor or as primary debtors is void unless the guarantor is a legal entity who agrees to such joint liability.
- The creditor must notify the debtor’s default to the guarantor in writing within 60 days of default, otherwise the guarantor will be released from its obligations in respect of the guaranteed interest, damages and other charges arising from the lapse of such 60 days.
- The liability of the guarantor will be discharged once the obligations of the debtor are extinguished.
- Advance consent granted by the guarantor for any extension of the guarantor’s obligation or the guarantee period is not enforceable under Thai law.
The above-mentioned provisions are mandatory under Thai Law and cannot be agreed otherwise by the parties as such terms will be void or unenforceable. The guarantor is not allowed to provide a mortgage of the guarantor’s assets to secure another person’s debt with the condition to be liable for the deficit amount after the enforcement of mortgaged property unless (i) such other person is a legal entity, (ii) the mortgagor is a director or a controlling person of such legal entity and (iii) the guarantor separately enters into a guarantee agreement. The purpose of this provision is to limit the liability of the mortgagor to only the mortgaged asset, so that the mortgagor will not have to be liable for the deficit of the outstanding debt of another person. Under Thai law, the mortgagor will not be liable for the deficit amount of money at the time of enforcement, if it is a mortgage to secure another person’s debt. Therefore, the exemption will apply if the mortgagor / guarantor is the director or the controlling person of the legal entity who is a primary debtor.

Guarantees can be made either at the time of entering into the underlying obligation or after that.

It should be noted that if a creditor rejects the requests of a guarantors to perform the guaranteed obligations once such obligations are due, the guarantor will be released from its liability.

**Giving or taking security**

**PLEDGE**

- Physical possession of pledged property is required to perfect a pledge. As a result, the pledge will be terminated once the pledged property is returned into the possession of pledgor.

- Shares in a company can be pledged but it will only be enforceable against third parties once such pledge is recorded in the share register book of the company whose shares are pledged. A pledge of transferable instruments eg notes must be endorsed on the pledged instrument.

- Prior to enforcement of a pledge, the pledgee must notify the pledgor in writing within a specified period of time unless the pledged property are notes.

- A pledge is enforced by the selling the pledged property at public auction and the pledgee must notify the pledgor of the date and time of such sale.

- The pledgor is liable for the deficit amount of money after the enforcement of pledged property.

**MORTGAGE**

- A mortgage is required to be made in writing and registered with the relevant authority, e.g. the local land office is the registry for land mortgage and the Office for Machinery Registration is the registry for mortgage on machinery, otherwise the mortgage will be void.

- The means of enforcement of a mortgage is limited only to selling the mortgaged property at public auction or to foreclose the mortgaged property.

- Prior to enforcement of a mortgage, the mortgagee must provide the debtor and the mortgagor at least 60 days' notice in writing to perform the obligation.

- The mortgagor will not be liable for any deficit amount of money following enforcement of the mortgage, if the mortgage is granted to secure other person’s debt.

Regulatory authorization

Who are the regulators?

The Securities and Exchange Commission (SEC) is the supervisory authority responsible for securities regulations. The remit of the SEC covers a wide range of securities-related activities and transactions in both the retail and wholesale market.

The Stock Exchange of Thailand (SET) is the supervisory authority which provides a platform for the sale and purchase of listed securities. The SET also acts as a clearing house and securities depository.

The Bank of Thailand (BOT) is the supervisory authority which regulates financial institutions, currency exchange, payment system, regulated non-banks, peer-to-peer lending and asset management.

The Ministry of Finance (MOF) oversees the SEC, the SET and the BOT. The MOF also regulates other specific finance activities, such as
credit bureau and escrow agent.

The Ministry of Commerce (MOC) oversees the business registration and the business security registration.

What are the authorization requirements and process?

Depending on the type of firm or the transaction, a firm or an individual must generally apply to obtain authorization from the relevant regulator and satisfy documentary requirements.

Certain activities are exempt from authorization. For instance, certain types of activity only require the satisfaction of documentary or information requirements before commencement or upon completion of a transaction. Activities exempt from authorization but which must satisfy documentary filing requirements include private placement offerings of debentures or shares, as regulated by regulations of Securities and Exchange Commission.

What are the main ongoing compliance requirements?

There are two main forms of ongoing compliance requirements, namely merit-based regulations and disclosure-based regulations.

Merit-based regulations

Ongoing compliance obligations are determined depending on the type of transaction involved, for example corporate governance requirements apply to an offering of equity securities and credit rating requirements apply when a transaction involves debt instruments.

Examples of merit based regulations include the following.

THE CORPORATE GOVERNANCE CODE FOR LISTED COMPANIES

The latest version of these guidelines for listed companies was issued in 2017 and contains eight main practices of good governance. Although not mandatory, compliance with good corporate governance provides reassurance for investors.

THE INVESTMENT GOVERNANCE CODE FOR INSTITUTIONAL INVESTORS (I CODE)

Having considered the Stewardship Code of United Kingdom, the Securities and Exchange Commission (SEC) has issued this code which sets out seven keys practices regarding investment governance of institutional investors. Similarly to the Corporate Governance Code for Listed Companies, this I CODE is not a mandatory guideline but has been encouraged by the SEC to be implemented to enhance creditability and investment environment.

NOTIFICATION OF THE SECURITY EXCHANGE COMMISSION NO. KORJOR. 3/2560 - DETERMINATION OF UNTRUSTWORTHY CHARACTERISTICS OF COMPANY DIRECTORS AND EXECUTIVES

This Notification sets out criteria to determine the characteristics of untrustworthy directors.

Disclosure-based regulations

Disclosure requirements depend on the nature of a transaction and the type of investors involved, for example disclosure requirements for private placement are more lenient than for initial public offerings. Disclosure of information about a company, the securities and investors are generally required. In some instances, approval must be obtained before commencement of a transaction and/or certain documentary requirements must be fulfilled upon completion.
Examples of disclosure based obligations include the following.

**EQUITY SECURITIES**

The offering of equity securities to the public requires disclosure on a strict basis. Disclosure is normally carried out by filing a form and preparing a prospectus which contains information regarding the issuer, details of securities, risks of investment.

**BONDS / DEBENTURES**

The offering of bonds / debentures requires disclosure of certain details, including the terms and conditions of the bonds / debentures, any transfer restrictions and the rights of holders of such debt instruments.

**EXECUTIVE SUMMARY**

The issuer is obliged to prepare an Executive Summary in the form required, which is attached to the subscription form for the securities. In addition, disclosures must be published on the website of the Securities and Exchange Commission and investors are encouraged to read it.

*Last modified 4 Apr 2020*

**What are the penalties for failure to be authorized?**

A person undertaking a regulated activity without being authorized or exempt, commits a criminal offence and is liable to a fine and/or imprisonment.

*Last modified 4 Apr 2020*

**Regulated activities**

**What finance and investment activities require authorization?**

**Generally**

A person must not carry on a regulated activity in Thailand unless authorized or exempted.

A financial activity requires regulatory authorization when it is identified as a regulated activity in relation to a regulated investment and it does not fall within any of the available exemptions.

- Regulated activities include, without limitation, activities such as accepting deposits, dealing in, managing, arranging and advising on investments, and establishing collective investment schemes.

- Regulated investments include, without limitation, equity instruments, debt instruments, options, futures and units in a collective investment scheme eg mutual funds, property funds, funds for foreign investors and infrastructure funds.

**Consumer credit**

Regulated consumer credit activities include, without limitation, the operation of an electronic system in relation to credit cards, personal loans, nano finance, PICO financing, payment gateway services, electronic money, clearing house services and the settlement of payment.

Unless exempted by law, these activities can only be offered by qualified companies who are licensed and supervised by the Ministry of Finance and the Bank of Thailand.

It might be worth noting that currently there is a draft Bill on the Regulated Financial Service Providers, e.g. hire purchasing, leasing and factoring. Once this bill become enacted as an act, certain consumer financial services will become regulated services.

*Last modified 4 Apr 2020*
**Are there any possible exemptions?**

There are two types of exclusions available when regulated activities may be undertaken without authorization.

**General exclusions**

Certain persons may carry on a regulated activity provided such activity does not fall into a category of operating a securities business which requires authorization. For example, providing general advice on securities investment to foreign investors or providing advice to closed groups or institutional investors may be undertaken without authorization.

**Specific exclusions**

For each type of regulated activity there are a number of specific exemptions that could also apply, such as making introductions (that is, making arrangements under which clients can, under certain circumstances, be introduced to another person).

*Last modified 4 Apr 2020*

**Do any exchange controls or other restrictions on payments apply?**

Yes.

The Bank of Thailand applies foreign exchange regulations to control and supervise cross-border transactions which involve foreign currencies, in particular if there will be repatriation of funds outside of Thailand.

Foreign currencies can be transferred into Thailand without limit. However, any person receiving foreign currencies from abroad is required to immediately sell such funds to an authorized bank or deposit such funds in a foreign currency account opened with an authorized bank within 360 days of receipt. Non-Thai residents and foreigners staying in Thailand for not more than three months, foreign embassies, and international organizations (including staff with diplomatic privileges) are exempt from this rule.

Antimoney laundering and tax considerations should also be taken into account.

*Last modified 4 Apr 2020*

**What are the rules around financial promotions?**

**Rules**

Only a securities company licensed by the SEC can contact or solicit business from or otherwise provide advice on securities investment to investors or clients.

**Exemptions**

Exemptions include solicitation to institutional investors for investment outside of Thailand. For example, a non-Thai securities company licensed by a regulator which is an ordinary member of the International Organization of Securities Commissions can solicit business from Thai institutional investors to manage investments overseas without being licensed by the SEC.

*Last modified 4 Apr 2020*

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

**Generally**
The most common types of legal entities are private limited companies and public limited companies, both of which are body corporates with separate legal personality and limit the liability of their members to their shareholdings (ie shareholders are liable to pay for their shares but no the company's debts).

Limited companies can either be private (denoted by the suffix Co Ltd, Ltd or Limited) under the Civil and Commercial Code of Thailand (CCC) or public (denoted by the suffix PLC or Public Limited Company) under the CCC and the Public Limited Companies Act (PLCA). Only shares in public limited companies listed on an exchange can be publicly traded, subject to approval by the SEC.

Thai public limited companies can choose to list their shares with the Stock Exchange of Thailand (SET) or the Market for Alternative Investment (MAI) depending on its qualifications. Companies listed on the SET or the MAI are required to comply with the regulations of the SEC and the SET applicable to the main exchange or the alternative exchange, as the case may be. Foreigners may invest in listed securities using non-voting depository receipts (NVDRs) through Thai NVDR Co., Ltd. (the Thai NVDR), which is a subsidiary of the SET. The Thai NVDR was established in order to alleviate the constraints on foreign shareholding in Thai companies.

**Funds**

The most common type of funds used as investment vehicles for the private sector are mutual funds, private funds and provident funds.

**Mutual fund**

A mutual fund is a form of collective investment, pooled and managed by an asset management company holding a license from the SEC to undertake investment management business. A mutual fund is established as a separate legal entity from the asset management company. Mutual funds may be established for specific investment purposes and/or investors, for example property, infrastructure, carbon credit, retirement and collective investment schemes.

**Private fund and provident fund**

A private fund is formed of no more than 35 investors. It is managed by an asset management company licensed by the SEC to invest in securities or other assets according to an agreement with its investors. Unlike a mutual fund, a private fund does not have a separate legal personality. To protect the interests of its investors, the asset management company is required to appoint a private fund manager approved by the SEC. In addition, the assets of the private fund must be segregated from the portfolio of the asset management company and a custodian approved by the SEC to safeguard the assets of the private fund must be appointed. The custodian must also separate the assets of the private fund from the custodian's own proprietary portfolio.

A provident fund is a form of pooled fund to which an employer and its employees contribute as an incentive for additional savings for retirement or resignation. Regulations on provident funds are generally in line with those governing mutual and private funds, including asset segregation, asset custody, prevention of conflicts of interest, investment restrictions, asset valuation, information disclosure, investors' choice and unitization of members' rights. Provident funds are managed by a private fund manager who is approved by the SEC and appointed by the asset management company.

The only type of pension fund recognized under the laws of Thailand is the Government Pension Fund established under the Government Pension Fund Act B.E. 2539 (1996) for the purposes of ensuring benefits upon retirement, promoting awareness of saving and providing other welfare to members who are employed by government agencies.

Funds must be managed by an asset management company and such companies are generally required by law to be set up as either a private limited or public limited company and must be licensed by the SEC.

Generally, fund managers must be qualified individuals approved by the SEC.

**Others**

Other types of investment vehicles recognized under Thai law include:

- trusts for transactions in capital market, established under the Trust for Transactions in Capital Market Act, B.E. 2550 (2007) for the purposes of investing and managing investment eg institutional investors and high net worth trust funds, real estate investment trusts, exchange-traded funds and special purpose trusts (such trusts must be managed by a trustee licensed by the SEC);

- venture capital funds, which are required to be set up as a limited company or a public limited company established specifically to operate a venture capital business (such funds must be managed by a securities company licensed for venture capital management by
the SEC); and

- crowdfunding platforms, established in order for small and medium enterprises to fundraise through funding portals approved by the SEC (investors can be retail investors (with an offer limit) or non-retail investors (without an offer limit)).

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

In the context of banks, a branch of foreign commercial bank is considered as Commercial bank under the Financial Institution Act B.E. 2551 (2008). Therefore, if such branch is duly granted with approval from the BOT, it will be allowed to operate banking business in Thailand, including lending and investment activities.

In case of non-banks side, an establishment in Thailand (i.e. as a private limited company or public limited company) is able to conduct the lending or investment business in Thailand. If the entity in question is a foreign majority owned company, a foreign business license/certificate is needed to be granted by the MOC. Besides, if any lending and/or investment activities is by its natures regulated by the BOT (i.e. personal loan and nano finance) or the Fiscal Policy Office (FPO) under the MOF (i.e. pico finance) then approval from the BOT and/or FPO (as applicable) must be obtained.

For the purpose of the above:

- ‘Commercial bank’ means a public limited company approved to operate commercial bank business, a retail bank, a commercial bank which is a subsidiary of foreign commercial bank and a branch of foreign commercial bank being approved to operate commercial bank business in Thailand.

- ‘Credit foncier company’ means a public limited company being approved to operate credit fonder business

- ‘Finance company’ means a public limited company approved to operate finance business.

- ‘Financial institution’ means a commercial bank, a finance company and a credit foncier company.

- ‘Personal loan’ means (i) lending, purchasing, discounting or rediscounting bills or any negotiable instruments to natural person, either with or without purpose to obtain goods or services; and (ii) lending with purpose of doing business. Currently, the personal loan regulated by BOT are the unsecured personal loan, i.e. without collateral, which shall include (i) and the financing on hire purchase or leasing of goods, except cars and motorcycles, that are not sold by the personal loan operator in ordinary course of business, except vehicles and (ii) the financing secured by vehicle plates. Nevertheless, the regulated personal loan shall exclude loans provided for (i) education, (ii) traveling in respect of overseas employment, (iii) medical treatment, (iv) staff welfare where the employer has signed contract with the personal loan operator and (v) others as prescribed by BOT.

- ‘Nano finance’ means lending, purchasing, discounting or rediscounting bills or any negotiable instruments, hire-purchase, leasing to natural person with the purpose of doing business without assets or property as collateral. Currently, the regulated nano finance is defined as nano finance with the purpose to do business with the lending procedure flexible in line with the criteria of debtors’ group, e.g. start-up business. The credit limit for each debtor must not exceed THB 100,000 with the credit period as agreed between debtor and nano finance operator. Nevertheless, regulated nano finance shall exclude (i) hire-purchase and sale and lease back of car and motorcycles, (ii) car for cash and motorcycles for cash, (iii) hire-purchase and lease of goods that are sold by the nano finance operators in their ordinary course of business, (iv) traveling loan in respect of overseas employment and (v) others as further prescribed by BOT.

- Pico Finance which is regulated means lending made to a natural person either with or without assets or property as collateral, at the province on which a head office of the pico finance operator is located, and calculated the maximum interest, profits from lending, fine, fees and other expenses not exceeding the interest rate permissible under CCC. The regulated pico finance shall exclude (i) traveling loan in respect of overseas employment, (ii) loan granted as staff welfare where the employer has signed contract with the pico operator and (iii) others as prescribed by FPO.
FinTech

**FinTech products and uses**

*What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?*

**Peer-to-peer funding platforms and marketplace lending**

The BOT is the authority that supervises and regulates financial business and activities in Thailand. Currently, Peer-to-peer lending and consumer lending (e.g., personal loan, nano finance and pico finance) have been regulated in Thailand. The BOT is responsible for supervising the peer-to-peer lending activity whereby it requires the prospective peer-to-peer operator to participate in the BOT's Regulatory Sandbox and be licensed before operating the peer-to-peer business.

Please see [Electronic payments platforms and regulation of peer-to-peer lenders](#).

**Blockchain, smart contracts and cryptocurrencies**

The BOT has implemented the FinTech regulatory sandbox (BOT Sandbox) which will enable financial institutions, as well as FinTech companies, to experiment with and develop innovative financial products or services within a well-defined space and duration, under the BOT’s supervision.

The main criteria is that the products or services in questions must be the products or services which are under supervision of BOT. Otherwise, it could not participate in the BOT Sandbox. Currently, the financial services to be tested in the BOT Sandbox must be (i) relevant to infrastructure or centralised standard or (ii) required by laws to participate in the BOT Sandbox.

According to the practice guidance concerning the FinTech regulatory sandbox issued by the BOT on 15 March 2019, the financial products or services which can enter into the Sandbox must have the following criteria:

- being financial products / services regulated by the BOT;
- being financial products / services or FinTech innovation using new technology – it could be (i) a new innovation, (ii) different from currently available financial products or services in Thailand or (iii) an innovation which applies new technology to improve efficiency of existing products/services; and
- having any of the following qualifications;
  - being financial products / services which could be developed to be infrastructure or centralised standard for Thai financial sectors which shall be tested together by financial service providers; or
  - being required to participate in the Sandbox by virtue of laws or relevant supervising criteria (e.g., the regulated peer-to-peer lending).

However, if the services are not qualified under the criteria above, it could be apply to be tested under the Own Sandbox scheme. The Own Sandbox is a separate and independent sandbox of each business operator but still under the monitor of BOT. Quarter report on progress of the Own Sandbox is required to be submitted to BOT.

Several FinTech companies have participated and are currently participating in the BOT Sandbox. According to the publication of BOT, technologies tested under the BOT Sandbox are for example Standardized QR Code, Biometrics (i.e., facial and iris recognition), Blockchain, Machine Learning and Standardized API, etc.

**Initial coin offerings and token-based products**

By virtue of the Emergency Decree on Digital Asset Business B.E. 2561 (2018), since 14 May 2018, the Initial Coin Offerings (ICOs) as well as the operation of Digital Assets Business in Thailand have become the regulated activity under the supervision of the SEC. Cryptocurrencies and Digital Tokens are considered as Digital Assets thereunder.

**Initial Coin Offerings (ICOs)**
The ICOs under the supervision of the SEC refer to the offering of regulated Digital Tokens in Thailand. Basically, an ICO issuer must be a private or public limited company licensed by the SEC and must offer the ICO through the ICO portals licensed by the SEC. Currently, while three ICO portals are licensed by the SEC, no ICO issuer has been licensed by the SEC.

Further, the SEC has prescribed the following types of qualified investors being able to subscribe for the ICO:

- Institutional Investors or Ultra High Net Worth (UHNW) Investors;
- Venture Capital or Private Equity; and
- Other investors who are subject to the capped of offering value as prescribed by the SEC.

Similarly to the securities offerings, a disclosure-based regulation theme is applicable to the ICO whereby a prospectus is required to be submitted to the SEC and effective before the ICO can be made. Nonetheless, certain types of offerings are exempted from being supervised by the SEC (e.g. an offering of Digital Tokens by the Bank of Thailand) or from the disclosure and prospectus requirements (e.g. a private placement of Digital Tokens to limited types of investors).

OPERATION OF DIGITAL ASSETS BUSINESS

The Emergency Decree on Digital Asset Business B.E. 2561 (2018) categorised three types of business operation which are relevant to the digital assets; being (i) Digital Asset Exchange, (ii) Digital Asset Broker and (iii) Digital Asset Dealer. These three businesses are subject to licensing requirements of the SEC prior to operating its digital assets-related business in Thailand.

To prevent the illegal use of digital assets, the SEC requires the secondary trading or exchange of the digital tokens to be done only through the licensed Digital Asset operators. Besides, in case where the ICO issuer and / or the Digital Asset operators receives cryptocurrencies as remuneration or part of transaction, only the cryptocurrencies tradeable or exchangeable at the licensed Digital Asset operators can be accepted.

**Artificial intelligence and robo advisory systems**

Currently, there are no particular laws that are specifically intended to apply to the artificial intelligence (AI) and robo advisory systems; and there is no regulatory sandbox exclusively dedicated to AI and robo advisory systems.

However, the SEC has supported the use of technology especially AI and robo advisory systems in the context of securities. The SEC therefore has cooperated with private sectors to opening an official website under the project named ‘Five Steps to Investment with Confidence’ which is so-called ‘Wealth Advice for All’. This project is aimed to be an introductory platform for investors to easily connect with wealth advisors as licensed by the SEC with less associated investment costs and to advocate long-term financial well-being of Thai nationals.

Certain licensed operators are implementing AI and robo advisory systems when providing investment consultation services. To be qualified as a licensed wealth advisor, the operator must be licensed by the SEC to provide securities/derivatives business and shall also be equipped with reliable systems and personnel in response to the five key concerns of the SEC i.e.:

- exploring and understanding customers;
- constructing an investment portfolio;
- implementing the portfolio according to the asset allocation plan;
- monitoring and rebalancing the portfolio; and
- providing consolidated reports for clients’ review.

Please see [FinTech products and uses – particular rules](#).

**Data analysis and cloud computing**

Currently, there are no particular laws that are specifically intended to apply to the data analysis and cloud computing market; and there is no regulatory sandbox exclusively dedicated to data analysis and cloud computing activities.

There is no specific legal requirement for the use of cloud services. However, a service provider of electronic transactions under the
Electronic Transaction Act B.E. 2544 (2001) who opts in to use the cloud services are encouraged to follow the Notification of the Electronic Transaction Committee re: Guideline on Application of Cloud Services B.E. 2562 (2019) (Cloud Guideline) which sets out the fundamental criteria and recommendations when using the cloud services regardless of whether the cloud services are provided by third parties. Initially, the Cloud Guideline guides on key considerations in several aspects which should be factored when using the cloud services, eg policies and practices of electronic transactions service providers, efficiency of cloud services, security, data management and personal data protection.

Please see FinTech products and uses – particular rules.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

Due to the wide range of FinTech products in the market, the regulatory authorities with responsibility will depend on the type of FinTech products involved. Currently, there are four main supervisory authorities under which FinTech activities or products may be caught:

- the Bank of Thailand (BOT);
- the Securities and Exchange Commission of Thailand (SEC);
- the Stock Exchange of Thailand (SET); and
- the Office of Insurance Commission (OIC); and
- the Board of Investment of Thailand (BOI).

GENERAL

A person cannot carry on a restricted / regulated activity in Thailand unless authorization or exemption is granted (known as the general prohibition). Most financial activity requires regulatory authorization when:

- it is identified as a specified activity in relation to a specified investment;
- it is carried on by way of business in Thailand; and
- it does not fall within any of the available exemptions.

Where FinTech products or applications involve financial activities which require regulatory authorization, the firms providing such products or applications must be authorized by the relevant supervisory authority.

FINTECH REGULATORY SANDBOX

Please see FinTech products and uses – common technology products for the FinTech Regulatory Sandbox offered by the Bank of Thailand.

The SEC set up the FinTech Department and Data Management and Analytics Department (effective from 1 January 2017) to work on a strategic plan concerning innovation in capital markets.

REGULATORY DEVELOPMENTS ON INVESTMENT PLATFORMS

A draft FinTech Act is currently under review by the relevant authorities and stakeholders. On 4 September 2017, the public hearing of the draft FinTech Act emphasized its importance and revised it to reflect comments raised by parties who may be affected by its enactment.

Electronic payments platforms and regulation of peer-to-peer lenders

ELECTRONIC PAYMENT PLATFORMS

The Payment System Act B.E. 2560 (2017) (PSA) has been enacted to regulate electronic payment businesses in Thailand. The PSA has
categorised three types of payment-related businesses under the supervision of the BOT as follows:

- **Highly Important Payment Systems**: These are payment systems that are a principal infrastructure of the country whose problems or disruptions would be likely to affect members systemically, and handle large value fund transfers or used for clearing or settlement between members; including the payment systems operated by the BOT which are the inter-bank large value funds transfer systems (BAHTNET) and Imaged Cheque Clearing and Archive System (ICAS). In addition, the Minister of Finance is empowered to designate other payment systems to be the highly important payment systems.

- **Designated Payment Systems**: These are payment systems that (i) are the center or network between system users for handling funds transfer, clearing or settlement eg retail funds transfer systems, payment card network, settlement system, etc, and or (ii) may affect public interests, public confidence or stability and security of the payment systems.

- **Designated Payment Services**: The regulated payment services are (i) credit card, debit card, or ATM card services, (ii) electronic money services, (iii) acceptance of electronic payment for and on behalf of others, (iv) electronic money transfer services, and (v) other payment services which may affect payment systems or public interests.

In order to legally operate an electronic payment business in Thailand, prospective operators (either natural or juristic persons) need to comply with applicable requirements before operating permitted electronic payment activities. The applicable requirements depend on the types of electronic payment activities to be conducted but would be either to register or to obtain a license from the BOT. Further details regarding regulation of electronic payment platforms can be found on the BOT website.

**PEER-TO-PEER LENDERS**

Due to the enactment of the MOF Notification re Business Subject to Approval to Clause 5 of the Revolutionary Council Decree 58 (Regulated Peer-to-Peer Lending Platform Business) and the BOT Notification No. SorNorSor. 4/2562 re Regulations, Procedures and Conditions for Conducting Peer-to-Peer Lending Business through Electronic System/Platform (BOT Notification re Peer-to-Peer Lending), the peer-to-peer lending is a regulated activity in Thailand.

The BOT has been authorised to be an in-charge authority for:

- receiving an application form;
- specifying applicable regulations; and
- requiring a business operator to apply for an application to the BOT’s Regulatory Sandbox.

According to the BOT Notification re Peer-to-Peer Lending, the BOT requires an operator who wishes to conduct the peer-to-peer lending business through electronic system/platform to:

- make an individual consultation to the BOT;
- participate in the BOT’s Regulatory Sandbox until reaching successful outcome; and
- apply for the application of the peer-to-peer lending business through electronic system/platform prior to legally operate the peer-to-peer lending business through electronic system/platform in Thailand.

Please note the operator must be a company incorporated in Thailand with the registered and paid-up capital of at least THB5 million (including shareholder’s equity) and have a Thai shareholder holding not less than 75% of total shares with the right to vote.

Scope of business activity of peer-to-peer lending business through electronic system/platform is being an online market place or matchmaker whereby a loan agreement between a lender and a natural person borrower will be made through electronic system/platform and the loan must be granted in THB currency.

The maximum of the total amount of loan granted by each lender through any peer-to-peer ending operators is not exceeding THB500,000 per lender within any 12-month period unless such lender that is a qualified institutional investor, a private equity, a venture capital or a specific investor. The interest chargeable is not exceeding 15% per annum.

Apart from the above, the general principle for monetary lending under the Civil and Commercial Code of Thailand (CCC) is that borrowing of money in amounts above THB2,000 must be evidenced in writing and signed by the borrower. If such formalities are not complied with, a claim cannot be made against the other party to the transaction. According to the Electronic Transaction Act B.E. 2544, such evidence
can be in an electronic form, since electronic data and signatures are enforceable if such electronic data is accessible and usable for subsequent reference without its meaning being altered and if the electronic signatures are made using a reliable method to identify the signatories.

**Regulation of payment services**

Please see Electronic payments platforms and regulation of peer-to-peer lenders above.

**Application of data protection and consumer laws**

**DATA PROTECTION LAW**

The Personal Data Protection Act B.E. 2562 (2019) (PDPA) has recently been enacted on 28 May 2019. Due to the one-year grace period, the PDPA will fully be enforceable on 28 May 2020. The PDPA signals a new dawn in the handling of personal data in Thailand because prior to the PDPA, Thailand did not have an overarching law governing the protection of personally identifiable information. The collection, use and disclosure of personal data in Thailand were regulated to an extent by a patchwork of laws including the Constitution, sector-specific legislation and various self-regulatory codes. The PDPA is mainly similar to the EU General Data Protection Regulation regime, bringing personal data protection law in Thailand in line with other jurisdictions.

The PDPA introduces two key roles in collecting, processing and transfer of personal data. The Personal Data Administrator (Data Administrator) will have overall responsibility to determine and control the use of personal data. The Personal Data Processor (Data Processor) will be responsible for using, disclosing or processing the data on behalf of, or in accordance with, the instructions of a Data Administrator.

Affirmative consent must be obtained from the data subject in order for Data Administrators to legitimately collect personal data. Data Administrators must obtain consent for any use or disclosure of data that is beyond the original collection request. There are however limited circumstances in which Data Administrators may be exempt from obtaining the data subject's consent.

The PDPA applies to all organisations that collect, use or disclose personal data in Thailand. This is regardless of whether they are formed or recognised under Thai law; and whether they have residence, office or place of business in Thailand. Cross-border transfer of personal data outside of Thailand is prohibited, unless the recipient country's data protection standard is equivalent or higher than the PDPA but limited exceptions are available.

**CONSUMER LAW**

The Consumer Protection Act B.E. 2522 (CPA) has been enforced with an aim to provide protection for consumers who buy or obtain services or are offered goods or services. The CPA applies to business operators who are:

- sellers, manufacturers or importers of goods or are purchasers of such goods for re-sale; and
- service providers, including those who operate an advertising business.

The CPA provides protection for consumers in several aspects eg advertisement, unsafe goods, labelling and contractual requirements etc. To ensure the consumer protection, the Consumer Case Procedure Act B.E. 2551 (2008) has been enacted to provide specific procedural requirements in relation to a consumer litigation.

**Money laundering regulations**

In addition to commercial banks and other governmental authorities, certain other business operators are subject to anti-money laundering laws in Thailand. According to the Anti-Money Laundering Act B.E. 2542 (1999) (AMLA) and subordinated regulations, certain business operators are subject to the requirements under AMLA to:

- report required transactions (e.g. cash transactions with amounts exceeding specified thresholds);
- procure know-your-customer (KYC) checks; and
- arrange customer due diligence.

Apart from financial institutions (eg commercial banks, finance companies, credit foncier companies, securities companies, insurance companies and operators of regulated payment systems or services, etc.), certain non-financial institution business operators covered by
the AMLA include:

- non-financial institutions providing advice or acting as advisors in transactions relating to the investment or movement of funds under the law governing securities and the stock exchange;
- operators trading precious stones, diamonds, gems, gold, or ornaments decorated with precious stones, diamonds, gems or gold;
- operators trading in or providing the hire-purchase of cars;
- operators acting as brokers or agents in respect of the purchase or sale of immovable property;
- operators trading antiques under laws governing the sale by auction and trading of antiques;
- operators providing personal loans under the supervision of businesses that are not financial institutions or who are not caught by the Ministry of Finance's notification requirements in respect of personal loan businesses or who do not otherwise fall under the supervision of the laws governing financial institution businesses;
- operators transacting in electronic money that are not financial institutions caught by the Ministry of Finance's notification requirements in respect of electronic money or that are not otherwise subject to the laws governing financial institution businesses;
- non-financial institution operators conducting credit card business;
- electronic payment operators governed by laws relating to the supervision of electronic payment service business; and
- non-financial institution operators carrying out currency exchange activities as specified in the relevant ministerial regulation.

The Anti-Money Laundering Office is the supervisory authority of the AMLA.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital (VC) providers.

CROWDFUNDING

Crowdfunding platforms are currently available under the supervision of the Thai Securities and Exchange Commission (SEC). The funding portal used for screening the offering company, disclosing information and educating investors must be approved by the SEC. Moreover, the approved funding portal must also categorize its members as either retail investors or non-retail investors (eg VC, private equity trust and qualified investors). Retail investors will be subject to a limit on investment while non-retail investors will not be subject to such a limit.

Currently, both equity and debt crowdfunding are permitted in Thailand.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

ACCELERATORS

There are various incubators or accelerators in the Thai market which offer support, facilities and funding for startups, often in return for an equity stake.

Venture capital and debt

VC funding is a type of equity investment usually targeted at early-stage FinTech companies with an established business and some
trading history. VC provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of VC and involves an equity investment by a corporate fund, examples of which include Beacon Venture Capital (being a CVC vehicle of Kasikorn Bank PLC) or Digital Ventures (being a CVC vehicle of Siam Commercial Bank). Both CVCs are targeting FinTech startups. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

VC debt is not available in the funding market as the corporate laws in Thailand do not allow conversion of debt to equity or the issuance of convertible debt instruments by a private limited company (which is the form of business vehicle commonly used by startups in Thailand). However, we have been working with the relevant authorities to amend the relevant laws and regulations to facilitate the funding market for startups in Thailand, including amendments to allow debt-to-equity conversion and the issuance of convertible debt instruments by private limited companies in Thailand.

In addition, proposed amendments to corporate law to promote and facilitate the funding market for startups include changes to:

- allow the offer of shares in a private limited company to employees / directors under an Employee Stock Option Plan (ESOP) and creditors under debt-to-equity conversion programs or convertible debt instruments;
- enable the rights attached to preference shares to be amended by special resolution of shareholders; and
- enable a private limited company to buy back its shares, subject to certain requirements and criteria being met.

Warehouse and platform funding

The SEC is currently actively monitoring the SEC FinTech regulatory sandbox relating to investment advisors, private funds, clearing and settlement activities and electronic trading platforms (ETP).

In addition to the FinTech regulatory sandbox, there is also a know-your-customer (KYC) regulatory sandbox which enables temporary rules to apply to business activities which do not need to be supervised by the FinTech regulatory sandbox. Temporary rules for Limited Brokerage Dealing and Underwriting (LBDU) are now also available.

To participate in the SEC FinTech regulatory sandbox, FinTech companies must fulfil the requirements set out in relevant SEC regulations. Generally, to enter into the FinTech regulatory sandbox, businesses need to:

- involve innovation in financial services;
- be operationally ready in terms of capital, work systems, human resources, risk management processes and customer contact processes; and
- have an exit strategy.

Please see FinTech products and uses – particular rules.

Senior bank debt and capital markets funding

Senior Bank Debt

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

Capital Markets Funding

Thailand has both debt and equity capital markets which are accessible to businesses (usually of a certain size).

Raising finance by way of an Initial Public Offering (IPO) can be done in the SET and MAI, depending on applicable criteria and requirements. However, IPOs are not a popular funding arrangement for FinTech companies because FinTech is an emerging sector with numerous applicable regulations and with incentives which are less favorable when compared to other jurisdictions in the region such as the Singapore market.
Incentives and reliefs

Thai Revenue Department (RD) has continuously provided tax incentives and reliefs to qualified startups and SMEs including its investors, e.g. VC and angel investors. The conditions and qualifications of eligible person/entities under the tax schemes granted are amended periodically.

In respect of startup itself, the key conditions and qualifications to be eligible for 5-year corporate income tax exemption are, e.g. being incorporated during the prescribed period, having at least THB5 million of registered capital, having the income not exceeding THB30 million in the accounting year whereby 80% of which is generated from the operating targeted business, and applying for an approval with the RD.

Further to the foregoing, the startup must operate the targeted business as specified by the National Science and Technology Development Agency, including businesses in the following industries:

- food and agriculture;
- energy saving, renewable energy and clean energy;
- biotechnology;
- medical and public health;
- tourism, services and creative economic;
- advanced materials;
- textiles, fabrics and accessories;
- vehicles and auto parts;
- electronics, computers, software and information services; and
- research and innovation.

VC and angel investors are also subject to certain requirements in order to claim for tax privileges e.g. participating in an investment during the promoted period, and retaining the investment within the minimum period, etc.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Buying and selling loans is very common.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are:

- **Novation** – A novation is a full legal transfer of the party’s rights and obligations. It is a tripartite arrangement between the existing parties and the transferee and results in a fresh contract being formed between the continuing party and the transferee and the transferor being released from its obligations.

- **Assignment** – An assignment is a transfer of rights only, not obligations. Subject to any contractual restrictions, assignment can be done without the consent of the debtor. However, the assignee is able to claim such assignment against the debtor only if such transfer is notified to the debtor in writing; and if the debtor consents in writing to such transfer, the debtor will not be able to use any defense it has over the assignor against the assignee.
Under Thai law, the security will not automatically transfer with the loan which it secures. An amendment to the security agreement or a new security agreement (as the case may be) must be done to secure the transferred loan.

Please note that there is no specific provision on sub-participation under Thai law. However, commercial banks will be subject to requirements and criteria under the risk participation regulations of the Bank of Thailand.

Last modified 4 Apr 2020

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller’s legal advisors. Some of the key considerations include:

- **confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;
- **data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;
- **lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;
- **undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;
- **transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and
- **consent** – whether a transfer requires the consent or notification of any other parties.

An asset management company approved by the Bank of Thailand for the purpose of transferring assets (ie non-performing assets) from financial institutions will benefit from, for example, exemptions on (i) certain fees and taxes and (ii) requirements to provide notices of transfer.

Last modified 4 Apr 2020

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

The ownership of energy and infrastructure assets in Thailand varies according to the asset class. The main asset classes are usually considered to be:

- economic infrastructure (energy, aviation, rail, telecommunications, water, roads and waste); and
- social infrastructure (education, health and justice/prisons, housing).

Key sectors are considered below.

Energy

GAS

PTT Public Company Limited (PTT) is a state-owned listed oil and gas company. It owns gas pipelines and LPG terminals and engages in the production of oil and gas as well as petrochemical products. PTT has many subsidiaries investing in various sectors. Private
participation is allowed in the gas sector through receipt of concessions from the government. There are encumbrances on investment in certain areas e.g. LPG in terms of strict criteria and conditions for investment. Therefore, few private investors engage in such business sector.

There are six main companies engaging in oil refinery business in Thailand:

- Thai Oil Public Limited Company;
- PTT Global Chemical Public Company Limited;
- Star Petroleum Refining Public Company Limited;
- Bangchak Petroleum Public Company Limited;
- IRPC Public Company Limited; and
- Esso (Thailand) Public Company Limited.

**ELECTRICITY**

Three state enterprises manage the electricity industry in Thailand. The Electricity Generating Authority of Thailand (EGAT) is responsible for producing, generating and transmitting electricity. The Metropolitan Electricity Authority (MEA) and the Provincial Electricity Authority (PEA) deal with distribution of electricity. Private sector entities are able to participate in the electricity business as electricity producer in accordance with government policy.

There are three main types of private electricity producer:

- Independent Power Producer (IPP);
- Small Power Producer (SPP); and
- Very Small Power Producer (VSSP).

**Telecoms infrastructure**

The National Broadcasting and Telecommunication Commission (NBTC) is an independent state organization empowering to assign the frequencies and to regulate the broadcasting and telecommunications businesses with regard to the utmost public benefit. Private entities are able to take part in telecommunication business through an auction and licensing process. Qualified candidates need to accept terms and conditions specified by NBTC before entering into an auction to engage in telecoms infrastructure. The major telecommunications operators are True Move, DTAC and AIS.

TOT Public Limited Company (TOT) and CAT Telecom Public Limited Company (CAT) operate national telecommunications and provide international telecommunication services. Both are Thai state-owned telecommunications companies.

**Transport infrastructure**

**URBAN TRANSPORT**

Currently, there are three urban rail transport systems operating in Thailand and connecting Bangkok with outer Bangkok and urban areas; being the Bangkok Mass Transit System (BTS), Metropolitan Rapid Transit (MRT) and Airport Rail Link (ARL).

- Bangkok Mass Transit System Public Limited Company (BTSC) built and operated the BTS which was entirely funded by private sectors. The BTSC’s 30-year concession awarded by the Bangkok Metropolitan Authority (BMA) ends in 2029, following which (subject to renewal), the BTS business will be transferred to the BMA because the concession is in the form of a Build Operate Transfer (BOT) contract.
- The MRT is a cooperation between public and private sectors. The Mass Rapid Transit Authority of Thailand (MRTA) as a project owner built the infrastructure and offered the operating concession to the Bangkok Expressway and Metro Public Limited Company (BEM).
- The ARL is entirely owned by State Railway of Thailand (SRT) and operated by State Railway of Thailand Electrified Train Company Limited which is now a state enterprise under the supervision of the Ministry of Transportation.
- Additional rail and urban transport systems are currently under working progress whereby the main project owner is MRTA.
NATIONAL RAIL

Double-track rail and high speed railway projects are currently under construction or negotiation process. SRT is responsible for study and procurement of both projects. High speed railway projects which have been active are:

- Bangkok – Nakhon Ratchasima;
- Nakhon Ratchasima – Nong Khai;
- High-speed rail linking three airports;
- U-Tapao – Rayong;
- Bangkok – Chiang Mai; and
- Bangkok – Padang Besar.

Certain routes of high speed railway project have the cooperation from foreign countries eg Italy, China and Japan in terms of technology transfer. Private sector is able to participate in the investment on both projects in the form of public-private partnerships scheme (PPP) which is usually made by auction process.

ROADS, BRIDGES AND TUNNELS

Roads

The Department of Highways (DOH), an authority under the supervision of Ministry of Transportation, is responsible for research and development, construction, expansion, maintenance and renovation of the motorways, national highways and concession highways. Rural and local highways are under the responsibility of the Department of Rural Highways (DORH) and local authorities, respectively. The Expressway Authority of Thailand is responsible for expressway whereby BEM receives the concession to be an operator. Don Muang Tollway Public Limited Company won an auction to manage and collect toll revenues of the Don Muang Tollway which is the highway under the supervision of DOH. Private sector participates in the roads investment by procurement process of sub-contracts, eg a construction contract, a system installation contract or a design, operation and maintenance contract.

Bridges and tunnels

The sub-divisions of the DOH and DORH called the Bureaus of Bridge Construction are responsible for construction of bridges and tunnels over and around a highway under its responsibility. Unless local competent authorities are responsible for design, construction and maintenance of bridges and tunnels in the area of its responsibility eg Department of Public Work of Bangkok is responsible for construction of bridges and tunnels in certain areas of Bangkok.

Aviation

Airport of Thailand Public Limited Company (a majority state owned company) owns and operates main airports in Thailand. Private ownership on airports, and aircrafts is recognized in Thailand as long as relevant licenses are obtained. All models are heavily regulated by government and the Civil Aviation Authority of Thailand which is the aviation regulator in Thailand.

Port

Port Authority of Thailand (PAT) is the supervisory authority of ports in Thailand. Six main ports are under the regulation of PAT which assigns the management. Private can invest in port business eg sea port business by licensing process.

Other infrastructure

EASTERN ECONOMIC CORRIDOR (EEC)

The EEC is a developing economic zone created with an aim:

- to increase and improve infrastructure such as rails, deep seaports, and aircraft;
- to create business, industrial clusters, and innovation hubs; and
to benefit tourism and employment.

The EEC region preliminarily includes areas in three provinces in Thailand, i.e. Chonburi Province, Chachoengsao Province, and Rayong Province.

Investment privileges and benefits which available to qualified investors of the EEC regime relate to tax in terms of corporate income tax and import duties, land ownership permission, and visa and work permits for non-Thai nationals. Plus, financial assistance for purposes of innovative R&D or experts development of the targeted business could also be obtained.

**SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS / PRISONS)**

Private participation is permitted in social infrastructure area in order to assist public sector providing such infrastructure not to directly earn profits.

*Education*

A licensed person or entity is able to establish a school or university. Specific requirements may be applied depending on each type of entities established eg allocation of profits to reserved funds of school, maintenance of Thai majority committees of university and requirement of notification to supervisory authorities on an incident-based basis.

*Hospitals*

A license is mandatory in order to operate sanatorium. Regulatory compliance is also of important for this type of business operation.

**DEFENSE**

Typically, defense assets are owned by the public sector.

**WASTE**

The Pollution Control Department (PCD) is the main supervisory authority of waste management in Thailand. PCD then hires private sector to procure waste collection and waste management.

**WATER**

The authority in charge of water industry in Thailand is Metropolitan Waterworks Authority and Provinicial Waterworks Authority. East Water Resources Development and Management Public Limited Company (EW) was set up for privatization of water industry. EW handles development of water resources for both industrial and consuming purpose for the eastern part of Thailand to support the plan to create main industrial district of Thailand. Other private companies also take part in investment on water infrastructure eg water-supply projects. Waste water management is under the responsibility of Public Works Department. Establishment of factory dealing with waste water treatment by private companies is allowed provided that license or approval from relevant authorities are duly obtained.

Last modified 4 Apr 2020

*Are there special rules for investing in energy and infrastructure?*

**Generally**

Generally, investment in the infrastructure business takes the form of public-private partnerships (PPP). The main law is therefore the Public-Private Partnership Act B.E. 2562 (2019) (PPP Act). Where public government authorities procure private sectors, the Government Procurement and Supplies Management Act B.E. 2560 (2017) (GPSMA) is also relevant.

PPP Act generally sets out:

- the PPP Committee to regulate and supervise the private investment on State undertaking;
- eligible categories of infrastructure projects and public services to be invested under the PPP Act:
  - roads, highways, special ways and land-transportation;
• trains, electric trains and other rail-transportation;
• airports and air-transportation;
• ports and water-transportation;
• water management, irrigation, waterworks and wastewater;
• energy works;
• telecommunications and general communications;
• hospitals and public health;
• schools and education;
• housing and facilities for low or medium wage earners, the elderly, underprivileged or disabled;
• exhibition centres and conference centres; and
• other projects as to be announced by Royal Decree.

• the investment threshold and applicable rules and procedures being; a project with a value from THB5 billion is subject to the rules and procedures under the PPP Act while others with a value less than THB5 billion is subject to rules and procedures of the PPP Committee; and
• criteria and process of the joint investment between the authority which is a project owner and private sector e.g. feasibility study of the project, selection of private party and on-going supervision of the project, etc.

GPSMA sets out methods and process of procurement, consideration, criteria for selection of offer and forms of contract of procurement.

Foreign Direct Investment (FDI) in infrastructure sectors is not strictly prohibited under Thai law. However, a foreign business license (FBL) or foreign business certificate (FBC) pursuant to the Foreign Business Act B.E. 2542 (1999) (FBA) will normally be required if an operating company is considered a foreigner (being a foreign established entity or a Thai established entity with at least 50% of its shares are owned by foreign natural person and/or foreign entities) unless a foreigner invests in construction of infrastructure for public services in the sphere of public utilities or transportation which requires special apparatuses, machines, technology or expertise with the minimum capital of THB500 million or upwards, FBL or FBC is not required.

Under the Investment Promotion Act B.E. 2520 (1977) (IPA), if the operating business is within the scope of promoted business activities, such company may be eligible for tax and/or non-tax privileges e.g right to own a land because it is normally prohibited for a foreigner to have land ownership under Thai laws.

Compliance with Factory Act B.E. 2535 (1992) and Town Planning Act B.E. 2518 (1975) and its subordinated laws is also of importance as the violation of having the license to operate a factory or procedures to take before construction of building could result in revocation of premises as well as civil and criminal sanctions.

Other special requirements could be specified in the term of reference of the project in question or contracts between private investors and public authorities.

Please note that there are ministerial regulations and other subordinated laws, e.g. notification or order, issued pursuant to the act.

**Energy**

The specific laws and/or regulations regarding the investment in energy sector include:

• Energy Industry Act B.E. 2550 (2007) empowers the Energy Regulatory Commission as the supervisory authority for operation of energy industry business and sets out provisions regarding process for application of a license to operate the industry business and details of energy business operation e.g. standards and safety.

• Petroleum Act B.E. 2514 (1971) empowers the Petroleum Commission as the supervisory authority for energy business operation and sets out details of concession to operate the petroleum business and the operation of the petroleum business e.g. sale and disposal and payment of governmental fees.

• Fuel Trade Act B.E. 2543 (2000) sets out regulatory provisions regarding the trading, transportation and quality of fuel as well as
preventive and mitigation measures for fuel shortage.

- Fuel Control Act B.E. 2542 (1999) empowers the Fuel Control Commission as the supervisory authority for business operation concerning with possession of fuel, fuel station, fuel storage and transportation of fuel as well as sets out details and requirement of such business operators.

**Telecoms infrastructure**

The specific laws and/or regulations regarding the investment in telecoms infrastructure include:

- Radio Communications Act, B.E. 2498 (1955) sets out provisions regarding licensing application and approval for production, use, importation, exportation and trading of radio communication equipment.

- Sound Broadcasting and Television Broadcasting Act B.E. 2498 (1955) sets out provisions regarding licensing application and approval for sound and television broadcasting business including legal obligation from such business operation.

- Telecommunications Business Act B.E. 2544, (2001) sets out provisions regarding licensing application and approval for operation of telecommunication business, requirements to access and interconnect telecommunication network, standard of telecommunication network and equipment, rights of licensee and user and details of contract between the licensee and user.

- Broadcasting and Television Businesses Act B.E. 2551 (2008) sets out provisions regarding licensing application and approval for operation of broadcasting and television business, details of types of business, ratio and details of programs to be broadcasted and requirements for construction of fundamental network and the use and connect of network.

- Organization to assign Radio Frequency and to regulate the Broadcasting and Telecommunications Services B.E. 2553 (2010) empowers NBTC and the National Telecommunications Commission (NTC) as the supervisory authority for business operation of broadcasting, television and telecommunication and sets out provisions regarding licensing application for such business operation.

**Transport infrastructure**

As mentioned above, mostly the form of investment in rail and road is PPP. Therefore, the relevant laws are for example PPP Act, GPSMA, FBA and IPA.

**Other infrastructure**

**SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS / PRISONS)**

The main acts regulating the below social infrastructure are as follows.

**Education**

- Private School Act B.E. 2550 (2007) empowers the Office of the Private Education Commission as the supervisory authority for operation of private school and sets out provisions regarding the requirements for establishment of private school in terms of licensing, operation and funds.

- Private Higher Education Institution Act B.E. 2546 (2003) empowers the Office of the Higher Education Commission as the supervisory authority for operation of private higher education institution and sets out provisions regarding the requirements for establishment of private higher education institution in terms of licensing, operation and funds.

**Hospitals**

Sanatorium Act, B.E. 2541 (1998) empowers the Sanatorium Commission as the supervisory authority for operation of sanatoriums and sets out provisions regarding the requirements for establishment of sanatorium in terms of licensing and operation.
The Government Procurement and Supplies Management Act B.E. 2560 (2017) (GPSMA) is the recently enacted act regulating procurement process of public sector which is not captured under the PPP Act. Under the GPSMA, there are four methods for procurement:

- **General invitation** – Public authorities generally invite an operator and any qualified operator is able to make the offer. The relevant committee of each project will consider offers based on consideration of various factors, e.g. offering price, cost, quality of product or service and after-sale service, etc. The selection process could be different depending on practice of each authority. However, the principle of transparency is generally applied.

- **Selection process** – Public authorities invite at least three operators possessing qualifications specified by such authorities to make an offer.

- **Specific method** – Similar to the selection method but only one qualified operator is chosen to make an offer or negotiate with the authorities.

- **Design contest** – This approach is used only for the procurement of design or supervision of construction where it concerns with special construction to compliment fine arts or architecture of Thailand.

Public procurement is relevant where the Thai government or public authorities is seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset.

Requirements and conditions to participate in the procurement process are different depending on the terms of reference (TOR) of each project. In rail infrastructure procurement, some additional requirements or conditions are added to match the nature or type of such project.

In most cases, the public authorities will need to publish a contract notice and/or TOR in its website of and typically run one of the four procurement procedures under the GPSMA. Date, time and place to submit the offer or other electronics means are generally included in such publication. If the bidding process is needed, details will also stipulate in such publication.

The procurement process under the GPSMA is not applicable to certain projects including but not limited to:

- procurement of state enterprise in relation to direct commerce;
- procurement of arms and services regarding national security by G2G method or from other foreign countries whereby its laws specified otherwise;
- procurement for research and development to provide educational services to higher education or hire of consultancy which cannot follow the procurement under GPSMA;
- procurement by using loan or financial assistance from foreign entities; or
- procurement of higher education or sanatorium which is a public division.

A procurement which is not governed by procurement process under GPSMA will be subject to criteria specified by the Policy Committee of Government Procurement and Supplies Management.

**Investing in energy and infrastructure**

According to PPP Act, the public authority which is the project owner needs to conduct the feasibility study and prepare the joint investment project plan. A qualified external consultant is required to be hired to assist in studying the project and preparing the joint investment project plan. After the completion of the feasibility study and joint investment project plan, the project owner needs to request the approvals from the relevant minister and the PPP Committee in relation to the principle of the joint investment project plan. Once those approvals are duly granted, the matter will then be forwarded to the cabinet for final approval.

In relation to the selection process of private party, a bidding is a default method under the PPP Act. However, in certain limited cases, the cabinet may approve other means for the selection process. Under the bidding process, the project owner shall prepare a draft invitation to tender, draft document for selection of private entity and draft joint investment contract and propose them for the PPP Committee's approval. Once approved, the selection process of private party shall begin.

Upon receiving the result of the selection process and the draft joint investment contract negotiated with the selected private party, such draft joint investment contract shall be submitted to the Office of Attorney-General for review. Consequently, the full set of (i) selection

1125

www.dlapiperintelligence.com/investmentrules
result, (ii) reviewed draft joint investment contract and (iii) material conditions of the project shall be reviewed and approved by the minister of the project owner and the cabinet before executing the joint investment contract with the selected party.

After the joint investment contract is executed, the PPP Supervisory Committee will be set up to supervise the investment project. Revision to the executed joint investment contract could be done if the PPP Supervisory Committee's approval is granted and the draft of revised joint investment contract is approved by the Office of Attorney-General and the minister of the project owner.

Financing energy and infrastructure

The public sector may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector.

What are the most common forms of funding / investing in energy and infrastructure?

The principal forms of private sector funding/investment in energy and infrastructure in Thailand are:

Funding

Common forms of funding in energy and infrastructure include:

- loans made on a corporate-finance basis (balance sheet debt);
- loans made on a project-finance basis;
- bond finance;
- mezzanine debt (in some sectors);
- refinancing of the debt in operational projects; and
- asset financing.

Investing

Common forms of investing in energy and infrastructure include:

- Infrastructure fund which must be listed on the SET to raise capital from both individual investors and institutional investors in order to finance infrastructure projects across Thailand. Infrastructure fund is allowed to invest in infrastructure projects, for example, railway, road / expressway / toll-way / concession way, alternative energy, natural disaster prevention system, waterworks, airport / airfield, telecommunications system and irrigation system / water management system.
- Infrastructure trust which must be listed to raise funds from the public. The trust can invest in infrastructure assets of greenfield and / or brownfield projects. Infrastructure trust is allowed to invest in infrastructure projects that provide benefits to the public either in Thailand or overseas, for example, railroad, electrical power generating system, waterworks, road or expressway or concession way, airport, deep sea port, telecommunications system, alternative energy, irrigation system, natural disaster prevention system, pipeline transportation system and multi-infrastructure project with joint benefits to the community or interconnected communities.

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?
When the Securities and Exchange Commission, the Stock Exchange of Thailand, the Bank of Thailand or the Ministry of Finance considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation run by its committee and to the extent permissible under the laws concerning duties of those authorities. This may result in regulatory sanctions.

**What regulatory penalties may apply?**

Regulatory penalties generally include:

- revocation / cancellation of licenses or permission;
- prevention from trading or involving in the securities market eg prohibition to be a director or executive of listed companies; and
- reimbursement of benefits received from regulatory violation or of expenses arising from investigation.

**What criminal penalties may apply?**

Fines including daily fines until a violation is corrected and/or imprisonment are generally imposed to a natural person or company violating the regulations.

A director of the company may be subject to a fine or imprisonment if he or she orders or omits an action resulting in the company's violation. However, fines and other regulatory penalties are generally imposed provided that it is the company that violates the law.

**Tax**

**Tax issues**

*Are stamp, registration, transfer or other similar taxes applicable?*

**Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?**

**ADVANCE OF LOAN**

No stamp, registration, transfer or other similar taxes are payable on the advance of a loan. However, the loan agreement itself is required to be affixed with stamp duty of THB1 for every THB2,000 or its fraction (i.e. 0.05% of the loan principal amount). The maximum stamp duty payable on a loan agreement is THB10,000.

**TRANSFER OR ASSIGNMENT OF A LOAN**

No stamp, registration, transfer or other similar taxes are payable on an assignment agreement for the transfer or assignment of a debt under a loan. Note that if a new loan agreement is to be executed, stamp duty will need to be affixed at the rate as mentioned above.

**Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?**

**MORTGAGES**

Mortgages must be registered with the relevant government authority. Government fees for mortgage registrations are variable.
depending on the type of mortgaged property. Government fees are normally calculated on a percentage basis subject to variable maximum caps. No stamp duty is required to be paid.

Mortgages can be transferred or assigned to secure the transferred or assigned debts to which they relate. The registration fees are normally calculated on a percentage basis with variable maximum caps. No stamp duty is required to be paid.

**DEBENTURES**

The transfer of a corporate debenture is required to be affixed with THB1 stamp duty for every THB1,000 or its fraction (i.e. 0.1%) of the face value of the instrument.

**OTHER SECURITY**

A guarantee is required to be affixed with stamp duty of between THB1 to THB10.

A pledge is required to be affixed with stamp duty of THB1 for every THB2,000 or fraction thereof (i.e. 0.05%) of the amount of debt which it secures. Stamp duty is not required to be paid if the loan agreement which is secured by such pledge is duly affixed with stamp duty.

A business security agreement under the Business Security Act B.E. 2558 (2015) is required to be registered with the relevant authority and is subject to the payment of certain government fees. No stamp duty is required to be paid.

**Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?**

A corporate bond is required to be affixed with stamp duty of THB5.

Any government bond sold in Thailand is required to be affixed with stamp duty of THB1 for every THB100 or its fraction (i.e. 1%) of the face value of the instrument.

The transfer of a Thai government bond and of certain instruments issued by Bank for Agriculture and Agricultural Cooperatives are exempt from stamp duty. Bills (i.e. bills of exchange and promissory notes) are required to be affixed with stamp duty of THB3 per instrument, except for a series of such bills or notes if the first bill or note is duly affixed with stamp duty.

**Do tax authorities take priority on enforcement?**

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

Secured lenders and secured debt security holders take priority over the Revenue Department on enforcement of a security.

**Is withholding tax on interest payments applicable?**

Is there withholding tax on interest payments under a loan?

Yes, Thailand levies a withholding tax on interest payments under a loan. Profits earned from the sale of a bond or the redemption of bills are also subject to withholding tax.

**If so:**

**What is the rate of withholding?**

The current rate of withholding tax on loan interest in Thailand (i.e. the basic rate) is 1% where the lender is a legal entity residing in Thailand and 15% where the lender is a natural person residing in Thailand.
The current rate of withholding tax (i.e. the basic rate) applicable to a legal entity or a natural person residing outside Thailand is 15%.

What are the key exemptions?

Exemptions from withholding tax on interest include those applicable to:

- payments of interest under a loan made by either a commercial bank, a finance company, a security company, a credit finance company or an asset management company regulated under Thai law (each a Finance Entity) or a legal entity of a Finance Entity and certain foundations or associations; and
- payments of interest to a payee resident in a country which has a double tax treaty with Thailand (such treaty may only provide for a partial exemption).

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

The applicable exemptions from withholding tax on interest payments under a debt security depend on the type of payer, for example:

- payments of interest, including, but not limited to, interest arising from bonds, deposits, debentures and bills issued, made or entered into by a Finance Entity or certain foundations or associations to another Finance Entity or certain foundations or associations, is exempt from withholding tax;
- payments of interest arising from bonds and debentures issued or entered into by a legal entity (which is not a Finance Entity) to any Finance Entity is subject to a reduced withholding tax rate of 1%; and
- payments of interest arising from bills issued by a legal entity (which is not a Finance Entity) to any legal entity (which is not a Finance Entity) is subject to a reduced withholding tax rate of 1%.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

It is unlawful to offer debt securities to the public in Ukraine, or to request that they are admitted to trading on a stock exchange operating in Ukraine, unless an approved prospectus has been made available to the public. A prospectus should include information on the issuer, its financial and economic position and the securities being issued.

Last modified 24 Jan 2020

What are common issuing methods and types of debt securities?

The following debt securities are commonly used in Ukraine:

- corporate bonds;
- sovereign bonds of Ukraine (issued by the state);
- municipal bonds (securities issued by local authorities);
- treasury bills of Ukraine;
- certificates of deposit (securities to be issued by the National Bank of Ukraine with redemption right on a redemption date);
- promissory notes; and
- bonds of international financial organizations (such as the European Bank for Reconstruction and Development).

In practice, the issuance of local securities is usually documented as a standalone offering. Program offerings are in place but are uncommon.

Last modified 24 Jan 2020

What are the differences between offering debt securities to institutional/professional or other investors?

Ukrainian law does not yet have sophisticated regulation in respect of institutional/professional investors. There is, however, the draft law 'On Amending Certain Legislative Acts of Ukraine in relation to Investment Attraction and Introducing of New Financial Instrument' approved by the Ukrainian Parliament in the first reading relating to investor (client) categorization. In particular, investors will be distinguished between qualified and non-qualified investors in line with Markets in Financial Instruments Directive II 2014/65/EU (MiFID II).
The nature of the investor, their experience in the financial market and awareness about market products are relevant to the determination of the category. As a result, the different protection regimes will apply to investors. Non-qualified investors will be protected with the highest degree of regulatory protection, while qualified investors will have less protection.

Last modified 24 Jan 2020

**When is it necessary to prepare a prospectus?**

An offer would not be deemed to have been made to the public if it is addressed to fewer than 100 persons.

Last modified 24 Jan 2020

**What are the main exchanges available?**

There are four principal markets on which debt securities are traded:  

- the **Ukrainian Exchange**;  
- the **Ukrainian Stock Exchange**;  
- the **PFTS Ukraine Stock Exchange**; and  
- the **Ukraine Interbank Currency Exchange**.

Last modified 24 Jan 2020

**Is there a private placement market?**

Ukraine has a non-active private placement market. Generally, shareholders use private placement as a means of funding companies' needs.

Last modified 24 Jan 2020

**Are there any other notable risks or issues around issuing or investing in debt securities?**

**Issuing debt securities**

Issuers are responsible for prospectuses for debt securities. Offering documentation shall not contain any misrepresentation, omission or misstatement which may give rise to civil, administrative and criminal liability under Ukrainian legislation. The Criminal Code of Ukraine prescribes criminal liability for deliberate misrepresentation (fraud) in the documents submitted for registration.

**Investing in debt securities**

Once issued and placed, debt security terms cannot be modified.

Last modified 24 Jan 2020

**Establishing and investing in debt / hedge funds**

**Are there any restrictions on establishing a fund?**

The Law of Ukraine ‘On Collective Investment Funds’ dated 5 July 2012 determines the different procedures for establishing corporate and unit funds.

**Corporate funds**
A corporate investment fund is incorporated as a legal entity. It may be created only by way of establishment (no merger, division or transformation is permitted as a method of creating a fund). Members of governing bodies of such funds, for example the supervisory board and board of directors, have to comply with certain requirements.

A fund shall be established in accordance with the process set out by law. A failure to comply with the pre-determined stages may give grounds for the Security Commission to refuse to grant a registration certificate for a corporate fund's shares or to register a fund’s rules.

Unit funds

A unit investment fund does not have legal entity status under Ukrainian law. Such funds are established and operated by asset management companies.

Asset management companies are commonly incorporated in the form of limited liability companies or joint-stock companies and are entitled to render asset management services to institutional investors only after having obtained a license from the National Securities and Stock Market Commission. Members of governing bodies of asset management companies have to comply with certain requirements.

What are common fund structures?

Common forms of funds under Ukrainian law include:

- open-ended funds (redemption is possible at any time);
- interval funds (redemption is possible at periods set out in the prospectus); and
- closed-end types (redemption is only possible upon termination).

Depending on the duration of operation, a fund may be either fixed-term or perpetual.

Collective investment funds may also take the following forms:

- diversified funds (funds created to meet diversification criteria based on asset types);
- specialized funds (money market funds, government securities funds, bond funds, equity funds, index funds or bank metal funds);
- qualified funds (funds dealing with particular classes of assets, for example, pools of loans, real estate or securities funds); and
- non-diversified funds (any other funds which do not fall in the above categories).

What are the differences between offering fund securities to professional / institutional or other investors?

Ukrainian law makes a distinction between retail and institutional investors, but despite this statutory distinction, there is no sophisticated legislation which sets out different legal regimes for the marketing and selling of debt securities to professional or retail investors.

The Ukrainian draft law 'On Amending Certain Legislative Acts of Ukraine in relation to Investment Attraction and Introducing of New Financial Instrument' which has been pre-approved by Parliament, contains the Markets in Financial Instruments Directive II 2014/65/EU (MiFID II) approach to client categorization. In particular, investors will be distinguished between qualified and non-qualified investors depending on the nature of the investor, their experience in the financial market and awareness about market products, among other factors. In general, qualified investors require less regulatory protection, while non-qualified investors are protected with the highest degree of regulatory protection.

Are there any other notable risks or issues around establishing and investing in funds?
Establishing funds

Investment funds are generally held in separate accounts subject to the discretionary authority of the fund manager who shall acquire and dispose of assets using the funds in accordance with a pre-determined strategy set out in a management agreement entered into between the fund and the fund manager.

Managing investments is a regulated activity under Ukrainian law, therefore asset management companies are subject to authorization from the National Securities and Stock Market Commission.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

There are no selling restrictions applicable to offering securities under Ukrainian law.

Are there any restrictions on managing a fund?

Fund management is a regulated activity carried on by an asset management company on the basis of a management agreement. An asset management company has to obtain a license from the National Securities and Stock Market Commission.

Various restrictions apply to fund managers and their operations in the course of managing funds:

- independent custodian (a non-related party to the fund's participants);
- independent valuator of assets (a non-related party to the fund's participants); and
- independent auditor (a non-related party to the fund's participants).

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

A person entering into a derivative contract as a dealer in Ukraine will commonly be authorized under Ukrainian law, although the licensing procedure is not clear as the legislation on this is fragmented.

There is not yet sophisticated legislation governing the regulatory, insolvency and other aspects of derivative transactions. However, note that comprehensive amendments introducing European Market Infrastructure Regulation (EMIR), Markets in Financial Instruments Directive II (MiFID II) and Markets in Financial Instruments Regulation (MiFIR) standards into local statutory law are now being considered by the Ukrainian Parliament and are expected to be adopted soon.

What are common types of derivatives?

Derivatives may be traded over-the-counter or on an organized exchange.

The most common types of underlying assets seen in Ukraine are commodities and foreign currencies.

As other types of assets, including equity, credit events and fixed income instruments, are less developed in Ukraine, Ukrainian
counterparties tend to document these transactions via offshore entities and subject to foreign law.

**Are there any other notable risks or issues around entering into derivatives contracts?**

Ukrainian law lacks a number of derivative-related concepts, including: close-out netting, novation of trades, margin requirements (in relation to title security) and effective disclosure rules. There is not sufficient legal regulation in respect of title security or escrow arrangements, reporting requirements, trade repository and central counterparty. However, the aforementioned concepts have been addressed in the draft law 'On Amending Certain Legislative Acts of Ukraine in relation to Investment Attraction and Introducing of New Financial Instrument' already approved by the Ukrainian Parliament in the first reading.

**Debt finance**

**Lending and borrowing**

**Are there any restrictions on lending and borrowing?**

**Lending**

Generally, lending is a regulated activity only in relation to consumer lending. Lending made available to borrowers by financial institutions at the expense of attracted funds are also regulated. The lender (being a bank or financial institution) must be authorized by the National Bank of Ukraine or Financial Authority. Corporates and individuals may rely on statutory exemption.

**Borrowing**

Borrowing is generally not a regulated activity but note that consumer borrowers are afforded more beneficial legal protection than other borrowers.

**What are common lending structures?**

Lending may be structured in a number of different ways depending on various factors.

**Number of parties**

- Bilateral loans (one lender to one or several borrowers)
- Syndicated loans (multiple lenders)

Note that syndicated structures are rarely seen between local banks and borrowers, however, it is quite common for Ukrainian borrowers to structure their borrowings as syndicated deals with foreign lenders outside Ukraine.

**Loan security**

- Secured loans
- Unsecured loans

**Types of facility**

- Term loan facility
Repayment profiles

- Amortizing payment
- Balloon payment
- Bullet payment

What are the differences between lending to institutional / professional or other borrowers?

Ukrainian law does not contain sophisticated regulation in relation to lending to institutional/professional borrowers. Generally, the regulation is less onerous on lenders to institutional/professional borrowers.

Do the laws recognize the principles of agency and trusts?

For a long time, Ukraine as a civil law jurisdiction did not recognize trust structures. The Law of Ukraine 'On Amendments to Certain Legislative Acts in relation to Stimulation of Investment Activity in Ukraine' dated 20 September 2019 introduced the concept of security trust in Ukrainian law. The fulfilment of debtor’s obligations may be secured by way of transferring to the creditor, acting as a trustee, of the property owned by a debtor or a third party. A trustee receives an ownership right to the secured property, however, cannot alienate it, except for the enforcement purposes.

A trust shall be documented by a trust agreement in writing. A trust over immovable property must be notarised and becomes legally binding upon its state registration with the State Register of Proprietary Rights to Immovable Property. It is important that the trust property shall not be included into the liquidation estate neither of a trustee, nor a trustor. Furthermore, there is a carve-out for the trust property ringfencing it from moratorium under the insolvency law.

Are there any other notable risks or issues around lending?

Cross-border loans

After liberalization of the Ukrainian currency market, effectiveness and validity of the cross-border loans (and amendments thereto) between foreign lenders and Ukrainian borrowers is no more linked to their registration with the National Bank of Ukraine. Instead, the bank servicing the cross-border loan notifies the National Bank of Ukraine on the loan in the automatic information system. The mandatory interest cap rates were also cancelled, so the parties have more flexibility in agreeing terms of financing.

Specific types of lending

Ukrainian legislation provides special requirements for specific types of lending, for example, consumer lending.

The Law of Ukraine ‘On Consumer Lending’ dated 10 June 2017 introduced specific requirements in respect of the following.

Promotion and origination of loans

- Advertisements for consumer lending must indicate all service fees and expenses.
• Consumers must be informed of fees and costs of third parties, including insurance companies and valuers.
• Compulsory assessment of borrower's affordability is also a requirement.

ADMINISTRATION AND REPAYMENT OF LOANS
• Outstanding principal amounts shall be repaid first.
• Outstanding interest and principal payments shall be repaid second.
• Default interest and penalty amounts shall be repaid third.

Standard form documentation
Loan Market Association (LMA) standard documentation is predominantly used for cross-border lending, but this is uncommon in local transactions.

Bail-in
Ukrainian legislation sets out bail-in arrangements which give a regulator special powers to make a conversion or writing down of a bank's liabilities to its related parties (and in some circumstances to non-related entities) by way of exchange of additionally issued shares in the amount of unencumbered monetary liabilities owed by the bank to its related parties. Bail-in legislation applies only to banks under local law.

Are there any other notable risks or issues around borrowing?
Borrowing is generally unregulated activity under Ukrainian legislation.

Giving and taking guarantees and security
Are there any restrictions on giving and taking guarantees and security?
Some of the key areas affecting the giving of security are as follows.

Capacity
It is important to check the constitutional documents of a company giving security to ensure it has power to do so and there are no restrictions on the directors' powers. Ukrainian law does not recognize the 'corporate benefit' concept. Under corporate law, certain transactions (including the granting of security) are subject to corporate approval by a company's shareholders/participants or the board of directors at a general meeting.

Insolvency
Security may be at risk of being set aside under Ukrainian insolvency law if the security is granted by a company within a certain period of time prior to the onset of insolvency. This would be the case if the company giving the security received considerably less consideration, and as such, the transaction was at an undervalue. For such transactions to be set aside, certain statutory criteria needs to be met, including the requirement that security has been given within three years prior to the onset of insolvency of the affected company. Security may also be challenged on other grounds relating to insolvency.

Financial assistance
This applies to certain types of legal entity including banks and joint-stock companies. For example, banks are not allowed to extend loans to third parties for the purposes of acquiring the bank's shares or any third party bank's shares (this includes subordinated loans to
banks). Joint-stock companies are also not allowed to lend funds (including the granting of security) for the purposes of acquiring their shares or securities.

**What are common types of guarantees and security?**

**Common forms of guarantees**

Ukrainian law distinguishes between guarantee (garantiya) and suretyship (poruka).

A guarantee is a security which can only be granted by a regulated entity (a bank or other financial institution), whereby the guarantor is under a primary obligation to the creditor to pay upon a debtor's default. A guaranteeing obligation is independent to the validity and existence of the principal obligation.

A suretyship can be provided by corporates or individuals. Under suretyship a surety undertakes to perform the principal obligation secured by suretyship, for and instead of the defaulting debtor. Under Ukrainian law a suretyship is a secondary obligation, meaning that its validity and existence is entirely dependent on the validity and existence of the principal obligation.

**Common forms of security**

There are three basic types of security interest that can be created under Ukrainian law:

- a pledge;
- a suretyship; and
- a mortgage.

Different types of security are suitable for securing different types of assets.

Under Ukrainian law it is possible to grant security over all of the assets of an Ukrainian company or individual assets. Granting security over all of a company's assets will tend to be achieved by way of mortgage over a business unit (an integral property complex) which will include:

- a mortgage over real estate; and
- a mortgage over fixed assets and equipment (except for movable equipment).

**Are there any other notable risks or issues around giving and taking guarantees and security?**

**Giving or taking guarantees**

To be valid, a guarantee needs to be in writing and signed by the guarantor.

**Giving or taking security**

A security document may need to be executed as a notarial deed if it contains:

- a mortgage over land;
- a mortgage over immovable property; or
- a mortgage over space facilities.

Parties may elect to have any security contract notarized. Generally, notarization gives the lender:
• additional comfort in terms of the counterparty's capacity to enter the contract; and
• additional enforcement benefits (a notary writ may be an out-of-court remedy available to the lender).

Certain types of assets cannot be pledged or mortgaged. For example, assets which have a cultural heritage cannot be pledged. Agricultural land can only be mortgaged to banks.

Perfection and registration requirements

• Encumbrance of immovable property with a mortgage is subject to a mandatory registration with the State Register of Proprietary Rights to Immovable Property.
• Encumbrance entries recording ranking and priority against third parties' claims over pledged movable assets, and prohibiting the disposal of pledged (movable) assets, shall be registered at State Register of Pledges over Movable Properties.
• An absence of state registration affects the validity of a mortgage.

Failure to comply with perfection and registration requirements means that the ranking or enforceability of the movable pledge can be undermined and the creditor's claims will rank alongside unsecured creditors.

Security is at risk of being set aside in certain circumstances under insolvency laws. For more information, see Giving and taking guarantees and security – restrictions.

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

Civil Code of Ukraine (No.435-IV, 16.01.2003) (general contractual principles)

Commercial Code of Ukraine (No.436-IV, 16.01.2003) (general principles governing business to business transactions)

Law of Ukraine 'On Protection of Foreign Investment in Ukraine' dated 10 September 1991 (No.1540a-XII, 10.09.1991) (principles of state protection of foreign investments)

Consumer credit

Law of Ukraine 'On Consumer Lending' dated 10 June 2017 (No.1734-VIII, 10.06.2017) (consumer lending)

Mortgages

Law of Ukraine 'On Pledge' dated 2 October 1992 (No.2654-XII, 02.10.1992) (general provisions on pledges, including mortgage transactions)
Law of Ukraine 'On Mortgage' dated 5 June 2003 (No.898-IV, 05.06.2003) (mortgages and mortgage notes)

Business entities (banks, financial institutions)

Funds and platforms

Law of Ukraine 'On Collective Investment Funds' dated 5 July 2012 (No.5080-VI, 05.07.2012) (establishment, operation and termination of collective investment funds)

Other key market legislation

Decision No. 1688 'On Approval of Regulation on Functioning of Stock Markets' approved by the National Securities and Stock Market Commission dated 22 November 2012 (No.1688, 22.11.2012) ttp://zakon3.rada.gov.ua/laws/show/2082-12 (principles and requirements for trading on the stock exchanges)

Law of Ukraine 'On Payment Systems and Money Transfer in Ukraine' dated 5 April 2001 (No.2346-III, 05.04.2001) (payment systems regulation)

Last modified 24 Jan 2020

Regulatory authorization

Who are the regulators?

There are three independent state authorities which supervise financial markets and financial products:

- The National Bank of Ukraine (NBU) oversees banks and the bank lending market,

- The National Securities and Stock Market Commission (Securities Commission) is responsible for supervision of securities, regulated markets and derivatives.
What are the authorization requirements and process?

Depending on the type of financial institution, a firm shall apply for authorization from either the National Bank of Ukraine, the National Securities and Stock Market Commission or the National Commission for Regulation of Financial Services Markets of Ukraine. The relevant regulator will assess the application on the terms set out in statutory law.

Banking activity

The application fee for a banking license amounts to GBP1,134 (UAH 35,890) and the procedure takes two months following receipt of the full set of application documents.

Financial services

The application fee for a license for carrying on financial services, including factoring, financial leasing and asset management, amounts to GBP64 (UAH 2,027) and the procedure takes thirty days following receipt of the full set of application documents.

The application fee for a license for carrying on particular types of professional activities in the capital market amounts to GBP95 (UAH 3,000) and the procedure takes three months following receipt of the full set of application documents for Ukraine residents, and six months for non-Ukraine residents.

Staff requirements

There may be certain requirements for key individuals, including senior management, to be employed in banks, funds and financial institutions. The regulator will assess whether or not they meet the applicable requirements.

Registers

Authorized firms, banks and individuals are listed in the following registers:

- State Register of Financial Institutions;
- State Register of Financial Institutions that Provide Financial Services in the Securities Market;
- Register of Payment Systems;
- List of Operating Banks; and
- Unified State Register of Collective Investment Funds (publicly unavailable but information may be provided on charged basis).

What are the main ongoing compliance requirements?

Compliance requirements may be applicable to banks, funds and financial institutions. Ukrainian law sets out general compliance and prudential requirements depending on the type of financial activity, such as lending, asset management, securities trading or fund investment.

Failure to comply with the threshold conditions and more detailed regulatory rules can result in sanctions for a bank, fund or financial institution and regulated individuals, as well as loss of regulated status.

What are the penalties for failure to be authorized?
Banking activity

Carrying on banking activity, banking transactions or other financial services without the appropriate license or in violation of such license may be subject to fines ranging from GBP54 (UAH1,700) to GBP1,610 (UAH51,000) depending on the size of profit received from unauthorized transactions, among other factors.

Financial services

Carrying on financial services without the appropriate license or in violation of such license may be subject to fines ranging from GBP537 (UAH17,000) to GBP2,685 (UAH85,000) depending on the size of profit received from unauthorized transactions, among other factors.

The National Securities and Stock Market Commission may impose penalties on participants in financial markets for an unauthorized activity (without a license) in amounts ranging from GBP537 (UAH17,000) to GBP5,369 (UAH170,000).

Regulated activities

What finance and investment activities require authorization?

Generally, financial services shall be provided by an authorized entity included in the local registry of financial institutions. Some specific types of services require additional licenses.

The below services are deemed to be financial services:

- banking and associated transactions;
- capital market transactions;
- issuance and/or servicing and clearing of payment documents, payment cards, travellers' cheques and other forms of payment provision;
- transactions relating to mortgage assets for the purpose of issuing mortgage-back securities;
- fiduciary management of financial assets;
- money transfer and remittance;
- lending (including financial facilities);
- currency exchange activity;
- financial leasing;
- provision of guarantees and suretyship;
- insurance services and fully funded pension provision;
- factoring;
- asset management for construction finance or real estate finance; and
- others.

Are there any possible exemptions?

Generally, financial services may only be provided by funds, banks and financial institutions, unless an exemption applies.
Corporates and individuals are exempt and are able to give loans and suretyships for their commercial needs.

**Do any exchange controls or other restrictions on payments apply?**

**General restrictions**

The new Law of Ukraine 'On Currency and Currency Operations' and secondary legislation of the National Bank of Ukraine effective as of 7 February 2019 liberalised Ukrainian currency control regulation and set out new core principles for currency transactions. The new regulation introduced significant changes and simplifications in the currency market which give more freedom to both business and individuals.

Permanent currency control and exchange restrictions include:

- settlements within the territory of Ukraine shall be made in Hryvna (UAH);
- financial monitoring for transactions in access of UAH 150,000 equivalent; and
- import or export of foreign currency (in excess of EUR10,000) shall be declared in custom declarations.

**Temporary restrictions**

NBU Regulation No. 5 ‘On Approval of the Regulation on Protective Measures and Determination of the Procedure for Caring out of Particular Foreign Currency Transactions' dated 2 January 2019 introduced protective measures which will remain effective for an indefinite period until cancelled by the National Bank of Ukraine. Key protective measures include:

- E-limits for individuals (EUR100,000 equivalent per year) and corporates (EUR2,000,000 equivalent per year) on the outgoing payments in foreign currency abroad;
- 365-day limitation period for conducting settlement under export and/or import contracts.

**Cashless payment restrictions**

The National Bank of Ukraine limits cash payments in same day transactions:

- between legal entities – to GBP305 (UAH10,000); and
- between individuals/individuals and legal entities – to GBP1,527 (UAH50,000).

All payments on amounts exceeding the above thresholds shall not be paid in cash and shall be made by way of bank transfer.

**Anti-money laundering restrictions**

If any payment in a financial transaction appears to be suspicious or relates to money laundering or terrorism financing, such settlements may be stopped or suspended by a bank, financial institution or state authority. The screening period will range from two to 30 days (unless extended). The payments will be blocked during that period.

**What are the rules around financial promotions?**

**Rules**

Financial institutions are not allowed to disseminate misleading advertising about financial services and products, for example, deposits, consumer credits, investments and mortgages.

In marketing or offering financial services, a financial institution must inform a client about certain matters, including:

- details of proposed financial services and their actual cost;
• terms and costs of additional financial services;
• payment of applicable taxes and duties; and
• consequences of acceleration or early termination under the agreement.

It is prohibited under Ukrainian law to advertise securities offerings, including specifying the amount of returns under debt securities, predicting the increase in value of debt securities (except for fixed rate securities), advertising prior to the registration of the issuance of debt securities, and promoting information about returns without stating that this does not guarantee an expected return.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Banks

In Ukraine, banks are commonly formed as public joint-stock companies.

Investment funds (corporate funds) are incorporated as joint-stock companies.

Unit investment funds do not have legal entity status under Ukrainian law, however, their operating fund managers shall be established in the form of asset management companies that are either limited liability or joint-stock companies.

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

Banks

Ukrainian law allows foreign banks to establish branches in Ukraine, however, such branches are only entitled to carry on lending and banking services upon special accreditation being given by the National Bank of Ukraine. Such branches act on behalf of foreign banks and are not deemed to be legal entities.

Funds

Unlike banks and insurance companies, foreign investment funds cannot operate in Ukraine via a branch or other permanent establishment. Ukrainian law requires that funds are incorporated in Ukraine and licensed by the National Securities and Stock Market Commission.

FinTech

FinTech products and uses
What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- consumer loans; and
- small and medium-sized enterprises lending;

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P)-type structures often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition, to or rather than, individual investors on a traditional P2P basis.

ISSUES FOR STARTUP MARKETPLACE LENDERS

Following the initial incorporation and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform. As the startup lender will not have an established track record, deposit base or asset pools, the funding structure will often follow the format of a warehouse securitization structure. Origination of new assets will be funded through drawings on a note issuance facility backed by security over the new assets. Each of the new assets will be subject to eligibility criteria determined by reference to the nature of the underlying asset. In order to provide an efficient financing structure, the assets will typically be held through a SPV with origination and servicing provided by the marketplace lender. In order to cover expected losses on the asset pool, the senior facility will be subject to the lending platform maintaining sufficient subordinated capital in the form of equity, or a combination of equity and subordinated debt.

Ukrainian law does not regulate securitization. If the funding of the marketplace lending is structured through a revolving loan and includes tranching of the debt, this will not result in the platform being treated as a securitization for the purposes of regulation. Thus, it would neither be required to have risk retention nor provide appropriate reporting and disclosures.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever
transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third-party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized, can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another, or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles, the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Although there were several bills registered in the Ukrainian Parliament aimed at creating the regulatory framework for virtual assets and currencies, Ukrainian law still lacks regulation on cryptocurrency. At the same time, use of cryptocurrency is not prohibited or restricted by the state, so Ukraine can be considered a jurisdiction with a neutral approach.

In November 2019 the Ministry of Digital Transformation of Ukraine and Binance, a global cryptocurrency exchange, signed Memorandum of Understanding. The parties agreed to cooperate in the determining of legal status of cryptocurrency and virtual assets in Ukraine and creating of the legal framework that would meet the requirements of the industry.
The Ministry of Digital Transformation also signed Memorandum of Cooperation with Belarusian company Currency.com on developing Ukrainian legislation in the field of IT and crypto regulation using the Belarusian experience.

**Initial coin offerings and token-based products**

**WHAT IS AN INITIAL COIN OFFERING (ICO)?**

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

**Artificial intelligence and robo advisory systems**

Automated financial advice tools, also known as 'robo advisors' are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

**Data analysis and cloud computing**

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.
Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The National Commission for Regulation of Financial Services Market (NCRFSM) is the conduct regulator for firms providing financial products and services in both retail and wholesale markets. In order to operate, the firms have to be incorporated as a non-banking financial institution under Ukrainian law.

GENERAL

A person must not carry on a regulated activity in Ukraine unless authorized or exempt. A financial activity requires regulatory authorization when it:

- is identified as a specified activity in relation to a specified investment;
- is carried on by way of business in Ukraine; and
- does not fall within any of the available exemptions.

Where FinTech products and applications involve financial activity which requires regulatory authorization, the firms providing such products and applications must be authorized by the NCRFSM.

INNOVATION

In the past few years, Ukraine has been actively demonstrated its focus on promoting a blockchain system.

On 13 April 2017, the state agency for e-governance of Ukraine partnered with Bitfury Group, a US-based global technology company, to launch what is probably the largest project on transferring government data on a blockchain platform. This technology initiative was launched to increase the transparency of government data and efficiency of its use by both local and global customers.

The project has three blockchain initiatives:

- **State Register of Proprietary Rights to Immovable Property** - This involves putting data on all ownership, lease titles and other in-rem rights including encumbrances records on blockchain platforms to improve data protection, transparency and security.
- **State Land Cadastre** - This is a pilot blockchain-based project aimed at improving data storage on legal titles to land in Ukraine. This technology will phase in a web-based auction platform whereby local and international customers will be able to lease Ukrainian state-owned land plots.
- **SETAM** - This provides businesses with access to the public auction platform built on blockchain technology, enabling users to buy assets of the Ukrainian distressed and insolvent entities.

In 2018 the Blockchain Association of Ukraine was established. It is a non-profit organisation which unites blockchain and crypto industry specialists and promotes the integration of blockchain technology into the economy of Ukraine. The Association launched BlockchainHub Academy, a free course for preparation of specialists for the blockchain industry, and practical course for developers. Members of the Association are also working on elaboration of the necessary regulatory basis for the industry and lobby its implementation in Ukraine.

Furthermore, there is an inter-factional association called “blockchain4Ukraine” in the Ukrainian Parliament which is working on blockchain related draft laws.

REGULATORY DEVELOPMENTS ON INVESTMENT PLATFORMS

In September 2017, the payment systems regulator (NBU) published an initiative to support FinTech development in Ukraine, recognizing the increasingly important role of investment platforms in the retail distribution landscape. This initiative will focus on the impact of investment platforms providing digital lending (both peer-to-peer (P2P) and business-to-peer (B2P)) as well as non-banking lending to small and medium-sized enterprises.
In January 2020, the Strategy of Ukrainian Financial Sector Development until 2025 approved by the National Bank of Ukraine and all other financial market regulators was presented. The Strategy is aimed at reforming and development of Ukraine’s financial sector in line with international best practices and the EU-Ukraine Association Agreement. Among the major priorities are introducing innovations in the financial sector and development of financial markets.

Electronic payments platforms and regulation of peer-to-peer lenders

**ELECTRONIC PAYMENT PLATFORMS**

The NBU is the payment systems regulator and it currently regulates 78 payment systems, including MasterCard, Visa, American Express and PivatMoney. All participants in a designated payment system will fall under the remit of the payment systems regulator, including operators that manage or operate the systems, the payment service providers using the system and the infrastructure providers to the payment system.

The NBU Regulation No. 481 'On Amendments to Certain Legislative Acts of the National Bank of Ukraine in respect of the E-Money Issuance and Circulation' dated 4 November 2010, contains a number of electronic money-related rules, directions and guidance aimed at businesses that are issuing or considering the issuing of electronic money (e-money). E-money is defined as electronically (including magnetically) stored monetary value, represented by a claim on the issuer, which is issued on receipt of funds for the purpose of making payment transactions. E-money must be accepted by a person other than the electronic money issuer and include pre-paid cards and electronic pre-paid accounts for use online. Generally, an issuer of e-money must be registered as a bank under Ukrainian law and must have a banking license granted by the NBU.

**PEER-TO-PEER LENDERS**

A person carries out a regulated activity (requiring authorization by the NCRFSM) if they facilitate lending and borrowing between two individuals or between individuals and businesses. According to NBU P2P activity is not a banking activity under Ukrainian banking law, and that P2P lenders are to be notified in advance by marketplaces that they are not eligible for any deposit protection scheme. In light of this, all P2P marketplaces require authorization from the NCRFSM and are subject to supervision of the NCRFSM as non-banking financial institutions.

**Regulation of payment services**

Where a Ukrainian business provides payment services as a regular occupation or business activity in Ukraine, it will require authorization by the NBU to become an authorized payment institution under Ukrainian law 'On Financial Services and State Regulation of Financial Services Markets'. Under Ukrainian law, an authorized payment institution may be incorporated only in a form of either a bank or a financial institution. Failure to obtain the required authorization is an administrative offence.

In order to become authorized by the NBU, a payment services business will need to meet certain criteria, including in relation to its business plan, initial capital, processes and procedures in place for safeguarding relevant funds, sensitive payment data and money laundering and other financial crime controls.

**Application of data protection and consumer laws**

The Personal Data Protection Law (PDPL) regulates the processing of personal data in Ukraine. Where a business determines the purposes and manner in which any personal data is processed, it will be regulated by the PDPL and have certain notification and compliance obligations. The PDPA implements the European Data Protection Directive 95/46/EC.

The Ukrainian law 'On Electronic Commerce' 2015, regulates unsolicited direct marketing by electronic means, in addition to sector specific regulations, for instance, financial promotion rules established by the Ukrainian law 'On Advertising' 1996.

Finally, the Ukrainian law 'On Consumer Lending' 2015, sets out certain provisions and procedures to protect consumers. A lender must follow and comply with these statutory requirements while making available loans to consumers.

**Money laundering regulations**

The Ukrainian law 'On Prevention and Counteraction to Legalization (Laundering) of the Proceeds from Crime or Terrorism Financing, and Financing Proliferation of Weapons of Mass Destruction' 2014 gives the NCRFSM responsibility for supervising the anti-money laundering controls of businesses that offer certain services, such as non-banking lending, providing payment services and issuing and administering...
other means of payment.

Generally, the NSRFSM authorizes and supervises a company for complying with anti-money laundering requirements. Electronic currencies such as bitcoin and other cryptocurrencies tend to represent a higher money-laundering risk. It is worth noting that in those cases where Ukrainian banks issue e-money, the NBU may also supervise them for compliance with anti-money laundering requirements.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING

The crowdfunding sector is well established, and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

ACCELERATORS

There are various incubators or accelerators in the Ukrainian market which offer support, facilities and funding for startups, often in return for an equity stake. For example, Kyivstar, a major mobile operator, has an accelerator program which offers investment, and mentoring from industry experts. There are also Borsch Ventures, Polyteco, GrothUP, Founder Institute, Happy Farm and EastLab.

Venture capital and debt

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), which is secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

Warehouse and platform funding

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the
originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

Another alternative form of funding is by way of peer-to-peer (P2P) lending platforms, which bring individual borrowers and lenders together without the involvement of traditional banks. In 2016, UAH 5 billion was originated through P2P platforms in Ukraine. P2P lending does not involve equity investments, and instead interest is paid on the money borrowed.

**Senior bank debt and capital markets funding**

**SENIOR BANK DEBT**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. Bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft and general liquidity purposes.

**CAPITAL MARKETS FUNDING**

The capital market in Ukraine is in a state of development. So far, funding in both debt and equity capital markets is uncommon and typically inaccessible to businesses.

**Incentives and reliefs**

Ukrainian legislation does not provide for any special tax incentives for FinTech companies and activities related to FinTech. However, there are certain tax incentives which may be potentially applicable to FinTech companies.

For example, small and medium-sized enterprises can benefit from 0% of income tax rate if they meet certain criteria.

Also, a supply of program products (including software) within the territory of Ukraine is temporarily exempted from VAT until 1 January 2023. This incentive may be applicable to the supply of special FinTech software.

*Last modified 24 Jan 2020*

**Portfolio sales**

**Loan transfers and portfolio sales**

*What are common ways of buying and selling loans?*

The Civil Code of Ukraine sets out the grounds for selling and buying loans.

The most common ways of selling loans are:

- assignment; and
- novation.

A loan transfer is commonly documented under a factoring contract. However, note that a loan purchaser shall be an authorized entity (being a factoring company and holding a license from the National Commission for Regulation of Financial Services Markets of Ukraine).

Loan Market Association (LMA) secondary market documentation is used by Ukrainian banks for transferring commitments under loans with foreign parties.

*Last modified 24 Jan 2020*

*What are the main considerations when transferring a loan and related security?*

Key considerations include:
· **confidentiality** – consent is usually required for disclosure except for by banks which are permitted under banking law to disclose information relating to loans;

· **bank secrecy restrictions** – consent for disclosure of information constituting such secrecy is required;

· **data protection** – personal data shall not be disclosed without the consent of the holder of such data;

· **contractual restrictions** – the contract may stipulate some restrictions on transferee parties (black list or white list);

· **consent and/or notification** – novation requires mutual consents (borrower, lender and any third party security provider) whereas an assignment requires a notice to be given to the borrower; and

· **assignment restrictions** – contractual prohibition on assignment to third parties contained in the underlying debt obligation can be an issue except for instances where a factoring company is the purchaser of the debt.

Note that a factoring contract is valid irrespective of the existence of a prohibition on assignment of a monetary claim and other restrictions between the primary lender and the borrower.

*Last modified 24 Jan 2020*

**Projects**

**Financing / investing in energy / infrastructure**

*To what extent are energy and infrastructure assets publicly or privately owned?*

**Generally**

The ownership of energy and infrastructure assets in Ukraine varies according to the asset class and sector. The main asset classes are usually considered to be:

· economic infrastructure (energy, aviation, rail, telecommunications, roads and waste); and

· social infrastructure (education, health and justice/prisons, housing).

Key sectors are considered below.

**Energy**

The gas and electricity industries in Ukraine are partially privatized. Gas producers and gas distribution companies are privately owned, however, transmission, distribution grids and infrastructure are owned and operated by the state via public companies (*Ukrtransgaz*). The state is also present in other areas in the gas market such as gas production (*NAK Naftogas, UkrGasVydobuvannya*) while supply services are provided by a number of private sector companies. The Ukrainian gas market is heavily regulated.

Ukraine intends to reduce gradually the number of state-owned objects and launched privatization of state-owned companies. Every year the Ukrainian government approves the list of state-owned enterprises for privatization, including regional electricity supply companies.

The National Energy and Utilities Regulation Commission is responsible for the regulation of the electricity market in Ukraine.

**Telecoms infrastructure**

The telecommunications networks (mobile and fixed) in Ukraine are mostly privately owned by a number of service providers.

The National Commission for the State Regulation of Communications and Informatization is the regulator for the Ukraine telecommunications sector. The State Committee for Television and Radio Broadcasting of Ukraine also regulates the television broadcast services and wireless communication services.

**Rail infrastructure**
LIGHT RAIL

Typically, light rail assets (such as trams and associated track) are owned by local public sector promoting bodies.

HEAVY RAIL

The rail market in Ukraine involves both public and private entities. The principal elements to the rail sector in Ukraine are as follows:

- **Ukrzaliznytsia**, a state-owned public joint-stock company, which is on the public sector balance sheet and owns, operates and maintains rail tracks, signaling and station infrastructure. It is responsible for improving most of the regulated national rail infrastructure and for operating some of the stations on the national rail network. Ukrainian energy authorities have been conducting a corporate restructuring over the assets of Ukrzaliznytsia and foreign management has been employed to operate the company and increase business efficiency.

- **Freight Operating Companies** are wholly commercial entities.

- **Project finance** – There has been a number of project finance models dealing with and on that deal it is the private sector which owns the trains and will continue to do so following the expiry of the main contract with the public sector.

The rail sector is regulated by the Ministry of Infrastructure.

Other infrastructure

ROADS, BRIDGES AND TUNNELS

A government entity, the State Agency of Automobile Roads of Ukraine, operates, maintains and improves the motorways and major roads (ie the strategic road network) in Ukraine. The State Agency of Automobile Roads of Ukraine is regulated by the Ministry of Infrastructure and receives funding from the government for investment in the strategic road network (including additional road capacity). Local roads in Ukraine are the responsibility of local authorities. The public sector may outsource the construction, operation and maintenance (sometimes on a project financed basis) of such assets to the private sector (on a concession basis or otherwise). This year the government announced that it would be sponsoring a lot of tender procurement on the construction of the strategic road network.

AVIATION

Aviation in Ukraine is (for the most part) privatized. As regards airport infrastructure, there are a number of ownership structures in Ukraine, including public ownership, local government ownership and various forms of public-private ownership (airports in the cities of Odessa and Kyiv). All models are heavily regulated by the government and the State Aviation Administration is the aviation regulator in the Ukraine.

PORTS

The Ukrainian ports sector is mostly publicly owned, however, the government is considering different options to attract private investors (on a concession, lease or other model). Operating commercial companies, which operate in major Ukrainian ports are privately owned.

EDUCATION, HOSPITALS, DEFENSE AND WASTE

Typically, these assets are mostly owned by the public sector.

Last modified 24 Jan 2020

**Are there special rules for investing in energy and infrastructure?**

**Generally**

There is no specific regime restricting investment in energy or infrastructure projects in Ukraine for investors and funders but a particular proposed investment may be subject to legislative or regulatory control (eg merger control rules, authorizations, currency control restrictions).

In the course of the planning and implementation of an underlying energy or infrastructure project (in which the investment is to be
made), the legal/regulatory position relevant to that project must be considered. For example, a project involving development on land will require planning permission or a development consent order, and a project may require environmental authorizations/permits and/or sector specific regulatory consents or licenses. If a public body is procuring a project using private finance, and the public body is to benefit from central government funding towards the cost, the project will be subject to central government approval.

The gas and energy markets in Ukraine have a complex system of arrangements between suppliers, generators, transmitters and distributors which are heavily regulated. In particular, there are complex arrangements in respect of licensing, environmental permits, dangerous work performance permits, charging mechanisms with suppliers and customers and access to the local grid system.

Last modified 24 Jan 2020

What is the applicable procurement process?

Public procurement in Ukraine is in most instances governed by the Law of Ukraine ‘On Public Procurement’ dated 25 December 2015 which is based on EU Directives and EU best practice. In addition, note that the new Law ‘On Concession’ dated 3 October 2019 and the Law ‘On Public Private Partnership’ dated 1 July 2010 contain some specifics on procurement process.

Additionally, there is established Model Contract on Lease of State Owned Property.

Investing in energy and infrastructure

The Law of Ukraine ‘On Public Procurement’ dated 25 December 2015 sets out the following procedures:

- **Open bidding procedure** – This is suitable for easy-to-evaluate projects and tenderers simply submitting a tender offer in response to a notice. The pricing element will be a decisive factor for awarding a contract and announcing the winner.

- **Competitive dialogue** – There is a shortlisting of at least three tenderers following an expression of interest stage and tenderers submit a bid. The public authority will hold negotiations on the contract terms with each of the three tenders.

- **Negotiation procedure** – This procedure allows dialogue with one or a number of bidders. It can only be used in specific circumstances prescribed by the Law of Ukraine ‘On Public Procurement’ dated 25 December 2015.

Financing energy and infrastructure

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. Investors must ensure that they are fully familiar with the funding requirements set out in the specific tender documentation.

Last modified 24 Jan 2020

What are the most common forms of funding / investing in energy and infrastructure?

The principal forms of private sector funding/investment in energy and infrastructure in Ukraine (including in relation to public-private partnerships) are as follows.

**Funding**

Common forms of funding in energy and infrastructure include:

- loans made on a corporate finance basis (balance sheet debt);

- loans made on a project-finance basis (to a special purpose project company) on medium to long-term basis – such loans may be made by international financial institutions (such as the European Bank for Reconstruction and Development, the World Bank and the International Finance Corporation);

- loans made by export credit agencies; and

- asset financing (particularly relevant in the rail sector).
Investing

Common forms of investing in energy and infrastructure include:

- 'equity' investment through special purpose vehicles and subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of 'equity').

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

Where an authorized or regulated individual has breached an ongoing compliance requirement, the Regulator solely or jointly with the other respective authority is entitled to launch a formal investigation. If criminal liability is applicable, the Regulator will submit the documentation to the law enforcement bodies.

What regulatory penalties may apply?

The National Bank of Ukraine, the National Securities and Stock Market Commission or the Financial Services Market Commission may impose administrative sanctions (suspension or termination of a license, exclusion from the relevant registries of authorized entities), penalties and criminal liability on the firms and/or regulated individuals. The penalty may vary from GBP54 (UAH 1,700) to GBP5,369 (UAH 170,000), depending on the breach.

What criminal penalties may apply?

Formal investigation may result in criminal liability being imposed on a regulated entity and personnel in certain cases, including:

- insider dealing and manipulation, misleading statements and practices;
- violations of the money laundering regulations; and
- conducting regulated activities when not authorized.

Generally, the criminal liability may be punishable by:

- penalty which may vary from £415 (UAH 13,697) to £7,787 (UAH 257,006) depending on the breach;
- imprisonment for three to 15 years; and/or
- loss of regulatory status and right to occupy positions or engage in business activities for a term of up to three years.

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?
Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

No stamp, registration, transfer or other similar taxes are payable in Ukraine on the advance, transfer or assignment of a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

Registration of a mortgage (and the transfer or assignment of a mortgage) is subject to stamp duty at the rate of 0.01% of the value of the mortgaged property, as indicated in the mortgage agreement.

Notary fees may also apply and their amount may vary.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

**ISSUE OF DEBT SECURITIES**

The issue of debt securities is subject to stamp duty at the rate of 0.1% of the nominal value of the debt securities being issued. The maximum amount of stamp duty is capped at the level of UAH 80,000.

The issue of derivative securities is subject to stamp duty in the amount of UAH 850.

Last modified 24 Jan 2020

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

The State Fiscal Services of Ukraine does not have a priority over secured lenders or secured debt security holders, provided the security is registered in accordance with Ukrainian legislation prior to the emergence of any tax lien.

Last modified 24 Jan 2020

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Generally, Ukraine-source interest payable by Ukrainian corporate borrowers under loans provided by lenders not resident in Ukraine is subject to Ukrainian withholding tax.

Other payments (eg fees and commissions) under a loan agreement may not fall within the scope of Ukrainian withholding tax if they qualify as in return for services.

If so:

What is the rate of withholding?

The following tax rates apply to payments of interest by Ukrainian corporate borrowers under loans granted by lenders not resident in Ukraine:

- 15% – for loans provided by corporate lenders not resident in Ukraine; and
- 19.5% – for loans provided by individual lenders not resident in Ukraine.

What are the key exemptions?
A full or partial exemption from Ukrainian withholding tax on interest payable by Ukrainian corporate borrowers may be granted under double tax treaties in force in Ukraine.

Special withholding tax rules apply to interest payable by Ukrainian corporate borrowers to corporate lenders not resident in Ukraine under loan agreements, where the funds advanced were obtained by corporate lenders not resident in Ukraine from the issue of debt securities on exchanges outside of Ukraine (e.g. Eurobonds or LPNs). Under these types of structures, the rate of Ukrainian withholding tax on interest under such loan agreements with corporate lenders not resident in Ukraine is:

- completely eliminated – for loans provided before 2018; or
- reduced to 5% – for loans provided after 2019.

**Would the same analysis apply to interest payments under a debt security (e.g. a bond)?**

Yes, the same analysis applies to interest payments under a debt security.

*Last modified 24 Jan 2020*

**Are foreign lenders and debt security holders subject to tax on interest payments?**

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

No.

**Would the same analysis apply to interest payments under a debt security (e.g. a bond)?**

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are restrictions on offering and selling debt securities under both UK and EU law.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in the UK or to request that they are admitted to trading on a regulated market operating in the UK unless an approved prospectus has been made available to the public.

The International Capital Market Association has published standard form selling restrictions for offers of debt securities in the UK. These restrictions are aimed at preventing a breach of:

- the rules on financial promotion; and
- the rules on accepting deposits in the UK.

Last modified 6 Dec 2019

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in the UK are bonds or notes issued on a stand-alone basis or under a program.

Many different types of debt securities are offered in the UK. Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities and high-yield bonds;
- guaranteed securities, subordinated securities, perpetual debt securities (i.e., debt securities that have no specified redemption date);
- asset-backed securities;
- derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- hybrid securities (securities with both debt and equity features);
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer);
- exchangeable bonds (debt securities convertible into the equity of a third party);
- depositary receipts (a security issued by a depositary conferring on the holders beneficial ownership of certain underlying assets held by the depositary for the holders); and
What are the differences between offering debt securities to institutional / professional or other investors?

On 25 June 2019, the Financial Services and Markets Act 2000 (Prospectus) Regulations 2019 (SI 2019/1043) were published. These Regulations make UK legislation compatible with the EU Prospectus Regulation (2017/1129) (Prospectus Regulation) and ensured that the Prospectus Regulation is effective and enforceable in the UK from 21 July 2019.

Under the Prospectus Regulation one of the circumstances in which a prospectus must be produced is where an offer of securities is made to the public within the European Union. An exemption from this requirement to publish a prospectus applies where offers are made solely to qualified investors (which are defined as persons or entities under the professional investor classification in the MiFID II Directive (2014/65/EU) (professional clients, persons treated as professional clients, and persons recognised as eligible counterparties)). However, if the debt securities are to be admitted to trading on an EU-regulated market a prospectus would still be required.

The nature of the information that has to be disclosed in a prospectus for the issue of debt securities under the Prospectus Regulation depends on whether the issue falls within the retail regime or the wholesale regime.

If the denomination of the securities is equal to or above €100,000 (or the equivalent in another currency), the 'wholesale' rules apply. If the denomination is under €100,000, the 'retail' rules apply. Additional disclosure requirements apply for retail securities.

When is it necessary to prepare a prospectus?

Under the Prospectus Regulation (as implemented in the UK by Financial Services and Markets Act 2000 and the FCA's Prospectus Regulation Rules), securities shall only be offered to the public in the European Union after prior publication of a prospectus in accordance with the Prospectus Regulation. Securities shall only be admitted to trading on a regulated market situated or operating within the EU after prior publication of a prospectus in accordance with the Prospectus Regulation.

An offer would not be deemed to have been made to the public if, among other things, it is made solely to qualified investors, addressed to fewer than 150 persons (other than qualified investors) per member state or where the minimum denomination per unit is at least €100,000.

If the offer is deemed not to be made to the public, a Prospectus Regulation compliant prospectus may still be required if an application is made for the securities to be admitted to trading on a regulated market. An exemption from both the offer to the public and the admission to trading on a regulated market is needed to avoid having to publish a prospectus.

What are the main exchanges available?

The London Stock Exchange has three principal markets on which debt securities are traded:

- the Main Market;
- the Professional Securities Market; and
- the International Securities Market.

The London Stock Exchange Main Market

The Main Market is a regulated market for the purposes of the Markets in Financial Instruments Directive (MiFID), so issuers on the Main Market are subject to the requirements of a number of EU Directives, including the Market Abuse Directive and the Transparency Directive. Securities listed on the Main Market can be passported to other European Economic Area markets in order to access international investors.
The London Stock Exchange Professional Securities Market

The Professional Securities Market is an exchange-regulated market subject to the rules of the London Stock Exchange. It is not a regulated market for the purposes of MiFID. It is therefore outside the requirements of the Prospectus regulation and provides a more flexible alternative to the requirements regarding denomination and financial information, compared to the rules which apply to regulated markets across Europe. As it permits reporting under national Generally Accepted Accounting Principles (GAAP), it offers an alternative for issuers not wishing to prepare financial information to International Financial Reporting Standards (IFRS).

The London Stock Exchange also operates the Order Book for Retail Bonds, which is an electronic trading platform for debt securities that are issued in denominations of less than £100,000 and listed on the Main Market.

The London Stock Exchange International Securities Market

The International Securities Market was launched in May 2017. It is an exchange-regulated market subject to the rules of the London Stock Exchange. Securities admitted to trading on the International Securities Market are not listed on the Official List maintained by the UK Financial Conduct Authority (FCA), so FCA approval is not required. Admission to trading and approval of the admission document is conducted by the London Stock Exchange only.

Is there a private placement market?

The UK has an active private placement market.

There is no dominant standard for documentation but efforts have been made by the Loan Market Association and International Capital Markets Association to standardize private placement documentation.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil and criminal liability under English law. The UK has various investor protection statutory provisions relevant to liability for an inaccurate offering memorandum. There are also general fraud statutes and liability may also arise under common law through a civil action for deceit, negligent misstatement or misrepresentation.

Investing in debt securities

Debt security terms and conditions typically contain provisions which may permit their modification without the consent of all investors and confer significant discretions on the trustee, which may be exercised without the consent of investors and without regard to the individual interests of particular investors. The conditions also provide for meetings of investors to consider matters affecting the investors interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally
Establishing a fund, offering fund securities and operating a fund, among other things, are regulated activities under the Financial Services and Markets Act 2000 and therefore subject to regulation by the UK Financial Conduct Authority.

**Collective Investment Schemes**

The regulations apply to activities undertaken in relation to 'Collective Investment Schemes' which are schemes comprising the following arrangements (subject to certain specific exceptions set out in the legislation):

- with respect to property of any description, including money, the purpose or effect of which is to enable persons taking part in the arrangements (whether by becoming owners of the property or any part of it or otherwise) to participate in or receive profits or income arising from the acquisition, holding, management or disposal of the property or sums paid out of such profits or income;

- where the participants do not have day-to-day control over the management of the property, whether or not they have the right to be consulted or to give directions; and

- that have either or both of the following characteristics:
  - pooling of investors' contributions and profits or income; and
  - the property is managed as a whole by or on behalf of the operator of the scheme.

*Last modified 6 Dec 2019*

**What are common fund structures?**

Common forms of funds, some of which are further described in the UK Financial Conduct Authority Guidance on Collective Investment Schemes, include:

- open-ended (UK Authorized Unit Trusts (AUTs), Investment Companies with Variable Capital (ICVCs) and Authorized Contractual Scheme (ACSs)) and closed-ended funds;

- retail and non-retail funds (including Alternative Investment Funds (AIFs));

- Undertakings for Collective Investments in Transferable Securities (UCITS) and non-UCITS funds; and

- qualified investor structures that invest in, for example, corporate shares or bonds, real property, commodities (for example, precious metals) and derivatives.

*Last modified 6 Dec 2019*

**What are the differences between offering fund securities to professional / institutional or other investors?**

**Retail funds**

Open-end retail funds must be either authorized by the UK Financial Conduct Authority (if UK domiciled) or recognized by the Financial Conduct Authority (if domiciled in another jurisdiction). Funds that are ‘recognized’ by the Financial Conduct Authority in this context mostly comprise Undertakings for Collective Investment in Transferable Securities (UCITS) funds established in other jurisdictions. Closed-end retail funds that are listed in the London Stock Exchange Main Market or specialist funds market are not ‘authorized’ by the Financial Conduct Authority, but the listing itself requires approval by the Financial Conduct Authority in its capacity as the UK listing authority.

Retail funds, including UCITS, are subject to substantial regulatory oversight and restrictions, including obligations with regard to independent custodian/depository arrangements for assets, investment and borrowing powers specifications (for open-end retail funds), concentration requirements and other matters.

**Institutional/professional funds**

In practice, non-retail funds (other than limited partnerships) are usually established outside the UK because there are no UK non-retail
Establishing funds

Separately managed accounts are also commonly used in the UK as an investment management structure – investor funds are generally held in a separate account subject to the discretionary investment authority of a manager who can acquire and dispose of assets using the investor funds in line with a pre-determined strategy and parameters set out in an Investment Management Agreement. These are often also structured as ‘funds of one’ in a separate vehicle.

Managing investments is a regulated activity under the UK Financial Conduct Authority rules and therefore subject to authorization; however managed accounts ‘funds of one’ themselves are generally not classed as (and therefore avoid the regulatory restrictions in being classed as) Collective Investment Schemes or Alternative Investment Funds.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

UK selling restrictions

Generally, in the UK, offering securities is either covered under the UK Financial Conduct Authority's financial promotion regime, under the Undertakings for Collective Investment in Transferable Securities Directive regime or under the Alternative Investment Fund Managers Directive regime.

Undertakings for Collective Investments in Transferable Securities (UCITS)

UCITS, including those established in the UK, have a EU passport which enables fund promoters to create a single product for marketing in all EU member states and on the completion of the appropriate notification procedure, a UCITS established in one member state can be sold in any other.

A UCITS intending to market in another member state must complete and submit to its home regulator a notification including certain specified information, including copies of key investor documents. The home regulator then completes a notification file which is sent in a regulator-to-regulator transmission, following which the UCITS can be sold in the other member state.

Alternative Investment Funds (AIFs)

Under the Alternative Investment Fund Managers Directive, marketing is defined as: a direct or indirect offering or placement at the initiative of the Alternative Investment Fund Manager (AIFM) or on behalf of the AIFM of units or shares in an AIF it manages to or with investors domiciled or with a registered office in the EU.

An AIFM may only market an AIF to EU investors if it is authorized by a relevant EU regulator – registration with one EU regulator opens access, subject to certain further limited conditions, to marketing to professional investors across the EU under a EU passport or if it complies with national private placement regimes (where available).
Reverse solicitation and the definition of 'marketing'

Applicable in the context of professional investors, this is a sensitive area in the UK and Europe generally. The Alternative Investment Fund Managers Directive generally continues to permit professional investors who wish to invest in AIFs based on their own initiative (reverse solicitation); however, the EU is currently reviewing this area during 2017 and may impose tighter requirements.

Specifically in the UK, the Financial Conduct Authority has provided broad guidance on the definition of 'marketing' as follows:

- Marketing will, generally, not include secondary trading in the units of an AIF. Therefore, the listing of AIF units will not necessarily constitute marketing.
- The indirect offering or placement of units of an AIF will be considered as marketing (including the distribution through a chain of intermediaries or a placement agent).
- In certain circumstances, providing draft AIF documentation to potential investors will not constitute marketing.

The FCA also provides the following view specifically on reverse solicitation: confirmation from the investor that the offering or placement of units of shares of the AIF was made at its initiative, should normally be sufficient to demonstrate that this is the case, provided this is obtained before the offer or placement takes place.

Are there any restrictions on managing a fund?

Fund management in the UK is regulated under the Financial Services and Markets Act 2000, various statutory instruments and the Financial Conduct Authority Rules. The Financial Conduct Authority is responsible for regulating funds, fund managers and those marketing funds and any legal or natural person is prohibited from carrying on regulated activities, such as fund management, without authorization.

Various restrictions arise on manager structuring/compensation and profit-sharing arrangements as a result of the regulations and any manager that is subject to the remuneration rules must apply those rules proportionate to its size, internal organization and scope and complexity of its activities. The rules impact on, among other things, reporting, equity remuneration, deferred compensation arrangements and clawback.

Alternative Investment Fund Managers (AIFMs) are also subject to regulation under the Alternative Investment Fund Managers Directive (as implemented in the UK) and managers of Undertakings for Collective Investments in Transferable Securities (UCITS) are subject to certain requirements under the Undertakings for Collective Investment in Transferable Securities Directive. Full Financial Conduct Authority registration involves a significant authorization process – three-to-six months from completion of the application which must include:

- for the manager, information on senior personnel (must be suitable persons etc.), organizational structure, policies and procedures, remuneration practices; and
- for each fund, investment strategy, constitutional documents, depositary information and disclosure requirements.

However, AIFMs based in the UK can be exempted from full regulation on certain grounds, including managing assets under €500 million where assets are not leveraged and investors have no redemption rights for five years, and managing assets under €100 million including assets acquired through leverage. Exempted managers must still register with the regulator, are subject to limited reporting and it should be noted that they do not benefit from the general passporting for marketing purposes.

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

Unless an exemption or exclusion applies, a person entering into a derivatives contract by way of business in the UK (such as a dealer) will ordinarily have to be authorized under the Financial Services and Markets Act 2000 if the transaction is one of the specified activities set
out in Part II of the Regulated Activities Order or the derivative constitutes a specified investment under Part III of the Regulated Activities Order such as:

- options;
- futures;
- contracts for difference; or
- rights to or interests in investments.

One of the key exclusions to the requirements above applies to persons who deal in derivatives for risk management purposes.

Last modified 6 Dec 2019

**What are common types of derivatives?**

The UK accounts for about half of the $640 trillion over-the-counter market derivatives market.

Derivative contracts are entered into in the UK for a range of reasons including hedging, trading and speculation.

Derivatives may be traded over-the-counter or on an organized exchange.

All of the main types of derivative contract are widely used in the UK:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying asset seen in the UK are:

- equity;
- fixed income instruments;
- commodities;
- interest rates;
- foreign currency; and
- credit events.

Last modified 6 Dec 2019

**Are there any other notable risks or issues around entering into derivatives contracts?**

Since the global financial crisis in 2007-to-2008, derivatives and particularly over-the-counter (OTC) derivatives have attracted significant regulatory attention. The European Commission has sought in particular, to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative position;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result the derivatives market has seen and continues to see the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

The European Market Infrastructure Regulation (EMIR) formed part of the European regulatory response to the global financial crisis and
sought to address the issues highlighted above. For example, EMIR requires:

- all transactions to be reported to regulators;
- some more standardised OTC transactions between certain categories of counterparties to be cleared with a central counterparty (i.e. a third party intermediary in the trade); and
- for those transactions not subject to mandatory clearing, certain other risk mitigation techniques to be applied including the posting and collection of initial margin and/or variation margin.

EMIR was amended by the EMIR Refit Regulation in June 2019 with the primary aim of simplifying certain requirements and reducing compliance costs for smaller counterparties. For example, under the EMIR Refit Regulation those categorised as 'small non-financial counterparties' do not need to comply with reporting and clearing requirements from specified dates.

Debt finance

Lending and borrowing

Are there any restrictions on lending and borrowing?

Lending

Lending is only a regulated activity in relation to mortgages and consumer lending. In these circumstances, and assuming none of the available exemptions apply, a lender will need to be authorized by the UK Financial Conduct Authority to conduct such business.

Mortgage and consumer loans are subject to a range of regulatory requirements that do not apply to unregulated loans. For example, for regulated mortgage contracts, there are particular restrictions around how:

- the loans are marketed, originated and sold;
- lenders administer the loans on an ongoing basis; and
- borrowers who fall behind with their payments are dealt with.

Regulated credit agreements on the other hand have specific requirements around how the agreement is drafted and formatted and what information must be included.

There are no additional restrictions that apply to foreign lenders making loans to UK borrowers.

Borrowing

While borrowers are generally not regulated, it is advisable for borrowers to consider whether either the mortgage or consumer lending regimes apply to their activities, in which case they will benefit from the protections mentioned above.

What are common lending structures?

Lending in the UK can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents and trustees which fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one
of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, e.g., term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities, etc.

**Loan durations**

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

**Loan security**

A loan can either be secured, unsecured or guaranteed. For more information, see [Giving and taking guarantees and security](#).

**Loan commitment**

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

**Loan repayment**

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

_Last modified 6 Dec 2019_

**What are the differences between lending to institutional/professional or other borrowers?**

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

By contrast, lending in the context of mortgages and to consumers is a regulated activity and so requires UK Financial Conduct Authority authorization. For more information, see [Lending and borrowing – restrictions](#).

_Last modified 6 Dec 2019_

**Do the laws recognize the principles of agency and trusts?**

Yes, both principles are recognized as a matter of English law.

For instance, it is possible to appoint an agent to act on behalf of other parties and a trustee to hold rights and other assets on trust for the lenders or secured parties.

_Last modified 6 Dec 2019_

**Are there any other notable risks or issues around lending?**
Generally

Loan agreements and other finance documents are subject to general contractual principles. For example, the England & Wales courts will not enforce a penalty and so lenders have to be careful about the rate of default interest charged on a loan. Lenders therefore tend to opt for a modest uplift of around 2% above the usual rate.

Specific types of lending

Specific to the area of mortgage lending is the issue of whether a lender falls within the recently formed UK mortgage regime. The Mortgage Credit Directive, implemented in the UK through a series of primary and secondary legislation, aims to prevent the irresponsible lending and borrowing practices that were exposed during the global financial crisis. The Mortgage Credit Directive applies to first and second charge mortgages. It imposes a number of requirements on lenders including the need to:

• conduct affordability tests before lending;
• provide standard information about the mortgage to enable borrowers to compare products; and
• ensure that staff are suitably trained.

Standard form documentation

Most English law syndicated finance transactions are governed by documentation based on recommended forms published by the Loan Market Association (LMA). Bilateral finance transactions are more likely to be documented on bank standard form documentation prepared in-house.

Are there any other notable risks or issues around borrowing?

Borrowers should be aware of the potential implications of the EU’s Bank Recovery and Resolution Directive (BRRD), which outlines certain measures for dealing with failing financial institutions.

The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to ‘bail in’ obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. ‘Bail in’ describes a variety of write-down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of English or other EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

Market participants should also be aware of the on-going reform of the London Interbank Offered Rate (LIBOR) and other key interest rate benchmarks. LIBOR and other reference rates are commonly used in the calculation of interest and other payments under loans as well as various other financial products. Following the United Kingdom Financial Conduct Authority’s announcement in 2017 of its intention to stop compelling banks to submit rates required to calculate LIBOR after the end of 2021, the loan market, like other financial markets, has been in a period of transition to alternative reference rates which can be used in loan and other financial contracts going forward. The expectation is that market participants, in many cases, will transition to ‘risk free rates’ (RFRs), which are mostly backward-looking overnight rates, supplemented by a spread adjustment to account for the different bases upon which LIBOR and other existing reference rates are calculated compared to the proposed RFRs. One of the key challenge for the loan market remains how to adjust the position in existing finance documents.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?
Some of the key areas affecting the giving of guarantees and security are as follows.

**Capacity**

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors’ powers that would be preventative. Under English law, directors have a general duty to promote the success of the company for the benefit of its members as whole; as such, they will need to be able to show that adequate corporate benefit is derived from the company giving the guarantee or security. This is often more difficult in the case of upstream or cross-stream guarantees or security provided by a subsidiary to its parent or sister company. The safe approach is often to have the members of the company approve the giving of the guarantee or security by resolution.

**Insolvency**

Guarantees and security may be at risk of being set aside under England & Wales insolvency laws if the guarantee or security was granted by a company within a certain period of time prior to the onset of insolvency. This would be the case if the company giving the guarantee or security received considerably less consideration, and as such, the transaction was at an undervalue. For such a transaction to be set aside, certain statutory criteria would have to be met, including that the guarantee or security was given within six months (or two years for connected parties) of the onset of insolvency of the affected party. Guarantees and security may also be challenged on other grounds relating to insolvency.

**Financial assistance**

It is unlawful for a public company to provide financial assistance for the purchase of its own (or of its holding company's) shares. The prohibition against financial assistance for private companies was abolished on 1 October 2008. Financial assistance in this context would include giving a guarantee or security in connection with the share purchase.

**What are common types of guarantees and security?**

**Common forms of guarantees**

Guarantees can take a number of forms.

A particular distinction worth remembering is between a performance guarantee and a payment guarantee:

- A performance guarantee is a term used to describe both performance bonds (in the context of trade finance) and ‘see to it’ guarantees (in other contexts):
  - A performance bond describes a financial undertaking used to protect a buyer against the failure of a supplier to deliver goods or perform services in accordance with the terms of a contract. The issuer of the bond undertakes to pay to the buyer a sum of money if the seller fails to deliver the goods or perform the contracted services on time or in accordance with the terms of the contract.
  - A ‘see to it’ guarantee is a promise by the guarantor to see to it that the primary obligor fulfils its obligations under the primary contract. If the primary obligor fails to fulfil its obligations under the primary contract, the guarantor will be in breach of its obligations under the guarantee.
- A payment guarantee is narrower in scope than a performance guarantee as it only covers the payment of money rather than other contractual obligations.

**Common forms of security**

There are three basic types of security interest that can be created under English law:

- a pledge;
- a charge; and
- a mortgage.
Different types of security are suitable for securing different types of assets.

Under English law it is possible to grant security over all of the assets of an English company or individual assets. Granting security over all of a company’s assets will tend to be achieved by way of a debenture which will include:

- a mortgage over real estate;
- a fixed charge over assets which are identifiable and can be controlled by the creditors (such as equipment);
- a floating charge over fluctuating and less identifiable assets (such as stock); and
- an assignment by way of charge over receivables and contracts.

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

To be valid, a guarantee needs to be in writing, signed by the guarantor and provided for good consideration.

Consideration for a guarantee is subject to general contractual principles. In the case of a guarantee, the underlying obligations will usually be the consideration for the guarantee and so it is advisable to execute the guarantee at the same time as executing the underlying obligations to avoid any suggestion of past consideration. Often the guarantee is included in the loan agreement and so this should not be an issue. Also, it can be difficult to establish consideration for a guarantee as the primary obligations are between the underlying obligor and beneficiary, for example between the borrower and lender. As a result guarantees are often executed as deeds to avoid any argument about whether good consideration was provided. Deeds have particular execution requirements under English law which need to be observed.

Additionally, there is a risk that a guarantee may be set aside if it was procured by undue influence by a borrower or lender. A party being provided with a guarantee should be alive to this issue and take steps to avoid claims of undue influence by, for example, requiring the guarantor to take separate legal advice.

Giving or taking security

A security document may need to be executed as a deed if it:

- contains a mortgage over land;
- confers a statutory power of sale and power to appoint a receiver; or
- contains a power of attorney.

Once granted, security needs to be properly perfected before it is valid against third parties. Perfection formalities can range from having the secured asset delivered to the security holder, registration of the security and notice being given to third parties. Most charges created by an English company must be registered at Companies House within 21 days of its creation. Failure to register within this time means that the charge will be void against the liquidator, administrator or any creditor of the company and the money secured by the charge becomes immediately payable.

There are no notarization requirements for security documents under English law.

Like guarantees, for a period after a new security interest has been granted (known as the hardening period), it is at risk of being set aside in certain circumstances under insolvency laws. Reviewable transactions include those conducted at an undervalue, preferences and invalid floating charges.
Financial regulation

Law and regulation

*What are the main laws and regulations that apply to entities that are involved in finance and investments generally?*

**Generally**

Financial Services Act 2012  
Financial Services and Markets Act 2000  
Financial Services and Markets Act 2000 (Regulated Activities) Order 2001  
The Financial Services and Markets Act 2000 (Financial Promotion) Order 2005  
FCA Handbook and PRA Rulebook

**Consumer credit**

Consumer Credit Act 1974 (as amended)  
FCA Handbook, Consumer Credit sourcebook

**Mortgages**

Mortgage Credit Directive (2014/17/EU) (mortgage credit)  
Mortgages and Home Finance: Conduct of Business sourcebook

**Corporations**

Companies Act 2006  
Overseas Companies Regulations 2009

**Funds and platforms**

Alternative Investment Fund Managers Regulations 2013 (fund managers)  

**Other key market legislation**

Bank Recovery and Resolution Directive (2014/59/EU) (recovery and resolution)  
Capital Requirements Regulation (Regulation (EU) 575/2013) (capital requirements)  
European Market Infrastructure Regulation (EMIR) (Regulation (EU) 648/2012) (derivatives)  
EMIR Refit Regulation (Regulation (EU) 2019/834) (derivatives)  
Market Abuse Regulation (Regulation (EU) 596/2014) (market abuse)  
Markets in Financial Instruments regulation (600/2014) (financial instruments)  
Payment Services regulations 2017 (payment service providers)  
Electronic Money Regulations 2011 (electronic money issuers)

_Last modified 6 Dec 2019_
Who are the regulators?

The Financial Conduct Authority (FCA) is the conduct regulator for firms providing financial products and services in both retail and wholesale markets, and also the prudential regulator for many firms. It is also responsible for enforcing the market abuse and listing regimes.

The Prudential Regulation Authority (PRA) is responsible for the prudential regulation of systemically important financial institutions, including banks, building societies, insurers and major investment firms.

What are the authorization requirements and process?

Depending on the type of firm, a firm must apply to the Financial Conduct Authority (FCA) or Prudential Regulation Authority (PRA) for authorization.

The regulators must assess whether the application meets the required threshold conditions within six months of the submission of the complete application.

The application fee depends on the type of the application ranging from £1,500 to £25,000.

The regulator will also approve key individuals (eg senior management) in their roles.

Authorized firms and individuals are listed on the FCA Register.

What are the main ongoing compliance requirements?

Threshold conditions (such as having adequate financial resources and compliance arrangements in place) are an ongoing compliance requirement for authorized firms.

Failure to comply with the threshold conditions and more detailed regulatory rules can result in sanctions for firms and regulated individuals, and loss of regulated status.

What are the penalties for failure to be authorized?

A person undertaking a regulated activity without being authorized or exempt, commits a criminal offence and is liable to imprisonment, fines and warnings. Contracts entered into with persons who are not authorized may not be enforceable and persons may be subject to compensation in various circumstances.

Regulated activities

What finance and investment activities require authorization?

Generally

A person must not carry on a regulated activity in the UK unless authorized or exempt (known as the general prohibition).

A financial activity requires regulatory authorization when it is identified as a specified activity in relation to a specified investment, it is carried on by way of business in the UK and it does not fall within any of the available exclusions.
 Specified activities include activities such as accepting deposits, dealing in, managing, arranging and advising on investments, and establishing collective investment schemes.

 Specified investments include deposits, shares, debt instruments, options, futures, units in a collective investment scheme and government and public securities.

 **Consumer credit**

 Consumer credit activities, including credit broking, operating an electronic system in relation to lending and entering into a regulated credit agreement as lender are regulated activities.

 Unless exempt agreements, these activities can only be offered by firms who are authorized and listed on the financial services register. The available exemptions relate to the nature of the agreement, the lender and the borrower, the number of repayments to be made and the total charge for credit. For example, credit agreements exceeding £25,000 that are entered into exclusively or predominantly for the purposes of the business of the borrower are exempt agreements.

 **Are there any possible exemptions?**

 There are two types of exclusions available when regulated activities may be undertaken without authorization.

 **General exclusions**

 Certain persons may carry on a regulated activity without being authorized. For example, in certain cases regulated activities carried on by overseas persons may be undertaken without authorization.

 **Specific exclusions**

 For each type of regulated activity there are a number of specific exclusions that could also apply, such as making introductions (that is, making arrangements under which clients can, under certain circumstances, be introduced to another person, who is authorized).

 **Do any exchange controls or other restrictions on payments apply?**

 The UK does not operate any foreign currency controls.

 For cases of money transferring from non-EU member states, imports of foreign currency may need to be declared in the custom declarations, but there is no legal restriction on moving money in and out of the country.

 Compliance with the EU rules on payments (EU Payments Regulation and the Transfer of Funds Regulations) must be ensured.

 Anti-money laundering and tax considerations may also need to be taken into account.

 Payments services are regulated in the UK and must be undertaken by an authorised Payment Service Provider, such as a bank.

 **What are the rules around financial promotions?**

 A financial promotion is a communication of an invitation or inducement to engage in investment activity made by a person in the course of business. Since such communications can influence consumers, a person is restricted from communicating such promotions unless they are an authorized person, or the content of the communication has been approved by an authorized person, or the promotion falls within one of the exclusions in the Financial Services and Markets Act 2000 (Financial Promotion) Order 2005.

 It is a criminal offence for an unauthorized person to communicate a financial promotion.
Exclusions

Exclusions include certain promotions to certified high-net worth individuals or overseas recipients, provided certain criteria are fulfilled.

Last modified 6 Dec 2019

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

The most common types of legal entities are limited companies and limited partnerships, both of which are body corporates with separate legal personality and limit the liability of their members.

Limited companies can either be private (denoted by the suffix Ltd or Limited) or public (denoted by the suffix PLC or Public Limited Company) depending on whether their shares are offered to the public. Some activities require a particular type of legal entity to be used. For example, offering debt securities to the public can only be done by UK Public Limited Companies.

The liability of a company's shareholders can be limited by shares, in which case they are liable to pay for their shares but not the company's debts, or by guarantee, where they are also liable to pay a certain amount if the company is wound up.

Limited partnerships (or LLPs) are similar to limited companies in many ways, with the main differences being that they are:

- formed by partners whose relationship is governed by private agreement rather than having shareholders and directors; and
- taxed like a partnership.

Funds

Investment funds tend to take the form of limited partnerships, limited companies (including open-ended investment companies (OEICs)), unit trusts (authorized and unauthorized), UK public companies (including those approved by HMRC as UK investment trusts) and authorized contractual schemes (ACS).

Fund managers on the other hand tend to be set up as limited companies (generally limited by shares), limited liability partnerships or limited partnerships.

Last modified 6 Dec 2019

Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

A company can conduct lending or investment business in the UK through an establishment (also known as a 'branch') but this does not create a separate legal entity.

Overseas companies having a UK establishment (but which are not incorporated in the UK e.g. as a subsidiary entity) need to comply with the Overseas Companies Regulations 2009 which imposes registration, accounting, disclosure and other requirements. Such requirements do not apply to partnerships or other unincorporated entities with a similar UK presence.

Overseas companies carrying on a trade in the UK through a 'permanent establishment' will be subject to UK corporation tax.

Last modified 6 Dec 2019
FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
- consumer loans;
- student lending products;
- small and medium-sized enterprises (SME) lending; and
- residential property and commercial property mortgage lending.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

How are marketplace lending platforms funding themselves?

Marketplace lending includes peer-to-peer (P2P)-type structures, often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds, as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

Issues for startup marketplace lenders

Following the initial incorporation and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform. As the startup lender will not have an established track record, deposit base or asset pools, the funding structure will often follow the format of a warehouse securitization structure. Origination of new assets will be funded through drawings on a note issuance facility backed by security over the new assets. Each of the new assets will be subject to eligibility criteria determined by reference to the nature of the underlying asset. In order to provide an efficient financing structure, the assets will typically be held through a SPV with origination and servicing provided by the marketplace lender. In order to cover expected losses on the asset pool, the senior facility will be subject to the lending platform maintaining sufficient subordinated capital in the form of equity, or a combination of equity and subordinated debt.

While the funding may be structured through a revolving loan or note program, if there is tranching of the debt, this will typically result in the platform being treated as a securitization for the purposes of the European Union Securitization Regulation, with the attendant requirements to hold risk retention and provide appropriate reporting and disclosures.

Blockchain, smart contracts and cryptocurrencies
WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a peer-to-peer mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features, such as; its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that, once authorized can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another, or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of the transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin
platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

## Initial coin offerings and token-based products

### WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

### Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms, which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

### Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.
Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The Financial Conduct Authority (FCA) is the conduct regulator for firms providing financial products and services in both retail and wholesale markets.

GENERAL

A person must not carry on a regulated activity in the UK unless authorized or exempt (known as the general prohibition). A financial activity requires regulatory authorization when it is identified as a specified activity in relation to a specified investment, it is carried on by way of business in the UK and it does not fall within any of the available exemptions. Where FinTech products and/or applications involve financial activity which requires regulatory authorization, the firms providing such products and/or applications must be authorized by the FCA.

PROJECT INNOVATE

In October 2014, the FCA launched an initiative known as Project Innovate with a view to encouraging innovation in the interest of consumers. Project Innovate has five initiatives:

- **regulatory sandbox** – providing businesses with access to the real market to test innovative products, services, business models and delivery mechanisms;
- **direct support** – providing a dedicated contact for innovator businesses that are considering an application for authorization or a variation to their permission;
- **advice unit** – providing regulatory feedback to firms developing automated models to deliver lower-cost advice and guidance to consumers;
- **reg tech** – encouraging technologies that may facilitate the delivery of regulatory requirements more efficiently and effectively; and
- **engagement** – providing FCA engagement with a wide variety of businesses in the UK regions and internationally.

REGULATORY DEVELOPMENTS ON INVESTMENT PLATFORMS

In March 2019, the FCA published the final report of its Investment Platforms Market Study, in response to the increasingly important role of investment platforms in the retail distribution landscape. In December 2019, the FCA published final rules for platforms to make it easier for consumers to move from one platform to another without liquidating their assets. The new rules ensure that consumers moving onto a new platform are given the option to convert to discounted units, where these are available for them to invest in. These new rules come into force on 31 July 2020.

Electronic payments platforms and regulation of peer-to-peer lenders

ELECTRONIC PAYMENT PLATFORMS

Since April 2014, a subsidiary of the FCA, the Payment Systems Regulator has regulated eight payment systems designated by HM Treasury, namely Bacs, Cheque & Credit, CHAPS, Faster Payment Scheme, LINK, Northern Ireland Cheque Clearing, MasterCard and Visa Europe. All participants in a designated payment system will fall under the remit of the Payment Systems Regulator, including operators that manage or operate the systems, the payment service providers using the system and the infrastructure providers to the payment system.

There are an increasing number of FinTech businesses joining these electronic payment platforms. Rules governing access to or participation in a payment system are required to be objective, proportionate and non-discriminatory. The Payment Systems Regulator is
responsible for upholding the prohibition against restrictive rules on access to payment systems. Enhanced competition is one of the objectives of the second Payment Services Directive (EU) 2015/2366 (PSD 2) which has been implemented in the UK via the Payment Services Regulations 2017.

**ELECTRONIC MONEY ISSUERS**

The FCA Handbook contains a number of electronic money-related rules, directions and guidance aimed at businesses that are issuing or considering the issuing of electronic money (e-money). In addition to the FCA Handbook, the law governing the issuance of electronic money is the Electronic Money Regulations 2011. E-money is defined as electronically (including magnetically) stored monetary value, represented by a claim on the issuer, which is issued on receipt of funds for the purpose of making payment transactions. E-money must be accepted by a person other than the electronic money issuer and include pre-paid cards and electronic pre-paid accounts for use online. Generally, firms issuing e-money must be authorized or registered with the FCA.

**PEER-TO-PEER LENDERS**

A person carries out a regulated activity (requiring authorization by the FCA) if they facilitate lending and borrowing between two individuals or between individuals and businesses of less than £25,000 in circumstances where the borrower does not enter into the agreement wholly or predominantly for business purposes. Such agreements are known as Article 36H Agreements and will only be caught by the regulations where either the lender or the borrower is an individual or a partnership with two or three persons or an unincorporated body.

**Regulation of payment services**

Where a UK business provides payment services as a regular occupation or business activity in the UK, it will require authorization by the FCA to become an authorized payment institution under the Payment Services Regulations 2017. Failure to obtain the required authorization is a criminal offence. The regulations implement the European Union Payment Services Directive II.

In order to become authorized by the FCA as a Payment Institution, a payment services business will need to meet certain criteria, including in relation to its business plan, initial capital, processes and procedures in place for safeguarding relevant funds, sensitive payment data and money laundering and other financial crime controls.

The FCA has published an Approach Document on the FCA's role under the Payment Services Regulations 2017 and the Electronic Money Regulations 2011. It gives readers a comprehensive picture of the payment services and electronic money regulatory regime in the UK. It also provides guidance for a practical understanding of the requirements, the FCA's regulatory approach and how businesses will experience regulatory supervision.

**Application of data protection and consumer laws**

The UK's Data Protection Act 1998 (DPA) regulates the processing of personal data within the UK. The DPA implements the European Data Protection Directive. Where a business determines the purposes and manner in which any personal data is processed, it will be regulated by the DPA and have certain notification and compliance obligations.

The European General Data Protection Regulation (EU) 2016/679 (GDPR) came into effect on 25 May 2018. As a result of GDPR, the DPA has been amended and replaced with the Data Protection Act 2018. The GDPR is more prescriptive and restrictive, compared to the principles-based DPA, including mandatory notifications where a breach occurs and provide for severe monetary sanctions for breach. GDPR sets the key principles, rights and obligations for most processing of personal data. As a European Regulation, it has direct effect in UK law and automatically applies in the UK until the UK leaves the EU. After this date (Brexit), GDPR will continue to apply in the UK as a result of the European Union (Withdrawal) Act 2018, with some technical changes to make it work effectively in a UK context.

The UK's Privacy and Electronic Communications Regulations 2003 (PECR) regulate unsolicited direct marketing by electronic means, in addition to sector specific regulations, such as the FCA's financial promotions regime. PECR has been updated in light of GDPR and uses a new standard of GDPR consent.

**Money laundering regulations**

The Money Laundering, Terrorist Financing and Transfer of Funds (Information on the Payer) Regulations 2017 give the FCA responsibility
for supervising the anti-money laundering controls of businesses that offer certain services, such as lending, providing payment services and issuing and administering other means of payment.

Generally, where a firm is authorized and supervised by the FCA it will also be authorized and supervised by the FCA for complying with anti-money laundering requirements.

The MLRs have been updated to implement the Fifth Anti-Money Laundering Directive (EU) 2018/843. These changes include bringing into scope of the MLRs the following firms:

- cryptoasset exchange providers (including Cryptoasset Automated Teller Machine (ATM), Peer to Peer Providers, Issuing new cryptoassets, e.g Initial Coin Offering (ICO) or Initial Exchange Offerings); and
- custodian wallet providers.

Electronic currencies such as bitcoin and other cryptocurrencies tend to represent a higher money-laundering risk. Cryptoasset exchange providers and custodian wallet providers are required to register with the FCA and comply with the MLRs.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals, (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING

The crowdfunding sector is well established, and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform, such as Crowdcube or Crowdfunder.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

ACCELERATORS

There are various incubators or accelerators in the UK market, which offer support, facilities and funding for startups, often in return for an equity stake. For example, Barclays has an accelerator program which offers up to US$120,000 investment from Techstars, together with mentoring from industry experts.

Venture capital and debt

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending, given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund, examples of which include Santander InnoVentures and Citigroup’s Citi Ventures. The benefit of having a CVC as an investor for a FinTech startup is that the
fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), which is secured against a company’s assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

**Warehouse and platform funding**

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

Some FinTech companies may see warehouse funding as a temporary form of financing to be followed by a larger capital markets transaction at a later date.

Another alternative form of funding is by way of peer-to-peer (P2P) lending platforms, such as Zopa and Funding Circle, which bring individual borrowers and lenders together without the involvement of traditional banks. P2P lending does not involve equity investments; interest is paid on the money borrowed instead.

**Senior bank debt and capital markets funding**

**SENIOR BANK DEBT**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**CAPITAL MARKETS FUNDING**

The UK has both debt and equity capital markets which are accessible to businesses (usually of a certain size).

Raising finance by way of an Initial Public Offering (IPO) is a popular funding arrangement for FinTech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange, such as the London Stock Exchange. The London Stock Exchange’s Alternative Investment Market (AIM) caters specifically for small, growth-orientated companies.

A number of marketplace loan securitizations have been launched in the UK, where loans originated via marketplace lending platforms are packaged together and sold to investors as bonds by companies such as Funding Circle and Zopa.

FinTech companies have also accessed funding by issuing bonds to retail investors as a way of raising more competitive funding. For example, in July 2017 LendInvest issued an initial £50 million of retail bonds, which are tradeable on the LSE.

**CONVERTIBLE BONDS/LOAN NOTES**

A popular funding tool for fast-growing FinTech businesses is to issue convertible bonds or loan notes, which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

**Incentives and reliefs**

The Seed Enterprise Investment Scheme (SEIS) is designed to help small, early-stage companies raise equity finance by offering 50% income tax relief for individuals who invest in the shares of qualifying startups, up to a maximum investment of £100,000 per annum. This scheme complements the Enterprise Investment Scheme (EIS), which offers a lower rate of income tax relief of 30% to investors in higher-risk small companies. It is worth noting that some financial activities, such as money lending or insurance are non-qualifying trading activities, and as such, EIS and SEIS may not be available for all FinTech companies.

In addition, research and development (R&D) tax credits are an incentive designed to encourage companies to invest in R&D. SME
businesses (those with fewer than 500 employees, and either revenue less than €100 million or balance sheet assets less than €86 million) can benefit from up to 230% tax relief on their R&D expenditure.

The Patent Box Scheme enables companies to apply lower rate of Corporation Tax (10%) to profits earned from its patented inventions.

Finally, since 6 April 2017, payments of interest made by a UK borrower to a UK lender through a UK peer-to-peer platform are exempt from withholding tax provided that certain conditions are met. To avail the exemption, the credit provided by the lender to the borrowers needs to have been provided at the invitation of a regulated operator of an electronic system.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Buying and selling loans is very common.

A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are:

- **Novation** – A novation is a full legal transfer of the party’s rights and obligations. It is a tripartite arrangement between the existing parties and the transferee and results in a fresh contract being formed between the continuing party and the transferee and the transferor being released from its obligations.

- **Assignment** – An assignment is a transfer of rights only, not obligations. Subject to any contractual restrictions, assignment can be done without the consent of the debtor. An assignment can be effected as either an equitable assignment or legal assignment depending on whether certain statutory requirements have been satisfied.

- **Sub-participation** – A sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the buyer taking on double credit risk, both on the seller as well as the borrower.

Loan transfers are commonly documented using standard form contracts made available by the Loan Market Association. For more complex transactions, a more bespoke form of sale and purchase agreement would tend to be used. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller’s legal advisors. Some of the key considerations include:

- **Confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;

- **Data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;

- **Lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;

- **Undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;

- **Transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and

- **Consent** – whether a transfer requires the consent or notification of any other parties.
Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

The ownership of energy and infrastructure assets in the UK varies according to the asset class. The main asset classes are usually considered to be:

- economic infrastructure (energy, aviation, rail, telecommunications, water, roads and waste); and
- social infrastructure (education, health and justice/prisons, housing).

The UK government has announced that Private Finance Initiative (PFI) or Public Private Partnership (PPP) models may no longer be utilised in England and Wales. Until this policy is changed, investment and lending opportunities are therefore likely to be found in economic infrastructure with the exception of some opportunities in the social housing sector. The Welsh and Scottish government continue to utilise PPP-style models on certain projects using the Mutual Investment Model (MIM) and the Non-Profit Distributing (NPD) model respectively.

Key sectors are considered below.

Energy

The gas and electricity industries in the UK are privatized, with the generation, transmission, distribution and supply services provided by a number of private sector companies. The relevant private sector companies own the generation, transmission and distribution assets. Notably, the National Grid, a listed public company (albeit heavily regulated) owns all of the mainland transmission lines. On certain offshore projects, private entities other than the National Grid may own transmission lines.

The private sector finances and delivers most of the required infrastructure but there are a number of government policy mechanisms (adopted through legislation) which are used to incentivize investment in eligible energy generation technologies. In certain instances, including on major energy infrastructure, projects may be procured by the public sector and depending on the terms of the procurement, the asset may either be publicly or privately owned.

The Office of Gas and Electricity Markets (Ofgem) (as governed by the Gas and Electricity Markets Authority) is the principal body with responsibility for regulation of the energy sector in Great Britain. There is a separate regulator (the Utility Regulator) for the energy sector in Northern Ireland.

Telecoms infrastructure

The telecommunications networks (fixed and mobile) in the UK are privately owned by a number of service providers. A good example is BT Openreach which is responsible for most of the UK's broadband infrastructure but whose work is heavily regulated by government; it, in turn, works with more than 500 service providers to provide local access to users.

The Office of Communications (Ofcom) is the regulator of the UK's telecommunications sector. It also has responsibilities for television broadcast services and wireless communications services.

Due to the UK government's focus on driving the digital transformation through enhanced telecommunications, recent years have seen Ofcom seek to address the issue of BT Openreach's strong position in the broadband access market by attempting to level the playing field in terms of access of BT Openreach's own network and infrastructure to other private providers and making it easier for such providers to build their own broadband networks. As a result, there has been an expansion of other providers building their own networks.

There has also been significant M&A activity in the ownership of telecommunications towers.
Transport infrastructure

LIGHT RAIL

Typically, light rail assets (such as trams and associated track) are owned by local public sector promoting bodies. For example, Transport for London owns the tubes, track and supporting infrastructure in London. Outside of London and on a small number of lines on the London Underground network, certain elements of light rail projects may be outsourced to the private sector; for example, the private sector may provide new trams, run a concession or operate and maintain a light rail system on behalf of a local transport executive – the assets will continue, however, to be owned by the public sector.

HEAVY RAIL

The rail market in the UK is privatized but its composition (which is complex) involves both public and private entities. The principal elements to the rail sector in Great Britain are:

- **Network Rail**, a private limited company, is on the public sector balance sheet and owns, operates and maintains rail tracks, signaling and station infrastructure. It is responsible for improving most of the regulated national rail infrastructure and for operating some of the stations on the national rail network. It is not responsible for the London Underground network, Crossrail and High Speed rail infrastructure.

- **Public transport authorities**, ie central and devolved government bodies and some metropolitan bodies, specify, let and manage operating contracts and give Network Rail a significant proportion of the funding for infrastructure maintenance and enhancement.

- **Train operating companies (TOCs)** are awarded franchises by the Department for Transport or local transport executives to operate certain train lines. 'Open Access TOCs' may apply to the rail regulator for use of certain train paths/routes when not being used by the franchised TOCs. Note that the UK government is currently reviewing the franchise system.

- **Freight operating companies (FOCs)** are wholly commercial entities.

- **Rolling stock companies (ROSCOs)** are private entities which own and maintain rolling stock and lease them to the TOCs for use on their franchise.

- **Project finance** – There have been limited deals (for example both phases of the Intercity Express Programme) where rolling stock has been procured through a PFI (Private Finance Initiative) / PPP (Public Private Partnership) project finance-style model and on that deal it is the private sector which owns the trains and will continue to do so following the expiry of the main contract with the public sector. The Thameslink rolling stock PPP also deployed elements of a PFI-style model albeit in a hybrid PFI/asset finance structure. Project finance structures have been utilised on other deals but they have tended to adopt alternative ownership and revenue models rather than a direct PFI-style availability model.

The rail sector is regulated by the Office of Rail and Road (ORR).

ROADS, BRIDGES AND TUNNELS

A government entity, Highways England, operates, maintains and improves the motorways and major 'A' roads (ie the strategic road network) in England. Highways England is regulated by the Office of Road and Rail and receives funding from the government for investment in the strategic road network (including additional road capacity). Local roads in England are the responsibility of local authorities. The public sector may outsource the construction, operation and maintenance (sometimes on a project financed basis) of such assets to the private sector. In the case of tolled roads, the private sector has taken on roads/crossings on a full concession basis – namely, responsible for the design, build, financing, operation, maintenance and collection of tolls for a number of years with the main revenue stream being the collection of toll revenues from users (rather than any service payments from the public sector) but these types of projects are no longer considered viable as the private sector is not willing to take ‘demand risk’ in order to service the upfront capital costs and associated bank debt. On more recent projects, the private sector provides toll collection services (in part) for a service fee rather than it solely relying on those tolls as its main source of revenue.

AVIATION

Aviation in the UK is (for the most part) privatized. As regards airport infrastructure, there are a number of ownership structures in the UK market, including private ownership, local government ownership and various forms of public-private ownership. All models are heavily regulated by government and the Civil Aviation Authority is the aviation regulator in the UK.
PORTS

The UK ports sector comprises a variety of company, trust and municipal ports, all operating on commercial principles, independently of government and largely without public subsidy. The private sector operates the vast majority of the UK’s major ports.

Other infrastructure

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES HUBS AND PRISONS)

Typically, these are owned by the public sector with the exception of social housing projects (please see below) with the private sector’s responsibility being for any or all of the design, build, financing, operation and maintenance of the infrastructure. The majority of social infrastructure assets in the UK are directly financed by the government. Subject to value for money considerations, historically private finance may also have been considered in the procurement of social infrastructure assets using the Private Finance Initiative and its successor, Private Finance 2 (PF2). However, the UK government has declared that PFI, PF2 or any other Public Private Partnership (PPP) model may not be used going forward. This means that likely financing model for future projects is through direct financing by government unless there is a change of policy. In relation to some of these specific sectors:

Education

The ownership of a school’s infrastructure depends upon which category of school it belongs to. For example, in the case of a local authority maintained school, the school and playing fields will be owned by the local authority; and an academy school (which receives funding directly from the government) may lease land from a local authority.

Hospitals

Ownership of hospitals is vested in various public sector bodies operating within the National Health Service.

Social housing

This is a diverse sector involving many different organizations and individuals including housing developers, building contractors, mortgage lenders, local authorities, housing associations, landlords, owner-occupiers, private renters and those in the social rented sector. Typically, on a social housing project, housing associations own the relevant housing stock. Although housing associations tend to be private limited companies their governance is constrained by public sector regulation and, effectively, operate as quasi-public sector entities.

DEFENSE

Typically, defense assets are owned by the public sector.

WASTE

In the past, the public sector procured new waste treatment or collection facilities and these were owned by the public sector even if the private sector would be responsible for design, build, operation or maintenance of the facility. One example being long-term Private Finance Initiative (PFI) contracts with private sector companies in relation to the building and operation of waste infrastructure, with financial support being provided to the local authorities by the government through the PFI in respect of the cost of those projects. Increasingly, merchant facilities, namely those developed and operated by private sector entities, are being used and these facilities serve both their public sector and private sector customers. According to the Infrastructure and Projects Authority’s National Infrastructure Delivery Plan 2016-2021 (March 2016), the government is not planning to fund any new waste infrastructure projects beyond those in the pipeline.

WATER

Water and wastewater (sewage) services in England and Wales are delivered by private sector companies (water companies) which own the relevant infrastructure assets. In Scotland and Northern Ireland, water and wastewater services are provided by state owned companies. The Thames Tideway Tunnel (a major new sewer) in London is being built and will be operated by a private sector company called Tideway, which is independent of Thames Water (the regional water company). The Water Services Regulation Authority (Ofwat) is the regulator of the water sector in England & Wales. The Northern Ireland Authority for Utility Regulation (NIAUR) is the regulator for Northern Ireland. The Water Industry Commission for Scotland (WICS) is the equivalent for Scotland.
Are there special rules for investing in energy and infrastructure?

Generally

There is no specific regime governing or restricting investment in energy or infrastructure projects in the UK over and above existing regulation for investors and funders more generally but a particular proposed investment may be subject to legislative or regulatory control (e.g., merger control rules). As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory position relevant to that project must be considered. For example, a project involving development on land will require planning permission or a development consent order; and a project may require environmental authorizations/permits and/or sector specific regulatory consents or licenses. If a public body (e.g., a government department, a local authority, or a National Health Service Trust) is procuring a project using private finance, and the public body is to benefit from central government funding towards the cost, the project will be subject to central government approval. Key sector-specific issues are flagged in the sections below.

Whether an investor can invest will depend on the terms of the procurement of that project if it is a public sector project and, in respect of an existing/operational project, that will depend on whether there are any contractual restrictions on ‘Change of Control’. This is less of a concern on private sector infrastructure although investors would need to consider whether any licenses/consents/permits would be affected by their acquisition of an interest.

Energy

The energy markets in the UK have a complex system of arrangements between suppliers, generators, transmission and distribution which are heavily regulated. In particular, there are complex arrangements in respect of licensing, subsidies and demand/charging mechanism with suppliers, customer and the National Grid and these are subject to change/regular updates meaning that investors will need to have a good understanding of the current framework and the potential directions in which the market may move. Investors need to understand how technology changes may impact on the overarching regulatory framework and vice versa.

Investors should also consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with any license conditions or the granting of specific subsidies. In particular, if a breach of those conditions could lead to the revocation of a license/subsidy that might make the potential target less attractive or viable.

Telecoms infrastructure

There is a complex regulatory environment for this sector including how access and interconnectors (between networks) are regulated under the Digital Economy Act 2017, Communications Act 2003 and the Communications (Access to Infrastructure) Regulations 2016 and how Ofcom grants rights to access private or public land in order to install and maintain essential equipment in, over or under that land. This equipment might be cables sunk beneath the ground or a mobile mast sited on the ground.

The industry is largely privatized, therefore investors should consider if any permits/consents/licenses will be affected by their interest.

Transport infrastructure

RAIL

There is an extensive and complex regulatory framework to consider in respect of a practical and operational involvement in this sector. Key areas include understanding the regulatory regime for certification for train use and acceptance and user fare regulation. Depending on how an investor wishes to invest in a project (specifically what type of entity or asset), there is a varying degree of difficulty for investors to enter into an existing project. For example, rolling stock operating companies (ROSCOs) are privately owned companies where third-party investment is relatively common whereas train operating companies (TOCs) are often special purpose vehicles so, in theory, investment into a TOC should be relatively straightforward. However, any change in control of a TOC under a Franchise Agreement will usually require a consent from the Department for Transport. Note that the UK government is currently reviewing its policy on rail franchising and the market is expecting changes to be made to the current model.
In order for a private sector partner to carry out its duties on certain types of roads projects, the procuring public sector authority (Highways Agency or a local authority) may delegate certain of its statutory duties to the private sector partner. This will be dependent on the project and the specific contractual requirements. Any investor will, therefore, need to understand those duties and whether it is able to subcontract those duties to an appropriate person. There is usually a restriction on the change of control of the private sector partner during the construction period. Following the construction period, the private sector may be allowed a change of control provided that they do not fall within a definition of an ‘Unsuitable Third Party’ (which may include concerns about national security, tax avoidance). The precise scope of the restrictions will depend on the contractual terms.

Other infrastructure

On publicly-procured infrastructure, it is quite common for long-term projects to have a ‘change in control’ clause which restricts change in ownership structures of the private sector. For example, in most sectors there is a restriction on change in control during the construction period but this is often relaxed post construction provided any change in control is not to an ‘Unsuitable Third Party’. How strict these restrictions are will often depend on the sector. For example, the defense sector usually gives the Ministry of Defence a strong degree of discretion (particularly on the grounds of national security) as to whether to accept a change in control over its private sector partner.

What is the applicable procurement process?

Public procurement in England & Wales is, for the time being, in most instances governed by the Public Contracts Regulations 2015 which is based on EU Directives. There are some sector-specific regulations such as the Utilities Contract Regulations 2016 (applicable to the rail sector, water and energy) and the Defence and Security Public Contracts Regulations 2011 (which are also based on EU Directives and therefore this entire framework is subject to change as the UK leaves the EU).

The key principles are that any contracts procured by the public sector are awarded fairly, transparently and without discrimination on the grounds of nationality and that all potential bidders are treated equally.

Investing in energy and infrastructure

Public procurement is relevant where the UK government, or a branch of it, is seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset. The relevant procurement legislation applies to certain public bodies including central government departments, local authorities, police and fire authorities, NHS Trusts, various non-governmental bodies such as the Competition and Markets Authority and the House of Commons. A regulated procurement is required where certain financial thresholds are met and on most major infrastructure projects (where limited exclusions do not apply), it is likely that those thresholds will be met so a regulated procurement would need to be run.

In most cases, the public sector will need to publish a contract notice in the Office Journal of the European Union (OJEU) and typically run one of the following procedures:

- **Open procedure** – This is suitable for easy-to-evaluate projects and tenderers simply submit a tender in response to the OJEU notice. Change and negotiations to the tender are not permitted.

- **Restricted procedure** – There is a shortlisting of at least five tenderers following an expression of interest stage and tenderers submit a bid. Again, no negotiation is permitted other than clarification and finalization of the contract terms.

- **Competitive dialogue** – This is often the most common procedure for complex infrastructure projects and involves a shortlisting of at least three bidders who are invited to dialogue with the public sector to develop detailed solutions which are capable of being accepted by the public sector. Clarification and further negotiations are allowed following final tender but only on the basis of confirming the financial and other commitments in a tenderer’s bid.

- **Competitive procedure with negotiation** – This is sometimes described as a hybrid procedure as it allows dialogue with bidders but also allows the public sector to award a contract on the basis of an initial tender (or further stages) but clarification and negotiation is not allowed following final tender.

An investor may choose, however, to seek to invest in a project (by acquiring an interest in a private sector partner) that has already been
procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the original awarded contract rather than procurement regulations themselves.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement-related considerations that need to be borne in mind.

**Financing energy and infrastructure**

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector and any refinancing gains to be shared with the public sector.

*Last modified 6 Dec 2019*

**What are the most common forms of funding / investing in energy and infrastructure?**

The principal forms of **private** sector funding/investment in energy and infrastructure in the UK (including in relation to public-private partnerships) are:

**Funding**

Common forms of funding in energy and infrastructure include:

- loans made on a corporate finance basis (balance sheet debt);
- loans made on a project-finance basis (to a special purpose project company) on medium to long-term bases – such loans may later be syndicated to other funders. For publicly procured project financed deals, this has traditionally meant using the PF2 or Private Finance Initiative (PFI) model since the UK government announced that such models can no longer be used, the market had adapted to provide financing on private sector-initiated energy and infrastructure projects;
- syndicated to other funders. (For publicly procured project financed deals, this often means using the PF2 model which is a successor to the Private Finance Initiative (PFI));
- bond finance;
- mezzanine debt (in some sectors);
- refinancing of the debt in operational projects; and
- asset financing this is particular relevant in the rail sector.

Funding/funding products can also, sometimes, be provided by the European Investment Bank and export credit agencies.

**Investing**

Common forms of investing in energy and infrastructure include:

- ‘equity’ investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of ‘equity').

*Last modified 6 Dec 2019*

**Restructuring**

**Enforcement and sanctions**

*When can there be regulatory investigations?*
When the Financial Conduct Authority or the Prudential Regulatory Authority considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

**What regulatory penalties may apply?**

When a rule breach has taken place, the Financial Conduct Authority or the Prudential Regulatory Authority have a variety of regulatory penalties they may impose depending on the seriousness of the matter. These include:

- withdrawing a firm's authorisation;
- prohibiting individuals from carrying on regulated activities;
- suspending firms and individuals from undertaking regulated activities;
- issuing fines against firms and individuals who breach the rules or commit market abuse such as insider dealing;
- issuing fines against firms breaching competition laws;
- making a public announcement and publishing details of a warning, decision or final notices;
- applying to the courts for injunctions, restitution orders, winding-up and other insolvency orders;
- bringing criminal prosecutions for financial crime, such as insider dealing, unauthorised business and false claims to be authorised; and
- issuing warnings and alerts about unauthorised firms and individuals and requesting that web hosts deactivate associated websites.

**What criminal penalties may apply?**

Following formal investigation, the regulators have powers to impose criminal penalties in certain cases, including:

- insider dealing and misleading statements and practices;
- breaches of the Money Laundering Regulations; and
- conducting regulated activities when not authorized.

**Tax**

**Tax issues**

*Are stamp, registration, transfer or other similar taxes applicable?*

*Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?*

**ADVANCE OF LOAN**

No stamp, registration, transfer or other similar taxes are payable on the advance of a loan.

**TRANSFER OR ASSIGNMENT OF A DEBT UNDER A LOAN**
A written instrument transferring or assigning a debt under a loan is, in principle, chargeable to 0.5% UK stamp duty. An agreement to transfer a debt is also, in principle, chargeable to UK stamp duty reserve tax (SDRT) (although, in practice, a payment of both UK stamp duty and SDRT should not be required). However, provided the debt constitutes loan capital and does not have certain offensive features (such as a right to interest exceeding a commercial return or a right to conversion into shares or other securities), the written instrument assigning or transferring, or the agreement to assign or transfer, such debt should be exempt from both UK stamp duty and SDRT. This is known as the loan capital exemption.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

There is no stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security.

However, most security interests created by English companies and English limited liability partnerships must be registered at Companies House to perfect the security and ensure it is valid against third parties. The grant of most security interests over UK real estate should also be registered at the Land Registry (in the case of real estate in England and Wales) and the Scottish Land Registry (in the case of real estate in Scotland) to ensure that the security interest takes effect as a legal charge. It would be unusual for the fees payable for such registrations to be a material amount.

Other forms of registration may also be required (or be advisable), depending on the nature of the asset over which security is taken. Such registrations may also require the payment of fees.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (eg a bond)?

**ISSUE OF DEBT SECURITIES**

*Bearer bonds*

The issue of a debt security in the UK which is a bearer bond or the issue by or on behalf of a UK company of a debt security which is a bearer bond, in principle, gives rise to a charge to UK bearer instrument duty (BID). Such BID is chargeable at a rate of 1.5% of the issue price of the bearer bond. However, currently, HM Revenue and Customs is not seeking to collect BID on the issue of a debt security which is a bearer bond.

*Registered bonds*

Subject to the special regime for issues into a depository or clearing system (see below), there is generally, no charge to UK stamp duty or SDRT on the issue of a debt security which is a registered bond. The issue of a debt security which is a registered bond should also not give rise to a charge to BID (which is only relevant to bearer instruments).

**TRANSFER OF BONDS**

*Bearer bonds*

The first transfer in the UK of a debt security which is a bearer bond issued outside of the UK by a non-UK company, in principle, gives rise to a UK bearer instrument duty charge (if stamp duty would have been payable on the instrument of transfer if the bond had been in registered form). Such BID is charged at a rate of 1.5% of the transfer consideration. UK stamp duty only applies in respect of written instruments of transfer and so is not, normally, relevant to the transfer of a debt security which is a bearer bond, provided it is transferred by delivery. However, any agreement to transfer a bearer bond issued by or on behalf of a UK company is, in principle, chargeable to SDRT. Such SDRT is charged at a rate of 0.5% of the transfer consideration.

*Registered bonds*

A written instrument transferring a debt security which is a registered bond is, in principle, chargeable to UK stamp duty if the instrument is executed in the UK, or relates to UK stock or marketable securities or to something done, or to be done, in the UK. Any agreement to transfer a debt security which is a registered bond issued by a UK company or registered in a UK register is also, in principle, chargeable to SDRT. Such UK stamp duty and SDRT are chargeable at a rate of 0.5% of the transfer consideration.

**DEPOSITORY AND CLEARING SYSTEMS**
Bearer bonds and registered bonds

A written instrument transferring certain debt securities to a person whose business is, or includes, issuing depositary receipts or the provision of clearance services for chargeable securities (or the agent or nominee of such a person) is, in principle, chargeable to UK stamp duty. Such stamp duty is generally chargeable at a rate of 1.5% of the consideration or market value of the debt securities (depending on the circumstances).

The issue or transfer of certain debt securities to a depositary receipt issuer (or its nominee), where a depositary receipt is issued or to be issued, or the issue or transfer of debt securities into a clearing system (or its nominee) in pursuance of an arrangement for the provision of clearance services, in principle, gives rise to a charge to SDRT. Such SDRT is generally chargeable at a rate of 1.5% of the issue price, consideration or market value of the debt securities (depending on the circumstances). However, currently, HM Revenue and Customs is not seeking to collect SDRT on the issue, or (where integral to the raising of capital) the transfer, of debt securities into a clearing system or depositary receipt system, provided that the debt securities comprise loans raised by the issue of debentures or other negotiable securities for the purposes of Article 5(2)(b) of the Capital Duty Directive (2008/7/EC).

EXEMPTIONS

While in some circumstances, both UK stamp duty and SDRT may apply to the same transaction, as a general principle, there should be no double charge due to the operation of a franking system.

If a debt security benefits from the loan capital exemption, the issue or transfer of such debt security (whether a bearer bond or registered bond) should not be chargeable to UK stamp duty, BID or SDRT. The loan capital exemption applies to loan capital that does not have certain offensive features (such as a right to interest exceeding a commercial return or a right to conversion into share or other securities). The loan capital exemption is therefore the key exemption in the context of capital markets transactions and serves to exempt most vanilla bonds entirely from UK stamp taxes.

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g., secured bond holders)?

Secured lenders and secured debt security holders take priority over HM Revenue and Customs on enforcement of security.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Unless an exemption applies, where a payment of interest with a UK source is paid under a loan which is intended or expected to have a duration of a year or more, an amount equal to the basic rate of the interest payment is required to be withheld and paid to HM Revenue and Customs.

If so:

What is the rate of withholding?

The current rate of UK withholding tax (i.e., the basic rate) is 20%.

What are the key exemptions?

The most commonly relied on exemptions to ensure that interest payments made by UK companies can be made free of UK withholding tax include:

- the exemption for interest paid on an advance from a UK tax resident bank;
the UK-to-UK exemption (applicable where interest is paid to a lender which is a UK tax resident company or a partnership of such companies);

the quoted Eurobond exemption (applicable to interest paid on a security which is listed on a recognized stock exchange);

reliance on a double tax treaty (such treaty may only provide for partial exemption);

the qualifying private placement (the key requirement being the residence of the lender in a qualifying double tax treaty jurisdiction);

or reliance on the EU Interest and Royalties Directive as implemented by UK law (the key requirement being that the lender and the borrower meet the association requirement).

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes, the analysis described above is applicable to both interest payments under a loan or other form of debt security. The quoted Eurobond exemption is particularly relevant to debt securities.

*Last modified 6 Dec 2019*

**Are foreign lenders and debt security holders subject to tax on interest payments?**

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?

No.

**Would the same analysis apply to interest payments under a debt security (eg a bond)?**

Yes.

Capital markets and structured investments

Issuing and investing in debt securities

*Are there any restrictions on issuing debt securities?*

There are restrictions on offering and selling debt securities under both UK and EU law.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities to the public in the UK or to request that they are admitted to trading on a regulated market operating in the UK unless an approved prospectus has been made available to the public.

The International Capital Market Association has published standard form selling restrictions for offers of debt securities in the UK. These restrictions are aimed at preventing a breach of:

- the rules on financial promotion; and
- the rules on accepting deposits in the UK.

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in the UK are bonds or notes issued on a stand-alone basis or under a program.

Many different types of debt securities are offered in the UK. Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities and high-yield bonds;
- guaranteed securities, subordinated securities, perpetual debt securities (ie debt securities that have no specified redemption date);
- asset-backed securities;
- derivative securities such as securities linked to the value of one or more reference asset including shares, commodities, interest rate, currency rate or index, and credit-linked notes;
- hybrid securities (securities with both debt and equity features);
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer);
- exchangeable bonds (debt securities convertible into the equity of a third party);
- depositary receipts (a security issued by a depositary conferring on the holders beneficial ownership of certain underlying assets held by the depositary for the holders); and
warrants (securities giving the holders the option to purchase the equity of the issuer or a related company).

What are the differences between offering debt securities to institutional/professional or other investors?

The Prospectus Directive does not make a distinction between professional and other investors for the purposes of its disclosure requirements but does include different disclosure regimes by reference to the minimum denomination of a single security.

If the denomination of the securities is equal to or above €100,000 (or the equivalent in another currency), the 'wholesale' rules apply. If the denomination is under €100,000, the 'retail' rules apply. Additional disclosure requirements apply for retail securities.

When is it necessary to prepare a prospectus?

Under the Prospectus Directive, unless an exemption applies, it is necessary to publish a prospectus where there is an offer of securities to the public or an application for the securities to be admitted to trading on a regulated market.

An offer would not be deemed to have been made to the public if it is made solely to qualified investors, addressed to fewer than 150 persons (other than qualified investors) per European Economic Area state or where the minimum denomination per unit is at least €100,000.

If the offer is deemed not to be made to the public, a Prospectus Directive compliant prospectus may still be required if an application is made for the securities to be admitted to trading on a regulated market. An exemption from both the offer to the public and the admission to trading on a regulated market is needed to avoid having to publish a prospectus.

What are the main exchanges available?

The London Stock Exchange has two principal markets on which debt securities are traded:

- the Main Market; and
- the Professional Securities Market.

The London Stock Exchange Main Market

The Main Market is a regulated market for the purposes of the Markets in Financial Instruments Directive (MiFID), so issuers on the Main Market are subject to the requirements of a number of EU Directives, including the Market Abuse Directive and the Transparency Directive. Securities listed on the Main Market can be passported to other European Economic Area markets in order to access international investors.

The London Stock Exchange Professional Securities Market

The Professional Securities Market is an exchange regulated market subject to the rules of the London Stock Exchange. It is not a regulated market for the purposes of MiFID and therefore provides a more flexible alternative to the requirements regarding denomination and financial information, compared to the rules which apply to regulated markets across Europe. As it permits reporting under national Generally Accepted Accounting Principles (GAAP), it offers an alternative for issuers not wishing to prepare financial information to International Financial Reporting Standards (IFRS).

The London Stock Exchange also operates the Order Book for Retail Bonds, which is an electronic trading platform for debt securities that are issued in denominations of less than £100,000 and listed on the Main Market.
Is there a private placement market?

The UK has an active private placement market. There is no dominant standard for documentation but efforts have been made by the Loan Market Association and International Capital Markets Association to standardize private placement documentation.

Are there any other notable risks or issues around issuing or investing in debt securities?

Issuing debt securities

Issuers are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil and criminal liability under Scots law. The UK has various investor protection statutory provisions relevant to liability for an inaccurate offering memorandum. There are also general fraud statutes and liability may also arise under common law through a civil action for deceit, negligent misstatement or misrepresentation.

Investing in debt securities

Debt security terms and conditions typically contain provisions which may permit their modification without the consent of all investors and confer significant discretions on the trustee, which may be exercised without the consent of investors and without regard to the individual interests of particular investors. The conditions also provide for meetings of investors to consider matters affecting the investors interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

Generally

Establishing a fund, offering fund securities and operating a fund, among other things, are regulated activities under the Financial Services and Markets Act 2000 and therefore subject to regulation by the UK Financial Conduct Authority.

Collective Investment Schemes

The regulations apply to activities undertaken in relation to ‘Collective Investment Schemes’ which are schemes comprising the following arrangements (subject to certain specific exceptions set out in the legislation):

• with respect to property of any description, including money, the purpose or effect of which is to enable persons taking part in the arrangements (whether by becoming owners of the property or any part of it or otherwise) to participate in or receive profits or income arising from the acquisition, holding, management or disposal of the property or sums paid out of such profits or income;

• where the participants do not have day-to-day control over the management of the property, whether or not they have the right to be consulted or to give directions; and

• that have either or both of the following characteristics:

  • pooling of investors' contributions and profits or income; and

  • the property is managed as a whole by or on behalf of the operator of the scheme.
What are common fund structures?

Common forms of funds include:

- open-ended (UK Authorized Unit Trusts (AUTs), Investment Companies with Variable Capital (ICVCs) and Authorized Contractual Scheme (ACSs)) and closed-ended funds;
- retail and non-retail funds (including Alternative Investment Funds (AIFs));
- Undertakings for Collective Investments in Transferable Securities (UCITS) and non-UCITS funds; and
- qualified investor structures that invest in, for example, corporate shares or bonds, real property, commodities (for example, precious metals) and derivatives.

What are the differences between offering fund securities to professional / institutional or other investors?

Retail funds

Open-end retail funds must be either authorized by the UK Financial Conduct Authority (if UK domiciled) or recognized by the Financial Conduct Authority (if domiciled in another jurisdiction). Funds that are 'recognized' by the Financial Conduct Authority in this context mostly comprise Undertakings for Collective Investment in Transferable Securities (UCITS) funds established in other jurisdictions. Closed-end retail funds that are listed in the London Stock Exchange Main Market or specialist funds market are not 'authorized' by the Financial Conduct Authority, but the listing itself requires approval by the Financial Conduct Authority in its capacity as the UK listing authority.

Retail funds, including UCITS, are subject to substantial regulatory oversight and restrictions, including obligations with regard to independent custodian/depositary arrangements for assets, investment and borrowing powers specifications (for open-end retail funds), concentration requirements and other matters.

Institutional/professional funds

In practice, non-retail funds (other than limited partnerships) are usually established outside the UK because there are no UK non-retail tax-exempt fund vehicles (other than unauthorized unit trusts that are only offered to UK tax-exempt investors).

Closed-end funds are generally established as UK or offshore limited partnerships and open-end funds such as hedge funds are typically established as companies and unit trusts.

Non-retail funds that are offered in the UK generally fall into the category of Alternative Investment Funds (AIFs) and therefore subject to the Alternative Investment Fund Managers Directive regime in relation to authorization of the manager/fund, marketing arrangements, reporting, governance etc.

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

Separately managed accounts are also commonly used in the UK as an investment management structure – investor funds are generally held in a separate account subject to the discretionary investment authority of a manager who can acquire and dispose of assets using the investor funds in line with a pre-determined strategy and parameters set out in an Investment Management Agreement. These are often also structured as 'funds of one'.

Managing investments is a regulated activity under the UK Financial Conduct Authority rules and therefore subject to authorization;
however, managed accounts and ‘funds of one’ themselves are generally not classed as (and therefore avoid the regulatory restrictions in being classed as) Collective Investment Schemes or Alternative Investment Funds.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

UK selling restrictions

Generally in the UK, offering securities is either covered under the UK Financial Conduct Authority’s financial promotion regime, under the Undertakings for Collective Investment in Transferable Securities Directive regime or under the Alternative Investment Fund Managers Directive regime.

Undertakings for Collective Investments in Transferable Securities (UCITS)

UCITS, including those established in the UK, have a EU passport which enables fund promoters to create a single product for marketing in all EU member states and on the completion of the appropriate notification procedure, a UCITS established in one member state can be sold in any other.

A UCITS intending to market in another member state must complete and submit to its home regulator a notification including certain specified information, including copies of key investor documents. The home regulator then completes a notification file which is sent in a regulator-to-regulator transmission, following which the UCITS can be sold in the other member state.

Alternative Investment Funds (AIFs)

Under the Alternative Investment Fund Managers Directive, marketing is defined as: a direct or indirect offering or placement at the initiative of the Alternative Investment Fund Manager (AIFM) or on behalf of the AIFM of units or shares in an AIF it manages to or with investors domiciled or with a registered office in the EU.

An AIFM may only market an AIF to EU investors if it is authorized by a relevant EU regulator – registration with one EU regulator opens access, subject to certain further limited conditions, to marketing to professional investors across the EU under a EU passport or if it complies with national private placement regimes (where available).

Reverse solicitation and the definition of ‘marketing’

Applicable in the context of professional investors, this is a sensitive area in the UK and Europe generally. The Alternative Investment Fund Managers Directive generally continues to permit professional investors who wish to invest in AIFs based on their own initiative (reverse solicitation); however, the EU is currently reviewing this area during 2017 and may impose tighter requirements.

Specifically in the UK, the Financial Conduct Authority has provided broad guidance on the definition of ‘marketing’ as follows:

- Marketing will, generally, not include secondary trading in the units of an AIF. Therefore, the listing of AIF units will not necessarily constitute marketing.
- The indirect offering or placement of units of an AIF will be considered as marketing (including the distribution through a chain of intermediaries or a placement agent).
- In certain circumstances, providing draft AIF documentation to potential investors will not constitute marketing.

The FCA also provides the following view specifically on reverse solicitation: confirmation from the investor that the offering or placement of units of shares of the AIF was made at its initiative, should normally be sufficient to demonstrate that this is the case, provided this is obtained before the offer or placement takes place.
Are there any restrictions on managing a fund?

Fund management in the UK is regulated under the Financial Services and Markets Act 2000, various statutory instruments and the Financial Conduct Authority Rules. The Financial Conduct Authority is responsible for regulating funds, fund managers and those marketing funds and any legal or natural person is prohibited from carrying on regulated activities, such as fund management, without authorization.

Various restrictions arise on manager structuring/compensation and profit-sharing arrangements as a result of the regulations and any manager that is subject to the remuneration rules must apply those rules proportionate to its size, internal organization and scope and complexity of its activities. The rules impact on, among other things, reporting, equity remuneration, deferred compensation arrangements and clawback.

Alternative Investment Fund Managers (AIFMs) are also subject to regulation under the Alternative Investment Fund Managers Directive (as implemented in the UK) and managers of Undertakings for Collective Investments in Transferable Securities (UCITS) are subject to certain requirements under the Undertakings for Collective Investment in Transferable Securities Directive. Full Financial Conduct Authority registration involves a significant authorization process – three-to-six months from completion of the application which must include:

- for the manager, information on senior personnel (must be suitable persons etc), organizational structure, policies and procedures, remuneration practices; and
- for each fund, investment strategy, constitutional documents, depositary information and disclosure requirements.

However, AIFMs based in the UK can be exempted from full regulation on certain grounds, including managing assets under €500 million where assets are not leveraged and investors have no redemption rights for five years, and managing assets under €100 million including assets acquired through leverage. Exempted managers must still register with the regulator, are subject to limited reporting and it should be noted that they do not benefit from the general passporting for marketing purposes.

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

Unless an exemption or exclusion applies, a person entering into a derivatives contract by way of business in the UK (such as a dealer) will ordinarily have to be authorized under the Financial Services and Markets Act 2000 if the transaction is one of the specified activities set out in Part II of the Regulated Activities Order or the derivative constitutes a specified investment under Part III of the Regulated Activities Order such as:

- options;
- futures;
- contracts for difference; or
- rights to or interests in investments.

One of the key exclusions to the requirements above applies to persons who deal in derivatives for risk management purposes.

The European Market Infrastructure Regulation applies to all derivative transactions and requires transactions to be reported to regulators, for transactions between dealers to be cleared or subject to other risk mitigation techniques such as initial margin and variation margin requirements.

Last modified 20 Oct 2017

What are common types of derivatives?

The UK accounts for about half of the $600 trillion over-the-counter market derivatives market.
Derivative contracts are entered into in the UK for a range of reasons including hedging, trading and speculation. Derivatives may be traded over-the-counter or on an organized exchange.

All of the main types of derivative contract are widely used in the UK:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

The value of the derivative contracts is based on the value of the underlying assets. The main classes of underlying asset seen in the UK are:

- equity;
- fixed income instruments;
- commodities;
- foreign currency; and
- credit events.

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007 to 2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. The European Commission has sought in particular, to:

- enhance transparency by requiring the provision of comprehensive information on over-the-counter derivative position;
- reduce counterparty risk by increasing the use of central counterparty clearing; and
- improve the management of operational risk by increasing the standardization of derivatives contracts.

As a result, the derivatives market has seen and continues to see the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.
• lenders administer the loans on an ongoing basis; and
• to deal with borrowers who fall behind with their payments.

Regulated credit agreements on the other hand have specific requirements around how the agreement is drafted and formatted and what information must be included.

There are no additional restrictions that apply to foreign lenders making loans to UK borrowers.

**Borrowing**

While borrowers are generally not regulated, it is advisable for borrowers to consider whether either the mortgage or consumer lending regimes apply to their activities, in which case they will benefit from the protections mentioned above.

*Last modified 20 Oct 2017*

**What are common lending structures?**

Lending in the UK can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents and trustees which fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, e.g., term loans, working capital loans, equity bridge facilities, project facilities and letter of credit facilities etc.

**Loan durations**

The duration of a loan can also vary between:

• a term loan, provided for an agreed period of time but with a short availability period;
• a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
• an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
• a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

**Loan security**

A loan can either be secured, unsecured or guaranteed. For more information, see [Giving and taking guarantees and security](#).

**Loan commitment**

A loan can also be:

• committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
• uncommitted, meaning that the lender has discretion whether or not to provide the loan.

**Loan repayment**

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).
What are the differences between lending to institutional/professional or other borrowers?

Lending to institutional/professional borrowers is subject to less regulatory oversight and so less burdensome from a compliance perspective.

By contrast, lending in the context of mortgages and to consumers is a regulated activity and so requires UK Financial Conduct Authority authorization. For more information, see Lending and borrowing – restrictions.

Do the laws recognize the principles of agency and trusts?

Yes, both principles are recognized as a matter of Scots law.

For instance, it is possible to appoint an agent to act on behalf of other parties and a trustee to hold rights and other assets on trust for the lenders or secured parties.

Are there any other notable risks or issues around lending?

Generally

Loan agreements and other finance documents are subject to general contractual principles. For example, the Scottish courts will not enforce a penalty and so lenders have to be careful about the rate of default interest charged on a loan. Lenders therefore tend to opt for a modest uplift of around 2% above the usual rate.

Specific types of lending

Specific to the area of mortgage lending is the issue of whether a lender falls within the recently formed UK mortgage regime. The Mortgage Credit Directive, implemented in the UK through a series of primary and secondary legislation, aims to prevent the irresponsible lending and borrowing practices that were exposed during the global financial crisis. The Mortgage Credit Directive applies to first and second charge mortgages. It imposes a number of requirements on lenders including the need to:

- conduct affordability tests before lending;
- provide standard information about the mortgage to enable borrowers to compare products; and
- ensure that staff are suitably trained.

Standard form documentation

Although not a regulatory requirement, most Scots law syndicated finance transactions are governed by documentation based on recommended forms published by the Loan Market Association (LMA). Bilateral finance transactions are more likely to be documented on bank standard form documentation prepared in-house.

Are there any other notable risks or issues around borrowing?

Borrowers should be aware of the potential implications of the EU's Bank Recovery and Resolution Directive (BRRD), which outlines certain measures for dealing with failing financial institutions.
The BRRD applies to financial institutions incorporated in the European Economic Area (EEA), but does not apply to EEA branches of non-EEA incorporated entities.

Article 55 of the BRRD gives authorities the power to ‘bail in’ obligations of failed EEA financial institutions and also postpone the enforcement of early termination rights against the affected institution. ‘Bail in’ describes a variety of write down and conversion powers, such as the power to convert certain liabilities into shares or cancel debt instruments. In the case of English or other EEA law contracts, such powers override what the contracts says. In the case of non-EEA law contracts, there are requirements to incorporate such provisions into the contract.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Some of the key areas affecting the giving of guarantees and security are as follows.

Capacity

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors’ powers that would be preventative. Under Scots law, directors have a general duty to promote the success of the company for the benefit of its members as whole; as such, they will need to be able to show that adequate corporate benefit is derived from the company giving the guarantee or security. This is often more difficult in the case of upstream or cross-stream guarantees or security provided by a subsidiary to its parent or sister company. The safe approach is often to have the members of the company approve the giving of the guarantee or security by resolution.

Insolvency

Guarantees and security may be at risk of being set aside under Scottish insolvency laws if the guarantee or security was granted by a company with a certain period of time prior to the onset of insolvency. This would be the case if the company giving the guarantee or security received considerably less consideration, and as such, the transaction was at an undervalue. For such a transaction to be set aside, certain statutory criteria would have to be met, including that the guarantee or security was given within six months (or two years for connected parties) of the onset of insolvency of the affected party. Guarantees and security may also be challenged on other grounds relating to insolvency. Note that where a guarantee is given to a related company, the circumstances in which it can be set aside are far wider and, in particular, there is no requirement in these circumstances that the chargor was insolvent at the time the guarantee was given.

Financial assistance

It is unlawful for a public company to provide financial assistance for the purchase of its own (or of its holding company’s) shares. The prohibition against financial assistance for private companies was abolished on 1 October 2008. Financial assistance in this context would include giving a guarantee or security in connection with the share purchase.

What are common types of guarantees and security?

Common forms of guarantees

Guarantees can take a number of forms.

A particular distinction worth remembering is between a performance guarantee and a payment guarantee:

- A performance guarantee is a term used to describe both performance bonds (in the context of trade finance) and ‘see to it’ guarantees (in other contexts).
A performance bond describes a financial undertaking used to protect a buyer against the failure of a supplier to deliver goods or perform services in accordance with the terms of a contract. The issuer of the bond undertakes to pay to the buyer a sum of money if the seller fails to deliver the goods or perform the contracted services on time or in accordance with the terms of the contract.

A ‘see to it’ guarantee is a promise by the guarantor to see to it that the primary obligor fulfils its obligations under the primary contract. If the primary obligor fails to fulfil its obligations under the primary contract, the guarantor will be in breach of its obligations under the guarantee.

A payment guarantee is narrower in scope than a performance guarantee as it only covers the payment of money rather than other contractual obligations.

Common forms of security

The law of Scotland differs greatly from that in England and Wales in relation to the forms of security which can be taken over assets located in Scotland. Scots law does not recognize a distinction between equitable and legal charges. In general, Scottish security can be taken over a much more limited range of assets than is the case in England and Wales and there is no overarching security document which would replicate an English debenture. The main forms of security available in Scotland are as follows.

STANDARD SECURITY

This is the equivalent of an English legal mortgage and relates to security over heritable or feuhold property (the equivalent of freehold under English law) and leasehold property for a term of more than 20 years. Standard securities follow a statutory form.

FLOATING CHARGES

A floating charge is a charge over all of the assets of a company and, unlike the position in England, the floating charge is a separate legal document in Scotland covering all of the assets of a company that are held at the time of enforcement, subject to the priority of certain fixed charges and of certain other preferred debts (including a ‘prescribed part’ which is made available for unsecured creditors). A floating charge is usually enforced by way of appointment of an administrator.

ASSIGNATIONS IN SECURITY

This is a form of security which can be created over incorporeal moveable assets in Scotland and is the equivalent of an English law assignment. However, because there is no concept of equitable security in Scotland, any assignation in security must be intimated (effectively notified to the counterparty) in order for the security to be treated as valid.

PLEDGES

A pledge is a fixed security over corporeal moveable property. In order to perfect a pledge, the chargee, or its nominee, must have possession of the actual asset. For that reason the only form of pledge which is common to see in Scotland is a pledge over shares. In order to perfect a pledge over shares, the shares in the relevant company must be transferred to the chargee, or its nominee. This is often an issue for banks out with Scotland even though the Companies Act does largely address the various concerns that are raised in relation to this, for example, by making it clear that where shares are only held by way of security, the registered shareholder does not need to treat the relevant company as part of its overall group for various purposes including tax. It should be noted that, in addition to this, the introduction of the person with significant control regime in the UK has led to an (ongoing) debate amongst lawyers in Scotland as to whether a bank which holds shares in a company by way of security should be treated as a person of significant control in relation to that company. The view that the firm takes at present is that this is not the case. However, other firms in the market disagree.

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

To be probative (ie admissible in court without further evidence), a guarantee needs to be in writing and signed by the guarantor.

Guarantees and other securities can be signed on a unilateral basis (ie unlike the case of English law, there is no requirement under Scots
law that a guarantee should be given for consideration (although see above for other conditions).

Additionally, there is a risk that a guarantee may be set aside if it was procured by undue influence by a borrower or lender. A party being provided with a guarantee should be alive to this issue and take steps to avoid claims of undue influence by, for example, requiring the guarantor to take separate legal advice (note, this is a significant issue if the guarantor is an individual, particularly if they are a spouse of the borrower).

**Giving or taking security**

Some funders take the view that rather than intimate the assignation and security of a contract or write themselves up as registered members pursuant to a share pledge, they will maintain an 'unintimated' or 'unregistered' position up until such a time as they require to enforce the relevant security. This is occasionally seen in the Scottish market although DLA Piper advise against taking this approach as, if the 'intimation' occurs only at the time of enforcement, then there is a greater risk that this may be set aside as someone taking security following the onset of insolvency.

Once granted, security needs to be properly perfected before it is valid against third parties. Perfection formalities can range from having the secured asset delivered to the security holder, registration of the security and notice being given to third parties. Most charges created by a Scottish company must be registered at Companies House within 21 days of its creation. Failure to register within this time means that the charge will be void against the liquidator, administrator or any creditor of the company and the money secured by the charge becomes immediately payable.

There are no notarization requirements for security documents under Scots law.

Like guarantees, for a period after a new security interest has been granted (known as the hardening period), it is at risk of being set aside in certain circumstances under insolvency laws. Reviewable transactions include those conducted at an undervalue, preferences and invalid floating charges.

---

**Financial regulation**

**Law and regulation**

*What are the main laws and regulations that apply to entities that are involved in finance and investments generally?*

**Generally**

- Financial Services Act 2012
- Financial Services and Markets Act 2000
- Financial Services and Markets Act 2000 (Regulated Activities) Order 2001

**Consumer credit**

- Consumer Credit Act 1974 (as amended)
- FCA Handbook, Consumer Credit sourcebook

**Mortgages**

- FCA Handbook
- Mortgage Credit Directive (2014/17/EU) (mortgage credit)
- Mortgages and Home Finance: Conduct of Business sourcebook

**Corporations**
Companies Act 2006
Overseas Companies Regulations 2009

Funds and platforms

Other key market legislation

Bank Recovery and Resolution Directive (2014/59/EU) (recovery and resolution)
Capital Requirements Regulation (Regulation (EU) 575/2013) (capital requirements)
European Market Infrastructure Regulation (Regulation (EU) 648/2012) (derivatives)
Market Abuse Regulation (Regulation (EU) 596/2014) (market abuse)

Last modified 20 Oct 2017

Regulatory authorization

Who are the regulators?

The Financial Conduct Authority (FCA) is the conduct regulator for firms providing financial products and services in both retail and wholesale markets, and also the prudential regulator for many firms. It is also responsible for enforcing the market abuse and listing regimes.

The Prudential Regulation Authority (PRA) is responsible for the prudential regulation of systemically important financial institutions, including banks, building societies, insurers and major investment firms.

Last modified 20 Oct 2017

What are the authorization requirements and process?

Depending on the type of firm, a firm must apply to the Financial Conduct Authority (FCA) or Prudential Regulation Authority for authorization.

The regulators must assess whether the application meets the required threshold conditions within six months of the submission of the complete application.

The application fee depends on the type of the application ranging from £1,500 to £25,000.

The regulator will also approve key individuals (eg senior management) in their roles.

Authorized firms and individuals are listed on the FCA Register.

Last modified 20 Oct 2017

What are the main ongoing compliance requirements?

Threshold conditions (such as having adequate financial resources and compliance arrangements in place) are an ongoing compliance requirement for authorized firms.

Failure to comply with the threshold conditions and more detailed regulatory rules can result in sanctions for firms and regulated individuals, and loss of regulated status.

Last modified 20 Oct 2017
What are the penalties for failure to be authorized?

A person undertaking a regulated activity without being authorized or exempt, commits a criminal offence and is liable to imprisonment.

Last modified 20 Oct 2017

Regulated activities

What finance and investment activities require authorization?

Generally

A person must not carry on a regulated activity in the UK unless authorized or exempt (known as the general prohibition).

A financial activity requires regulatory authorization when it is identified as a specified activity in relation to a specified investment, it is carried on by way of business in the UK and it does not fall within any of the available exemptions.

- Specified activities include activities such as accepting deposits, dealing in, managing, arranging and advising on investments, and establishing collective investment schemes.
- Specified investments include deposits, shares, debt instruments, options, futures, units in a collective investment scheme and government and public securities.

Consumer credit

Consumer credit activities, including credit broking, operating an electronic system in relation to lending and entering into a regulated credit agreement as lender are regulated activities.

Unless exempt agreements, these activities can only be offered by firms who are authorized and listed on the financial services register. The available exemptions relate to the nature of the agreement, the lender and the borrower, the number of repayments to be made and the total charge for credit. For example, credit agreements exceeding £25,000 that are entered into exclusively or predominantly for the purposes of the business of the borrower are exempt agreements.

Last modified 20 Oct 2017

Are there any possible exemptions?

There are two types of exclusions available when regulated activities may be undertaken without authorization:

- **General exclusions** – Certain persons may carry on a regulated activity without being authorized. For example, in certain cases regulated activities carried on by overseas persons may be undertaken without authorization.

- **Specific exclusions** – For each type of regulated activity there are a number of specific exemptions that could also apply, such as making introductions (that is, making arrangements under which clients can, under certain circumstances, be introduced to another person).

Last modified 20 Oct 2017

Do any exchange controls or other restrictions on payments apply?

The UK does not operate any foreign currency controls.

For cases of money transferring from non-EU member states, imports of foreign currency may need to be declared in the custom declarations, but there is no legal restriction on moving money in and out of the country.

Compliance with the EU rules on payments (EU Payments Regulation and the Transfer of Funds Regulations) must be ensured.
There may also be anti-money laundering and tax considerations to take into account.

**What are the rules around financial promotions?**

A financial promotion is a communication of an invitation or inducement to engage in investment activity made by a person in the course of business. Since such communications can influence consumers, a person is restricted from communicating such promotions unless they are an authorized person, or the content of the communication has been approved by an authorized person, or the promotion falls within one of the exemptions.

It is a criminal offence for an unauthorized person to communicate a financial promotion.

**Exemptions**

Exemptions include certain promotions to certified high-net worth individuals or overseas recipients, provided certain criteria are fulfilled.

**Entity establishment**

**What types of legal entity are generally used to undertake financial or investment activity?**

**Generally**

The most common types of legal entities are limited companies and limited liability partnerships, both of which are body corporates with separate legal personality and limit the liability of their members.

Limited companies can either be private (denoted by the suffix Ltd or Limited) or public (denoted by the suffix PLC or Public Limited Company) depending on whether their shares are offered to the public. Some activities require a particular type of legal entity to be used, such as offering debt securities to the public which can only be done by UK Public Limited Companies.

The liability of a company's shareholders can be limited by shares, in which case they are liable to pay for their shares but not the company's debts, or by guarantee, where they are also liable to pay a certain amount if the company is wound up.

Limited liability partnerships (or LLPs) are similar to limited companies in many ways, with the main differences being that they are:

- formed by partners whose relationship is governed by private agreement rather than having shareholders and directors; and
- taxed like a partnership.

Scottish limited partnerships (SLPs) are also often used in transactions. These differ from limited liability partnerships in that instead of having a number of limited liability partners, a Scottish limited partnership has one general partner who has unlimited liability for the partnership and a number of limited partners (often individuals) who only have limited liability. The limited partners have no right to be involved in the management of the business or to enter into documentation on behalf of the limited partnership, with that right instead being held by the general partner. These partnerships are governed by partnership agreements and differ from the English equivalent limited partnerships in that a Scottish limited partnership has separate legal personality and can enter into agreements in its own name (through the general partner).

**Funds**

Investment funds tend to take the form of limited partnerships, limited companies (including open-ended investment companies (OEICs)), unit trusts (authorized and unauthorized), UK public companies (including those approved by HMRC as UK investment trusts) and authorized contractual schemes (ACS).

Fund managers on the other hand tend to be set up as limited companies (generally limited by shares) or limited partnerships.
Is it possible to conduct lending or investment business through a branch or establishment?

Yes.

A company can conduct lending or investment business in the UK through an establishment (also known as a 'branch') but this does not create a separate legal entity.

Overseas companies having a UK establishment need to comply with the Overseas Companies Regulations 2009 which imposes registration, accounting, disclosure and other requirements. Such requirements do not apply to partnerships or other unincorporated entities with a similar UK presence.

Overseas companies carrying on a trade in the UK through a 'permanent establishment' will be subject to UK corporation tax.

FinTech

FinTech products and uses

What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?

Peer-to-peer funding platforms and marketplace lending

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

- operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
- applying technology to leverage and optimize the lending platform and user experience; and
- connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Recently products have included:

- virtual credit cards;
- consumer loans;
- student lending products;
- small and medium-sized enterprises (SME) lending; and
- residential property and commercial property mortgage lending.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support the marketplace lending sector.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P)-type structures, often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has...
also been appealing to larger pools of available capital, such as private equity and venture capital funds, as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

ISSUES FOR STARTUP MARKETPLACE LENDERS

Following the initial incorporation and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform. As the startup lender will not have an established track record, deposit base or asset pools, the funding structure will often follow the format of a warehouse securitization structure. Origination of new assets will be funded through drawings on a note issuance facility backed by security over the new assets. Each of the new assets will be subject to eligibility criteria determined by reference to the nature of the underlying asset. In order to provide an efficient financing structure, the assets will typically be held through a SPV with origination and servicing provided by the marketplace lender. In order to cover expected losses on the asset pool, the senior facility will be subject to the lending platform maintaining sufficient subordinated capital in the form of equity, or a combination of equity and subordinated debt.

While the funding may be structured through a revolving loan or note program, if there is tranching of the debt, this will typically result in the platform being treated as a securitization for the purposes of the European Union Capital Requirements Regulation, with the attendant requirements to hold risk retention and provide appropriate reporting and disclosures.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a peer-to-peer mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called 'blocks' or algorithm functions called 'hashes'.

Each block includes unique features, such as: its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a 'proof of work' process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that, once authorized can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the form of so called ‘smart contracts’. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.
Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another, or advanced, more-complex interactions with the outside world using so called 'Oracles'. With Oracles the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of the transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

WHAT IS A CRYPTOCURRENCY?

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

Initial coin offerings and token-based products

WHAT IS AN INITIAL COIN OFFERING (ICO)?

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer’s business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
- compliance with law and all regulatory requirements.
The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

In September 2017 the Financial Conduct Authority issued a statement warning the public that 'ICOs are very high-risk, speculative investments' and outlining the potential risks associated with investing in unregulated parts of the financial sector.

**Artificial intelligence and robo advisory systems**

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms, which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

**Data analysis and cloud computing**

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

**Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?**

**General financial regulatory regime**

The Financial Conduct Authority (FCA) is the conduct regulator for firms providing financial products and services in both retail and wholesale markets.

**GENERAL**

A person must not carry on a regulated activity in the UK unless authorized or exempt (known as the general prohibition). A financial activity requires regulatory authorization when it is identified as a specified activity in relation to a specified investment; it is carried on by way of business in the UK and it does not fall within any of the available exemptions. Where FinTech products and/or applications involve financial activity which requires regulatory authorization, the firms providing such products and/or applications must be authorized by the FCA.

**PROJECT INNOVATE**

In October 2014, the FCA launched an initiative known as Project Innovate with a view to encouraging innovation in the interest of consumers. Project Innovate has five initiatives:

- **regulatory sandbox** – providing businesses with access to the real market to test innovative products, services, business models and delivery mechanisms;
- **direct support** – providing a dedicated contact for innovator businesses that are considering an application for authorization or a variation to their permission;
- **advice unit** – providing regulatory feedback to firms developing automated models to deliver lower-cost advice and guidance to consumers;
- **reg tech** – encouraging technologies that may facilitate the delivery of regulatory requirements more efficiently and effectively; and
- **engagement** – providing FCA engagement with a wide variety of businesses in the UK regions and internationally.
REGULATORY DEVELOPMENTS ON INVESTMENT PLATFORMS

In July 2017, the FCA published an Investment Platforms Market Study Terms of Reference, recognizing the increasingly important role of investment platforms in the retail distribution landscape. The market study is to focus on the impact of investment platforms on retail consumers and financial advisors, being platform services which involve arranging, safeguarding, administering investments and distributing retail investment products which are offered to retail clients by more than one product provider and which is neither solely paid for by advisor charges, nor ancillary to the activity of managing investments for the retail client.

Electronic payments platforms and regulation of peer-to-peer lenders

ELECTRONIC PAYMENT PLATFORMS

Since April 2014, a subsidiary of the FCA, the Payment Systems Regulator has regulated eight payment systems designated by HM Treasury, namely Bacs, Cheque & Credit, CHAPS, Faster Payment Scheme, LINK, Northern Ireland Cheque Clearing, MasterCard and Visa Europe. All participants in a designated payment system will fall under the remit of the Payment Systems Regulator, including operators that manage or operate the systems, the payment service providers using the system and the infrastructure providers to the payment system. A number of FinTech businesses are offering electronic payment platforms to rival the traditional payment systems; and the introduction of the Payment Services Regulations 2017 recognizes the rise in such business with the aim of creating a more level playing field for payment services providers while addressing the need for enhanced security and customer protection.

The FCA Handbook contains a number of electronic money-related rules, directions and guidance aimed at businesses that are issuing or considering the issuing of electronic money (e-money). E-money is defined as electronically (including magnetically) stored monetary value, represented by a claim on the issuer, which is issued on receipt of funds for the purpose of making payment transactions. E-money must be accepted by a person other than the electronic money issuer and include pre-paid cards and electronic pre-paid accounts for use online. Generally, firms issuing e-money must be authorized or registered with the FCA.

PEER-TO-PEER LENDERS

A person carries out a regulated activity (requiring authorization by the FCA) if they facilitate lending and borrowing between two individuals or between individuals and businesses of less than £25,000 in circumstances where the borrower does not enter into the agreement wholly or predominantly for business purposes. Such agreements are known as Article 36H Agreements and will only be caught by the regulations where either the lender or the borrower is an individual or a partnership with two or three persons or an unincorporated body.

Regulation of payment services

Where a UK business provides payment services as a regular occupation or business activity in the UK, it will require authorization by the FCA to become an authorized payment institution under the Payment Services Regulations 2017. Failure to obtain the required authorization is a criminal offence. The regulations implement the European Union Payment Services Directive II.

In order to become authorized by the FCA, a payment services business will need to meet certain criteria, including in relation to its business plan, initial capital, processes and procedures in place for safeguarding relevant funds, sensitive payment data and money laundering and other financial crime controls.

Application of data protection and consumer laws

The UK's Data Protection Act 1998 (DPA) regulates the processing of personal data within the UK. The DPA implements the European Data Protection Directive. Where a business determines the purposes and manner in which any personal data is processed, it will be regulated by the DPA and have certain notification and compliance obligations.

The European General Data Protection Regulation (GDPR) is due to replace the DPA from 25 May 2018. The GDPR is more prescriptive and restrictive, compared to the principles-based DPA, including mandatory notifications where a breach occurs and provide for severe monetary sanctions for breach.

The UK's Privacy and Electronic Communications Regulations 2003 (PECR) regulate unsolicited direct marketing by electronic means, in addition to sector specific regulations, such as the FCA's financial promotions regime.

Money laundering regulations
The Money Laundering, Terrorist Financing and Transfer of Funds (Information on the Payer) Regulations 2017 give the FCA responsibility for supervising the anti-money laundering controls of businesses that offer certain services, such as lending, providing payment services and issuing and administering other means of payment. These regulations implement the European Union's Fourth Money Laundering Directive.

Generally, where a firm is authorized and supervised by the FCA it will also be authorized and supervised by the FCA for complying with anti-money laundering requirements. Electronic currencies such as bitcoin and other cryptocurrencies tend to represent a higher money-laundering risk.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals, (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING

The crowdfunding sector is well established, and may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform, such as Crowdcube or Crowdfunder.

There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

ACCELERATORS

There are various incubators or accelerators in the UK market, which offer support, facilities and funding for startups, often in return for an equity stake. For example, Barclays has an accelerator program which offers up to US$120,000 investment from Techstars, together with mentoring from industry experts.

Venture capital and debt

Venture capital funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. Venture capital provides a viable alternative to traditional lending, given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of venture capital and involves an equity investment by a corporate fund, examples of which include Santander InnoVentures and Citigroup's Citi Ventures. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), which is secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through venture capital.

Warehouse and platform funding
Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

One example of warehouse financing involves LendInvest, which borrowed £40 million from Macquarie in 2016 under a warehouse facility, secured against UK mortgage loans. Some FinTech companies may see warehouse funding as a temporary form of financing to be followed by a larger capital markets transaction at a later date.

Another alternative form of funding is by way of peer-to-peer (P2P) lending platforms, such as Zopa and Funding Circle, which bring individual borrowers and lenders together without the involvement of traditional banks. In 2015, £2.8 billion was originated through P2P platforms in the UK. P2P lending does not involve equity investments; interest is paid on the money borrowed instead.

### Senior bank debt and capital markets funding

#### SENIOR BANK DEBT

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

#### CAPITAL MARKETS FUNDING

The UK has both debt and equity capital markets which are accessible to businesses (usually of a certain size).

Raising finance by way of an Initial Public Offering (IPO) is a popular funding arrangement for FinTech companies that have grown to a certain size. An IPO is the initial sale of company shares on a public exchange, such as the London Stock Exchange. For example, in 2015, Worldpay (a payment processing business) listed on the London Stock Exchange (LSE) in a deal that represented the largest UK IPO of that year. The London Stock Exchange’s Alternative Investment Market (AIM) caters specifically for small, growth-orientated companies and, recently, FreeAgent, (a provider of cloud-based accounting software) raised £10.7 million in its AIM IPO in 2016, having previously raised growth capital through equity crowdfunding.

A number of marketplace loan securitizations have been launched in the UK, where loans originated via marketplace lending platforms are packaged together and sold to investors as bonds. For example, in 2015, Funding Circle completed a £129 million securitization of loans to small and medium sized enterprises (SMEs) that had been originated through its online marketplace lending platform. Later on that year, Zopa completed a £150 million securitization of consumer loans originated on its platform.

FinTech companies have also started to access funding by issuing bonds to retail investors as a way of raising more competitive funding. For example, in July 2017 LendInvest issued an initial £50 million of retail bonds, which are tradeable on the LSE.

#### CONVERTIBLE BONDS/LOAN NOTES

A popular funding tool for fast-growing FinTech businesses is to issue convertible bonds or loan notes, which are essentially a hybrid between debt and equity. Convertible instruments begin as a loan accruing interest and are convertible into shares in the issuing company at prescribed prices in certain circumstances.

### Incentives and reliefs

The Seed Enterprise Investment Scheme (SEIS) is designed to help small, early-stage companies raise equity finance by offering 50% income tax relief for individuals who invest in the shares of qualifying startups, up to a maximum investment of £100,000 per annum. This scheme complements the Enterprise Investment Scheme (EIS), which offers a lower rate of income tax relief of 30% to investors in higher-risk small companies. It is worth noting that some financial activities, such as money lending or insurance are non-qualifying trading activities, and as such, EIS and SEIS may not be available for all FinTech companies.

In addition, research and development (R&D) tax credits are an incentive designed to encourage companies to invest in R&D. SME businesses (those with fewer than 500 employees, and either revenue less than €100 million or balance sheet assets less than €86 million) can benefit from up to 230% tax relief on their R&D expenditure.
The Patent Box Scheme enables companies to apply lower rate of Corporation Tax (10%) to profits earned from its patented inventions.

Finally, since 6 April 2017, payments of interest made by a UK borrower to a UK lender through a UK peer-to-peer platform are exempt from withholding tax provided that certain conditions are met. To avail the exemption, the credit provided by the lender to the borrowers needs to have been provided at the invitation of a regulated operator of an electronic system.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Buying and selling loans is very common. A loan can be sold on an individual basis or packaged up with other loans and sold as a portfolio pursuant to overarching terms.

The most common ways of selling loans are:

- **Novation** – A novation is a full legal transfer of the party's rights and obligations. It is a tripartite arrangement between the existing parties and the transferee and results in a fresh contract being formed between the continuing party and the transferee and the transferor being released from its obligations.

- **Assignation** – An assignation is a transfer of rights only, not obligations. Subject to any contractual restrictions, assignation can be done without the consent of the debtor. An assignation must be notified ('intimated') to the debtor to become effective.

- **Sub-participation** – A sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the buyer taking on double credit risk, both on the seller as well as the borrower.

Loan transfers are commonly documented using standard form contracts made available by the Loan Market Association. For more complex transactions, a more bespoke form of sale and purchase agreement would tend to be used. The form and content of the transfer documentation will depend on the nature of the loan assets being sold.

Last modified 20 Oct 2017

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan or portfolio of loans. These issues are often covered as part of a due diligence exercise by the seller's legal advisors. Some of the key considerations include:

- **Confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;

- **Data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser;

- **Lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;

- **Undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;

- **Transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and

- **Consent** – whether a transfer requires the consent or notification of any other parties.

Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

The ownership of energy and infrastructure assets in the UK varies according to the asset class. The main asset classes are usually considered to be:

- economic infrastructure (energy, aviation, rail, telecommunications, water, roads and waste); and
- social infrastructure (education, health and justice/prisons, housing).

Key sectors are considered below.

Energy

The gas and electricity industries in the UK are privatized, with the generation, transmission, distribution and supply services provided by a number of private sector companies. The relevant private sector companies own the generation, transmission and distribution assets. Notably, the National Grid, a listed public company (albeit heavily regulated) operates all of the mainland transmission lines (although in Scotland these are owned by other entities). On certain offshore projects, private entities other than the National Grid may own transmission lines.

The private sector finances and delivers most of the required infrastructure but there are a number of government policy mechanisms (adopted through legislation) which are used to incentivize investment in eligible energy generation technologies. In certain instances, including on major energy infrastructure, projects may be procured by the public sector and depending on the terms of the procurement, the asset may either be publicly or privately owned.

The Office of Gas and Electricity Markets (Ofgem) (as governed by the Gas and Electricity Markets Authority) is the principal body with responsibility for regulation of the energy sector in Great Britain. There is a separate regulator (the Utility Regulator) for the energy sector in Northern Ireland.

Telecoms infrastructure

The telecommunications networks (fixed and mobile) in the UK are privately owned by a number of service providers. A good example is BT Openreach which is responsible for most of the UK’s broadband infrastructure but whose work is heavily regulated by government; it, in turn, works with more than 500 service providers to provide local access to users.

The Office of Communications (Ofcom) is the regulator of the UK’s telecommunications sector. It also has responsibilities for television broadcast services and wireless communications services.

Transport infrastructure

LIGHT RAIL

Typically, light rail assets (such as trams and associated track) are owned by local public sector promoting bodies. Certain elements of light rail projects may be outsourced to the private sector; for example, the private sector may provide new trams, run a concession or operate and maintain a light rail system on behalf of a local transport executive – the assets will continue, however, to be owned by the public sector.

HEAVY RAIL

The rail market in the UK is privatized but its composition (which is complex) involves both public and private entities. The principal elements to the rail sector in Great Britain are:

- Network Rail, a private limited company, is on the public sector balance sheet and owns, operates and maintains rail tracks, signaling
and station infrastructure. It is responsible for improving most of the regulated national rail infrastructure for operating some of the stations on the national rail network.

- Public transport authorities, ie central and devolved government bodies and some metropolitan bodies, specify, let and manage operating contracts and give Network Rail a significant proportion of the funding for infrastructure maintenance and enhancement.

- Train Operating Companies (TOCs) are awarded franchises by the Department for Transport or local transport executives to operate certain train lines. ‘Open Access TOCs’ may apply to the rail regulator for use of certain train paths/routes when not being used by the franchised TOCs. The Scottish TOC is currently Scotrail, a subsidiary of Abellio. Scotrail and Network Rail in Scotland, although separate entities, have a common management structure.

- Freight Operating Companies (FOCs) are wholly commercial entities.

- Rolling Stock Companies (ROSCOs) are private entities which own and maintain rolling stock and lease them to the TOCs for use on their franchise.

- Project finance: There has been one deal (both phases of the Intercity Express Programme) where rolling stock has been procured through a project finance model and on that deal it is the private sector which owns the trains and will continue to do so following the expiry of the main contract with the public sector.

The rail sector is regulated by the Office of Rail and Road (ORR).

ROADS, BRIDGES AND TUNNELS

Transport Scotland, an executive agency of the Scottish Government accountable to the Scottish Ministers, are responsible for the trunk road network in Scotland.

AVIATION

Aviation in the UK is (for the most part) privatized. As regards airport infrastructure, there are a number of ownership structures in the UK market, including private ownership, local government ownership and various forms of public-private ownership. All models are heavily regulated by government and the Civil Aviation Authority is the aviation regulator in the UK.

PORTS

The UK ports sector comprises a variety of company, trust and municipal ports, all operating on commercial principles, independently of government and largely without public subsidy. The private sector operates the vast majority of the UK’s major ports.

Other infrastructure

SOCIAL INFRASTRUCTURE (SCHOOLS, HOSPITALS, EMERGENCY SERVICES CENTERS/PRISONS)

Typically, these are owned by the public sector with the exception of social housing projects (please see below) with the private sector’s responsibility being for any or all of the design, build, financing, operation and maintenance of the infrastructure. The majority of social infrastructure assets in the UK are directly financed by the government. Subject to value for money considerations, private finance may also be used in the procurement of social infrastructure assets – namely, using the Private Finance Initiative (in the past) and its successors in Scotland, the Non-Profit Distributing (NPD) Model.

Education

The ownership of a school’s infrastructure is generally by the relevant local authority. For example, in the case of a local authority maintained school, the school and playing fields will be owned by the local authority; and an academy school (which receives funding directly from the government) may lease land from a local authority. The current program for new schools is through the ‘Priority Schools Building Programme’, delivering schools either through a traditional construction procurement or on a project-financed basis albeit there is an unusual ‘Aggregator’ structure for that latter.

Hospitals

Ownership of hospitals is vested in various public sector bodies operating within the National Health Service in Scotland.

Social housing
This is a diverse sector involving many different organizations and individuals including housing developers, building contractors, mortgage lenders, local authorities, housing associations, landlords, owner-occupiers, private renters and those in the social rented sector. Typically, on a social housing project, housing associations own the relevant housing stock. Although housing associations tend to be private limited companies their governance is constrained by public sector regulation and, effectively, operate as quasi-public sector entities.

**DEFENSE**

Typically, defense assets are owned by the public sector.

**WASTE**

In the past, the public sector procured new waste treatment or collection facilities and these were owned by the public sector even if the private sector would be responsible for design, build, operation or maintenance of the facility. One example being long-term Private Finance Initiative (PFI) contracts with private sector companies in relation to the building and operation of waste infrastructure, with financial support being provided to the local authorities by the government through the PFI in respect of the cost of those projects. Increasingly, merchant facilities, namely those developed and operated by private sector entities, are being used and these facilities serve both their public sector and private sector customers.

**WATER**

In Scotland, water and wastewater services are provided by a state-owned company (Scottish Water). The Water Industry Commission for Scotland (WICS) is the relevant regulatory body.

*Last modified 20 Oct 2017*

**Are there special rules for investing in energy and infrastructure?**

**Generally**

There is no specific regime governing or restricting investment in energy or infrastructure projects in the UK over and above existing regulation for investors and funders more generally but a particular proposed investment may be subject to legislative or regulatory control (eg merger control rules). As regards the planning and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory position relevant to that project must be considered. For example, a project involving development on land will require planning permission [or a development consent order]; and a project may require environmental authorizations/permits and/or sector specific regulatory consents or licenses. If a public body (eg a government department, a local authority or a National Health Service Trust) is procuring a project using private finance, and the public body is to benefit from central government funding towards the cost, the project will be subject to central government approval. Key sector-specific issues are flagged in the sections below.

Whether an investor can invest will depend on the terms of the procurement of that project if it is a public sector project and, in respect of an existing/operational project, that will depend on whether there are any contractual restrictions on 'Change of Control'. This is less of a concern on private sector infrastructure although investors would need to consider whether any licenses/consents/permits would be affected by their acquisition of an interest.

**Energy**

The energy markets in the UK have a complex system of arrangements between suppliers, generators, transmission and distribution which are heavily regulated. In particular, there are complex arrangements in respect of licensing, subsidies and demand/charging mechanism with suppliers, customer and the National Grid and these are subject to change/regular updates meaning that investors will need to have a good understanding of the current framework and the potential directions in which the market may move. Investors need to understand how technology changes may impact on the overarching regulatory framework and vice versa.

Investors should also consider whether the acquisition of any interests in the energy sector (at an entity or asset level) would cause any issues with any license conditions or the granting of specific subsidies. In particular, if a breach of those conditions could lead to the revocation of a license/subsidy that might make the potential target less attractive or viable.
Telecoms infrastructure

There is a complex regulatory environment for this sector including how access and interconnectors (between networks) are regulated under the Communications Act 2003 and (Access to Infrastructure) Regulations 2016 and how Ofcom grants rights to access private or public land in order to install and maintain essential equipment in, over or under that land. This equipment might be cables sunk beneath the ground or a mobile mast sited on the ground.

The industry is largely privatized, therefore investors should consider if any permits/consents/licenses will be affected by their interest.

Transport infrastructure

RAIL

There is an extensive and complex regulatory framework to consider in respect of a practical and operational involvement in this sector. Key areas include understanding the regulatory regime for certification for train use and acceptance and user fare regulation. Depending on how an investor wishes to invest in a project (specifically what type of entity or asset), there is a varying degree of difficulty for investors to enter into an existing project. For example, rolling stock operating companies (ROSCOs) are privately owned companies where third party investment is relatively common whereas train operating companies (TOCs) are often special purpose vehicles so, in theory, investment into a TOC should be relatively straightforward. However, any change in control of a TOC under a Franchise Agreement will usually require a consent from the Department for Transport.

ROADS

In order for a private sector partner to carry out its duties on certain types of roads projects, the procuring public sector authority (Transport Scotland or a local authority) may delegate certain of its statutory duties to the private sector partner. This will be dependent on the project and the specific contractual requirements. Any investor will, therefore, need to understand those duties and whether it is able to subcontract those duties to an appropriate person. There is usually a restriction on the change of control of the private sector partner during the construction period. Following the construction period, the private sector may be allowed a change of control provided that they do not fall within a definition of an ‘Unsuitable Third Party’ (which may include concerns about national security, tax avoidance). The precise scope of the restrictions will depend on the contractual terms.

Other infrastructure

On publicly-procured infrastructure, it is quite common for long-term projects to have a ‘change in control’ clause which restricts change in ownership structures of the private sector. For example, in most sectors there is a restriction on change in control during the construction period but this is often relaxed post construction provided any change in control is not to an ‘Unsuitable Third Party’. How strict these restrictions are will often depend on the sector. For example, the defense sector usually gives the Ministry of Defence a strong degree of discretion (particularly on the grounds of national security) as to whether to accept a change in control over its private sector partner.

What is the applicable procurement process?

Public procurement in Scotland is, for the time being, in most instances governed by the Public Contracts Regulations 2015 which is based on EU Directives. There are some sector-specific regulations such as the Utilities Contract Regulations 2016 (applicable to the rail sector, water and energy) and the and Security Public Contracts Regulations 2011 (these are also based on EU Directives and therefore subject to change as the UK leaves the EU).

The key principles are that contract procured by the public sector are awarded fairly, transparently and without discrimination on the grounds of nationality and that all potential bidders are treated equally.

Investing in energy and infrastructure

Public procurement is relevant where the UK government, or a branch of it, is seeking to outsource delivery of a new project. On an infrastructure project, a potential investor would have to bid in its own capacity or as part of a consortium to deliver the overall deal which could include design, build, operation, maintenance and financing of the relevant energy or infrastructure asset. The relevant
procurement legislation applies to certain public bodies including central government departments, local authorities, police and fire authorities, NHS Trusts, various non-governmental bodies such as the Competition and Markets Authority and the House of Commons. A regulated procurement is required where certain financial thresholds are met and on most major infrastructure projects (where limited exclusions do not apply), it is likely that those thresholds will be met so a regulated procurement would need to be run.

In most cases, the public sector will need to publish a contract notice in the Office Journal of the European Union (OJEU) and typically run one of the following procedures:

- **Open procedure** – This is suitable for easy-to-evaluate projects and tenderers simply submit a tender in response to the OJEU notice. Change and negotiations to the tender are not permitted.

- **Restricted procedure** – There is a shortlisting of at least five tenderers following an expression of interest stage and tenderers submit a bid. Again, no negotiation is permitted other than clarification and finalization of the contract terms.

- **Competitive dialogue** – This is often the most common procedure for complex infrastructure projects and involves a shortlisting of at least three bidders who are invited to dialogue with the public sector to develop detailed solutions which are capable of being accepted by the public sector. Clarification and further negotiations are allowed following final tender but only on the basis of confirming the financial and other commitments in a tenderer’s bid.

- **Competitive procedure with negotiation** – This is sometimes described as a hybrid procedure as it allows dialogue with bidders but also allows the public sector to award a contract on the basis of an initial tender (or further stages) but clarification and negotiation is not allowed following final tender.

An investor may choose, however, to seek to invest in a project (by acquiring an interest in a private sector partner) that has already been procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the original awarded contract rather than procurement regulations themselves.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement-related considerations that need to be borne in mind.

**Financing energy and infrastructure**

On a publicly procured contract, the public sector may have prescribed requirements on the funding arrangements. Following entry into the contract, the main tool for controlling the financing is that, typically, on project finance deals, a refinancing of the senior debt will require the consent of the public sector.

An investor may choose, however, to seek to invest in a project (by acquiring an interest in a private sector partner) that has already been procured and is operational. Typically, such investments are controlled by contractual mechanisms (particularly on publicly procured projects) within the original awarded contract rather than procurement regulations themselves.

Depending on the structure of the deal, any acquisition of an interest or variation to the existing project may have procurement-related considerations that need to be borne in mind.

**What are the most common forms of funding / investing in energy and infrastructure?**

The principal forms of private sector funding/investment in energy and infrastructure in the UK (including in relation to public-private partnerships) are as follows.

**Funding**

Common forms of funding in energy and infrastructure include:

- **loans made on a corporate finance basis (balance sheet debt);**

- **loans made on a project-finance basis (to a special purpose project company) on medium to long-term bases – such loans may later be syndicated to other funders. (For publicly procured project financed deals in Scotland, this often means using the NPD model which is a successor to the Private Finance Initiative (PFI));**

- **bond finance;**

- **mezzanine debt (in some sectors);**

- **refinancing of the debt in operational projects; and**

- **asset financing; this is particularly relevant in the rail sector.**
Following the global financial crisis, the UK government has tried to expand the funding base and increase liquidity in the market (particularly encouraging institutional investors) by various means. These include HM Treasury/Infrastructure UK offering the UK Guarantee Scheme to guarantee certain types of debt on an infrastructure projects (for example, guaranteeing bond finance debt (similar to the role monolines used to play on such deals) so as to lower debt pricing to near gilt levels) and the Green Investment Bank lending on energy projects (although the latter is in the process of being privatized).

Funding/funding products can also, sometimes, provided by the European Investment Bank and export credit agencies.

**Investing**

Common forms of investing in energy and infrastructure include:

- ‘equity’ investment in special purpose vehicles or entities that may have a portfolio of interests, ie share capital and subordinated sponsor loans; and
- secondary market investment in operational projects (acquisition of 'equity').

**Restructuring**

**Enforcement and sanctions**

*When can there be regulatory investigations?*

When the Financial Conduct Authority or the Prudential Regulatory Authority considers that an authorized firm or regulated individual may have breached the ongoing compliance requirements, it will launch a formal investigation. This may result in regulatory sanctions.

*What regulatory penalties may apply?*

When a rule breach has taken place, the Financial Conduct Authority or the Prudential Regulatory Authority may impose a financial penalty or censure, or withdraw regulated status against the firm and/or regulated individuals. The regulator will publicize these penalties.

*What criminal penalties may apply?*

Following formal investigation, the regulators have powers to impose criminal penalties in certain cases, including:

- insider dealing and misleading statements and practices;
- breaches of the Money Laundering Regulations; and
- conducting regulated activities when not authorized.

**Tax**

**Tax issues**

*Are stamp, registration, transfer or other similar taxes applicable?*
Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

**ADVANCE OF LOAN**

No stamp, registration, transfer or other similar taxes are payable on the advance of a loan.

**TRANSFER OR ASSIGNMENT OF A DEBT UNDER A LOAN**

A written instrument transferring or assigning a debt under a loan is, in principle, chargeable to 0.5% UK stamp duty. An agreement to transfer a debt is also, in principle, chargeable to UK stamp duty reserve tax (SDRT) (although, in practice, a payment of both UK stamp duty and SDRT should not be required). However, provided the debt constitutes loan capital and does not have certain offensive features (such as a right to interest exceeding a commercial return or a right to conversion into shares or other securities), the written instrument assigning or transferring, or the agreement to assign or transfer, such debt should be exempt from both UK stamp duty and SDRT. This is known as the loan capital exemption.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

There is no stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security.

However, most security interests created by English companies and English limited liability partnerships must be registered at Companies House to perfect the security and ensure it is valid against third parties. The grant of most security interests over UK real estate should also be registered at the Land Registry (in the case of real estate in England and Wales) and the Scottish Land Registry (in the case of real estate in Scotland) to ensure that the security interest takes effect as a legal charge. It would be unusual for the fees payable for such registrations to be a material amount.

Other forms of registration may also be required (or be advisable), depending on the nature of the asset over which security is taken. Such registrations may also require the payment of fees.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?

**ISSUE OF DEBT SECURITIES**

**Bearer bonds**

The issue of a debt security in the UK which is a bearer bond or the issue by or on behalf of a UK company of a debt security which is a bearer bond, in principle, gives rise to a charge to UK bearer instrument duty (BID). Such BID is chargeable at a rate of 1.5% of the issue price of the bearer bond. However, currently, HM Revenue and Customs is not seeking to collect BID on the issue of a debt security which is a bearer bond.

**Registered bonds**

Subject to the special regime for issues into a depository or clearing system (see below), there is generally, no charge to UK stamp duty or SDRT on the issue of a debt security which is a registered bond. The issue of a debt security which is a registered bond should also not give rise to a charge to BID (which is only relevant to bearer instruments).

**TRANSFER OF BONDS**

**Bearer bonds**

The first transfer in the UK of a debt security which is a bearer bond issued outside of the UK by a non-UK company, in principle, gives rise to a UK bearer instrument duty charge (if stamp duty would have been payable on the instrument of transfer if the bond had been in registered form). Such BID is charged at a rate of 1.5% of the transfer consideration. UK stamp duty only applies in respect of written
instruments of transfer and so is not, normally, relevant to the transfer of a debt security which is a bearer bond, provided it is transferred by delivery. However, any agreement to transfer a bearer bond issued by or on behalf of a UK company is, in principle, chargeable to SDRT. Such SDRT is charged at a rate of 0.5% of the transfer consideration.

Registered bonds

A written instrument transferring a debt security which is a registered bond is, in principle, chargeable to UK stamp duty if the instrument is executed in the UK, or relates to UK stock or marketable securities or to something done, or to be done, in the UK. Any agreement to transfer a debt security which is a registered bond issued by a UK company or registered in a UK register is also, in principle, chargeable to SDRT. Such UK stamp duty and SDRT are chargeable at a rate of 0.5% of the transfer consideration.

DEPOSITORY AND CLEARING SYSTEMS

Bearer bonds and registered bonds

A written instrument transferring certain debt securities to a person whose business is, or includes, issuing depositary receipts or the provision of clearance services for chargeable securities (or the agent or nominee of such a person) is, in principle, chargeable to UK stamp duty. Such stamp duty is generally chargeable at a rate of 1.5% of the consideration or market value of the debt securities (depending on the circumstances).

The issue or transfer of certain debt securities to a depositary receipt issuer (or its nominee), where a depositary receipt is issued or to be issued, or the issue or transfer of debt securities into a clearing system (or its nominee) in pursuance of an arrangement for the provision of clearance services, in principle, gives rise to a charge to SDRT. Such SDRT is generally chargeable at a rate of 1.5% of the issue price, consideration or market value of the debt securities (depending on the circumstances). However, currently, HM Revenue and Customs is not seeking to collect SDRT on the issue, or (where integral to the raising of capital) the transfer, of debt securities into a clearing system or depositary receipt system, provided that the debt securities comprise loans raised by the issue of debentures or other negotiable securities for the purposes of Article 5(2)(b) of the Capital Duty Directive (2008/7/EC).

EXEMPTIONS

While in some circumstances, both UK stamp duty and SDRT may apply to the same transaction, as a general principle, there should be no double charge due to the operation of a franking system.

If a debt security benefits from the loan capital exemption, the issue or transfer of such debt security (whether a bearer bond or registered bond) should not be chargeable to UK stamp duty, BID or SDRT. The loan capital exemption applies to loan capital that does not have certain offensive features (such as a right to interest exceeding a commercial return or a right to conversion into share or other securities). The loan capital exemption is therefore the key exemption in the context of capital markets transactions and serves to exempt most vanilla bonds entirely from UK stamp taxes.

Last modified 20 Oct 2017

Do tax authorities take priority on enforcement?

On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (eg secured bond holders)?

Secured lenders and secured debt security holders take priority over HM Revenue and Customs on enforcement of security.

Last modified 20 Oct 2017

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

Unless an exemption applies, where a payment of interest with a UK source is paid under a loan which is intended or expected to have a duration of a year or more, an amount equal to the basic rate of the interest payment is required to be withheld and paid to HM Revenue and Customs.
If so:
What is the rate of withholding?

The current rate of UK withholding tax (i.e., the basic rate) is 20%.

What are the key exemptions?

The most commonly relied on exemptions to ensure that interest payments made by UK companies can be made free of UK withholding tax include:

- the exemption for interest paid on an advance from a UK tax resident bank;
- the UK-to-UK exemption (applicable where interest is paid to a lender which is a UK tax resident company or a partnership of such companies);
- the quoted Eurobond exemption (applicable to interest paid on a security which is listed on a recognized stock exchange);
- reliance on a double tax treaty (such treaty may only provide for partial exemption);
- the qualifying private placement (the key requirement being the residence of the lender in a qualifying double tax treaty jurisdiction); or
- reliance on the EU Interest and Royalties Directive as implemented by UK law (the key requirement being that the lender and the borrower meet the association requirement).

Would the same analysis apply to interest payments under a debt security (e.g., a bond)?

Yes, the analysis described above is applicable to both interest payments under a loan or other form of debt security.

The quoted Eurobond exemption is particularly relevant to debt securities.

Last modified 20 Oct 2017

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g., by virtue of incorporation, residence or local branch)?

No.

Would the same analysis apply to interest payments under a debt security (e.g., a bond)?

Yes.

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

There are a number of restrictions on offering and selling debt securities under UAE law.

Unless certain exclusions or exemptions apply, it is unlawful to offer debt securities (including foreign debt securities) to the public in the UAE or to provide trading services in respect of those debt securities without an appropriate license or approval from the Securities and Commodities Authority (SCA).

The SCA has published detailed rules and guidance on the restrictions for offers of debt securities in the UAE. These restrictions are aimed at preventing a breach of the rules on financial promotion and the protection of retail customer. However, the SCA's rules and regulations are still evolving and there continue to be changes in respect of permitted exceptions and exclusions to the SCA's regime.

Acting as a principal in respect of financial products that affect the financial position of any of the licensed financial institutions, including (but not limited to) debt securities will also be considered financial activities subject to UAE Central Bank licensing and supervision in accordance with the provisions of the New Banking Law.

What are common issuing methods and types of debt securities?

The most common types of debt securities issued in the UAE are bonds, Sukuk (also known as Islamic bonds) or notes issued on a stand-alone basis or under a program.

Many different types of debt securities are offered in the UAE. Some common forms include:

- debt securities characterized by the type of interest or payment such as fixed-rate securities and floating-rate securities;
- Islamic debt securities (Sukuk) characterized by the type of underlying Islamic structure or payment profile such as fixed-rate Islamic securities and floating-rate Islamic securities;
- guaranteed securities, subordinated securities, securities issued for regulatory capital purposes (Tier 1 or Tier 2);
- asset-backed securities; and
- convertible or exchangeable bonds.
What are the differences between offering debt securities to institutional/professional or other investors?

In summary, the promotion of debt securities or trading service to any person in the UAE requires a Securities and Commodities Authority (SCA) license or approval. The SCA does, however, make certain exclusions from this requirement:

- There is a distinction between institutional ‘Qualified Investors’ and other investors for the purposes of offering and selling debt securities under UAE law, and promoting to (or introducing) institutional investors and licensed financial institutions, or government bodies (and entities owned by them) is permitted.

- Acting on the basis of a reverse solicitation may also be permitted in certain circumstances.

However, promoting or introducing in relation to UAE retail or high net worth individuals is not permitted without the relevant license or approval (which may involved a locally authorised firm).

If in any doubt as to the scope or application of an exemption, we would always recommend contacting the SCA directly to clarify the latest position in this regard.

Last modified 23 Jan 2020

When is it necessary to prepare a prospectus?

The general position under UAE law is that a prospectus is required where there is either:

- an offer to the public of the relevant debt securities; or

- an application is made for listing on one of the exchanges in the UAE.

However, on the basis that debt securities are often also marketed outside of the UAE, the local debt securities market has seen a degree of alignment with prospectus requirements under the EU Prospectus Directive.

Last modified 23 Jan 2020

What are the main exchanges available?

In the UAE, there are three main exchanges:

**Dubai Financial Market (DFM)**

DFM was created in 2000 and operates as a secondary market for the trading of securities issued by public shareholding companies, bonds issued by federal or local governments, local public institutions and mutual funds as well as other local or foreign DFM approved financial instruments. DFM is governed and regulated by the Securities and Commodities Authority (SCA). In 2010, DFM consolidated its operations with NASDAQ Dubai, which means investors can trade across the two exchanges. However, both exchanges are regulated separately, DFM by the SCA and NASDAQ Dubai by the Dubai Financial Services Authority (DFSA).

**Abu Dhabi Securities Exchange (ADX)**

ADX was also established in 2000 and operates as a secondary market for the trading of different types of securities. It currently has trading locations in Al Ain and in the Emirates of Fujairah, Sharjah and Ras Al-Khaimah. ADX is governed and regulated by the SCA.

**NASDAQ Dubai**

NASDAQ Dubai was created in 2005 and is based in the Dubai International Finance Centre (DIFC) which has an independent commercial legal system based largely on English law. The exchange is regulated by the DFSA. There is also a greater emphasis on a regional (and global) role for NASDAQ Dubai by contrast to the domestic focus of DFM and ADX.

Last modified 23 Jan 2020
**Is there a private placement market?**

The UAE has a relatively active private placement market.

There is no dominant standard for documentation, but private placement documentation will often take into consideration the style/approach of the Loan Market Association and International Capital Markets Association (if appropriate to do so).

*Last modified 23 Jan 2020*

**Are there any other notable risks or issues around issuing or investing in debt securities?**

**Issuing debt securities**

Issuers, originators and obligors are required to take responsibility for prospectuses for debt securities. Misleading statements in, or omissions from, any applicable offering document can give rise to both civil and criminal liability under UAE law.

**Investing in debt securities**

Debt security terms and conditions typically contain provisions which may permit their modification without the consent of all investors and confer significant discretions on the trustee (or delegate), which may be exercised without the consent of investors and without regard to the individual interests of particular investors. The conditions also provide for meetings of investors to consider matters affecting the investors interests. These provisions typically permit defined majorities to bind all investors including investors who did not attend and vote at the relevant meeting and investors who voted against the majority.

In certain respects, the legal and regulatory framework in the UAE is still developing for debt securities (and is therefore viewed as an emerging market). Accordingly, there may be certain additional risks for investors in terms of enforceability of obligations and the ability to exercise certain rights. However, this will ultimately depend of the nature of the debt securities and careful consideration will need to be made as to the appropriate risk factors to be included in the prospectus or offering document in this regard.

Before making an investment decision, prospective investors in debt securities should always consider carefully – in the light of their own financial circumstances and investment objectives – all of the information in the prospectus (and consult their own financial, tax, legal and other professional advisors regarding the suitability of any debt security).

*Last modified 23 Jan 2020*

**Establishing and investing in debt / hedge funds**

**Are there any restrictions on establishing a fund?**

**Onshore UAE**

The federal securities regulatory authority of the UAE is the Emirates Securities and Commodities Authority (SCA), which is responsible for regulating the rules applicable to the incorporation and establishment of domestic funds as well as the promotion and marketing of foreign funds, in the UAE.

Generally speaking, under the relevant regulations (notably SCA Board Decision No.3 of 2017 regarding the Promotion and Introduction Regulations (PIRs)), the promotion of financial products to persons in the UAE requires a SCA license for which an onshore UAE business presence is required. Any person introducing UAE investors to a service provider in order to receive financial services, including trading services, needs to get the SCA’s approval. However, neither the SCA license nor the SCA approval requirements apply when an exclusion is available. For example, promoting to, or introducing, institutional investors and licensed financial institutions, or government bodies and entities owned by them are excluded as is acting on the basis of a reverse solicitation. Promoting or introducing in relation to UAE retail or high net worth individuals is not permitted without the relevant license/approval. Finally, while licensed promoters need only notify the
SCA of any promotions they make in the UAE, promoters proposing to market foreign funds in the UAE must obtain the SCA's prior approval.

These requirements also apply to firms located in the Dubai International Financial Centre (DIFC) and the Abu Dhabi Global market (ADGM) when they wish to approach retail or high net worth individuals who are located in the UAE.

**DIFC**

In the DIFC, the Dubai Financial Services Authority (DFSA) is the relevant regulatory authority that oversees funds established and marketed in the DIFC. Similarly with the position onshore in the UAE, various licencing requirements must be met before a fund can be established and promoted in the DIFC. For example, depending on the type of fund there may be requirements to register the fund with the DFSA or notify the DFSA of the fund's activity, as well as certain licencing requirements that fund managers operating in the DIFC must meet.

Last modified 23 Jan 2020

**What are common fund structures?**

**Onshore UAE**

The SCA Chairman Decision No. 9 of 2016 Concerning the Regulations as to Investment Funds (Investment Fund Regulations) governs the establishment, licensing and management of funds in onshore UAE. The types of funds that are able to be established under the Investment Fund Regulations include:

- public investment funds (i.e. funds which target any type of investor); and
- private investment funds (i.e. funds which target only qualified investors).

The Investment Fund Regulations provide that these public or private funds may either be "open-ended" (i.e. a fund with variable capital where the number of unitholders can increase or decrease) or "close-ended" (i.e. a fund with generally fixed capital). Under the Investment Fund Regulations:

- all funds established have corporate personality and independent financial liability; and
- all funds must be managed by a management company that is licensed in accordance with the Investment Fund Regulations, meets certain minimum capital requirements and meets other operational requirements set out in the Investment Fund Regulations.

**Dubai International Finance Centre (DIFC)**

The three types of corporate entity that can be used to establish a domestic fund in the DIFC are:

- investment companies;
- investment trusts; and
- investment partnerships.

Trust structures are predominately used for property funds and investment partnerships are commonly used for private equity funds. An investment partnership is a limited partnership registered with the DIFC, comprised of general partners and limited partners. The general partner must be authorized by the Dubai Financial Services Authority (DFSA) to act as the fund manager.

The three types of fund that can be established in the DIFC are:

- public funds (including REITs);
- exempt funds; and
• qualified investor funds (QIFs).

As public funds are open to retail investors, more extensive regulatory requirements apply to these funds. Exempt funds are only open to professional clients who must make a minimum subscription of US$50,000, and cannot be offered to the public (distribution is only allowed through private placement). Private equity funds are usually exempt funds.

A QIF provides a lower cost and less regulated alternative to an exempt fund. The QIF regime is specifically targeted at sophisticated investors such as high net worth individuals and family offices. To qualify as a QIF, the fund must meet all of the following criteria (both at inception and on an ongoing basis):

• units in the QIF must only be offered by way of private placement to unit holders who meet the ‘professional client’ criteria; and

• unit holders must subscribe for at least US$500,000 of units in the QIF.

The DIFC has also adopted a special purpose company (SPC) structure through which many managers effect their private equity, real estate and alternative investments. Managers have looked to the SPC structure due to the short time frame to establish an SPC (ie one week versus potentially months to establish in other local jurisdictions), as well as the DIFC's legal regime (which is based on English law) and the general recognition and treatment of DIFC companies as onshore companies for tax and regulatory purposes in the GCC.

What are the differences between offering fund securities to professional / institutional or other investors?

Onshore UAE

When it comes to offering or marketing securities in onshore registered funds, the main rule is that fund securities may not be offered if such funds securities have not been approved and registered with the SCA. Very limited exeptions however may apply in the context of a private offering made to Qualified Investors (noting that the Qualified Investors exception does not apply to natural persons whether or not such natural persons are high-net worth individuals).

DIFC

In relation to offering or marketing securities in DIFC registered funds, the governing regulations (i.e. the Collective Investment Law DIFC Law No. 2 of 2010 (Collective Investment Law)) provides that, for offering securities to both professional/institutional investors (known as "Professional Clients") and for offering securities to other investors (such as retail investors), a prospectus must be prepared and the offer must be made by a qualified fund manager. However where the regulations differ between professional/institutional investors and retail investors is when it comes to publication of the prospectus, given that the Collective Investment Law provides that where an offer of securities is in relation to a “Public Fund” (i.e. any fund which includes retail investors) then the prospectus must be filed with the with the relevant DIFC authority.

General comments

Care should be had when marketing an onshore registered fund in an offshore jurisdiction and vice versa, given that the relevant regulatory authorities may have memorandums of understanding in place which set out separate regulations with respect to these situations.

We also note that the fund regulations, both onshore and offshore, are subject to any guidance notes issued by the respective authorities that may be published from time to time.

Are there any other notable risks or issues around establishing and investing in funds?

In certain respects, the legal and regulatory framework in the UAE (both onshore UAE and the Dubai International Financial Centre (DIFC)) is still developing for the funds market (and is therefore viewed as an emerging market). Accordingly, there may be certain additional risks.
for investors in terms of enforceability of obligations and/or the ability to exercise certain rights. However, this will ultimately depend of the nature of the fund and careful consideration will need to be made as to the appropriate risk factors to be included in the prospectus or offering document in this regard.

Before making an investment decision, prospective investors in funds should always consider carefully – in the light of their own financial circumstances and investment objectives – all of the information in the prospectus (and consult their own financial, tax, legal and other professional advisors regarding the suitability of any debt security).

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Onshore UAE

Funds promoted and introduced to investors based onshore in the UAE will need to be registered with the UAE Securities and Commission Authority (SCA) unless a statutory exemption applies (noting that the regulations provide for exemptions for reverse solicitation and for marketing to "Qualified Investors", among others). For an issuer to be able to obtain a licence to promote funds to investors in the UAE, the issuer must:

- seek approval of the SCA;
- meet certain minimum capital requirements;
- pay applicable licence fees; and
- undertake to comply with the relevant SCA rules and conditions.

Once the fund is registered then, in order to market securities/units in the fund, the issuer will be required to comply with various rules regarding prospectuses, documentation regarding key investor information and ensuring that the fund has an investment policy.

DIFC

In the Dubai International Financial Centre (DIFC), "Public Funds" are required to be registered with the Dubai Financial Services Authority (DFSA). An application to register a Public Fund must include, among other things, the fund’s constitution and prospectus. Other funds established in the DIFC such as "Exempt Funds" and "Qualified Investor Funds" are not required to be registered with the DFSA, however the DFSA must be notified prior to any offering of securities/units with respect to such funds.

When it comes to offering securities/units, the governing regulations (i.e. the Collective Investment Law DIFC Law No. 2 of 2010 (Collective Investment Law)) provide that before any offer a prospectus must be prepared by a qualified fund manager which, for Public Funds, is to be registered with the DFSA.

Are there any restrictions on managing a fund?

Onshore UAE

All entities that practice the activities of establishing and running onshore funds must be licenced with the UAE Securities and Commission Authority (SCA). In order to obtain a licence then the management entity must meet the criteria specified in the SCA Chairman Decision No. 9 of 2016 Concerning the Regulations as to Investment Funds (Investment Fund Regulations), which includes:

- being a company operating in the area of securities / fund management, or being a local or foreign bank specified in the Investment Fund Regulations;
- meeting certain minimum capital requirements;
DIFC

Hedge funds in the Dubai International Financial Centre (DIFC) are regulated by the Collective Investment Rules module of the Dubai Financial Services Authority (DFSA) Rulebook, similar to other investment funds. The DFSA has implemented the Hedge Fund Code of Practice (Code), which sets out the principal risks associated with hedge funds and similar structures and sets out best practice standards. Hedge fund managers are permitted a degree of flexibility to adapt the standards to suit their particular businesses in light of market conditions and emerging issues. These standards, *inter alia*, address back-office systems, valuation procedures, and the skills and resources of the manager.

The Code, which sets out best practice standards for Fund Managers of Hedge Funds in the DIFC (ie Fund Managers of Public Funds, Exempt Funds or qualified investment funds (QIFs) which are classified as Hedge Funds), addresses risks inherent in the operation of Hedge Funds and are set out under the following nine principles:

- **principle 1** – appropriate skills and resources to conduct the operations of the fund;
- **principle 2** – robust and flexible investment process in line with the risk profile of the fund;
- **principle 3** – systems and controls to mitigate trading related risks;
- **principle 4** – adequate back-office systems and controls;
- **principle 5** – appropriate measures to identify and manage portfolio risks;
- **principle 6** – adequate valuation policies and procedures;
- **principle 7** – no arrangements where material benefits are given only to some investors;
- **principle 8** – adequate systems and controls to deal with market sensitive information; and
- **principle 9** – no investment in underlying hedge funds without appropriate due diligence.

Entering into derivatives contracts

*Are there any restrictions on entering into derivatives contracts?*

The development of derivatives in the UAE has not been without its challenges for a number of years due to the lack of recognition of close-out netting and the absence of a UAE law dealing with derivatives contracts. This is no longer the case with the recent introduction of Federal Law No. 10 of 2018 (the “Netting Law”) which applies to counterparties based ‘onshore’ in the UAE.

Before the Netting Law, financiers would effectively be taking their chances with the UAE Federal Bankruptcy Law - which only allows set-off or netting of debts that are contractually agreed before the onset of insolvency. This left a great deal of uncertainty as to the enforceability of netting provisions in any post-insolvency scenario involving a UAE counterparty.

The new Netting Law is expected to provide greater certainty by recognising the principle of close-out netting as incorporated into a master level agreement (intended to cover a series of derivatives transactions between two parties), by providing for a single ‘net’ amount to be payable - as between those parties - upon a close-out or termination. Furthermore, qualified financial contracts under the umbrella of a master agreement constitute a ‘single’ agreement which is essential for the purposes of netting multiple financial contracts entered into between the same two counterparties.
**What are common types of derivatives?**

Although a variety of derivatives structures exist in the UAE, so far, the only relevant court decisions relate to foreign exchange contracts.

The new Netting Law contemplates a number of qualified financial contracts as well Shariah compliant contracts: murabaha, musawamah, master collateralized murabaha, restricted and unrestricted wakala, alternative profit rate swap, alternative cross-currency swap and alternative foreign exchange forward are all mentioned.

**Are there any other notable risks or issues around entering into derivatives contracts?**

UAE courts are in general not very experienced in dealing with complex financial transaction structures, and will often require an expert to be appointed to guide the court on such matters. The Netting Law is relatively new and remains largely untested with very few case law dealing with derivatives transactions. Accordingly, the parameters around its implementation remain to be seen.

The ISDA has commissioned a law firm to provide a netting-law opinion in respect of the enforceability in the UAE of the ISDA Master Agreement.

**Debt finance**

**Lending and borrowing**

**Are there any restrictions on lending and borrowing?**

**Lending**

**LICENSING REQUIREMENTS IN THE UAE**

The Central Bank of the UAE (Central Bank) and the Securities and Commodities Authority (SCA) are the main regulatory bodies for financial services in the UAE (except in the DIFC and ADGM). Pursuant to Federal Law No. 14 of 2018 (New Banking Law), the Central Bank regulates financial institutions, including those who wish to provide financing in or from onshore UAE.

Lenders including commercial banks, investment banks, investment companies, finance companies, Islamic banks, Islamic finance companies and real estate finance companies are regulated by the Central Bank and require a license.

In order to obtain a license from the Central Bank to carry out one or more licensed financial activities, a letter of application, certain corporate documents of the applicant and a business plan are submitted to the Central Bank. The specific documents required for the license are not listed by the Central Bank but the applicant should expect to be notified if additional documents are necessary for the process to be finalized. The New Banking Law provides that the Central Bank should issue its acceptance within 60 working days from the date all documents and conditions are met. If the applicant does not receive a decision within 60 working days, then this would mean the Central Bank has rejected the application.

UAE lenders who enter into financial arrangements with a borrower in the UAE without a license may face imprisonment and/or a fine and the relevant institution may be liable for civil and criminal claims.

**LICENSING REQUIREMENTS IN THE DUBAI INTERNATIONAL FINANCIAL CENTRE (DIFC)**

The principal regulator for regulating financial services within the DIFC is the Dubai Financial Services Authority (DFSA). An individual or entity based in the DIFC which provides a financial service must be authorized by the DFSA by obtaining the appropriate license.

An entity who wishes to satisfy the eligibility requirements in the DIFC must be structured as any one of the following forms of business:
limited liability company; company limited by shares; limited liability partnership; protected cell company; investment company; branch of foreign company or partnership; or special purpose company.

The consequences of licensing violations can be severe. If a lender does not satisfy the requirements, then the DFSA (under the regulatory law and DFSA’s Enforcement Rulebook) can enforce the following actions as punishment:

- a fine of US$100,000 per contravention; damages or restitution;
- injunctions and restraining orders; corporate penalties – unlimited fines through the Financial Markets Tribunal (FMT); and
- a banning order through the FMT.

As a consequence of violating the Financial Services Prohibition section of the regulatory law, lenders will also face censure by way of publication of any enforcement action leading to critical reputational damage and the loan arrangement may also be considered unenforceable.

**Borrowing**

**MORTGAGE FOR PROPERTY**

In the last quarter of 2013 the Central Bank issued set of regulations (Regulations) on mortgage lending which defines the eligibility of various categories of borrowers based on a loan-to-property value ratio (LTV). The primary aim of the Regulations is to ensure that banks, finance companies and other financial institutions providing mortgage loans to UAE nationals and expatriates do so in accordance with best practice and have control frameworks in place. The Regulations applies without exemption to banks and institutions providing Shari'a-compliant loans for the purchase of properties.

Whether these Regulations would still be in force or new set of regulations would be issued by the UAE Central Bank following the implementation of the New Banking Law, remains to be seen. As of now, these Regulation would appear to continue to apply as they are still made available to banks in the Central Bank’s website. Pursuant to these Regulations, the following LTV requirements apply.

**UAE NATIONALS (INCLUSIVE OF GULF CORPORATION COUNCIL (GCC) NATIONALS)**

- Properties >AED 5 million, the LTV = 80% of the property value
- Properties <AED 5 million, the LTV = 70% of the property value
- Off-plan properties, the LTV = 50% of the property value

Each borrower is only entitled to seek a loan for one property falling within these two categories and therefore it would appear that these LTV ratios are intended for owner occupiers.

If UAE nationals seek loans for a second home or investment property, the LTV must not exceed 65% of the value of the property.

**NON GCC NATIONALS**

- Properties >AED 5 million, the LTV = 75% of the property value
- Properties <AED 5 million, the LTV = 65% of the property value
- Off-plan properties, the LTV = 50% of the property value

Each borrower is limited to one loan for the purchase of properties within these categories.

In the event of a second home or an investment property purchase by a non-UAE national, the Regulations state that the maximum loan available will be 60% of the value of the property.

UAE Law No. 2 of 2015 concerning Commercial Companies provides that shareholders in LLCs can pledge security, and that such pledges must be made in accordance with the company's memorandum and articles of association, and be notarized. For more information, see Giving and taking guarantees and security.

_Last modified 23 Jan 2020_
What are common lending structures?

Lending in the UAE can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility) or syndicated basis (multiple lenders each providing parts of the overall facility).

Syndicated facilities by their nature involve more parties (such as agents which fulfil certain roles for the finance parties), and are more highly structured, involving more complex documentation. Larger financings will typically be done on a ‘club’ or syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, eg term loans, working capital loans, equity bridge facilities, project, real estate facilities, trading finance and letter of credit facilities.

Loan durations

The duration of a loan can also vary between:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- an overdraft, provided on a short-term basis to solve short-term cash flow issues; or
- a standby or a bridging loan, intended to be used in exceptional circumstances when other forms of finance are unavailable and often attracting a higher margin.

Loan security

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security.

Loan commitment

A loan can also be:

- committed, meaning that the lender is obliged to provide the loan if certain conditions are fulfilled; or
- uncommitted, meaning that the lender has discretion whether or not to provide the loan.

Loan repayment

A loan can also be repayable on demand, on an amortizing basis (in instalments over the life of the loan) or scheduled (usually meaning the loan is repayable in full at maturity).

Shari'a and Islamic finance

Islamic banking and finance transactions are based on Islamic principles and jurisprudence (together referred to as Shari'a or Islamic law) which is derived from a number of sources, including the Qu'ran. Islamic finance structures and techniques have developed in accordance with Shari'a principles and these principles must be adhered to when deciding whether a proposed financing structure or product is Islamically acceptable.

The key principles are as follows:

- **No interest** – Under Shari'a, money is regarded as having no intrinsic value and also no time value. The payment and receipt of interest (riba) is prohibited under Islamic law and any obligation to pay interest is considered to be void. This rule also prevents a financier from charging penalties and/or default interest.

- **No uncertainty** – Uncertainty (or gharrar), particularly any uncertainty as to one of the fundamental terms of an Islamic contract (such
as subject matter, price or delivery), is considered to be void under *Shari’a*. This principle is fairly broad as it requires certainty on all fundamental terms of a contractual arrangement.

- **No speculation** – Contracts which involve any speculation are not permissible (*haram*) and are considered to be void. This does not, however, prevent a degree of commercial speculation which is evident in a lot of commercial transactions. The prohibition applies to forms of speculation which are regarded as gambling. The general test is whether something has been gained by chance.

- **Unjust enrichment/exploitation** – A contract where one party is regarded as having unjustly gained (at the expense of another) is also void. The principle also extends to the enrichment of one party who exercises undue influence or duress over the other party.

- **Investments** – The proceeds in Islamic finance should not be used for the purposes of purchasing or investing in products or activities that are prohibited. These prohibited items and activities include the manufacture and/or the sale or distribution of alcohol, tobacco, pork products, music or pornographic productions, the operation of gambling casinos or manufacturers of gambling machines – but also extend to conventional banking and insurance activities, as well as defense and weaponry.

Islamic financiers or investors work closely with *Shari’a* scholars – Muslim scholars who specialize in providing guidance on the application of *Shari’a* principles to commercial activities – to make sure that structures and products remain compliant with the rules and principles outlined above. In effect, these scholars have the controlling say in whether or not a particular structure, product or document should be approved. However, it is important to note that *Shari’a* is not a codified system of law and interpretations of the key principles can vary, particularly between the different ‘schools of thought’ within Islam.

Islamic principles do not prohibit a financier in an Islamic finance transaction from making a profit, rental or other return on its asset or investment. To that end, a number of contemporary structuring techniques (or Islamic contracts) have developed which allow Islamic bankers to structure transactions and products in a way that comply with Islamic principles while also replicating the economics of conventional loans and products. Alternatively, a structure may demonstrate that the financier has assumed some of the commercial risk inherent in an underlying transaction or business venture. Sometimes these structures or approaches can be combined.

**SOME EXAMPLES OF SHARI’A CONTRACTS**

- **Sukuk** – These are a type of certificate or note (often called Islamic bonds) which represent a proportionate interest (sometimes also described as a participatory interest) in an underlying asset or investment. They are generally considered to be debt securities (akin to bonds) which, depending on the underlying asset or transaction, can be traded in the secondary market. The Sukuk certificates are often ‘layered’ on top of an underlying Islamic financing technique which is intended to derive a return from an underlying asset or investment (such as *Ijara* – see below).

- **Ijara** – This is Islamic financing’s equivalent of leasing and is often described as a hybrid between an operating lease and a finance lease. In general terms, the financier will act as lessor and the borrower entity will act as lessee and will pay rentals to the lessor.

- **Murabaha** – The financier will buy an asset or a commodity from a supplier and will then on-sell the asset to the customer on deferred payment terms at an agreed marked-up price (cost price plus profit).

- **Wakala** – This is an agency relationship between an investor or principal (*muwakkil*) and the agent (*wakil*).

- **Istisna’a** – This is essentially a sale contract whereby the seller or manufacturer undertakes to deliver a specific asset according to certain agreed specifications. The price of the asset and the date of delivery are specified at the outset.

- **Mudaraba** – This is a contractual arrangement between investors (*rab al-maal*) and a manager (*mudareb*). The investors typically put up capital which the manager then invests.

**What are the differences between lending to institutional / professional or other borrowers?**

Lending to institutional/professional borrowers is subject to different regulatory oversight and may be less burdensome from a compliance perspective.

The Central Bank issued regulations No 29 of 2011 regarding Bank Loans & Services Offered to Individual Customers. The regulations control lending activities and excessive charges by banks and aim to protect banks by regulating lending and encouraging banks to carry out detailed due diligence on their potential borrowers. The regulations enable individual customers to borrow only up to 20 times their
salary or monthly income and requires that repayment instalments should not exceed 50% of the borrower's gross salary or any regular income from a specific source. With the introduction of the New Banking Law, it is expected that a new set of regulations for loans made available to consumers will be issued in the next 2-3 years.

For more information, see Lending and borrowing – restrictions.

Last modified 23 Jan 2020

Do the laws recognize the principles of agency and trusts?

The concept of 'trusts' and 'trustees' are more regularly referred to in the UAE as 'agent' or 'security agent' or due to concerns around trusts not being recognised onshore in the UAE. By contrast, agency is a largely recognized concept and often utilized in onshore, offshore (including the Dubai International Finance Centre) and Islamic finance structures. In Islamic transactions, if the transaction is structured in compliance with Shari’a, the addition of an agent is not uncommon, in order for them to represent a group of lenders and guard their interests.

Further, onshore and offshore entities in the UAE may require a security agent to be employed, particularly in the context of security over certain type of assets (such as shares) which is granted in the region and can only be enforced by local institutions or entities that have specific licenses. Typically, this only becomes an issue upon enforcement; however, lenders should be mindful of this as it may affect the value they place on such types of security.

It is also worth noting that parallel debt language is often used to support a security agent's rights to claim against a security provider in the UAE.

Last modified 23 Jan 2020

Are there any other notable risks or issues around lending?

Financial assistance

Under the Companies Law it is not possible for a public joint-stock company (PJSC) target, or any of its subsidiaries, to provide any financial aid (such as loans and guarantees) that will assist a purchaser in acquiring its shares. However, limited liability companies are exempt from such restrictions under Ministerial Resolution No. 272 of 2016 on the Implementation of Certain Provisions of the PJSC to LLCs.

Standard form documentation

Most syndicated finance transactions are governed by documentation based on recommended forms published by the Loan Market Association. Bilateral finance transactions are more likely to be documented on bank standard form documentation prepared in-house.

Last modified 23 Jan 2020

Are there any other notable risks or issues around borrowing?

Borrowers may often be limited in the kinds of transactions and financings they can enter into, particularly in cases where the transaction is highly structured and involves the issuance of debt securities. In addition, restrictions arise when the relevant financiers or borrowers are Shari’a-compliant. However, most of the major international lenders have their own Islamic banking desks and many retain Shari’a advisory boards. Such institutions are growing more comfortable with the main Islamic financing mechanisms.

Last modified 23 Jan 2020

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?
Some of the key areas affecting the giving of guarantees and security are as follows.

**Capacity**

It is important to check the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors' powers to do so. In general, the directors'/managers' duties requirements under the Companies Law require the directors/manager to 'preserve' the company's rights which is similar to the English law requirement that directors act in the best interests of the company. However, provided that the giving of a guarantee or the granting of security is considered to be in the best interests of the group as a whole, there should be no issues from a directors' duties perspective. This should be recorded in the authorizing resolutions when the security is granted.

**Public joint-stock company (PJSCs)**

Special care needs to be taken if a PJSC is granting security or giving a guarantee. Article 154 of the Companies Law requires directors to have express powers to enter into mortgages (over moveable and immovable property). Consequently, a separate shareholders' resolution will be required if such express powers are not already provided in, for instance, the company's constitutional documents. Although the legislation would appear to capture LLCs as well, it was clarified by a 2016 Ministerial Decision that this requirement does not apply to LLCs.

In addition, there is a broad prohibition on PJSCs providing financial assistance for the purchase of its own (or of its holding company's) shares. It is important to note that there is no 'whitewash' procedure available of the type seen in other jurisdictions.

**Insolvency**

Guarantees and security may be at risk of being set aside under the UAE Insolvency Law if granted by a company within a certain period of time prior to the onset of insolvency.

**No concept of trust**

There is no concept of trust as exists in common law jurisdictions and the use of a local security agent holding security for the benefit of lenders through a parallel debt mechanism has become market practice (although has not been tested by the courts).

**Notarization**

With respect to security over certain assets (such as share security taken with respect to certain companies), it is necessary that the signing of the security is notarized in front of a UAE notary public. In order to notarize the signing of a document, the notary public will generally require all relevant documents (such as constitutional documents of the grantor, required board or shareholder resolutions and licenses to be translated into Arabic, notarized in the relevant jurisdiction of the shareholders and then legalized both in the country of the shareholder and then brought onshore and stamped by the Ministry of Justice).

**What are common types of guarantees and security?**

**Common forms of guarantees**

Guarantees are common in the UAE and it is also quite common to see personal guarantees given in relation to a loan for commercial purposes.

Guarantees are specifically codified in Chapter V of the Civil Code. Separate rules apply to bank guarantees under the Commercial Transactions Law. Although UAE courts have taken different approaches as to whether a guarantee of a bank loan is a civil or commercial transaction, it is common to disapply certain provisions of the Civil Code which may have an impact on the lenders' position (such as Article 1092 of the Civil Code which provides that a creditor must claim for a due debt within six months from the date of maturity).

The Commercial Code recognizes bank guarantees (which often take the form of a bond). Certain rules apply to these instruments such as assignment and time limits and there is a provision that 'in exceptional circumstances', the guarantor can successfully resist payment. It should be noted that the courts have been reluctant to apply this provision.
Types of security

Security over real estate and real estate interests (such as usufructs and musatahas (akin to a development agreement) are taken by way of mortgage. Some of the Emirates (and free zones) have specific laws dealing with mortgages but in the absence of legislation, mortgages are governed by the Civil Code. Although the practices of the relevant registrars may differ (and the practice at a particular registrar might evolve as well), generally mortgages over real estate may only be granted in favor of a bank which is licensed by the UAE Central Bank, be translated into Arabic and notarized prior to registration.

In relation to moveable property, UAE Law No. 20 of 2016 on the Mortgage of Moveable Assets to Secure a Debt (Pledge Law) governs how security is taken over certain classes of moveable assets such as accounts, trade payables, equipment and tools, goods and raw materials and agricultural products. The Pledge Law provides that security over such moveable property should be by way of written security agreement or mortgage and, contrary to the previous position in the UAE, allows security to be taken over property without demonstrating possession and also allows security to be taken over future property (including bank accounts with fluctuating balances). It is therefore possible to take security over such moveable property which is similar in effect to an English debenture or law floating charge (provided that the requirements of the Pledge Law are adhered to).

We note, however, that the Pledge Law does not govern security over all moveable assets, and so care should be taken when securing a particular asset class to ensure that the security is in the correct form. For example, the Pledge Law specifically excludes insurance contracts and proceeds from its operation, meaning that any security taken over insurance contracts and proceeds should follow the traditional form (which is security by way of assignment). Security over ships, aircrafts and vehicles are also subject to different laws and regulations in the UAE. Depending on the nature of a transaction, this may require the security document to be notarized and for registration to be made in an appropriate asset register.

Due to the introduction of the new Companies Law, it is possible to take security over the shares in a company, including onshore LLCs. (It should be noted that the position differs from free zone to free zone and would need to be checked.) The process for taking security over pledges of shares should be checked with the relevant department in each Emirate as the process differs. However, generally the practice has been that this security may only be granted in favor of a bank licensed to carry out business in the UAE and is subject to notarization requirements.

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

The Civil Code provides that a lender should not be obliged to first prove the bankruptcy of the borrower before claiming against the guarantor and that the borrower and the guarantor shall not be discharged from the balance of the debt if the parties agree a composition in relation to part of the debt. These provisions can be set aside.

There is no concept of a deed under UAE law and accordingly, guarantees should be executed in the same manner as any other contract. There is also no requirement for guarantees to be notarized, although it is quite common for the signature of a personal guarantor to be witnessed.

However, if a guarantee were to be brought before a local court, it would need to be translated into Arabic by a certified translator and the Arabic version would prevail—this reason, parties sometimes require a guarantee to be translated into an agreed version of Arabic prior to execution although there is no universal practice in this regard.

Giving or taking security

As mentioned above, there is no concept of a deed under UAE law. Depending upon the type of security and where the asset is located (onshore or in a free zone), there may be a prescribed form of security (for example, the Dubai Land Department requires a short form mortgage to be registered, so a practice has developed that both a long form and short form mortgage are signed).

In relation to security taken over moveable property pursuant to the Pledge Law, in order to perfect such security it is necessary to register the security on the register established under the Pledge Law, which is known as the “Emirates Moveable Collateral Registry”. The Emirates Moveable Collateral Registry is an online registry, and so in order for a secured party to effect a registration with this registry it is...
a matter of the secured party creating an online account with the registry and then submitting via an online form the required information about the secured property and the security provider.

The registration requirements in relation to other forms of security should always be checked as there are time periods required by some free zone registries.

Last modified 23 Jan 2020

Financial regulation

Law and regulation

What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

LEGISLATION IN THE UAE

The Consolidated Constitution of the UAE (as amended) – (Article 7 establishes the Shari'a law as a fundamental source of legislation)

UAE Central Bank Federal Law No. 14 of 2018

UAE Federal Law No. 8 of 2018 on Financial Leasing

Central Bank Circulars

UAE Basel II Guidelines for Banks

Corporate Governance Guidelines 2009

Foreign Account Tax Compliance Act (FATCA)

UAE Federal Law Bo. 10 of 2018 regarding Netting

UAE Civil Code Federal Law No. 5 of 1985

UAE Commercial Transactions Law Federal Law 18 of 1993

UAE Commercial Companies Law Federal Law No. 2 of 2015

UAE Insurance Law Federal Law No. 6 of 2007

Central Bank Framework on Stored Values and Electronic Payment Systems of 2017

UAE Federal Law No. 9 of 2018 (Regarding Public Debt)

FREE/SPECIAL ECONOMIC ZONES IN THE UAE

There are over 40 free zones in the UAE currently which are set up under the laws of its host emirate regarding free zone companies and establishments. There is no federal free zone authority (although one was discussed extensively in 2007 and 2008) those free zones are given a degree of freedom to self-regulate so long as such regulation does not violate the provisions of local/national law, or constitute a violation of public morals or be contrary to public interest.
In addition to the free zones generally, Abu Dhabi Global Market (ADGM) and Dubai International Financial Centre (DIFC) are two financial free zones which have their own court system and legislative capacity.

While we do not cover the free zones in any great detail on this site, it is important to recognize that ADGM and DIFC have signed memoranda of understanding and mutual recognition with the local courts and/or federal court systems in their respective Emirates which means a decision from either of ADGM or DIFC can be enforced and executed directly through the local courts respectively without the case being heard ab initio.

- UAE Federal Law No. 8 of 2004 on the Financial Free Zones of the UAE
- DIFC Laws and Regulations
- Dubai Financial Services Authority (DFSA) Laws and Regulations
- ADGM Laws and Regulations
- The Free Zones Laws and Regulations
- Emirates Securities and Commodities Authority
- UAE Insolvency Law Federal Law No. 9 of 2016
- UAE Penal Code Federal Law No. 3 of 1987
- UAE Decree-law No. 20 of 2018 on Anti-Money Laundering

**Consumer credit**

UAE Credit Information Law Federal Law No 6 of 2010 and Cabinet Resolution 16 of 2014 (information requirements and sharing)

**Mortgages**

UAE Civil Code

UAE Commercial Transactions Law

UAE Central Bank Circular October 2013 established a loan to value ratio for mortgages

Dubai Law No. 8 of 2008 and 9 of 2009

Dubai Mortgage Law Decree No 31 of 2016

UAE Law No. 20 of 2016 on the Mortgage of Moveable Assets to Secure a Debt and its executive regulations (Cabinet Resolutions No. 5 and No. 6 of 2018). This law which came into effect on 15 March 2017 has established the Emirates Moveables Collateral Registry which is an online registry allowing the registration of security over moveables in the UAE. This law is perceived as a much welcomed addition to the UAE financial landscape (especially for cross-border financing).

**Corporations**

UAE Civil Code

UAE Commercial Companies Law Federal Law No. 2 of 2015

**Funds and platforms**

SCA Chairman's Regulation No. 9 of 2016

SCA Chairman's Regulation No. 3 of 2017
Taken together, these regulations establish procedures for licensing, management, offer document contents, subscription, issuance and listing of funds.

Funds are listed on the Dubai Financial Market and NASDAQ Dubai. There are many trading platforms available including online trading platforms.

Other key market legislation

The United Arab Emirates is a federation of seven independent states, each of which has judicial capacity. In addition, through changes to the UAE Constitution, special free economic and financial free zones have been set up to attract foreign direct inward investment, each of which has its own regulatory authority.

It is possible that in order to establish the regulatory framework applicable to a company, fund, investment scheme, or activity that one or more and potentially all of the following legislation will need to be reviewed:

- UAE Federal legislation;
- legislation passed by each individual emirate but note:
  - Ajman, Fujairah, Sharjah, and Umm Al Quwain generally follow the same or substantially similar laws and adhere to the Federal Court System; and
  - Dubai, Abu Dhabi and Ras Al Khaimah have derogated from the Federal Court System and each have their own court system or judicial departments (independent from the federal system) – they pass laws which affect their emirate alone;
- DIFC Legislation;
- The Law and Regulations enacted in each other free zone;
- DFSA Rules and Regulations;
- ADGM Legislation;
- UAE Central Bank Circulars and Resolutions; and
- UAE Securities and Commodities Authority.

Regulatory authorization

Who are the regulators?

This depends on the entity, its location and the relevant regulations and laws that apply.

The UAE is a federation of seven independent emirates each of which has its own judicial capacity. The applicable laws are those federal laws passed by the federal government of the UAE but each can be supplemented by laws passed by the rulers of individual emirates.

The UAE has a federal court system which is followed in the Emirates of Ajman, Fujairah, Sharjah and Umm Al Quwain. The Emirates of Abu Dhabi, Dubai and Ras Al Khaimah have separate court systems or judicial departments (independent from the federal system).

In addition, through changes to the UAE Constitution, two financial free zones have been created (Abu Dhabi Global Market (ADGM) and Dubai International Financial Centre (DIFC)) which have their own court systems based not on the federal Civil Code but English common law.

The Central Bank of the UAE (Central Bank) and the Securities and Commodities Authority (SCA) are the main regulatory bodies for financial services in the UAE. Pursuant to Federal Law No. 14 of 2018 (New Banking Law), the Central Bank regulates financial institutions, including those who wish to provide financing and engaged in financial licensed activities in or from the UAE. The New Banking Law replaces and repeals the Federal Law No. 10 of 1980 and Federal Law No. 6 of 1985 (together the Old Banking Laws).

Taking this together when considering the question of regulation of a particular entity or activity, it may be possible that any of the
following regulatory bodies may have authority:

- UAE Central Bank;
- UAE Securities and Commodities Authority;
- Abu Dhabi Global Market Authority Courts;
- Dubai International Financial Centre Courts;
- Dubai Financial Services Authority;
- a relevant Free Zone Authority;
- UAE Penal Code; and
- laws and regulations passed by individual emirates.

**What are the authorization requirements and process?**

This is dependent upon what type of business/financial activity the firm would be participating in the UAE. Secondly, it depends where the firm is located either onshore UAE or in one the economic free zones (in the case of finance, most likely to be in the Dubai International Financial Centre (DIFC) or Abu Dhabi Global Market (ADGM). The institutions listed in our answer to Regulatory authorization – regulators (ie the Central Bank, DIFC, Dubai Financial Services Authority and ADGM etc) have their own authorization requirements and processes in place.

If in doubt, the first port of call is the relevant Emirate's Economic Development Department who can advise further.

**What are the main ongoing compliance requirements?**

Whether the firm is located onshore or in a free zone, the firm will have ongoing compliance requirements. For example, if the firm is located in the Dubai International Financial Centre (DIFC) it will have to apply for an annual trading license from the Registrar of Companies and will need to comply with the relevant regulations and rules found in the Dubai Financial Services Authority (DFSA) Handbook. Furthermore, from time to time, the Central Bank will issue circulars with updated regulations/rules which financial firms will need to comply. In order to be clear which compliance regulations apply it is necessary to consider each case on its specific facts. But in any case, failure to comply with ongoing compliance of the relevant regulator can result in sanctions for firms including severe fines.

**What are the penalties for failure to be authorized?**

Depending on the individual circumstances, this could lead to corporate fines and trading privileges being removed, individual directors and corporate officers being held accountable personally for breaches of fiduciary duties, and in the case of compliance breaches and crimes this can include fines and/or terms of imprisonment of varying degrees of severity.

UAE lenders who enter into financial arrangements with a borrower in the UAE without a license may face imprisonment and/or a fine and the institution may be liable for civil and criminal claims. The relevant UAE authorities, such as the Central Bank of the UAE (Central Bank) and the Securities and Commodities Authority (SCA) may in addition impose administrative sanctions and fines.

In the case of the DIFC, if a relevant lender does not satisfy the requirements of the Dubai Financial Services Authority (DFSA), under the regulatory law and DFSA’s Enforcement Rulebook the DFSA can enforce the following actions as punishment:

- a fine of US$100,000 per contravention;
- damages or restitution;
- injunctions and restraining orders;
Regulated activities

What finance and investment activities require authorization?

Generally

Everything that is classified as financing and investment activities under various legislation.

Any licensed financial activities onshore in the UAE is governed by the UAE Central Bank. Depending on the category of activity, different rules and regulations and circulars will apply. Accordingly, interested parties should refer to the UAE Central Bank website where all current laws, regulations and circulars are provided. The scope of licensed financial activities is relatively broad and are listed in the New Banking Law. The board of directors of the Central Bank has also the power to review the list of licensed financial activities and add, exempt or remove certain activities from that list.

Any offshore entities conducting business activities within the UAE will need to be appropriately licensed by the UAE Central Bank. The types of licenses generally issued by the UAE Central Bank include commercial bank, investment companies and investment consultation, branches of foreign licensed institutions.

Anticipated regulatory changes

We understand that the UAE is contemplating reforming the financial services sector’s regulations, which is intended to cover, among other things, custody, collective investments and broker dealing. The UAE has recently enacted the New Banking Law. As a result, a number of regulations and circulars are expected to be implemented in the next two to three years. The New Banking Law states that the Central Bank will establish an electronic guideline (i.e. a rulebook) which will include all regulations, standards, decisions and circulars issued by the Central Bank. Such electronic guideline will be published and regularly updated on the Central Bank’s website. This will be a welcome change in the UAE (and follows the position adopted by the Dubai Financial Services Authority).

However, there currently exists something of a vaccum and market participants and practitioners should pay a close attention to the upcoming implementing regulations.

Are there any possible exemptions?

Tolerated practices

While the relevant legislation clearly prohibits entities or persons from engaging in regulated activities (unless licensed to do so), under the Old Banking Laws (i.e. Federal Law No 10 of 1981 and Federal Law No. 6 of 1985) the UAE Central Bank would not always strictly monitor performance within the regulations. These are generally referred to as the ‘tolerated practices’ in the UAE.

To fall within the scope of the tolerated practices, the activity in question must be:

- carried out from offshore and not involve local currency (being dirhams);
- ‘low profile’ (that is, targeted and marketed to a defined and select group of non-retail customers); and
- one-off (anything that involved approaching residents on an unsolicited basis, road shows etc are less likely to fall within the scope of
It is important to note that the concept of ‘tolerated practices’ is neither a legal concept nor officially recognized by the UAE Central Bank. While it has not been tested in the UAE courts, we are not aware of any examples of any action being taken against foreign entities under the Old Banking Laws. Whether these tolerated practices will be more closely regulated or supervised by the Central Bank under the New Banking Law remains to be seen.

Do any exchange controls or other restrictions on payments apply?

There are no foreign exchange controls in the UAE or restrictions on payments, except to the extent these may violate anti-money laundering rules or international sanctions.

What are the rules around financial promotions?

Under the New Banking Law, financial promotion refers to any form of communication by any means, aimed at inviting or offering to enter into any transaction, or offering to conclude any agreement related to any of the Licensed Financial Activities. Since such communications can influence consumers, entities are restricted from communicating financial promotions unless they are licensed to do so by the UAE Central Bank.

Exemptions

Even though engaging in regulated activities is clearly prohibited (unless the person is licensed to do so), the UAE Central Bank has tolerated certain practices under the Old Banking Laws. To fall within the scope of a tolerated practice, the foreign entity must ensure that, for instance:

- only a discrete and defined group of pre-identified clients (who are either institutional, professional or sophisticated clients) are approached;
- no mass advertising campaign is carried on in the UAE;
- the person marketing the product or service is not resident in the UAE; and
- marketing activities are performed from outside the UAE (except for ‘low profile’ activities).

It is important to note that the concept of ‘tolerated practices’ is neither a legal concept nor officially recognized by the UAE Central Bank. Whilst it has not been tested in the UAE courts, we are not aware of examples of foreign entities being found liable under the Old Banking Laws. Whether these tolerated practices will be more closely regulated or supervised by the Central Bank under the New Banking Law remains to be seen.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Generally

This question varies according to the type of financial activity being practiced and the rules of the emirate and free zone in which the vehicle is set up.

Pursuant to the New Banking Law:
• Banks shall take the form of public-joint stock companies (through an incorporating law or though a decree). This does not apply to branches of foreign banks operating onshore UAE. As a general rule, a Bank shall at least have 60% UAE national shareholding.

• Other Financial Institutions (i.e. any juridical person other than a Bank) carrying one or more Licensed Financial Activities may take the form of joint-stock companies or limited liability companies in accordance with the rules and regulations issues by the board of directors of the Central Bank.

• Exchange houses and monetary institutions may be a sole proprietorship or take any other form legal form in accordance with the rules and regulations of the board of directors of the Central Bank.

In the Dubai International Finance Centre (DIFC), the type of entity and activity will generally depend on which category of license being applied for.

In each case this question needs to be examined on a case-by-case basis depending on the financial or investment activity to be carried out.

Last modified 23 Jan 2020

**Is it possible to conduct lending or investment business through a branch or establishment?**

Generally, it is not possible to engage in lending or investment activities through a branch office.

Last modified 23 Jan 2020

**FinTech**

**FinTech products and uses**

*What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?*

**Peer-to-peer funding platforms and marketplace lending**

There is no strict definition for marketplace lending given the wide variety of entrants and financing techniques involved. The principal characteristics of new marketplace lenders, however, would include:

• operating from or through a non-bank lending platform established as a specialist corporate or special purpose vehicle (SPV) based structure;
• applying technology to leverage and optimize the lending platform and user experience; and
• connecting borrowers and lenders through the platform rather than applying funding arising from a wider deposit-based relationship.

Marketplace lending is available to address most forms of traditional bank funding products. Products under development are generally understood to include:

• virtual credit cards;
• consumer loans;
• student lending products;
• small and medium-sized enterprises (SME) lending; and
• residential property and commercial property mortgage lending.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over
the coming years, as financing becomes more readily available to support the marketplace lending sector.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Marketplace lending includes peer-to-peer (P2P)-type structures, often operated through an electronic platform provider as well as crowdfunding and also direct-to-retail financing mechanisms. The increase in demand for credit through these marketplace platforms has also been appealing to larger pools of available capital, such as private equity and venture capital funds, as well as institutional sponsors. Funding platforms will now often be backed by institutional finance in addition to, or rather than, individual investors on a traditional P2P basis.

ISSUES FOR STARTUP MARKETPLACE LENDERS

Following the initial incorporation and startup funding for a new marketplace lending business, there will be a need to establish funding lines which can accommodate growth of the ongoing lending activities of the platform. As the startup lender will not have an established track record, deposit base or asset pools, the funding structure will often follow the format of a warehouse securitization structure. Origination of new assets will be funded through drawings on a note issuance facility backed by security over the new assets. Each of the new assets will be subject to eligibility criteria determined by reference to the nature of the underlying asset. In order to provide an efficient financing structure, the assets will typically be held through a SPV with origination and servicing provided by the marketplace lender. In order to cover expected losses on the asset pool, the senior facility will be subject to the lending platform maintaining sufficient subordinated capital in the form of equity, or a combination of equity and subordinated debt.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain provides a new approach to holding and authenticating data. It is a database operating through distributed ledger technology in which data is recorded on computers, by way of a P2P mechanism, based on pre-agreed consensus algorithms in the applicable participating network. It is a form of database where data is stored in the chain in either fixed structures called ‘blocks’ or algorithm functions called ‘hashes’.

Each block includes unique features, such as its unique block reference number, the time the block was created and a link back to the previous block. Each block is reviewed by a number of nodes and the block is only added to the database if the node reaches consensus that the block only contains valid transactions. Content includes digital assets and instructions which reflect the transactions and parties to those transactions. The ability to track previous blocks in the chain makes it possible to identify transactions back to the first ever transaction completed, enabling parties to verify and establish the authenticity of the assets in the latest block. This makes blockchain exceptionally accurate and secure.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by all users in the network and verification of any block can only happen through a ‘proof of work’ process. This process requires vast amounts of computing power, making it practically impossible to insert fake transactions into a block.

As a result, the data is identified and authenticated in near real-time, providing a permanent and incorruptible database sufficiently robust to operate as a store of value (eg in the case of cryptocurrencies such as bitcoin) or providing an indisputable record for example relating to securities transfer.

Blockchain is a decentralized system, created and maintained by users of the network rather than being dependent on any central or third-party intermediary. It may be public and open (‘permissionless’ or ‘unpermissioned’) or structured within a private group (‘permissioned’).

Permissionless blockchains include bitcoin and ethereum, in which anyone can set up a node that once authorized can validate, observe and submit transactions. The identities of the participants are not known (other than the unique and random identities known as an ‘address’). Permissioned ledgers restrict participation in the network and only the specific participants are given access and are known within the network. The network is private, and only organizations that have been authorized can participate and view transactions.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?

Developments in blockchain are also providing an ability to transfer and rely on instructions verified within the electronic system in the
form of so called 'smart contracts'. These contracts have been converted into code and are then executed and enforced by the blockchain network on the occurrence of an event. This reduces the need for intermediaries to collect, store and act on communicated information.

Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another, or advanced, more-complex interactions with the outside world using so called 'Oracles'. With Oracles the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of the transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

**WHAT IS A CRYPTOCURRENCY?**

The European Central Bank definition of a cryptocurrency is that it is a digital representation of value that is neither issued by a central bank or public authority nor necessarily attached to a fiat currency, but is issued by natural or legal persons as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin (itself based on the bitcoin platform) although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether based on the ethereum platform and litecoin (these cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging currency).

**Initial coin offerings and token-based products**

**WHAT IS AN INITIAL COIN OFFERING (ICO)?**

ICOs are a form of digital currency or token using blockchain technology. ICOs are often a means by which funds are raised for a new blockchain or cryptocurrency venture (the market for ICOs is currently booming). ICOs come in a wide variety of forms and may be used for a wide range of purposes. Some forms of ICOs may be directed at customers or suppliers as a form of loyalty program or a form of access or purchasing power (preferential or otherwise) in respect of assets of the issuer's business. Other forms may be more focused on raising initial funding. It is essential to examine the legal and regulatory basis for any ICO, as an unauthorized offering of securities is illegal and may result in criminal sanctions in a number of jurisdictions. Legal analysis of the underlying token will determine if it should be treated as a specified investment or form of regulated security or is more appropriately a form of asset that is not itself subject to the regulatory regime.

Typical attributes provided by tokens will include:

- access to the assets or features of a particular project;
- the ability to earn rewards for various forms of participation on the platform; and
- prospective return on the investment.

Key aspects to consider will include the:

- availability and limitations on the total amount of the tokens;
- decision-making process in relation to the rules or ability to change the rules of the scheme;
- nature of the project to which the tokens relate;
- technical milestones applicable to the project;
- basis and security of underlying technology;
- amount of coin or token that is reserved or available to the issuer and its sponsors and the basis of existing rights;
- quality and experience of management; and
compliance with law and all regulatory requirements.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

The Abu Dhabi Global Markets free zone has set out guidance on its approach to ICOs and virtual currencies under the Financial Services and Markets Regulations (see here). The Dubai Financial Services Authority, the financial regulator of the Dubai International Financial Centre, has stated that it does not regulate any of these types of offerings and that ‘these offerings should be regarded as high-risk investments’.

It should be noted that any promotion of securities in the UAE (outside of the financial free zones) will require registration with the Securities and Commodities Authority (SCA) unless a qualified investor exemption applies (which does not include individuals). Public offers of securities in the UAE are outside the scope of our answer to this question.

Artificial intelligence and robo advisory systems

Automated financial advice tools, also known as ‘robo advisors’ are software tools driven by artificial intelligence (AI) that provide a variety of investment advice services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms, which produce optimized outcomes around specified parameters. Although generally of application in the asset management sector, AI and automated advice tools also impact in the banking and private wealth advisor sectors; the implications include decreased human involvement, although recent trends have included a growth in popularity of hybrid structures which combine AI and human inputs.

Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

The relevant regulation and regulator will depend on where an entity is operating in the UAE.

The UAE is a federation of seven independent emirates:

- Abu Dhabi;
- Ajman;
- Fujairah;
- Sharjah;
- Umm Al Quwain;
- Dubai; and
- Ras Al Khaimah.

The majority of regulation relevant to FinTech companies operating in onshore UAE will derive from federal laws.

The Central Bank of the UAE (Central Bank) and the Securities and Commodities Authority (SCA) are the main regulatory bodies for financial services in the UAE. Pursuant to Federal Law No. 14 of 2018 (Banking Law), the Central Bank regulates financial institutions,
including those who wish to provide financing in or from the UAE. A FinTech company operating in onshore UAE conducting, for instance, peer-to-peer (P2P) lending-type activities, would require a license under the Banking Law in order to legally operate.

In addition, through changes to the UAE Constitution pursuant to Federal Law No. 8 of 2004, two 'Financial Free Zones' have been created:

- Abu Dhabi Global Market (ADGM); and
- Dubai International Financial Centre (DIFC).

These two financial free zones are entitled to make their own financial regulations and are consequently regulated separately from onshore UAE, certainly in respect of financial activities. The regulators are the Financial Services Regulatory Authority (FSRA) for ADGM and the Dubai Financial Services Authority (DFSA) for DIFC.

Both of these financial free zones have specific licensing regimes for companies wishing to operate in the financial services sector. Interestingly, however, both ADGM and DIFC have created sandbox-type regimes for FinTech companies specifically, namely: the [ADGM RegLab](#) and the DIFC’s [Innovation Testing License](#).

Although FinTech is at an early stage of development in the UAE, the UAE is promoting a number of initiatives to be at the forefront of FinTech developments, such as:

- FinTech Hive at the DIFC (see [here](#));
- Dubai Future Accelerators (see [here](#));
- Dubai Blockchain Strategy (see [here](#)); and
- the UAE’s National Innovation Strategy (see [here](#)).

### Electronic payments platforms and regulation of peer-to-peer lenders

**UAE**

The Regulatory Framework for Stored Values and Electronic Payment Systems (Payment Systems Regulations) issued by the UAE’s Central Bank came into effect on 1 January 2017. The Payment Systems Regulations apply to Payment Service Providers (PSPs), which are effectively any entity that provides digital payment services (including using electronic, mobile or magnetic means but excluding credit and debit card payments) within the UAE.

The Payment Systems Regulations further define the concept of a PSP into four distinct sub-categories:

- **Retail PSP** – authorized commercial banks and other licensed PSPs offering retail, government and P2P digital payment services as well as money remittances;
- **Micropayments PSP** – PSPs offering micropayments solutions facilitating digital payments targeting the unbanked and under-banked segments in the UAE;
- **Government PSP** – federal and local government statutory bodies offering government digital payment services; and
- **Non-issuing PSP** – non-deposit taking and non-issuing institutions that offer retail, government and P2P digital payment services.

The Payment Systems Regulations also apply to so-called ‘Stored Value Facilities’, defined as non-cash facilities, whether in electronic or magnetic form, that are purchased and used by an individual or legal person to pay for goods or services. The Payment Systems Regulations provide that these services include:

- cash-in services (the exchange of cash for digital money, which is placed in a payment account);
- cash-out services (the exchange of digital money for cash, which is taken out of the payment account);
- retail credit/debit digital payment transactions;
- government credit/debit digital payment transactions;
- P2P digital payment transactions; and
• money remittances.

The Payment Systems Regulations also provide a list of services excluded from the Payment Systems Regulations as follows:

• payment transactions in cash without any involvement from an intermediary;
• payment transactions using a credit card/debit card;
• payment transactions using paper checks;
• payment instruments accepted as a means of payment only to make purchases of goods/services provided from an issuer/any of its subsidiaries (ie closed-loop payment instruments);
• payment transactions within a payment/settlement system between settlement institutions, clearing houses, central banks, and PSPs;
• payment transactions related to transfer of securities/assets (including dividends, income, and investment services);
• payment transactions carried out between PSPs (including their agents/branches) for their own accounts; and
• 'Technical Service Providers'.

In the above exclusions, 'Technical Service Providers' is perhaps the least apparent but these are effectively defined in the Payment Systems Regulations as an entity that 'facilitates the provision of payment services to PSPs', without at any time being in possession of or transferring any funds. Examples cited include data processors, authentication service providers, payment terminal maintenance companies and network providers.

DIFC

The DIFC Innovation Testing License provides a controlled environment for a firm to develop and test FinTech ideas without being subject to all the requirements that would otherwise apply to it as an 'Authorized Firm' under the DIFC rules and regulations. To be considered for this type of license, a firm must:

• involve innovation and the use of FinTech (ie have a business model, product or service that uses new, emerging or existing technology in an innovative way, and in a way that brings a new benefit to consumers or industry);
• involve an activity that, if carried on in the DIFC, would amount to a 'Financial Service' (or combination of 'Financial Services') within the scope of the DFSA's regulatory regime, for example, arranging deals in investments or advising on financial products;
• be ready (or soon be ready) to start testing with customers or industry; and
• intend to roll out its business on a broader scale in or from the DIFC after it has successfully completed testing.

The testing period will be for a finite period of time, normally six to 12 months. In exceptional cases, the DFSA will consider extending that period.

Beehive was the first P2P lending platform to receive a license from the DFSA to operate in the DIFC.

ADGM

According to the ADGM RegLab brochure ('The Regime For FinTech Innovation'), the ADGM RegLab is for all participants active in the FinTech space, from startups to existing, regulated companies. To qualify, the participant must be able to demonstrate that it has an innovative technological solution that is at the stage of development ready for testing. The solution should contribute to the development of the financial sector in UAE. In particular, it should:

• promote growth, efficiency or competition;
• promote risk management and better regulatory outcomes; or
• improve consumer choices.

The first five FinTech companies to be admitted to the ADGM RegLab were announced in May 2017 (see here).

Regulation of payment services
Organizations that wish to commence and maintain digital payment services must comply with the Payment Services Regulations. If such a service falls within the Payment Services Regulations, a company needs to make sure that they (among other things):

- apply for and obtain the requisite licenses/approvals from the Central Bank, before commencing new digital payment services;
- have the facility to store and retain all user and transaction data exclusively within the borders of the UAE (excluding the UAE financial free zones) for a period of five years from the date of the original transaction;
- three months before the implementation of any outsourcing of an operational function, have written approval from the Central Bank and ensure such services are provided onshore in the UAE under a contract which satisfies the relevant safeguard requirements;
- prepare customer service agreements which meet the required standards of the regulation and ensure those agreements are put in place with all users; and
- do not use or process any form or type of virtual currency.

Application of data protection and consumer laws

At a UAE federal law level, there is no specific federal data protection or privacy law, although there are several laws which relate to data protection and privacy. Within each UAE emirate, the applicable law is a combination of:

- federal law, which applies, in the main, across the UAE;
- the law of the emirate in which business is being undertaken (to the extent that this law is different to, but not inconsistent with, the federal law); and
- free zone legislation (such as ADGM and DIFC legislation).

The Federal Law No. 24 of 2006 on Consumer Protection defines consumer's rights and obligations and outlines certain protection measures to fight monopoly, overpricing and fraudulent commercial activities against consumers.

Money laundering regulations

The UAE Decree-law No. (20) of 2018 on Anti-Money Laundering and Combating the Financing of Terrorism and Financing of Illegal Organisations provides a list of criminal offences and penalties, as well as the institutional arrangements regarding anti-money laundering and combating terrorism financing. Both DIFC and ADGM have their own anti-money laundering regimes as well.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

Initial investment in FinTech businesses may be provided by family and friends of the founders and other high-net-worth individuals (often known as business angels) in return for an equity stake. Such seed investment is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company's development. The seed investors would typically not require the same controls over the business as, for example, venture capital providers.

CROWDFUNDING

The crowdfunding sector may be appropriate for a FinTech business in the early stages. It involves members of the public investing in a business by pooling their resources through an intermediary platform, such as Crowdcube or Crowdfunder.
There are two main types of crowdfunding: equity and reward-based.

- Equity crowdfunding involves company shares being given in exchange for investment in the business.
- Reward-based crowdfunding provides investors with a tangible benefit, such as early access to a platform or application that the business is developing.

Crowdfunding offers a large number of private investors an opportunity to make small-scale investments in early-stage businesses to which they may otherwise not have had access.

In the UAE, crowdfunding was not until recently provided for and those seeking to raise capital by such means would have had to work within the general financial regulatory framework in the UAE, including in relation to offers of securities. However, in August 2017 the Dubai Financial Services Authority (DFSA) launched its crowdfunding regulatory framework for loan and investment-based crowdfunding platforms, the first such framework among the Gulf Cooperation Council countries.

### ACCELERATORS

Both the Dubai International Financial Centre (DIFC) and the Abu Dhabi Global Market (ADGM) have their own accelerators, as more fully described in FinTech products and uses – particular rules; performing financial services in or from the DIFC or the ADGM requires a license from the DFSA or the Financial Services Regulatory Authority (FSRA) respectively.

### Venture capital and debt

Venture capital (VC) funding is a type of equity investment usually targeted at early stage FinTech companies with an established business and some trading history. VC provides a viable alternative to traditional lending, given that the business is unlikely to have the tangible asset base or long track record needed to attract traditional debt funding from financial institutions.

Corporate venture capital (CVC) is a type of VC and involves an equity investment by a corporate fund, examples of which include Santander InnoVentures and Citigroup's Citi Ventures. The benefit of having a CVC as an investor for a FinTech startup is that the fund is able to share its knowledge and expertise of the FinTech sector with the company and act as an advisor.

An additional funding option is venture debt, which is typically structured as a three-year term loan (or series of loans), which is secured against a company's assets and includes an equity element allowing the debt provider to purchase shares in the company. However, venture debt providers will usually only invest into companies that have already received investment through VC.

### Warehouse and platform funding

Warehouse financing may be suitable for FinTech companies which own a portfolio of assets. Funding is often provided by way of a loan from a small number of lenders to a special purpose vehicle (SPV). The loan is secured on the assets acquired by the SPV from the originator. The lenders will only fund a portion of the assets, with the remainder being financed by way of subordinated lending from the originator.

Some FinTech companies may see warehouse funding as a temporary form of financing to be followed by a larger capital markets transaction at a later date.

Another alternative form of funding is by way of peer-to-peer (P2P) lending platforms, which bring individual borrowers and lenders together without the involvement of traditional banks. Beehive was the first P2P lending platform to receive a license from the DFSA to operate in the DIFC.

### Senior bank debt and capital markets funding

As in many jurisdictions, listings via equity capital markets or debt capital markets are an option only for those of a certain size (local securities laws present various hurdles). Other debt financing options may be possible but, at this stage, equity and VC investment is a more common funding course for FinTech developers/users.

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.
Incentives and reliefs

One of the biggest attractions for corporates wishing to setup in the UAE (whether offshore or in the free zones) is the fact that the UAE is a (near) tax-free jurisdiction. Setting up in onshore UAE is more difficult for international firms given the rules around local ownership; however, the financial free zones are specifically setup to incentivize international corporates. They also offer clients a 50-year guarantee of zero taxes on corporate income and profits, complemented by the UAE’s network of double taxation avoidance treaties.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

The most common ways of selling loans are:

- **Novation** – A novation is a full legal transfer of the party’s rights and obligations. It is a tripartite arrangement between the existing parties and the transferee and results in a fresh contract being formed between the continuing party and the transferee and the transferor being released from its obligations.

- **Assignment** – An assignment is a transfer of rights only. There is some doubt as to whether an assignment can be done without an acknowledgment of the debtor and case law varies from Emirate to Emirate. For this reason, it is good practice to ensure that the debtor consents to and acknowledges any assignment.

- **Sub-participation** – A sub-participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Sub-participations involve the buyer taking on double credit risk, both on the seller as well as the borrower.

Similar to other jurisdictions, loan transfers are commonly documented using standard form contracts made available by the Loan Market Association. However, as mentioned in Giving and taking guarantees and security, as the concept of trust does not exist in the UAE, it will be necessary to consider any security arrangements governed by UAE law and it would be usual for a transferee to accede to any security agency arrangements.

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan. Some key considerations include:

- **Confidentiality** – whether the seller of the loan is allowed to disclose information relating to the loan to a potential purchaser;

- **Data protection** – whether there is any personal data or other restricted information in the loan that should not be disclosed to a potential purchaser. In this respect, reference should be had to UAE data protection legislation;

- **Lender eligibility** – whether there are any restrictions around the type of entity to which the loan can be transferred;

- **Undrawn commitments** – whether there are any continuing obligations for further funding or other material obligations on the part of the lender that may fall on the transferee or reduce claims made by the transferee;

- **Transfer mechanics** – whether there are any steps that need to be taken to transfer the loan in accordance with its terms; and

- **Security arrangements** – whether it is necessary for the new lender to accede to a security agency agreement or appoint a security agent on its behalf to hold security (if the security is of a type which needs to be granted in favor of a bank who is licensed by the Central Bank to carry out business in the UAE).
Projects

Financing / investing in energy / infrastructure

To what extent are energy and infrastructure assets publicly or privately owned?

Generally

Article 23 of the UAE Constitution provides that: ‘The natural resources and wealth of each Emirate shall be considered the Public Property of that Emirate. Society shall be responsible for the protection and proper exploitation of such natural resources and wealth for the benefit of the national economy.’

In general, although the ownership structure of an infrastructure project varies according to its type, it is generally the case that a government or quasi-government entity will be involved in it and benefit financially from the project. The actual involvement varies on a case-by-case basis.

Energy

ABU DHABI

Abu Dhabi National Oil Company (ADNOC) and its subsidiaries are part (usually the majority shareholder) in every project regarding the exploitation of its hydrocarbons. Traditionally because the Abu Dhabi hydrocarbon industry is mature, foreign stakeholders would enter into long-term concession agreements but with respect to newer fields, some of these have been placed on a production sharing agreement basis. More detailed information about the difference between concession agreements and productions sharing agreements is available on request.

DUBAI

Dubai’s hydrocarbon industry has been in decline for many years and started out with minimal reserves in comparison to the Emirate of Abu Dhabi. Previously its hydrocarbon production was done on the basis of concession agreements with strategic investors. Dubai’s Emirates National Oil Company (ENOC) remains a key player but much of its activity is now on the midstream (transmission and refining and sales and marketing through its chain of petrol stations).

SHARJAH

The government works closely with one of the largest privately – owned oil companies in the Gulf, Crescent Petroleum and Crescent Enterprises, which is owned by the Jafr family, on most hydrocarbon projects, whether oil or gas,. In addition, Crescent Petroleum is a 20% shareholder of the listed company, Dana Gas. Its gas reserves are more significant than its oil reserves.

The Northern Emirates of Ajman, Fujairah, Ras Al Khaimah and Umm Al Quwain have negligible hydrocarbon resources but were viable fields to be discovered, then there is a strong possibility that they would use a similar model to that adopted by the other governments in the Emirates.

Renewables

Increasingly pressure is being put on the UAE and its Gulf Cooperation Council (GCC) neighbors to reduce their carbon footprints. Accordingly a number of Emirates are responding enthusiastically to this challenge.

ABU DHABI

Masdar City is an integrated green development company and wholly owned subsidiary of Mubadala Development Company PJSC, a state-owned holding company and wholly-owned investment company set up to diversify Abu Dhabi's economy.

In addition, Mubadala has invested in solar power and has started to consider other renewables projects such as wind and wave power. While all projects are at an early stage, there is considerable optimism that investment in solar power will continue to grow due to the
abundance of sunlight available in the UAE,

**DUBAI**

While not as robustly as Abu Dhabi yet, Dubai has already invested in solar power, commissioning a 200 MW solar project located in Mohamed Bin Rashid Solar Park.

**Electricity and water**

Each of the seven Emirates has a government-owned monopoly supplier of water and electricity services.

In summary, investment in any conventional and alternative power projects in UAE will involve significant interface and contracting with a government or quasi-government entity to some degree.

The Emirates have a nascent nuclear program which is under the direct control of the International Atomic Energy Agency but the initiatives are implemented through the Emirates Nuclear Energy Corporation.

**Telecoms infrastructure**

There are two majority government-owned providers of telecommunications services in the UAE, Etisalat being the older entity (set up in 1976) and Du. While the majority shareholders are government-owned or backed companies, Du has over 20% public ownership and it is listed on the Dubai Financial Market.

The regulator of the Telecommunications networks is the Telecommunications Regulatory Authority (TRA).

**Transport infrastructure**

This depends on the type of transport.

Generally, the Road and Transport Authority in Dubai (RTA) is responsible for roads, monorail and marine; each of which has its own section under the general supervision of the RTA.

At a federal level, transport is regulated and supervised through the Ministry of Infrastructure and Development.

**Aviation**

Each of Abu Dhabi and Dubai has its own international airline, Etihad and Emirates respectively. All aviation issues are regulated by either Dubai Civil Aviation Authority or the General Civil Aviation Authority for other Emirates.

Developments and investment in aviation will involve contracting with a quasi-government entity, including services contracts in the airports and around the aviation infrastructure.

---

**Are there special rules for investing in energy and infrastructure?**

**Generally**

There is no specific regime governing or restricting investment in energy or infrastructure projects in the UAE except to the extent that may be set out in UAE Law and an invitation to tender (ITT) for such projects.

In addition, the ownership of the infrastructure must not violate the laws of foreign ownership of land and assets by a foreign national and company laid down in the New Commercial Companies Law, Federal Law No. 2 of 2015 (CCL) or any relevant regulations and circulars issued by the UAE Central Bank.

The interested investment party will need to examine the ITT carefully to ensure it complies with any specific requirements for that project including specific procurement provisions there may be. To this end the UAE public procurement legislation may be relevant.

A particular proposed investment may be subject to legislative or regulatory control (eg merger control rules). As regards the planning
and implementation of the underlying energy or infrastructure project (in which the investment is to be made), the legal/regulatory position relevant to that project must be considered. For example, a project involving development on land will require planning permission or a development consent order, and a project may require environmental authorizations/permits and/or sector specific regulatory consents or licenses. If a public body (eg a government department, or a local authority) is procuring a project using private finance, and the public body is to benefit from central government funding towards the cost, the project will be subject to central government approval. Key sector-specific issues are flagged in the sections below.

There are specific rules governing the ownership of land in each of the seven Emirates. Some of the free zones allow purportedly 100% foreign ‘freehold’ ownership of land. However, this applies only to residential property. With the exception of nationals from other Gulf Cooperation Council countries (GCC) it is generally very difficult for foreign nationals or companies to own land to develop for commercial purposes.

It follows from the above paragraph that any foreign investors in infrastructure projects must do adequate due diligence to ensure they can secure use of the land on which the infrastructure is to be built for the entire duration of the project. Failure to secure such rights will have a serious economic effect on the project.

Energy

Energy projects in the UAE are complex due to arrangements in respect of licensing, subsidies and revenue flow structure. In addition, current regulations are apt to change frequently, meaning that investors will need to have a good understanding of the current framework and the potential directions in which the market may move. Investors need to understand how political and technology changes may impact on the overarching regulatory framework.

Since natural resources belong to the public as a whole, another issue to address in project documentation will be that of ‘sovereign immunity’ and specific warranties and waivers need to be included in the project documents.

Specifically with respect to energy infrastructure projects and power generation, the investor should pay attention to the power purchase agreement/offtake agreement/tolling agreement etc, as if the off-taker is a government or quasi-government entity, it is possible that the project will not be able to sell its power/services at a full-y commercial rate which will impact the commercial value and project economics.

Other infrastructure

On other forms of infrastructure, much of the regulation and standard contracting terms should be set out in the ITT.

It is likely that long-term projects will include ‘change in control’ clauses which restrict change in ownership structures. For example, in most sectors there is a restriction on change in control during the construction period but this is often relaxed post construction provided any change in control is not to an ‘Unsuitable Third Party’.

How strict these restrictions are will often depend on the sector. For example, the energy sector has a deep-rooted fear of contractors bringing sub-contractors from cheaper territories, which is often considered to infer there may be quality and performance issues. As a result, the project sponsor will often require strict non-assignment provisions to ensure an assignment cannot be made without its reasonable consent.

Specific restrictions may be included depending on the nature of the project and how revenue for the project parties is being raised and shared. In general, in the UAE most infrastructure projects will use as their contracting base variations of internationally recognized contracts especially AIPN, FIDIC and JCT. In addition, most project financing follows international best practice and often involves the use of Loan Market Association standard agreements. While form is familiar, the details will be specific to the project and the project sponsor.

What is the applicable procurement process?

These issues must be understood on a case-by-case basis.

What are the most common forms of funding / investing in energy and infrastructure?
In the UAE, the principal forms of private sector funding/investment in energy and infrastructure are:

- loans made on a corporate finance basis (balance sheet debt, which may include Shari'a compliant financing);
- loans made on a project-finance basis (to a special purpose project company domiciled either in a UAE free zone or in a traditional offshore jurisdiction such as the Cayman Islands or British Virgin Islands) on medium- to long-term bases – such loans may later be syndicated to other funders;
- bond finance; and
- refinancing of the debt in operational projects.

Restructuring

Enforcement and sanctions

When can there be regulatory investigations?

This question needs to be considered from two main perspectives:

- firstly, is the activity itself regulated; and
- secondly, if regulated, by which body or bodies?

While it sounds simple it needs to be established which authority or authorities may regulate a given activity. From a lender's point of view, the UAE Central Bank has published numerous regulations and produced circulars that inform banks as to the necessary capital adequacy ratios and also provided many circulars on internal regulatory controls. Breach of these by the banks could see preventative and punitive action taken against them by the UAE Central Bank.

If a lender, or in a syndicated loan situation, lenders are based in Dubai International Financial Centre (DIFC), then breaches by them of the Dubai Financial Services Authority (DFSA) regulations could see sanctions imposed, or if they exceed the terms of their licenses this can lead also to regulatory problems. The same can be said for lenders based in Abu Dhabi Global Markets (ADGM).

If the lenders have not done sufficient due diligence on their clients and performed their obligations under the Anti-Loney Launderung Law, then this may also constitute a regulatory breach. For instance, they may have been in receipt of funds from either sanctioned countries or blacklisted people and entities.

As well as initial breaches such as those set out above, as the term of infrastructure projects tends to be long and financing arrangements commensurate with the term, the lenders need to ensure that they maintain all regulatory controls throughout the term of the financing. What this looks like in practice will depend on the financing structure and will be different for term credit facilities opposed to revolving credit facilities. In addition to regulatory issues there could be contractual problems for example for failure to be able to make ‘repeated warranties’ or satisfy conditions subsequent.

What regulatory penalties may apply?

This depends on the nature of the transgression but can be anything from fines to suspension and revocation of licenses.

What criminal penalties may apply?

There are many circumstances that can lead to criminal penalties for individuals involved in corporate wrongdoing and these have been expanded for directors under the new provisions of the Federal Commercial Companies Law, the Banking Law, the Bankruptcy Law and the Anti-Money Laundering Law.
There are criminal penalties for anyone that has been liable for transgressions under the Foreign Corrupt Practices Act; The UK Bribery Act; Dubai Financial Services Authority anti-money laundering and bribery regulations; as well as people engaged in business practices that may amount to violations of the UAE Penal Code Federal Law No. 3 of 1987. These go from fines to periods of imprisonment for the most serious offences.

Note that if a crime has been committed in either of the Financial Free Zones or Free Zones, the provisions of the UAE Penal Code will prevail.

Last modified 23 Jan 2020

Tax

Tax issues

Are stamp, registration, transfer or other similar taxes applicable?

Are there stamp, registration, transfer or other similar taxes payable on the advance, transfer or assignment of a loan?

ADVANCE OF LOAN

No stamp, registration, transfer or other similar taxes are payable on the advance of a loan. However, a customer may be required to pay value added tax (VAT) in connection with fees for certain products or services provided by a bank in respect of a loan.

TRANSFER OR ASSIGNMENT OF A DEBT UNDER A LOAN

No stamp, registration, transfer or other similar taxes are payable on the assignment or transfer of a debt under a loan.

Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?

Certain security interests created under United Arab Emirates (UAE) law must be registered in order to perfect the security and ensure that it is valid against third parties. For example:

- The grant of any security interest over real estate needs to be properly registered at the land department (in the relevant Emirate where the real estate is located) in order to ensure that the security interest takes effect as a mortgage. A registration fee will typically be payable to the relevant land department and the amount of that fee will depend on the amount secured and/or the value of the property (in accordance with their published fees at the relevant time).

- The grant of any security interest over moveable collateral pursuant to UAE Law No. 20 of 2016 on the Mortgage of Moveable Assets to Secure a Debt is required to be registered at the "Emirates Moveable Collateral Registry", which will attract nominal security registration fees.

- The grant of any security over shares in a UAE company may also need to be registered at the economic department or at the relevant free zone authority (i.e., in the relevant Emirate or free zone where that company is registered). A registration fee will also be payable to the relevant economic department or relevant free zone authority (in accordance with their published fees at the relevant time).

Other forms of registration may also be required (or be advisable), depending on the nature of the asset over which security is being taken. Such registrations may also require the payment of fees.

If security needs to be registered, then in certain circumstances it will also be necessary for the security document to be notarized before a notary public in a certified Arabic text (which may also include English, in a dual-text format). This process will involve additional costs in terms of translation charges and notary fees. A notary public will also require proof of authority for signatories, which can involve constitutional documents and resolutions needing to be translated then formally attested and/or legalized before they will be accepted.

Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or
assignment of a debt security (eg a bond)?

ISSUE OF DEBT SECURITIES

No stamp, registration, transfer or other similar taxes are payable in the UAE on the issue of a debt security (eg a bond). However, it is possible that a securitization structure or an Islamic bond (sukuk) may incur registration or transfer fees depending on the underlying transaction structure (for example, if real estate is involved).

TRANSFER OF BONDS

No stamp, registration, transfer or other similar taxes are payable in the UAE on the transfer or assignment of a debt security (eg a bond).

Are any filings or registrations with the local tax authority required in connection with a loan or a debt security (eg a bond)?

No. It is not necessary to file, register or record a loan or debt instrument with any tax authority, public authority or government agency in the UAE, save that:

• all documents brought before the UAE courts must be in Arabic (or accompanied by a court-certified translation); and
• any applicable court or other fees must be paid upon any court filing of those documents for enforcement purposes in the UAE courts.

However, a bank or any customer operating in the UAE should be registered separately with the FTA for VAT purposes.

Do tax authorities take priority on enforcement?

Preferred creditors (including any amounts owed to the government) will take priority over both ordinary unsecured creditors and secured creditors.

We note that the new United Arab Emirates (UAE) Federal Bankruptcy Law came into effect on 29 December 2016, and this law similarly provides that amounts payable to government authorities are considered to be preferred debts. However (to our knowledge) this law remains relatively untested before the UAE courts and so we are unable to express a view on the scope or application of that new law (or its executive regulations, if any) on preferred creditor status.

Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

No.

Would the same analysis apply to interest payments under a debt security (eg a bond)?

Yes.

Are foreign lenders and debt security holders subject to tax on interest payments?

Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (eg by virtue of incorporation, residence or local branch)?
Would the same analysis apply to interest payments under a debt security (e.g., a bond)?

Yes.

Issuing and investing in debt securities

Are there any restrictions on issuing debt securities?

The offering and sale of debt securities is subject to both federal and state securities laws.

For an issuance of debt securities to be permitted under federal law, the issuance must either be registered under the Securities Act of 1933 (Securities Act), or the issuance must be exempt from registration pursuant to an exemption from the registration requirements of the Securities Act.

For certain debt securities, the Trust Indenture Act of 1939 (TIA) will also apply. However, the TIA does not apply to private placements. As a result, only debt securities issued in a registered offering, or subsequently registered in an ‘A/B exchange offer’ will be subject to the TIA. However, indentures for debt securities issued in the high yield market may incorporate by reference all, or a portion, of the TIA, although this is fading as a market practice.

State securities laws (known as ‘blue sky’ laws) regulate both the offering and sale of debt securities as well. However, federal law pre-empts state securities laws for certain types of offerings, particularly registered offerings.

What are common issuing methods and types of debt securities?

Debt securities may be offered either in a registered offering or an unregistered offering which is exempt from registration.

Registered offerings of debt securities are most common in the investment grade context, where many issuers are ‘well-known seasoned issuers’ (WKSIs) and can therefore rely on the filing of an automatically effective registration statement on Form S-3 for the offering. For issuers which are not WKSIs, a registration statement would have to be filed, reviewed by the Securities and Exchange Commission, and only after the review was completed and the registration statement declared effective could the offering commence.

To avoid the delay of the registered offering process, many issuers rely on exemptions from the Securities Act of 1933 (Securities Act) to complete debt securities offerings. Two of the principal exemptions utilized in the debt securities market are Section 4(a)(2) of the Securities Act and Rule 144A issued under the Securities Act.

Section 4(a)(2) exempts from the registration requirements of the Securities Act ‘transactions by an issuer not involving any public offering.’ A broad range of private placements may be structured to rely on the exemption under Section 4(a)(2), including offerings arranged by the issuer directly and offerings where an investment bank acts as a placement agent. Among these are private placements which rely on the safe harbor provided by Regulation D.

Rule 144A provides a resale exemption, which is commonly relied upon in connection with debt securities offerings where an investment
bank acts as an initial purchaser (similar to an underwriter) of the debt securities, then resells the debt securities to the ultimate purchasers. Rule 144A is not an exemption which is available to the issuer for the initial sale to the investment banks (that issuance is usually a Section 4(a)(2) private placement). Securities issued initially in a Rule 144A offering may be subsequently registered under the Securities Act through an ‘A/B exchange offer.’

Numerous types of debt securities are offered in US markets. Among the most common are:

- debt securities issued by a corporate issuer, including fixed-rate securities, floating-rate securities, variable-rate securities, zero-coupon securities, Payment-in-Kind (PIK) toggle bonds and high-yield bonds;
- asset-backed securities;
- government securities (federal government bonds and bills, state and local municipal bonds, and bonds issued by government-controlled entities);
- derivative securities such as securities linked to the value of one or more reference assets including shares, commodities, interest rate, currency rate or ndex and credit-linked notes; and
- equity-linked securities such as convertible bonds (debt securities convertible into the equity of the issuer).

What are the differences between offering debt securities to institutional / professional or other investors?

The US debt securities market is dominated by institutional investors. Non-institutional investors typically participate in the debt securities market through institutional vehicles such as Exchange Traded Funds (ETFs) and mutual funds.

When is it necessary to prepare a prospectus?

Any registered securities offering under the Securities Act of 1933 will require the preparation and filing of a prospectus. Rule 144A only requires certain limited disclosures to be made to investors, however market practice typically requires substantially the same disclosure in a Rule 144A offering as in a registered securities offering.

What are the main exchanges available?

Debt securities in the US are not typically exchange listed, however all of the major exchanges including the New York Stock Exchange and NASDAQ permit the listing of debt securities.

Is there a private placement market?

Yes, there are multiple private placement markets and sub-markets in the US. Insurance companies invest in private placements on a series of model forms promulgated by the American College of Investment Counsel. On the other hand, the market for high-yield bonds does not have a single dominant documentation standard.

Are there any other notable risks or issues around issuing or investing in debt securities?
Issuing debt securities

An issuer of debt securities will be subject to certain of the anti-fraud protections of the US federal and state securities laws. As a result, an issuer of debt securities may be subject to claims from purchasers based upon the accuracy of the disclosure provided at the time of issuance, which would not apply in a loan transaction.

Investing in debt securities

As a holder of debt securities, the investor is typically not in direct contractual privity with the issuer and must rely upon a trustee to act on behalf of all the holders. As a result, collective action problems can develop, as different investors may have divergent interests and incentives.

Establishing and investing in debt / hedge funds

Are there any restrictions on establishing a fund?

A US investment vehicle that is deemed an 'investment company' under US law and cannot rely on an exception or exemption from registration will generally be required to:

- register with the US Securities and Exchange Commission (SEC) under the Investment Company Act of 1940 (ICA); and
- register its public offerings under the Securities Act of 1933 (Securities Act).

If registration is required, the investment company will be subject to various requirements and restrictions, including significant limitations on the ability of the investment company to make carried interest/performance fee payments to its investment manager.

Private investment funds, including hedge funds and debt funds, generally rely on the exceptions to the registration requirement set forth in Sections 3(c)(1) and 3(c)(7) of the ICA.

Section 3(c)(1)

Section 3(c)(1) of the ICA excepts any issuer whose outstanding securities (not including short-term paper) are beneficially owned by 100 persons or fewer and that is not making (and does not propose to make) a public offering of such securities. Where an entity holds more than 10% of the outstanding securities, the numerical cap on investors includes a 'look-through' to the ultimate owners of that entity. In practice, look-through determinations often require a complex law and fact analysis.

Pursuant to Securities Act requirements, an issuer availing itself of the section 3(c)(1) exception can raise an unlimited amount of capital, but all the investors must be sophisticated, and no more than 35 can be sophisticated without also being 'accredited investors.' If a general solicitation for investment is made, all investors must be 'accredited investors.'

Section 3(c)(7)

Section 3(c)(7) of the ICA excepts any issuer whose outstanding securities are owned exclusively by persons who, at the time of acquisition of such securities, are 'qualified purchasers' and that is not making (and does not propose to make) a public offering of such securities. Unlike the section 3(c)(1) exception, the Securities Act does not limit the number of investors, but private funds relying on the section 3(c)(7) exception generally cap investors at 1,999 (or less) in order to avoid registration requirements under the Securities Exchange Act of 1934.

A fund sponsor may be required to register as an Investment Adviser under the Investment Advisers Act of 1940.

What are common fund structures?

Most private funds offered to investors who are subject to US tax are generally limited partnerships or limited liability companies (LLC). US
entities are generally formed under the laws of a US state, rather than under national law. Most private funds are formed in Delaware.

In a master-feeder fund structure, the US feeder is generally a limited partnership or LLC formed in Delaware, while the offshore feeder and the master fund are formed or otherwise organized in a non-US jurisdiction. In most instances, a master fund will be taxed as a US partnership, which may require the filing of an election to that effect with the US Internal Revenue Service.

There are other fund structures common for registered investment companies which are not covered here.

Last modified 24 Jan 2020

What are the differences between offering fund securities to professional / institutional or other investors?

Retail funds

Offerings made to the public must be registered with the Securities and Exchange Commission (SEC) under the Securities Act of 1933 (Securities Act) unless an exemption from registration is available. Importantly, if a fund publicly offers its securities, it loses the ability to rely on the Section 3(c)(1) or 3(c)(7) exemptions from registration under the Investment Company Act of 1940 (ICA). If a fund elects to make a public offering of its securities it must create disclosure materials that comply with the requirements of the Securities Act and obtain SEC review thereof, and observe the rules set forth in the Securities Act and the Securities Exchange Act of 1934 (SEA) relating to the conduct of such offerings. Such a fund generally would also be subject to the provisions of the ICA, including the prohibition on performance-based compensation.

Institutional/professional funds

Offerings made to professional or institutional investors are typically made via an exemption from registration under the Securities Act, Regulation D, that permits private offerings to ‘accredited investors’ with limited oversight by the SEC. ‘Accredited investors’ include:

- a person whose individual net worth (or joint net worth with that person's spouse) exceeds USD1 million or who had an individual income in excess of USD200,000 in each of the two most recent years or joint income with that person's spouse in excess of USD300,000 in each of those years and has a reasonable expectation of reaching the same income level in the current year; and
- an entity, not formed for the specific purpose of acquiring the securities offered, with total assets in excess of USD5 million.

Most funds offered to institutional investors are limited to ‘qualified purchasers,’ and, as discussed above, are offered in private placements. Qualified purchasers include:

- a person who owns at least USD5 million in investments; and
- a person or entity, acting for its own account or the accounts of other qualified purchasers, who in the aggregate owns and invests on a discretionary basis at least USD25 million in investments.

So long as the conditions for the exemption from registration under the Securities Act are met the issuer is not required to obtain SEC review of the disclosure materials prior to the offering or to observe the rules relating to public offerings of securities. However, the fund remains subject to the Securities Act's anti-fraud rules, and the fund must notify the SEC no later than 15 days after the first sale of a security in the private placement.

Fund issuers must also comply with state securities laws to the extent not superseded by applicable federal securities laws. In particular, there may be post-sale filing obligations in states where subscribers for private fund interests reside which should be considered.

Last modified 24 Jan 2020

Are there any other notable risks or issues around establishing and investing in funds?

Establishing funds

A US fund deemed to be an ‘investment company’ must register with the Securities and Exchange Commission (SEC) under the Investment Company Act of 1940 (ICA) unless an exemption from registration is available. Failure to register when required may carry
significant civil and criminal penalties for fund sponsors. In addition, an entity that provides investment advisory or management services
to a fund may be required, depending on its aggregate assets under management (AUM), to register with the SEC as an Investment
Adviser under the Investment Advisers Act of 1940 (IAA) or with its state securities regulator. The manager of a fund that is not required to
register under the ICA may nevertheless be required to register under the IAA.

Prior to accepting investors, the fund must comply with applicable KYC and anti-money laundering rules as well as US tax rules (in
particular the Foreign Account Tax Compliance Act), which may require obtaining identification information from potential investors.

In addition, the fund must confirm whether or not potential investors are subject to the Employee Retirement Income Security Act (ERISA),
as the presence of such investors in the fund may cause the entire fund to be subject to ERISA's fiduciary duty rules and other restrictions.
The fund and/or its management may also be required to register with the US Commodity Futures Trading Commission under the
Commodity Exchange Act or apply for an exemption from registration.

Investing in funds

Potential investors in funds should note the following provisions of the fund's governing documents in the first instance:

- when and under what circumstances investors may be required to indemnify the fund's management or personnel for losses they
  incur related to the fund, or to return distributions previously made by the fund;
- what rights investors have to remove the fund's management;
- in closed-end funds, the priority of payments for distributable funds (the 'waterfall'), and the portion of such payments to be made as
  carried interest to the fund sponsor;
- in open-end funds, the methodology of computing performance compensation for the fund sponsor;
- the amount and timing of management fees payable to the fund sponsor;
- in open-end funds, when the investor may redeem/exit the fund;
- the circumstances in which an investor may transfer its interest; and
- the form and jurisdiction of the fund for tax purposes.

Managing and marketing debt / hedge funds

Are there any restrictions on marketing a fund?

Funds that intend to market securities to the public in a registered transaction under the Securities Act of 1933 (Securities Act) must
comply with the public offering rules set forth therein. Funds that intend to issue securities in private placements not subject to
registration under the Securities Act must comply with the marketing restrictions in the relevant exemption. Under the most
commonly-used exemption from registration under the Securities Act, Regulation D, sponsors marketing funds in a private placement
may not engage in 'general solicitation' or 'general advertising' relating to the offering. This includes any advertisement, mass mailing,
cold calls, article, notice, or other communication published in any newspaper, magazine, or similar media, or broadcast over television or
radio, and also any seminar or meeting whose attendees have been invited by any general solicitation or advertising.

Under certain circumstances an issuer using Regulation D may engage in general solicitation or general advertising if the issuer takes
additional steps to ensure that all securities sold in the offering are sold to accredited investors. Issuers choosing to market in this fashion
must elect to do so and, once they have elected to do so, may not change their election.

Issuers in both registered and unregistered offerings of securities are liable for violations of the anti-fraud provisions of the Securities
Exchange Act of 1934 relating to the contents of the disclosure materials provided in connection with the offering.

Are there any restrictions on managing a fund?
A fund registered under the Investment Company Act of 1940 (ICA) must comply with the rules set forth therein, including restrictions on the manner and timing of payments to its manager. Funds using an exemption from registration under the ICA must comply with the terms of that exemption at all times.

If the fund's manager is registered with the Securities and Exchange Commission (SEC) it must meet the duties and obligations imposed by the Investment Advisers Act of 1940 (IAA). Managers exempt from registration must nevertheless obey anti-fraud and other rules in the IAA. All managers whether exempt from registration or not owe fiduciary duties to the fund as a matter of both federal and state law. For example, managers must ordinarily obtain the consent of the investors or a committee of them before causing the fund to enter into a transaction that is subject to a conflict of interest.

Entering into derivatives contracts

Are there any restrictions on entering into derivatives contracts?

In the US the Commodity Futures Trading Commission (CFTC) and the Securities and Exchange Commission (SEC) share jurisdiction over the derivatives market depending on the underlying product that is being traded and whether the transaction is 'over-the-counter' (OTC) or traded on an exchange. In addition, banks and financial institutions are subject to the jurisdiction of the Prudential Regulators. Swap dealers and other entities that trade in large volumes need to be registered with the CFTC or the SEC depending on the underlying products being traded. In addition, US rules permit only 'eligible contract participants' (as defined under the Commodity Exchange Act) to enter into OTC derivatives.

Last modified 24 Jan 2020

What are common types of derivatives?

All of the main types of derivative contract are widely used in the US:

- forwards;
- futures;
- swaps (such as interest rate or currency swaps); and
- options (call options and put options).

Products may be 'over-the-counter' (OTC) or exchange traded and entered into for hedging or as part of a trading strategy.

The transactions types that we see most often relate to interest rate or currency hedging such as FX forwards, interest swaps or interest rate caps. The needs of the relevant entity drive the underlying type of hedging. A power company client may have commodity hedging needs whereas a manufacturer may be concerned only with hedging the interest rate on its debt.

Common products that we see are commodity derivatives, equity derivatives, interest rate derivatives, currency derivatives, credit derivatives and insurance-linked derivatives.

Last modified 24 Jan 2020

Are there any other notable risks or issues around entering into derivatives contracts?

Since the global financial crisis in 2007-to-2008, derivatives and particularly over-the-counter derivatives have attracted significant regulatory attention. As a result, the derivatives market has seen, and continues to see, the introduction of a significant amount of new regulation and this has led to substantial compliance costs for market participants.

There are business risks that need to be considered – although hedging is seen as a tool to minimize risk, an entity needs to consider whether the derivatives product is appropriate and assess the down-side risk. In most cases, a derivatives trading relationship requires the posting of margin; entities should consider whether they are in a position to post margin and, if so, the types of margin that are
available as in some instances applicable rules limit the types of margin that may be posted. In addition, margin that is posted to a counterparty may be at risk and an entity may want to consider posting margin to a third-party custodian instead of directly to its counterparty.

**Regulatory compliance**

Rules promulgated by the Commodity Futures Trading Commission (CFTC) and Securities and Exchange Commission (SEC) pursuant to the Dodd-Frank Act may impose a compliance burden such as record keeping or trade reporting. In addition, European regulations or the regulations of another jurisdiction may be relevant depending on the location of the parties. As a result of new global regulations that affect the derivatives market, an entity may be required by its counterparty to sign up to certain industry protocols or provide information.

**Operations**

Derivatives trading often involves the exchange of margin and an entity must be operationally capable of posting, calling for and calculating margin. In addition, the entity needs to have processes and systems in place to manage trading activity and the related documentation.

Last modified 24 Jan 2020

**Debt finance**

**Lending and borrowing**

*Are there any restrictions on lending and borrowing?*

**Lending**

The amount of regulation a lender faces will depend on the type of product (consumer or commercial) and the type of collateral securing the product (real estate or non-real estate). Consumer loans are more heavily regulated than commercial loans, with consumer loans secured by real estate being the most heavily regulated on both the federal and state level and unsecured commercial loans being the least regulated. That being said, it is unlikely for any credit product offered in the US to be completely unregulated in all states and jurisdictions.

Below are some general restrictions on lending.

**PROHIBITION ON UNSAFE AND UNSOUND BANKING PRACTICES**

The Federal Deposit Insurance Act (FDI Act) prohibits federally and state-chartered banks and thrift institutions from engaging in unsafe and unsound banking practices, including those relating to banks’ lending activities. Regulators can impose corrective measures, including cease-and-desist orders or termination of the bank’s deposit insurance coverage for a bank engaging in any unsafe or unsound banking practices.

**CAPPING OF INTEREST RATES**

State usury laws, which may apply to both federally and state-chartered banks, impose limitations on the interest rates that banks may charge for consumer and commercial loans.

**LIMITS ON LOANS TO ONE BORROWER**

Federal law caps the amount of credit that national banks are permitted to extend to one borrower or to a group of related borrowers, subject to specific exceptions which are tailored to the nature and type of loan. Some states have comparable limitations.

**RESTRICTIONS ON LENDING TO AFFILIATES**

Federal law restricts lending and other extensions of credit by a bank directly or indirectly to its affiliates by setting quantitative limitations on a bank’s transactions with any single affiliate, and with all affiliates combined, and by setting forth collateral requirements for certain.
bank transactions with affiliates, among other restrictions and limitations.

RESTRICTIONS ON LENDING TO INSIDERS

Loan terms to insiders are closely regulated and some transactions can be prohibited entirely. Additional requirements for loans to executive officers and directors exist.

ANTI-TYING RULES

The Bank Holding Company Act (BHC Act) prohibits banks from requiring their customers to obtain any product or service, including non-bank products or services, as a condition to the extension of credit. Certain safe harbors exist.

PROHIBITIONS ON DISCRIMINATION

The Equal Credit Opportunity Act (ECOA) applies to all creditors and prohibits a lender from discriminating on the basis of a protected characteristic (race, color, religion, national origin, sex, marital status, age, the receipt of public assistance).

Below are some consumer-specific restrictions on lending.

CONSUMER LENDING DISCLOSURE OBLIGATIONS

Truth in Lending Act (TILA) and Regulation Z require certain disclosures to be made when providing consumer credit. The ECOA requires notification disclosures to be provided to denied applicants of consumer credit.

PROHIBITIONS ON UNFAIR, DECEPTIVE, OR ABUSIVE ACTS OR PRACTICES (UDAAPS) IN CONSUMER LENDING

The Dodd-Frank Act prohibits UDAAPs. For generic examples of what may be considered a UDAAP please consider the Consumer Financial Protection Bureau bulletin dated 10 July 2013.

ADDITIONAL PROHIBITIONS ON DISCRIMINATION

The Fair Housing Act prohibits discrimination on the basis of race, color, national origin, religion, sex, familial status, and handicap in all aspects of residential real estate related transactions, including but not limited to: (1) making loans to buy, build, repair, or improve a dwelling; (2) purchasing real estate loans; (3) selling, brokering or appraising residential real estate; or (4) selling or renting a dwelling.'

RESIDENTIAL MORTGAGE REQUIREMENTS

Residential mortgage origination, selling/purchasing, and servicing is closely regulated on both a federal and state level. Numerous restrictions, standards, and disclosure requirements specific to residential mortgages exist in this highly regulated space.

Borrowing

While borrowers are generally not regulated, it is advisable for borrowers to consider whether either the mortgage or consumer lending regimes apply to their activities, in which case they will benefit from the protections mentioned above.

What are common lending structures?

Lending in the US can be structured in a number of different ways to include a variety of features depending on the commercial needs of the parties.

A loan can either be provided on a bilateral basis (a single lender providing the entire facility), a club basis (a small group of multiple lenders each providing parts of the overall facility) or syndicated basis (a larger group of multiple lenders each providing parts of the overall facility).

Loans can be secured or unsecured. Assets of a debtor can have multiple security interests attached thereto and such security interests are usually allocated among secured parties in respect of priority and other similar rights pursuant to an intercreditor agreement. A first-lien/second-lien loan can be combined into one unitranche loan. In this structure, the lenders enter into an agreement among
lenders outside of the credit agreement with the borrower.

Club and syndicated facilities by their nature involve more parties (such as agents which fulfil certain roles for the finance parties), are more highly structured and involve more complex documentation. Larger financings will typically be done on a syndicated basis with one of the syndicate taking the lead in coordinating and arranging the financing.

Loans will be structured to achieve specific objectives, e.g. acquisition financing, dividend recapitalizations, working capital loans or letter of credit facilities.

**Loan durations**

The duration of a loan may include:

- a term loan, provided for an agreed period of time but with a short availability period;
- a revolving loan, provided for an agreed period of time with an availability period that extends nearer to maturity of the loan and which may be redrawn if repaid;
- a swingline loan, provided on a short-term basis to solve short-term cash flow issues; or
- a bridge loan, provided for up to a year and intended to bridge the gap until another financing source is available.

**Loan security**

A loan can either be secured, unsecured or guaranteed. For more information, see Giving and taking guarantees and security – common types.

**Loan commitment**

Lenders are obligated to provide the loan if certain conditions are fulfilled.

A credit agreement may also include an uncommitted incremental facility or an accordion, which allow the borrower to increase the commitments of the existing lenders or bring new lenders into the facility. The lenders do not commit upfront to providing additional loans.

**Loan repayment**

Typically, a term loan is repayable on an amortizing basis (in instalments over the life of the loan) or is repayable in full at maturity. Revolving loans may be reborrowed and repaid throughout the life of the facility.

*Last modified 24 Jan 2020*

**What are the differences between lending to institutional / professional or other borrowers?**

Federal agencies, such as the US Consumer Financial Protection Bureau, regulate lending to consumers and in the context of residential real estate loans. Lenders in the context of commercial real estate loans should also consider zoning laws and environmental regulations.

For more information, see Lending and borrowing – restrictions.

*Last modified 24 Jan 2020*

**Do the laws recognize the principles of agency and trusts?**

Yes, both principles are recognized as a matter of US law.

For instance, it is common to appoint an agent in connection with a loan or a trustee in connection with a bond. The agent or trustee, as applicable, may act on behalf of the lenders or secured parties or hold rights and other assets on for such lenders or secured parties.
Are there any other notable risks or issues around lending?

Generally

Federal and state laws prohibit lenders from charging an unreasonably high interest rate or other unreasonable fees. Lenders who violate usury laws may incur civil or criminal penalties.

Standard form documentation

Credit agreements in the US are typically based on the agent's or lead lender's standard form. This may incorporate language recommended by the Loan Syndications and Trading Association, but there is no standard form documentation.

Are there any other notable risks or issues around borrowing?

There are no other notable risks or issues around borrowing to be raised further to those outlined in preceding sections.

Giving and taking guarantees and security

Are there any restrictions on giving and taking guarantees and security?

Below are some of the key areas affecting the giving of guarantees and security.

Capacity

It is important to check the law of the state in which the company is organized, as well as the constitutional documents of a company giving a guarantee or security to ensure it has an express or ancillary power to do so and there are no restrictions on the directors' powers that would be preventative.

Consideration

Many state statutes require that the guarantee be in furtherance of the company's purpose and that the company receive a benefit in exchange for providing such guarantee. This is often more difficult in the case of upstream or cross-stream guarantees or security provided by a subsidiary to its parent or sister company. The safe approach is often to have the members of the company approve the giving of the guarantee or security by resolution. Some state statutes also provide a safe harbor if the company and borrower are part of the same corporate group.

Insolvency

Guarantees and grants of security may be at risk of being set aside under US bankruptcy laws if the guarantee or security was granted by a company that was insolvent at the time of such grant and the company received less than reasonably equivalent value for the guarantee. Guarantees and security may also be challenged on other grounds relating to insolvency.

What are common types of guarantees and security?

Common forms of guarantees
Guarantees can take a number of forms. A particular distinction worth remembering is between a guarantee of payment and a guarantee of collection.

Under a guarantee of payment, the guarantor is obligated to repay the lenders immediately upon default of the borrower. The lenders are not required to first take any action against the borrower. Guarantees of payment are customary in the US.

Under a guarantee of collection, the lenders must first exhaust all remedies against the borrower before they may make a claim under the guarantee. The lenders are only entitled to the shortfall not paid by the borrower.

Common forms of security

Under US law, personal property, fixtures, general intangibles and other certain types of collateral are governed by the Uniform Commercial Code (UCC) as adopted in the borrower's state of organization. Other types of collateral, including mortgages and motor vehicles, are governed by applicable state or federal laws, instead of or in addition to the UCC.

Under US law it is possible to grant security over all or a portion of the assets of a US borrower or guarantor.

Are there any other notable risks or issues around giving and taking guarantees and security?

Giving or taking guarantees

Guarantees are typically considered secondary, and not primary, obligations.

Many legal defenses are available to guarantors which may invalidate the guarantor’s obligations under the guarantee, including the invalidity of the underlying credit agreement or a change to the corporate structure of the borrower. However, in most cases, the lenders require the guarantor to waive these defenses, and doing so is typically permitted under applicable US law.

US state law typically requires that a guarantee be in furtherance of the guarantor's purpose and that the guarantor receive a benefit in exchange for providing such guarantee. This may be achieved if the company and borrower are part of the same corporate group.

Giving or taking security

A security interest is created and attaches to the company's property when the lender extends credit to the borrower and the borrower delivers to the lender a written agreement granting the security interest and describing the property.

Once created, the security interest needs to be properly perfected before it is valid against third parties. Perfection formalities are governed by the Uniform Commercial Code (UCC) as adopted in the borrower's state of organization and, with respect to real estate, by the real estate law of the state where real property is located. Perfection formalities can range from having the secured asset delivered to the security holder, filing a financing statement or mortgage or entering into a control agreement. Under the UCC, a lender who properly files a financing statement first typically has priority over other lenders, with certain exceptions.

Security documents granting a security interest in personal property collateral generally do not need to be notarized, but notarization may be required for real property in certain states.

There may be negative tax consequences to a US borrower if the loan is secured by all of the assets of its non-US subsidiary that is considered a 'controlled foreign corporation.'
What are the main laws and regulations that apply to entities that are involved in finance and investments generally?

Generally

FEDERAL

Federal Deposit Insurance Act (FDI Act)
Federal Reserve Act
Dodd-Frank Wall Street Reform and Consumer Protection Act (Dodd-Frank Act)
Volcker Rule (implementing section 619 of the Dodd-Frank Act)
Regulation W (implementing sections 23A and 23B of the Federal Reserve Act pertaining to restrictions on lending to affiliates)
12 US Code (USC) section 84 and 12 Code of Federal Regulations (CFR) section 32 (restrictions on lending limits)
Regulation O (restrictions on lending to insiders)
Bank Holding Company Act (BHC Act) (anti-tying rules)
Equal Credit Opportunity Act (ECOA) (fair lending)
Regulation B (implementing the ECOA)
Bank Secrecy Act
Securities Act of 1933 (Securities Act) and the Securities and Exchange Commission (SEC) rules thereunder
Securities Exchange Act of 1934 (SEA) and the SEC rules thereunder
Investment Advisers Act of 1940 (IAA) and the SEC rules thereunder
Investment Company Act of 1940 (ICA) and the SEC rules thereunder

STATE

Individual state laws and related state regulations apply.

Consumer credit

FEDERAL

Truth in Lending Act (TILA)
Regulation Z (implementing TILA)

STATE

Individual state laws and related state regulations, including licensing and compliance regimes apply.

Mortgages

FEDERAL

Fair Housing Act
Home Mortgage Disclosure Act (HMDA)
Regulation C (implementing the HMDA)
Truth in Lending Act (TILA)
Regulation Z (implementing TILA)
Real Estate Settlement Procedures Act (RESPA)
Regulation X (implementing RESPA)
TILA/RESPA Integrated Disclosure Rule (TRID)

STATE

Individual state laws and related state regulations, including licensing and compliance regimes apply.

Securities

BROKER-DEALERS/INVESTMENT ADVISERS (AS DEFINED IN THE INVESTMENT ADVISERS ACT OF 1940)

Regulatory authorization

Who are the regulators?

Lending

FEDERAL

The Office of the Comptroller of the Currency (OCC) is an independent bureau within the US Treasury Department that charters, regulates, and supervises all national banks and thrift institutions and the federal branches and agencies of foreign banks in the US.

The Federal Deposit Insurance Corporation (FDIC) is a US government corporation that provides deposit insurance to depositors in US banks. It also examines and supervises certain financial institutions for safety and soundness, performs certain consumer-protection functions, and manages receiverships of failed banks.

The Federal Reserve Board of Governors (Federal Reserve) is the main governing body of the Federal Reserve System and is charged with
overseeing the Federal Reserve Banks and helping to implement monetary policy in the US.

The Consumer Financial Protection Bureau (CFPB) is an independent US government agency that enforces consumer protection laws and regulations specific to the US financial sector. Its jurisdiction includes banks, credit unions, securities firms, payday lenders, mortgage-servicing operations, debt collectors, and other financial companies operating in the US.

The Federal Trade Commission (FTC) is an independent US government agency that enforces consumer protection laws and regulations.

The Financial Crimes Enforcement Network (FinCEN) is a bureau of the US Treasury Department that collects and analyzes information about financial transactions in order to combat domestic and international money laundering, terrorist financing, and other financial crimes.

STATE

State regulatory agencies regulate state-chartered banks and certain non-affiliates of federally chartered banks, as well as non-bank lenders.

Securities

FEDERAL

The US Securities and Exchange Commission (SEC) is the primary regulator of the US securities markets and oversees the key participants in the securities world, including securities exchanges, brokers and dealers, investment advisors and mutual funds.

The Financial Industry Regulatory Authority (FINRA) is an independent, not-for-profit organization authorized by Congress to protect investors and market integrity through regulation of broker-dealers.

National Securities Exchanges (acting in the role of self-regulatory organizations) are securities exchanges that have registered with the SEC under section 6 of the Securities Exchange Act of 1934.

The US Commodity Futures Trading Commission (CFTC) is an independent US government agency that polices the derivatives markets and futures and swaps markets to lower the risk to the public.

STATE

State securities regulators enforce ‘blue sky’ laws, which cover many of the same activities the SEC regulates, but are confined to securities sold or persons who sell them within each state.

Last modified 24 Jan 2020

What are the authorization requirements and process?

Lending

The need for authorization to offer credit products varies depending on the type of product (consumer or commercial) and the type of collateral securing the product (real estate or non-real estate). Most product offerings require prior authorization. Certain entities (e.g. savings associations, credit unions, and banks) are authorized to lend on a national basis. Other non-bank lenders are required to obtain individual state authorization, which generally permits lending to borrowers located only in that state.

In most cases, the process for obtaining the requisite authorization is initiated with an application that typically includes identification of control parties and management, disclosure of any negative civil, criminal, and regulatory history, meeting capital and/or surety bond requirements, providing financial statements, business plans, and organizational charts, and related compliance obligations as discussed below.

Broker-dealers

Obligations include:

- registration of the entity with the Securities and Exchange Commission (SEC) as a broker-dealer;
• registration of the entity in each state in which it 'does business' (by having a physical presence in the state or by engaging in business with persons inside the state from outside the state);

• membership in a registered national securities association, i.e. the Financial Industry Regulatory Authority (FINRA) – the only exception is for broker-dealers that do no public customer business and only engage in activities on a national securities exchange of which they are a member, who may in some cases avoid FINRA membership;

• registration with FINRA of each individual engaged in the broker-dealer's securities business (except for clerical and administrative personnel) and with each state in which the individual does business – as with broker-dealer firms, registration by individuals working for firms whose only business is on the floor of an exchange may in some cases be done through that exchange;

• registration of each individual only after successful completion of one or more proficiency examinations relevant to the person's business; and

• fees and charges generally for each of the above items.

Investment Advisers (as defined in the Investment Advisers Act of 1940)

Obligations include:

• registration of the entity with the SEC as an 'Investment Adviser' (as defined in the Investment Advisers Act of 1940); or

• for certain small Investment Advisers (determined by assets under management), registration instead with the particular state in which they do business.

There are no self-regulatory organizations for investment advisers. Investment Adviser personnel do not have to register with the SEC; however, they may be required to register with certain states in which they do business and take a proficiency exam in connection therewith.

Last modified 24 Jan 2020

What are the main ongoing compliance requirements?

Lending

Compliance requirements vary depending on the type of lender (bank or non-bank), the regulatory agency from which that entity seeks authorization, and the products being offered. Nevertheless, common requirements include periodic financial reports to the regulator, assessment of management, compliance with Know your Customer (KYC) and anti-money laundering (AML) rules and regulations, compliance with applicable interest rate caps, fee limitations, disclosure obligations, and limitations or prohibitions on referral fees.

Broker-dealers

Specific requirements include:

• continually updating relevant information provided at the time of registration – for both the firm and its registered individuals;

• supervision of each business activity and each registered individual by a qualified (by examination) supervisor/principal pursuant to detailed written supervisory procedures;

• annual review and certification of adequacy of the broker-dealer's supervisory structure and procedures by the broker-dealer's CEO or an equivalent senior officer;

• regular (annual or bi-annual) regulatory examinations by the Securities and Exchange Commission (SEC), Financial Industry Regulatory Authority (FINRA) and, in some cases, state regulators;

• detailed procedures for opening customer accounts including obtaining detailed background and financial information for each customer, including required AML-related information;

• maintenance of accurate books and records relating to each part of the business, including transactions, finances, and customer/client information in prescribed formats and for prescribed periods;
• requirements for protection of confidential customer/client information and material non-public information;

• supervision, review and retention of all communications with the public (including all electronic communications);

• detailed minimum net capital requirements and regular reporting of net capital calculations and immediate notification and/or cessation of business requirements if capital falls below prescribed amounts;

• detailed requirements for protecting customer securities and funds;

• requirement to establish, maintain and enforce detailed cybersecurity, business continuity and disaster recovery procedures; and

• continuing education requirements for each registered individual.

Investment Advisers (as defined in the Investment Advisers Act of 1940)

Specific requirements include:

• continually updating relevant information provided at the time of registration;

• supervision of each business activity and each employee pursuant to detailed written compliance procedures;

• annual review of the Investment Advisers' written policies and procedures designed to prevent violations of the Investment Advisers Act of 1940 (IAA) and the rules thereunder;

• periodic regulatory examinations by the SEC and/or state regulators;

• developing and maintaining procedures with respect to political contributions;

• maintenance of accurate books and records relating to each part of the business;

• requirements for protection of confidential customer/client information and material non-public information;

• requirement to deliver a brochure and one or more brochure supplements to each client or prospective client that contains all information required by Part 2 of SEC Form ADV (a uniform form used by Investment Advisers to register with both the SEC and state securities authorities);

• requirements for prevention of misuse of material non-public information;

• requirement to establish, maintain and enforce a detailed code of ethics;

• requirement to file Form PF (reporting form for ‘investment advisers to private funds’), providing data intended to facilitate monitoring of systemic risk private fund (applies to all private funds including private equity funds, hedge funds and liquidity funds);

• requirement to establish, maintain and enforce detailed cybersecurity, business continuity and disaster recovery procedures;

• compliance with rules relating to advertising and marketing materials; and

• compliance with requirements relating to custody of client assets.

What are the penalties for failure to be authorized?

Lending

Penalties for violations of law can include cease and desist orders, civil monetary fines, enforcement actions, prescriptive orders, and even imprisonment depending on the regulator and the nature of the infraction. In some cases, if an entity is lending without authorization to do so, the loan will be considered void and unenforceable or the lender will be enjoined from collecting interest on the loan.

Securities

Examples of penalties for failure to obtain authorization are, for broker-dealers:

• cease and desist orders;
• monetary fines and penalties;
• disgorgement of fees, compensation or profits;
• potential rescission of any transaction intermediated by an unlicensed entity or person; and
• willful violations of the Securities Exchange Act of 1934 (SEA) may be prosecuted as criminal violations, with large fines to entities and potential incarceration for individuals.

And for Investment Advisers (as defined in the Investment Advisers Act of 1940):

• cease and desist orders;
• monetary fines and penalties;
• injunctions; and
• willful violations of the Investment Advisers Act of 1940 (IAA) may be prosecuted as criminal violations, with large fines to entities and potential incarceration for individuals.

Regulated activities

What finance and investment activities require authorization?

Lending

It will depend on the jurisdiction in which the products are being offered.

Broker-dealers

Any activity involving the offer or sale of securities, or the solicitation of an offer to purchase securities requires registration, including retail and institutional brokerage, proprietary trading and market making, and M&A activity that involves transactions in securities (as opposed to pure asset sales).

Investment Advisers (as defined in the Investment Advisers Act of 1940)

Engaging, for compensation, in the business of advising others, either directly or through publications or writings, as to the value of securities or as to the advisability of investing in, purchasing, or selling securities, or who, for compensation and as part of a regular business, issues or promulgates analyses or reports concerning securities.

Are there any possible exemptions?

Lending

It will depend on the jurisdiction in which the products are being offered.

Broker-dealers

FEDERAL

There are certain very limited exemptions from the broker-dealer registration requirements, including:

• exemptions for officers and employees of issuers engaged in the offer and/or sale of their employers’ own securities (subject to strict limitations including compensation restrictions);
exemptions for certain non-US broker-dealers operating from outside the US, engaging in certain limited activities with certain institutional investors (in most cases, the participation of a US registered broker-dealer in key parts of the process is required); and other exemptions provided from time-to-time by the Securities and Exchange Commission (SEC) through 'no-action' letters and similar relief.

STATE

A number of states have exemptions from registrations for broker-dealers and their individual personnel that engage in limited activities from outside the state with certain types of investors (in most cases institutional investors only) in the state. The existence, terms, and conditions of each state's exemption may differ.

Investment Advisers (as defined in the Investment Advisers Act of 1940)

The following Investment Advisers are exempt from authorization requirements:

- any Investment Adviser (other than an Investment Adviser who acts as an Investment Adviser to any private fund), all of whose clients are residents of the State within which the Investment Adviser maintains his or its principal office and place of business, and who does not furnish advice or issue analyses or reports with respect to securities listed or admitted to unlisted trading privileges on any national securities exchange;
- any Investment Adviser whose only clients are insurance companies;
- any Investment Adviser that is a private fund advisor, i.e. an advisor solely to private funds with less than USD150 million in assets under management in the US;
- any Investment Adviser that is a venture capital advisor;
- any Investment Adviser that is a charitable organization as defined in the Investment Company Act of 1940 (ICA), or is a trustee, director, officer, employee, or volunteer of such a charitable organization acting within the scope of such person's employment or duties with such organization, whose advice, analyses, or reports are provided only to one or more of the following:
  - any such charitable organization;
  - a fund that is excluded from the definition of investment company under the ICA; or
  - a trust or other donative instrument, or the trustees, administrators, settlors (or potential settlors), or beneficiaries of any such trust or other instrument;
- any plan described in section 414(e) of the US Internal Revenue Code of 1986 (Revenue Code), any person or entity eligible to establish and maintain such a plan under the Revenue Code, or any trustee, director, officer, employee of or volunteer for any such plan or person, if such person or entity, acting in such capacity, provides investment advice exclusively to, or with respect to, any plan, person, or entity or any company, account, or fund that is excluded from the definition of an investment company under section 3(c)(14) of the ICA;
- any Investment Adviser that is registered with the Commodity Futures Trading Commission (CFTC) as a commodity trading advisor whose business does not consist primarily of acting as an Investment Adviser, as defined in the Investment Advisers Act of 1940 (IAA), and that does not act as an Investment Adviser to certain registered investment companies or business development companies;
- any Investment Adviser that is registered with the CFTC as a commodity trading advisor and advises a private fund, provided that, if after the date of enactment of the Private Fund Investment Advisers Registration Act of 2010, the business of the advisor should become predominately the provision of securities-related advice, then such advisor must register; and
- any Investment Adviser, other than any entity that has elected to be regulated or is regulated as a business development company, who solely advises certain small business investment companies.

Do any exchange controls or other restrictions on payments apply?

Securities transactions effected by US broker-dealers, including transactions in non-US securities, must be reported by the executing
broker-dealer to Financial Industry Regulatory Authority (FINRA). Any transaction reported to FINRA must be reported in US dollars, regardless of the currency in which the transaction occurred. The methodology employed by the broker-dealer for currency conversion is left to the broker-dealer; however, the methodology must be reasonable and the broker-dealer must document its practice and employ the same method consistently.

Foreign exchange transactions are generally effected through futures commission merchants subject to the oversight of the Commodity Futures Trading Commission (CFTC) pursuant to the US Commodity Exchange Act. However, forex securities transactions effected by securities broker-dealers are subject to FINRA oversight. In an effort to protect retail investors, FINRA from time to time issues cautionary bulletins to investors about the risks of forex transactions and in 2009 proposed to limit the leverage ratio that a FINRA-member broker-dealer could offer a retail forex customer. The proposed rule was later withdrawn.

What are the rules around financial promotions?

Rules

Offers of securities and other financial products are subject to detailed requirements and restrictions imposed by the Securities Act of 1933, Securities Exchange Act of 1934 (SEA), Investment Advisers Act of 1940 (IAA) and Investment Company Act of 1940 (ICA), as well as relevant Securities and Exchange Commission (SEC) and Financial Industry Regulatory Authority (FINRA) rules and regulations thereunder, including without limitation:

- registration requirements for offered securities;
- registration and licensing requirements for persons involved in such activities;
- requirements with respect to the content of prospectuses, offering memoranda and other documents;
- supervision and retention requirements; and
- general antifraud prohibitions.

Offers of financial services are likewise subject to detailed requirements imposed by the foregoing statutes, rules and regulations, including:

- detailed requirements for content, retention and supervision of communications with clients/customers and potential clients/customers;
- advertising regulations;
- requirements for providing investment research; and
- general antifraud prohibitions.

Exemptions

The relevant requirements and restrictions imposed by the foregoing statutes, rules and regulations include various exemptions and exceptions, which generally are based on the nature of the offered products or services, the intended target audience, the type of communication and specific content thereof, and a number of other factors.

Entity establishment

What types of legal entity are generally used to undertake financial or investment activity?

Lending
It will depend on the nature and purpose of the intended activities and any applicable laws, regulations, or jurisdictional constraints.

**Securities generally**

Most broker-dealers and Investment Advisers (as defined in the Investment Advisers Act of 1940) are either corporations or limited liability companies (LLCs). Certain firms may operate as general or limited partnerships but this is not common today.

**Funds**

Funds are often established as LLCs or limited partnerships although other structures are used depending on taxation and regulatory analysis, amongst other things.

*Last modified 24 Jan 2020*

**Is it possible to conduct lending or investment business through a branch or establishment?**

**Lending**

Generally, yes, subject to laws and regulations regarding branches, which vary depending on the regulator and jurisdiction.

**Securities**

Broker-dealers commonly operate through branch offices and, in some cases, satellite offices not treated as branch offices (including certain home offices of individual registered representatives of broker-dealers). Each such office is subject to detailed rules regarding staffing, supervision, oversight by home office, recordkeeping, signage and other matters.

*Last modified 24 Jan 2020*

**FinTech**

**FinTech products and uses**

*What are the most common technology products and FinTech applications used or being developed in the finance and investment marketplace?*

**Online lending (e.g. peer-to-peer funding platforms and marketplace lending)**

A variety of online lending and similar platforms currently exist in the US. While each of these platforms have distinct business models and focus on different markets and asset classes, they can most easily be categorized as either ‘balance sheet lenders’ (i.e. those that invest their own money in the assets they originate) or ‘peer-to-peer (P2P) lenders’ (i.e. those that create and manage a platform on which investors in credit products can provide credit to either individuals or businesses seeking credit).

Balance sheet lenders make money the old-fashioned way – by earning yield on the products they originate, which after deducting losses, cost of funds and administrative costs, should result in a profit.

P2P lenders on the other hand, typically do not take balance sheet risk and instead earn a fee for every transaction executed on the platform. Both models use technology extensively and in novel ways for both customer acquisition, underwriting and portfolio management. Also, online lenders generally do not have a bank charter, and thus are unable to take deposits to fund their business (although some online lenders recently applied for an Federal Deposit Insurance Corporation (FDIC)-insured industrial loan company charter).

Online lenders address most forms of traditional bank funding products. Recently, products have included:
• credit cards;
• consumer loans (secured and unsecured);
• merchant cash advances;
• student lending products;
• small business lending;
• residential property and commercial property mortgage lending; and
• multiple forms of factoring.

It is likely that the volume of lending in these product areas as well as further and additional product areas will significantly increase over the coming years, as financing becomes more readily available to support this sector.

HOW ARE MARKETPLACE LENDING PLATFORMS FUNDING THEMSELVES?

Balance sheet online lenders, without a bank charter, raise debt and equity from both private and public sources to finance their asset originations, and also establish whole-loan sale programs whereby institutional investors purchase loans shortly after origination (thus earning the originator an immediate premium on the asset sold and relieving the originator from the burden of financing the asset through maturity). As these balance sheet online lenders are becoming more mature, they are also accessing funds via the traditional securitization markets, in both rated and unrated deals.

P2P lenders, on the other hand, originally conceived of a model whereby the ‘investor side’ of the platform would provide all necessary financing. However, as the P2P models have evolved, many platforms have become more reliant on the stability and cost-effectiveness of institutional financing, often executed through committed whole-loan sale programs whereby the institutional investors agree to buy newly-originated assets meeting certain specified criteria either on a one-off basis or on a periodic schedule. These investors then leverage the assets themselves in multiple ways, including with traditional warehouse and term financing and through the securitization markets.

ISSUES FOR STARTUP ONLINE LENDERS

Most startup online lenders initially raise equity to establish the business and fund initial originations, and thereafter raise private debt financing as they continue to build the business. Most of these debt facilities are structured as special purpose vehicle (SPV) financings, whereby the newly-originated asset is sold to the SPV (a subsidiary of the originator) and then the lender makes a loan to the SPV at a pre-agreed percentage of the principal balance of the asset (for instance, 85%). Thereafter, the SPV is required to maintain the ‘borrowing base’ at all times, lest it default on its obligations to the lender. First facilities tend to be quite expensive and advantageous to the lenders; but as the originator grows, and its performance track record increases, the cost of funding normally drops over successive debt facilities.

Depending on the model used, the particular asset class, and whether the online lender partners with a bank, the lender must also consider any license or authorization to lend that applies. Such requirements are driven by the state or location of the borrower in most cases, which unfortunately dictates a fairly extensive multi-state assessment for online lenders seeking to provide credit on a national basis.

Blockchain, smart contracts and cryptocurrencies

WHAT IS BLOCKCHAIN?

Blockchain is a distributed ledger technology in which data is recorded on a P2P network, using pre-agreed consensus algorithms to process changes in the data. Data is stored in ‘blocks’ that, as transactions are processed, connect to form a ‘chain’.

Specialist users on the system apply advanced computing software to identify time stamped blocks, verify the accuracy of the blocks using sophisticated algorithms and add the verified blocks to the chain. As the number of participants increases, the replication of the data over a wider base makes it harder for any person to alter the data in the chain. Any attempted addition or modification to the information on a block needs to be approved by a consensus of the users in the network following a verification process that requires significant effort and expense, which makes it practically impossible to insert fake transactions into a block.

WHAT ARE SMART CONTRACTS AND DECENTRALIZED AUTONOMOUS ORGANIZATIONS (DAOS)?
Developments in blockchain are also providing an ability to transfer and rely on instructions set forth in so-called ‘smart contracts’. Smart contracts are essentially pre-written computer codes which are stored and replicated on distributed ledger platforms such as blockchain. Execution takes place over the network, eliminating the need for intermediary parties to confirm the transaction, leading to self-executing contractual provisions. These contracts can be as simple as moving a balance from one account to another, or advanced, more-complex interactions with the outside world using so called ‘Oracles’. With Oracles the contract code consults with a service outside of the blockchain network to make a decision. This may entail receiving a confirmation that an event has occurred, such as payment, which automatically executes a further step in the contract, such as the transfer of an asset, which might be in digital form or by delivering instructions to a person or warehouse to release the asset for delivery.

DAOs are essentially online, digital entities that operate through the implementation of pre-coded rules. These entities often need minimal to zero input into their operation and they are used to execute smart contracts, recording activity on the blockchain. DAOs can be particularly challenging to regulate, depending on their software engine, the nature of the transactions they are completing or other unique features. Questions of ownership and responsibility for resulting acts of DAOs can also be brought to question if any technical issues arise with their operation.

**WHAT IS A CRYPTOocurrency?**

Cryptocurrency is the common name given to digital representations of value. Unlike fiat currencies, cryptocurrencies are not created or sanctioned or backed by any governmental entity. Instead, they are usually issued by entities as a means of exchange and can be transferred, shared or traded economically. The oldest and best-known cryptocurrency is bitcoin, although many other cryptocurrencies now exist. For example, the most widely-known alternatives to bitcoin include ether and litecoin. Cryptocurrencies are now actively traded with a large developing infrastructure for holding, pricing and exchanging them.

**Initial coin offerings and token-based products**

**WHAT IS AN INITIAL COIN OFFERING (ICO)?**

ICOs are offerings of digital currency (tokens) for sale to the public or to a set of users, often as a means of raising funds for a new blockchain or cryptocurrency venture. ICOs vary in structure and purpose. Some ICOs offer tokens to customers or suppliers as a form of loyalty program, while others offer network users access to the network or purchasing power as to the issuer's business. It is essential to examine the legal and regulatory basis for any ICO, as tokens may constitute securities, commodities, money transmission devices, or otherwise raise legal concerns.

The nature of the business and the purpose and structure of the token offering will typically be set out in a white paper available to potential purchasers.

The Securities and Exchange Commission and several other governmental authorities in the US are actively monitoring ICOs.

**Artificial intelligence and robo advisory systems**

Automated financial advice tools, also known as ‘robo advisors’, are software tools driven by artificial intelligence (AI) that provide a variety of investment advisory services, from portfolio selection to personal finance planning. The systems are generally operated on a platform/personal dashboard basis; a user can input a set of personalized data to be processed by the AI algorithms, which produce optimized outcomes around specified parameters. Robo advisors are particularly important to investment advisors and broker-dealers, including those serving younger clientele. The Financial Industry Regulatory Authority (FINRA) reported in December 2016 that 38% of investors between the ages of 18 and 34 have used robo advisors, although their popularity has been expanding among all age groups and classes of investors.

Robo advisors in the US must comply with the securities laws applicable to any other type of investment advisor, including state or federal registration obligations. These authorities have published various guidance concerning robo advisors, both for the benefit of investment advisors offering robo-advisor services and their clients. Key considerations relevant to anyone involved in this space include:

- decreased human involvement;
- the information provided to create recommendations;
- the approaches (from style to products to risk profile) that the robo advisors use; and
- the fees charged.
Data analysis and cloud computing

Cloud computing enables delivery of IT services through internet-based tools and applications, rather than direct connection to a physical server. Cloud-based storage makes it possible to save masses of data to remote servers, accessible through the internet rather than by way of a physical connection. With the vast data processing and storage capabilities offered by cloud computing technology and virtually no infrastructure barriers to entry, there are a number of applications in building and running FinTech businesses and the technology has had a significant impact in recent years.

Are there any restrictions, specific laws, regulations or procedures that apply to FinTech products?

General financial regulatory regime

In the US, financial services related activities are regulated under a variety of federal and state laws.

FEDERAL

At the federal level, the key banking regulators are the Federal Deposit Insurance Corporation (FDIC), the Federal Reserve Board (FRB), and the Office of Comptroller of the Currency (OCC), with the National Credit Union Administration (NCUA) regulating credit unions.

The Securities and Exchange (SEC) commission regulates securities issuers, investment companies, broker-dealers, investment advisors, and certain others involved in the securities industry.

The Commodity Futures Trading Commission (CFTC) regulates swap execution facilities, derivatives clearing organizations, designated contract markets, swap data repositories, swap dealers, futures commission merchants, commodity pool operators, and other entities.

The Financial Crimes Enforcement Network (FinCEN) of the US Department of the Treasury regulates money services businesses, including currency dealers, check cashers, money transmitters, and others.

STATE

In addition, most US states have separate laws that regulate these industries, as well as other ancillary financial services such as various types of consumer lending or loan brokering activities. Notably, the insurance industry is regulated at the state level.

Regulation of online lenders

ONLINE LENDERS

Online lenders are regulated by all 50 states and, in some capacities, at the federal level. Depending on the state and the asset class, licenses could be required for lending, collection/servicing or money transmission services.

Startup online lenders should consider the cost of these compliance activities as they conduct their initial equity raise(s), as the ability to raise subsequent debt financing will depend upon the prospective lenders being reasonably satisfied that the originator is in compliance with all applicable lending and other laws and has all necessary licenses.

Regulation of money service businesses

A 'money services business' (MSB) generally includes any person doing business, whether or not on a regular basis or as an organized business concern, in one or more of the following capacities in the US:

- currency dealer or exchanger;
- check cashier;
- issuer of traveler's checks, money orders or stored value;
- seller or redeemer of traveler's checks, money orders or stored value; or
money transmitter.

At the federal level, an activity threshold of greater than USD1,000 per person per day applies to the first four categories, but no activity threshold applies to money transmitters. Activities performed by banks or SEC or CFTC registrants are excluded from MSB registration. In addition, there is a limited exemption for persons that sell goods or provide services (other than money transmission services) and only transmit funds as an integral part of that sale of goods or provision of services.

An MSB must register with FinCEN. Among other things, MSBs must also implement a risk-based compliance program designed to detect and prevent money laundering, terrorist financing, and other illicit activities. In addition, most US states require licenses to perform these activities in their state, which can take more time and entail more resources to obtain. Notably, exemptions available at the federal level do not always translate to exemptions from state licensure.

FinCEN has stated that certain virtual currencies may trigger money transmission regulation. While users of virtual currencies are not money transmitters, those who issue virtual currency or put it into circulation and have the authority to redeem or withdraw it from circulation may be regulated as an ‘administrator’. In addition, if a business exchanges virtual currency for fiat currency or other virtual currency, the business may be regulated as an ‘exchanger’.

**Application of data protection and consumer laws**

US privacy law is a complex patchwork of privacy laws and regulations addressing specific industries, communications media, or marketing methods, supplemented by a backdrop of federal and state prohibitions against unfair or deceptive business practices and state laws that specifically address privacy and security of personal information.

The US has not adopted a comprehensive federal privacy and data security law akin to the UK Data Protection Act of 1998 and related laws. Instead, the US has implemented a sectoral approach to data privacy, promulgating regulations in areas that it deems to be of specific concern, including:

- financial data;
- credit data;
- background checks;
- health information;
- telecommunications companies;
- video rental records (which may include certain video streaming services);
- driver’s license information and history;
- children’s information; and
- marketing.

Outside of sector-specific laws, certain privacy protections are afforded by the general prohibition against unfair and deceptive trade practices, which has been interpreted to require appropriate notice to consumers about privacy or other practices, including the information collected, obtaining consent to sharing of sensitive data, or the failure to abide by representations made in privacy policies (including those about information security).

In addition, each state has its own consumer privacy and protection framework. Many state laws address privacy-related issues, such as requirements for data security, compliance with the Payment Card Industry Data Security Standard (PCI-DSS), storage of data, privacy of health data, disposal of data, privacy policies, appropriate use of social security numbers and data breach notification, among other things. States also have consumer protection laws that seek to protect consumers against unfair and deceptive trade practices, and state attorneys general typically enforce these laws against businesses (though, in some states a private right of action is available against companies that violate state consumer protection laws). State privacy laws typically track the location of the data subject or the consumer, regardless of where the business is located.

In the US, companies should generally:

- develop, implement and follow a privacy policy;
Money laundering and regulated regulations

Money laundering generally refers to concealing or disguising the existence, illegal origins, or illegal application of criminally derived income so that such income appears to have legitimate origins or constitute legitimate assets. Money laundering is typically associated with funds or proceeds derived from illegal activities, such as tax violations, environmental crimes, foreign corruption, healthcare offenses, fraud, drug trafficking, arms smuggling, prostitution, racketeering, or terrorism.

There are numerous federal anti-money laundering (AML) and combating the financing of terrorism (CFT) laws in the US, including the Money Laundering Control Act of 1986, criminal money laundering statutes contained in 18 U.S.C. §§ 1956 and 1957, the amendment to the Bank Secrecy Act (BSA), and certain provisions of the Uniting and Strengthening America by Providing Appropriate Tools to Restrict, Intercept and Obstruct Terrorism Act of 2001 (USA PATRIOT Act).

Individuals convicted of AML/CFT offenses can face imprisonment, as well as criminal and/or civil penalties. Companies that violate AML/CFT laws can face administrative, criminal, and civil penalties depending on the circumstances. Enforcement agencies may also seize and forfeit funds and property tainted by AML/CFT violations.

FinCEN is responsible for administering the BSA and also is empowered to bring civil enforcement actions for BSA violations. In addition to the federal regime, several US states have promulgated their own AML/CFT laws and regulations.

All US persons are prohibited from engaging in AML/CFT violations and transactions involving sanctioned jurisdictions or persons. In addition, US ‘financial institutions’ – which include not only traditional banks but also other organizations such as MSBs, casinos, pawn shops and many state-regulated financial institutions – must take additional steps such as:

- filing currency transaction and suspicious activity reports; and
- establishing and implementing written AML/CFT programs.

What type of funding arrangements and incentives are available to FinTech businesses?

Early stage

SEED INVESTMENT

In the US, initial outside investment in FinTech businesses is usually provided by private placements of securities sold to persons with a preexisting substantive relationship to the company or its founders, such as sophisticated friends or family or persons with whom they have had prior business dealings. Seed funding may also be provided by early stage ‘angel’ investors or incubator or accelerator programs. Investments usually take the form of equity or instruments convertible into equity. Seed funding is often used to fund the establishment and early growth of the business before larger investment is available. The investing individuals may also provide know-how and expertise to assist in the company’s development. The seed investors would typically not require the same controls over the business as, for example, venture capital (VC) investors.

CROWDFUNDING AND ‘ACREDITED INVESTOR CROWDFUNDING’

In the US, the sale of securities via crowdfunding has been underused, primarily due to the costs of compliance. For example, it requires using a registered broker-dealer or a registered ‘funding portal’, thereby prohibiting direct sales. It also requires providing specified disclosures and complying with many other requirements, including a USD2,000 limitation on the amount from any investor and a USD1 million limitation on the amount that can be raised. This resulting cost of using the exemption, together with the perceived stature of the businesses resorting to this exemption and concerns that its use could limit future financing options or M&A transactions, has resulted in low uptake of crowdfunding in the US.

The recent advent of Initial Coin Offerings (ICOs), token generation events and other blockchain-enabled financing structures has resulted in increased use of a relatively new technique sometimes referred to as ‘accredited investor crowdfunding’. In short, this involves using general solicitation to locate ‘accredited investors’ (as defined in Rule 501 of Regulation D), provided that sales only occur to those who...
the issuer has taken reasonable steps to verify are accredited investors. These steps generally involve reviewing independent
documentation (not just self-certification by the investor), such as reviewing Forms W-2, tax returns, bank and brokerage statements, or
confirmatory letters from investment advisors, broker-dealers, accountants, or lawyers. Other conditions apply, including that the
securities sold are 'restricted securities' subject to resale limitations.

**Venture capital and debt**

VC funding is usually more suitable for FinTech companies that, while still early-stage, have more established businesses. VC investors
usually acquire equity in the form of preferred stock, which may include preferences in payment on liquidation, dividends, voting, or other
matters. Depending on the amount of investment, VC investors might also require special governance rights, such as the right to
designate a director or to observe the board, or certain co-sale, first refusal, or preemptive rights. Many VC investors specialize in
particular sectors such as FinTech and therefore can provide tailored business support to FinTech companies.

VC investors include VC funds, which are special funds organized for the purpose of private investing. They may also include corporate VC,
where a corporation has formed a fund for deploying investment dollars or making strategic or research and development (R&D)
investments.

An additional funding option is venture debt. For example, the lender might provide the company a three-year term loan secured against
a company's assets or revenues. The loan may also include an equity component for the lender. Many venture debt providers only invest
in companies that have already received VC investment.

**Warehouse and platform funding**

Warehouse financing is a primary means of financing portfolios of FinTech assets. These facilities are most often structured as a loan to a
bankruptcy-remote special purpose vehicle that is a newly-formed subsidiary of the originator.

**Senior bank debt and capital markets funding**

**SENIOR BANK DEBT**

Once a FinTech company is established and has a track record, bank debt becomes a more viable source of funding, either on a secured
or unsecured basis depending on the creditworthiness and asset base of the business. In contrast to capital markets funding which is
often covenant-lite, bank funding will generally involve the imposition of financial covenants and controls that will apply over the life of the
facility. Bank finance may be particularly important for working capital, overdraft, accounts management and general liquidity purposes.

**CAPITAL MARKETS FUNDING**

When a company has grown to a sufficient size, an Initial Public Offering (IPO) may be a way to raise funds. Typically, an IPO will include
listing the company's shares on a national securities exchange, such as the New York Stock Exchange or Nasdaq. Financial and technology
sector companies are staples of the US capital markets, consistently representing a meaningful portion of US IPOs. In the last 12 months,
technology companies have represented approximately 20%, and financial services companies have represented about 11%, of US IPOs.

As described above, capital markets securitizations are also used by more mature originators as another source of liquidity.

**Incentives and reliefs**

To encourage early-stage investment in small, active businesses, section 1202 of the Internal Revenue Code (IRC) allows a non-corporate
shareholder to exclude from gross income gain up to the greater of:

- USD10 million;
- 10 times the adjusted basis of the investment that results from the sale or exchange of qualified small-business stock.

A qualifying small business must be a US C corporation whose aggregate gross assets immediately following the issuance of shares do
not exceed USD50 million. In addition, the shareholder must have acquired the shares at their original issuance and then held them for at
least five years.

A startup company may elect to deduct certain ‘startup expenditures’ incurred before the business is established over the 180-month
period beginning with the month in which the active trade or business begins. A ‘startup expenditure’ generally means certain amounts
paid or incurred in connection with either investigating or creating an active trade or business.

Taxpayers can also avail of R&D tax credits under section 41 of the IRC, for expenses stemming from qualifying research activities. The available credit ranges from 14%-to-20% of qualifying expenses over a fixed base amount. Certain companies unable to fully use the tax credit due to startup losses, may be eligible to choose to apply up to USD250,000 of the research credit against payroll tax liabilities.

Section 199A was newly enacted as part of the Tax Cuts and Jobs Act of 2017. Under this provision, owners of sole proprietorships, partnerships, S corporations and some trusts and estates may be eligible for a qualified business income (QBI) deduction for tax years beginning after 31 December 2017. Section 199A permits eligible taxpayers to deduct up to 20% of their QBI, plus 20% of qualified real estate investment trust (REIT) dividends and qualified publicly traded partnership (PTP) income. QBI is the net amount of qualified items of income, gain, deduction and loss from any qualified trade or business, including income from partnerships, S corporations, sole proprietorships, and certain trusts. Unless Congress decides to extend it, Section 199A will not apply to taxable years beginning after 31 December 2025.

Finally, many states have provided tax incentives to attract startup activity. These range from income tax credits to real property tax abatement for new office space.

Portfolio sales

Loan transfers and portfolio sales

What are common ways of buying and selling loans?

Buying and selling loans is customarily done in an over-the-counter market. The most common ways of selling loans are by assignment and participation.

Assignment

An assignment is a transfer of rights and obligations and creates direct contractual rights between the borrower and the assignee. Credit agreements typically require the consent of the borrower to effectuate an assignment.

Participation

A participation is a transfer of the economic interest in a loan without changing the legal relationship between the existing parties. Credit agreements typically permit participations without the consent of the borrower. Loan transfers are commonly documented using standard form contracts made available by the Loan Syndications and Trading Association.

Last modified 24 Jan 2020

What are the main considerations when transferring a loan and related security?

There are a number of issues to consider before transferring a loan. Below are some of the key considerations.

Lender eligibility

Credit agreements typically specify eligibility requirements for transferees (a borrower may also have the right to specify certain entities who are disqualified lenders, and loans may not be assigned to such entities).

Minimums

Credit agreements typically specify that assignments must be in a certain minimum amount, though assignments to affiliates are sometimes considered in the aggregate.

Transfer fees
Credit agreements typically require transfer fees be paid to the agent.

**Consent**

A transfer typically requires the consent of the borrower and the agent.

**Projects**

**Financing / investing in energy / infrastructure**

**To what extent are energy and infrastructure assets publicly or privately owned?**

**Generally**

Infrastructure assets in the US are both publicly and privately owned. Traditionally, government entities own and operate most roads and bridges, water supply and wastewater facilities as well as the interstate passenger rail system known as Amtrak. Most energy infrastructure, rail lines and landline and cellular telecommunications networks are privately owned but are subject to regulation by federal, state and local government entities.

Significant attention has been focused in recent years on the state of infrastructure assets in the US. At both the state and federal level, there have been initiatives with respect to assets traditionally owned by public authorities to encourage private investment or to establish public-private partnerships used successfully in many other jurisdictions. For example, at least 33 states and Puerto Rico have enacted laws permitting the use of such public-private partnerships for highway and bridge projects. Also, in 2014, the federal government launched the Build America Investment Initiative which was designed to expand the market for public-private partnerships, among other things.

**Energy**

Utility-scale electric generation facilities in the US are owned primarily by traditional regulated utility companies and independent power producers both of which are privately owned. Regulated utility companies provide retail electric service directly to residential and industrial customers. Independent power producers sell at wholesale to regulated utility companies, into the open market or directly to industrial customers. Transmission systems in the US are also owned primarily by regulated utility companies.

There are also numerous consumer-owned, not-for-profit electric cooperatives as well as public municipal utilities that provide electric or transmission services on a retail and wholesale basis. In addition, certain generating assets are owned by one of the Department of Energy’s four power marketing administrations and the Tennessee Valley River Authority. These generation assets are primarily hydropower or nuclear power facilities. In addition to utility-scale generation projects, sponsors in the US are developing residential and industrial rooftop and small-scale solar facilities as well as wind and gas-fired units. Development of both small and large-scale energy storage units is also increasing in the US.

The electric transmission systems and regional wholesale electricity markets in the US are controlled by independent system operators (ISO) within a single state or regional transmission organizations (RTO) across multiple states. RTOs and ISOs are not-for-profit organizations formed at the direction of the Federal Energy Regulatory Commission with the goal of providing open access to wholesale markets and available transmission.

Electric generation and transmission companies are regulated by the Federal Energy Regulatory Commission as well as a public utility commission at the state-level. Retail utility companies are subject to rate regulation designed to provide a reasonable return but limit costs to consumers. Interconnection with a transmission system is conducted pursuant to a standardized application process in each applicable state or region.

Energy policy is established by the federal government through the Department of Energy. Certain energy assets are also subject to regulation by the US Environmental Protection Agency and similar state agencies based on the impact on the environment and animal species and the treatment of hazardous materials. Nuclear plants are regulated by the Nuclear Regulatory Commission.
The production and transportation of oil and gas in the US is conducted primarily by private companies or municipalities. Pipelines throughout the US allow the transportation of oil and gas from production sources and import terminals to end-users or processing facilities. The Federal Energy Regulatory Commission also regulates the operation of oil and gas pipelines and related processing and import facilities.

Telecoms infrastructure

Private telecommunications companies provide wireless and wire-based services directly to consumers in the US. Many telecommunication companies are public companies with shares traded on the US stock market. The telecommunications industry in the US is dominated by several large players. The Federal Communications Commission is the primary regulator. Companies are subject to a complex regulatory scheme including licensing requirements.

Transport infrastructure

Freight rail in the US includes seven major carriers and dozens of smaller railroads all of which are privately owned. These companies own most of the tracks and related infrastructure.

The National Railroad Passenger Corporation or Amtrak is a for-profit corporation subsidized by the US, state and local governments. It was created by Congress pursuant to the Rail Passenger Service Act of 1970. It provides passenger rails services to 46 states and the District of Columbia and also operates certain commuter rail systems. Amtrak pays freight railroad companies for the use of their tracks.

Railroads in the US are regulated by the Federal Railroad Administration, an agency within the Department of Transportation, as well as state and local authorities. The Federal Railroad Administration has established a program to encourage the development of high-speed rail in the US.

Other infrastructure

Water supply in the US is provided via public water systems managed by state or local authorities. Wastewater treatment facilities are owned and operated primarily by local utilities or public water authorities although there has been some private investment in such facilities. Publicly supplied water is subject to federal standards issued by the federal Environmental Protection Agency.

Many roads and bridges are public assets operated by federal, state and local authorities, including the federal Department of Transportation. However, there are numerous private roads and bridges in the US. Many toll roads have been established via private investment and are operated as for-profit businesses.

Are there special rules for investing in energy and infrastructure?

Generally

The Committee on Foreign Investment in the United States (CFIUS) reviews the national security implications of transactions that would result in a foreign entity controlling a US business. CFIUS has at times found control when an entity has acquired less than 20% of the equity of a business. The President is authorized to suspend or prohibit a transaction under CFIUS jurisdiction when the President finds credible evidence that a foreign person controlling a US business might take action that threatens to impair the national security, and when no other provision of law (other than the International Emergency Economic Powers Act) provides suitable alternative authority. CFIUS does not have jurisdiction over greenfield investments or passive equity investments of 10% or less.

Section 7 of the Clayton Antitrust Act of 1914 (Clayton Act) prohibits 'acquisitions of assets or voting securities, the effect of which may be substantially to lessen competition or to tend to create a monopoly.' Enforcement standards applied by the US Department of Justice and the Federal Trade Commission are described in their Horizontal Merger Guidelines. Many transactions are reviewed pursuant to the Hart-Scott-Rodino Amendments to the Clayton Act which require formal advance notification to US Department of Justice and the Federal Trade Commission for many acquisitions of assets or equity interests over a certain size (currently US$80.8 million, a value adjusted annually).

Energy
The Federal Energy Regulatory Commission reviews many mergers and acquisitions involving energy assets pursuant to the Federal Power Act. It is in charge of determining the impact of the proposed transaction on competition and rates and reviewing concerns regarding the concentration of market power. Certain states also require the approval of such transactions by the state public utility commission. Many regulated and private energy companies seek to impose restrictions on the change in ownership or control of energy assets or company or the direct transfer of such assets via contractual limitations placed in long-term power purchase agreements, interconnection agreements as well as construction, supply, warranty and operation and maintenance agreements.

**Telecoms infrastructure**

As noted above, the Federal Communications Commission is the primary regulator of the telecommunications industry in the US. The transfer of licenses or companies holding licenses is subject to the review of the Federal Communications Commission. Pursuant to the Communications Act, the Federal Communications Commission is charged with determining if the proposed transaction will serve the public interest.

**Transport infrastructure**

Most investment in the transport infrastructure sector involves the US Department of Transportation (DOT) or an agency within the DOT, in addition to state and local transport authorities. By way of example, investments in roads, bridges and tunnels typically involve the Federal Highway Administration, an agency within the DOT. There are typically a number of legal requirements which must be met by such projects. The Federal Aviation Administration, also within the DOT, oversees the aviation sector. Public transit projects generally fall under the purview of the Federal Transit Administration, also a part of the DOT. Passenger rail and freight rail matters are governed by the Federal Railroad Administration which is once again included within the DOT. The DOT and local port authorities also handle port related matters.

**Other infrastructure**

In the US, social infrastructure such as schools, housing and hospitals are often operated by state or local authorities although of course many such assets are privately owned and operated. Increasingly, such projects are developed via public-private partnerships. In such cases, the applicable state or local government entity seeking a private investor to partner with will typically establish the relevant requirements in the applicable request for proposals.

*Last modified 24 Jan 2020*

**What is the applicable procurement process?**

**Investing in energy and infrastructure**

Generally, project sponsors establish new special-purpose entities to develop individual energy and infrastructure projects. As a result, many energy companies are structured with a parent company, various holding companies and individual projects companies. Investors may acquire an equity interest in specific project companies or in the upstream holding and parent companies. These transactions are typically accomplished via a negotiated purchase agreement. The transaction remains subject to the procurement of necessary regulatory and contractual approvals.

As for the procurement of power and related capacity and ancillary services by regulated utility companies, such companies often conduct requests for proposals (RFP) based on a standard-form agreement. Procurement is based on a procurement plan revised each year and subject to review by the state public utility commission. A public RFP process is managed pursuant to applicable legal requirements and is intended to promote competition and a fair assessment of the available offers. The result is typically a long-term power purchase agreement which forms the economic basis for the development and financing of the applicable generation project. Contracts with retail utility companies are typically subject to approval by the state public utility commission. Retail utilities and industrial customers may also engage in direct bilateral negotiation of such agreements. In recent years, a number of local cooperatives and industrial customers, such as manufacturing facilities, and public customers, such as universities and hospitals, have sought location-specific generation in the form of small generation units, including rooftop solar.

**Financing energy and infrastructure**

The procurement of financing for energy and other infrastructure projects typically involves negotiation with a bank, financial institution or
other lender or investor active in the infrastructure financing market. Often, such an entity is engaged as an arranger to assist with the marketing and syndication of the proposed financing to other players in the market in exchange for the payment of a fee. Many developers and sponsors rely on long-term relationships with such financing parties.

The financing of transport sector infrastructure projects often involves federal Transportation Investment Generating Economic Recovery (TIGER) grants. Rail projects may find funding via Railroad Rehabilitation and Improvement Financing (RRIF) loans. State and/or local governmental agencies also often contribute to the funding of transport projects. These matters are often developed as public-private partnerships (P3). Such P3 infrastructure projects are expanding beyond the traditional transport sector to include schools, housing, hospitals, courthouses, marinas, parking garages and other types of ‘social infrastructure.’

**What are the most common forms of funding / investing in energy and infrastructure?**

**Funding**

Financing infrastructure projects in the US can involve different forms of financing:

- traditional loans at the corporate level based on the balance sheet of the parent or holding company;
- project financing which involves loans to or bonds issued by the applicable project company secured by the project assets and equity in the project company – these may include construction and term loans, working capital loans, letter of credit facilities and asset-based securitizations, and the financing may involve a simple project or a portfolio of projects;
- tax equity investments which involve the acquisition by the financing party of an equity interest in order to take advantage of certain tax benefits, such as the production tax credit and the investment tax credit – as above, these financings are used to fund a single project or a portfolio of projects;
- sponsor loans or mezzanine debt;
- municipal bonds (used by state and local governments for public projects) which are typically exempt from federal, state and local taxes – bonds may be supported by fee-based revenues such as those generated by a toll road; and
- federal and state grants, loans or incentives used to fund public and private infrastructure assets – these programs vary by location and asset class (e.g. the federal government has established the Drinking Water State Revolving Fund and the Clean Water State Revolving Fund which offer low-interest loans to local authorities for water supply and wastewater facilities).

**Investing**

Direct investment in infrastructure often involves the purchase of an equity interest in applicable holding or project companies. In the US, active sponsors and developers often play multiple roles in transactions and an affiliate will act as the contractor, equipment supplier or operator in connection with such an investment. A number of energy companies have created joint ventures to facilitate such transactions.

As noted above, infrastructure projects may also be structured as public-private partnerships.

**Restructuring**

**Enforcement and sanctions**

**When can there be regulatory investigations?**

**Authority to commence an investigation**

The following outlines the various circumstances in which regulators have the authority to commence an investigation.
US SECURITIES AND EXCHANGE COMMISSION (SEC)

The SEC can issue subpoenas in connection with any investigation of violations of the Securities Act of 1933 or the Securities Exchange Act of 1934 (SEA).

The SEC conducts investigations in connection with violations of SEC Rule 10b-5, which broadly makes it unlawful for any person to commit fraud in connection with the sale or purchase of any security.

Criminal enforcement of the federal securities laws is done through the US Department of Justice and individual US Attorney's offices throughout the US.

FINANCIAL INDUSTRY REGULATORY AUTHORITY (FINRA)

FINRA may, in connection with an investigation, complaint, examination, or proceeding under the FINRA By-Laws or rules, require testimony under oath or inspect the books and records of any FINRA member or person associated with a FINRA member.

FEDERAL RESERVE

If the Federal Reserve determines that a supervised institution — state member banks, bank holding companies, savings and loan holding companies, non-bank subsidiaries of bank holding companies and of savings and loan holding companies, edge and agreement corporations, branches and agencies of foreign banking organizations operating in the US and their parent banks, officers, directors, employees, and certain other categories of individuals associated with the above banks, companies, and organizations (referred to as ‘institution-affiliated parties’) — has problems that affect its safety and soundness, or that the institution is not in compliance with applicable laws and regulations, the Federal Reserve may, by law, take action to ensure that the institution undertakes corrective measures.

The Federal Reserve may also pursue informal enforcement action through board resolutions or Memorandums of Understanding.

FEDERAL DEPOSIT INSURANCE CORPORATION (FDIC)

The FDIC pursues formal enforcement actions against FDIC-insured state chartered banks that are not members of the Federal Reserve System, including FDIC-insured branches of foreign banks, officers, directors, employees, controlling shareholders, agents and other institution-affiliated parties associated with such institutions for violations of laws, rules, or regulations, unsafe or unsound banking practices, breaches of fiduciary duty, and violations of final orders, conditions imposed in writing or written agreements.

The FDIC may also pursue informal enforcement action through board resolutions or Memorandums of Understanding.

OFFICE OF FOREIGN ASSETS CONTROL (OFAC)

The Department of Treasury’s OFAC may issue subpoenas in connection with any apparent violation of US economic sanctions laws, including the International Emergency Economic Powers Act, the Trading with the Enemy Act, the Foreign Narcotics Kingpin Designation Act, and other statutes administered or enforced by OFAC, as well as related executive orders, regulations, orders, directives, or licenses.

OFFICE OF THE COMPTROLLER OF THE CURRENCY (OCC)

The Department of the Treasury’s OCC uses informal and formal enforcement actions to ensure national banks, federal savings associations, federal branches, and agencies of foreign banks comply with the program, recordkeeping, and reporting requirements of the Bank Secrecy Act, its implementing regulations, and related anti-money laundering laws.

FEDERAL TRADE COMMISSION (FTC)

The FTC has authority to subpoena witnesses for testimony and require the production of documents if it has 'reason to believe' the law is being violated through unfair or deceptive acts affecting commerce.

Investigations may be originated upon the request of the President, Congress, governmental agencies, the Attorney General, upon referrals by the courts, upon complaint by members of the public, or by the FTC upon its own initiative.

CONSUMER FINANCIAL PROTECTION BUREAU (CFPB)
The CFPB may issue a 'civil investigative demand' (CID) to any person believed to be in possession, custody, or control of documents or testimony relevant to a violation of federal consumer protection laws.

**Standard for commencing an investigation and issuing an administrative subpoena**

In general, the standard for commencing an investigation or issuing an administrative subpoena is relatively low. Generally, the standard is met by having a good-faith basis for believing that an investigation may address conduct that falls within the jurisdiction of the relevant regulatory agency. By way of example, the SEC Division of Enforcement's Operating Manual notes that the relevant SEC staff 'should determine whether the known facts show that an enforcement investigation would have the potential to address conduct that violates the federal securities laws. The SEC Division of Enforcement receives information from a variety of sources that may warrant the opening of a new Matter Under Inquiry (MUI), including newspaper articles, complaints from the public, whistleblowers, and referrals from other agencies or self-regulatory organizations (SROs).' The manual emphasizes that these sources are 'suggestions only and should not discourage the opening of an MUI based on partial information.'

It is not uncommon for regulators, and even prosecutors, to commence investigations simply because of allegations of misconduct in press reports.

*Last modified 24 Jan 2020*

**What regulatory penalties may apply?**

The following is a list of regulatory penalties that may be imposed when a rule breach has occurred.

**US Securities and Exchange Commission (SEC)**

- Cease-and-desist orders and injunctions
- Civil money penalties for each act or omission that violates any relevant statutory provision or rule
- Disgorgement of fees, compensation or profits
- Rescission of transactions
- Willful violations may be prosecuted as criminal violations, with large fines to entities and potential incarceration for individuals

**Financial Industry Regulatory Authority (FINRA)**

- Censure, fine, suspension of membership and/or registration, expulsion, cease-and-desist order, or any other fitting sanction

**Federal Deposit Insurance Corporation (FDIC) and Federal Reserve**

- Cease-and-desist orders
- Restitution or reimbursement
- Indemnification or guaranty to third parties harmed by the wrongful conduct
- Removing institution-affiliated party from the banking institution and prohibiting the party from participating in banking at other financial institutions
- Civil money penalties against institution or institution-affiliated parties

**Office of Foreign Assets Control (OFAC)**

- Blocking actions against assets within jurisdiction of the US
- Civil money penalties

**Office of the Comptroller of the Currency (OCC)**

- Cease-and-desist orders
What criminal penalties may apply?

The regulators may impose criminal penalties in certain cases, including:

- securities or commodities fraud (a fine, imprisonment of not more than 25 years, or both);
- money laundering (violations of 18 US Code section 1956 may involve a fine, imprisonment for not more than 20 years, or both and violations of 18 US Code section 1957 may involve a fine, imprisonment for not more than ten years, or both);
- economic sanctions (a fine, imprisonment of not more than 20 years, or both);
- mail and wire fraud (a fine or up to 20 years of imprisonment, or both and if the violation affects a financial institution, the fine may be up to USD1 million, imprisonment for not more than 30 years, or both);
- conspiracy (a fine, imprisonment for not more than five years, or both if charged under 18 US Code section 371, and a fine, imprisonment for not more than 20 years, or both, if charged with conspiring to commit mail or wire fraud under 18 US Code section 1349); and
- breaches of the Bank Secrecy Act (a fine, imprisonment for not more than five years, or both and willful violations may involve a fine, imprisonment for not more than ten years, or both).

For all of the above-mentioned charges, courts may also impose both forfeiture and restitution orders.
No stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan.

**STATE AND LOCAL TAXES**

Generally, no stamp, registration, transfer or other similar taxes are payable on the advance, transfer or assignment of a loan. However, some jurisdictions (e.g. Florida) impose a documentary stamp tax on loans if the obligation is evidenced by a document (e.g. a note).

**Are there stamp, registration, transfer or other similar taxes payable on the taking, transfer or assignment of a mortgage, debenture or other security?**

**FEDERAL TAXES**

No stamp, registration, transfer or other similar taxes are payable on the taking, transfer or assignment of a mortgage, debenture or other security.

**STATE AND LOCAL TAXES**

Many jurisdictions (including New York and Florida) impose a documentary tax upon the recording of a mortgage. However, when a mortgage is assigned to a new lender without any increase in the amount of the secured indebtedness, the parties may be able to file an affidavit to be exempt from the mortgage recording tax. Likewise, some states will provide a credit for recording tax previously paid in connection with the assigned mortgage.

**Are there stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security (e.g. a bond)?**

**FEDERAL TAXES**

No stamp, registration, transfer or other similar taxes are payable on the issue, transfer or assignment of a debt security.

Debt instruments are typically held ‘in registered form’ because there are sanctions and penalties imposed on both the issuers and holders of bearer bonds. For issuers, these penalties can include the imposition of an excise tax and the denial of interest deductions. For holders, these penalties can include the denial of certain loss deductions or capital gain treatment upon sale, transfer, assignment or other disposition of the debt instrument and the denial of the beneficial portfolio interest exemption from withholding tax on interest payments.

**STATE AND LOCAL TAXES**

Generally, there are no stamp, registration, transfer or other similar taxes payable on the issue, transfer or assignment of a debt security.

However, some jurisdictions (e.g. Florida) impose a documentary stamp tax on loans if the obligation is evidenced by a document (e.g. a bond).

Last modified 24 Jan 2020

**Do tax authorities take priority on enforcement?**

**On the enforcement of security, do tax authorities take priority over secured lenders or secured debt security holders (e.g. secured bond holders)?**

**FEDERAL TAXES**

Although the United States Internal Revenue Service has a super-priority lien that arises upon the assessment of a federal tax even before a notice of tax lien is filed, federal tax liens do not take priority over secured creditors with respect to their collateral.

**STATE AND LOCAL TAXES**

State taxing authorities do not take priority over secured creditors with respect to their collateral. However, there is an exception for real property taxes, which are liens themselves by statute in each local jurisdiction.
Is withholding tax on interest payments applicable?

Is there withholding tax on interest payments under a loan?

FEDERAL TAXES

Generally, withholding tax is imposed on payments of interest to persons not resident in the US. However, there are important exceptions often utilized as discussed below.

Interest payments to certain 'foreign financial institutions' or 'non-financial foreign entities' may also be subject to withholding under the Foreign Account Tax Compliance Act if the foreign financial institution fails to enter into an agreement with the IRS which meets certain requirements.

STATE AND LOCAL TAXES

Generally, there is no withholding on interest payments.

However, some states (e.g. California) may impose backup withholding on interest received on loans used in a trade or business conducted in the state unless a proper exemption certificate is provided. For California purposes, dividends, interests, and any financial institutions release of loan funds made in the normal course of business are exempt from backup withholding.

If so:
What is the rate of withholding?

The current rate of US federal tax withholding on interest paid to persons not resident in the US is 30%.

What are the key exemptions?

FEDERAL TAXES

The most commonly relied upon exemptions to ensure that interest paid by US companies to persons not resident in the US can be paid without any US withholding tax include:

• the portfolio interest exemption ((i) a non-US lender (which is unrelated to the US borrower, is not a bank, is not a 'controlled foreign corporation', and is not engaged in the conduct of a US trade or business), (ii) lends money to a US borrower pursuant to a registered debt instrument which pays a fixed rate of interest, and (iii) the non-US lender provides adequate documentation as to its non-US status);

• lending using commercial paper (original issue discount notes with terms of 183 days or less);

• qualification under a US tax treaty for no withholding or reduced withholding; or

• loans by a lender that engages in a trade or business in the US and that will report the interest as income effectively connected with that trade or business. However, any such effectively connected income is subject to US federal income taxation at regular graduated tax rates.

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

FEDERAL TAXES

The analysis described above is applicable to interest payments under both a loan and other forms of debt instruments; provided it is in registered form (for portfolio interest exemption purposes).
Will the lender be taxed on interest payments under a loan in the jurisdiction of the borrower (other than by way of the application of withholding taxes (if any)), assuming the lender is not otherwise resident in that jurisdiction for tax purposes (e.g. by virtue of incorporation, residence or local branch)?

FEDERAL TAXES

A lender which is not resident in the US, e.g. a corporation, can be subject to income tax in the US at regular graduated tax rates, even without a physical presence, by engaging in a financing trade or business, or using the debt instrument in any other trade or business within the US. To have such a trade or business, US activities must be conducted on a considerable, continuous, and regular basis.

STATE AND LOCAL TAXES

A lender which is not resident in the US, e.g. a corporation, can be subject to income tax in the jurisdiction of the borrower even without a physical presence by engaging in a financing trade or business or otherwise using a note in its trade or business within that jurisdiction, or simply based on receiving a certain threshold of interest from borrowers and other income from within the jurisdiction (so called ‘economic nexus’).

Would the same analysis apply to interest payments under a debt security (e.g. a bond)?

FEDERAL TAXES

Yes, the analysis described above is applicable to interest payments under both a loan and other forms of debt securities.

Disclaimer

DLA Piper is a global law firm operating through various separate and distinct legal entities. Further details of these entities can be found at www.dlapiper.com.

This publication is intended as a general overview and discussion of the subjects dealt with, and does not create a lawyer-client relationship. It is not intended to be, and should not be used as, a substitute for taking legal advice in any specific situation. DLA Piper will accept no responsibility for any actions taken or not taken on the basis of this publication.

This may qualify as 'Lawyer Advertising' requiring notice in some jurisdictions. Prior results do not guarantee a similar outcome.
